MSHCP(d) = Surveys may be required within Criteria Area
MSHCP(e) = Conservation requirements identified in species-specific conservation objectives need to be met before classified as a Covered Species
MSHCP(f) = Covered species when a Memorandum of Understanding is executed with the Forest Service Land

Western Bat Working Group (WBWG)
H – High Priority
LM – Low-Medium Priority
M – Medium Priority
MH – Medium-High Priority

OCCURRENCE

- Does not occur – The site does not contain habitat for the species and/or the site does not occur within the geographic range of the species.
- Confirmed absent – The site contains suitable habitat for the species, but the species has been confirmed absent through focused surveys.
- Not expected to occur – The species is not expected to occur onsite due to low habitat quality, however absence cannot be ruled out.
- Potential to occur – The species has a potential to occur based on suitable habitat, however its presence/absence has not been confirmed.
- Confirmed present – The species was detected onsite incidentally or through focused surveys.

4.5.1 Special-Status Wildlife Species Observed

No special-status animals were detected within the disturbance limits of the Project; however, several species were detected adjacent to the Project site (to the south) in areas that were evaluated for potential indirect effects and/or for mitigation opportunities. These species are described below.

Least Bell's Vireo (*Vireo bellii pusillus*) – The least Bell's vireo (LBV) is state and federally listed as endangered, and is covered under the MSHCP. The LBV is typically associated with dense riparian habitats with a stratified canopy, including southern willow scrub, mule fat scrub, and riparian forest.

Three LBV territories were detected in the offsite riparian habitat adjacent to the Project footprint, two of which were detected within 300 feet of the Project, with third located about 800 feet from Project footprint [Exhibit 12 – LBV Survey Results]. Based on observed behavior, the LBV in all three locations appeared to be paired and nesting.

Northern Harrier (*Circus cyaneus*) - The northern harrier is designated as a CDFW SSC when nesting, but is a common, often abundant, winter visitor throughout California. The northern harrier is a MSHCP covered species. Characteristically, this hawk inhabits marshlands, both coastal salt and freshwater, but often forages over grasslands, fields, and low open scrub. It glides and flies low over open habitats searching for prey.

One northern harrier was detected flying offsite within agricultural and riparian areas during the biological surveys and would be expected to forage opportunistically over the Project site. The Project site does not support nesting habitat for northern harriers due to the historical and current land practices at the site.

Western Mastiff Bat (*Eumops perotis californicus*) – The western mastiff bat is designated as a CDFW SSC and a WBWG high priority species. This species is not covered under the MSHCP. The western mastiff bat occurs year-round in southern California and is typically associated with open, semi-arid to arid habitats including dry desert washes, flood plains, chaparral, oak woodland, montane meadows, grassland and agricultural areas. This species roosts in cliff faces and occasionally in buildings that provide unobstructed entry and exit access.

The western mastiff bat was detected faintly acoustically during the focused bat survey conducted in the offsite (adjacent) habitat located south of the Project footprint. The adjacent area contains suitable roosting habitat, including for maternity roosting. Although the Project site does not contain any roosting habitat, the site provides opportunistic foraging habitat as part of the mastiff bat's large foraging range, which can exceed 24 kilometers from roost sites.

Western Yellow Bat (*Lasiurus xanthinus*) – The western yellow bat is designated as a CDFW SSC and a WBWG high priority species. This species is not covered under the MSHCP. The western yellow bat occurs year-round in southern California and is typically associated with valley foothill, riparian, desert wash, desert riparian and palm oasis habitats, where they often roost in trees taller than three meters in height. Native and non-native palm trees are also known to provide suitable roosting habitat for the species.

The western yellow bat was detected acoustically during the focused bat survey conducted in the offsite (adjacent) habitat located south of the Project footprint. The adjacent area contains suitable roosting habitat, including for maternity roosting. Although the Project site does not contain any roosting habitat, the site provides opportunistic foraging habitat as part of the yellow bat's large foraging range.

Yellow-breasted chat (*Icteria virens*) – The yellow-breasted chat is designated as a CDFW SSC and is a MSHCP covered species. Yellow-breasted chats in southern California (including within the MSHCP Plan Area) are primarily found in dense, relatively wide riparian woodlands and thickets of willows, vine tangles, and dense brush with well-developed understories. Nesting areas are associated with streams, swampy ground, and the borders of small ponds.

The Project site does not contain habitat for the yellow-breasted chat, but at least one chat was detected in riparian habitat located immediately adjacent to the southern end of the Project footprint. The chat was detected in the same area occupied by least Bell's vireo that was part of broader study area surveyed to evaluate the potential for indirect effects during construction.

Yellow warbler (*Setophagia petechia*) – The yellow warbler is designated as a CDFW SSC and is a MSHCP covered species. Yellow warblers in southern California breed in lowland and foothill riparian woodlands dominated by cottonwoods, alders, or willows and other small trees and shrubs typical of low, open-canopy riparian woodland. The yellow warbler is found at elevations from 100 meters to 2,700 meters within riparian habitat and at higher elevations along watercourses with riparian growth.

The Project site does not contain habitat for the yellow warbler, but at least one warbler was detected in riparian habitat located immediately adjacent to the southern end of the Project footprint. The warbler was detected in the same area occupied by least Bell's vireo that was part of broader study area surveyed to evaluate the potential for indirect effects during construction.

4.5.2 Special-Status Wildlife Species Not Observed, but with a Potential to Occur at the Project Site

Golden eagle (*Aquila chrysaetos*) – The golden eagle is designated as a CDFW Fully Protected species and is a MSHCP covered species. Golden eagles prefer open areas with hills, cliffs, and bluffs including prairies, grasslands and tundra. They can also be found in forests, mountains, and deserts. Golden eagles nest in rugged areas generally with cliffs or bluffs or large trees.

The golden eagle was not detected during the biological surveys. However, historical records show the golden eagle occurs in the region. The Project site does not support suitable nesting habitat for the golden eagle, but the agricultural fields would provide limited low quality opportunistic foraging habitat for the species.

Loggerhead shrike (*Lanius ludovicianus*) – The loggerhead shrike is designated as a CDFW SSC and is a MSHCP covered species. The loggerhead shrike is a common resident and winter visitor in lowlands throughout California. Loggerhead shrikes prefer open habitats with scattered shrubs, trees, posts, fences, utility lines, and other perches and will eat mostly large insects, but will also take small birds, mammals, amphibians, reptiles, fish, carrion, and various other invertebrates. Shrikes usually fly directly to prey on ground or in a shrub; sometimes hovering. Occasionally this species will hawk aerial insects in mid-air. This species was not detected during the biological surveys but is historically known from the area. The shrike has a low potential to nest on site due to the general absence of suitable nesting habitat. However, the Project site does provide foraging habitat for the loggerhead shrike.

Purple martin (*Progne subis)* – The purple martin is designated as a CDFW SSC and is a MSHCP covered species. The purple martin was not detected during the biological studies but is historically known to occur in the area. The purple martin is not expected to nest on site due to the general absence of cavities. However, the Project site does provide suitable foraging habitat for this species.

Swainson's hawk (*Buteo swainsoni*) – The Swainson's hawk is State Threatened and is a MSHCP covered species. The Swainson's hawk was not detected during the biological studies but is historically known to occur in the area. The Swainson's hawk is expected to opportunistically forage within the agricultural fields in the region during the winter, which could include portions of the Project site. The Project site is not expected to provide suitable nesting habitat due to overall general absence of trees (especially solitary trees) on site.

Tricolored blackbird (*Agelaius tricolor)* – The tricolored blackbird is designated as State Threatened and CDFW SSC and is a MSHCP covered species. The tricolored blackbird was not detected during the biological studies but is historically known to occur in the area. The tricolored blackbird is not expected to nest on site due to the majority of the Project site being used for active agriculture and the Project site lacks wetland habitat. However, the Project site does provide foraging habitat for this species.

White-tailed kite (*Elanus leucurus)* – The white-tailed kite is a CDFW Fully Protected species and is a MSHCP covered species. The white-tailed kite was not detected during the biological

studies but is historically known to occur in the area. The white-tailed kite is not expected to nest on site due to the general absence of trees within the Project site. However, the Project site does provide foraging habitat for this species.

Yellow-headed blackbird (*Xanthocephalus xanthocephalus*) – The yellow-headed blackbird is designated as a CDFW SSC but is not a MSHCP covered species. The yellow-headed blackbird was not detected during the biological studies but is historically known to occur in the area. The yellow-headed blackbird is not expected to nest on site due to the majority of the Project site being used for active agriculture and the Project site lacks wetland habitat. However, the Project site does provide foraging habitat for this species.

Crotch's Bumble Bee (*Bombus crotchii*) - Crotch's bumble bee (CBB) is designated as a State Candidate Endangered (CE) species under CESA. CBB also has a State Ranking of S2 ("imperiled"), which conveys special status to CBB independent of its CESA status. CBB is not a covered species under the MSHCP, meaning that the MSHCP does not grant authorization to "take" CBB and does not directly mitigate the loss of habitat occupied by CBB.

CBB was not detected during the 2025 focused surveys [Appendix I], meaning that there was no evidence that CBB occupied the site in 2025. However, the site contains herbaceous floral resources suitable to support CBB for foraging, including common fiddleneck (*Amsinckia menziesii*) and alfalfa (*Medicago sativa*). In addition, the site contains substrates suitable to support nesting and/or overwintering, although due to the regular disturbance of much of the site for agricultural operations, CBB is less likely to utilize the site for those purposes. Because the Project site contains suitable for foraging, and CBB has been documented in the vicinity of the Project site, it is possible for CBB to utilize the site during the 2026 season and future seasons. Potential impacts to CBB and its habitat are discussed below in Section 5.2.2.

4.5.3 Special-Status Wildlife Species Confirmed Absent Through Focused Surveys

Burrowing Owl (*Athene cunicularia*) - The burrowing owl is designated as a CDFW Candidate Endangered species and is a covered species not adequately conserved under the MSHCP, which means that projects located within the Burrowing Owl Survey Area may have to evaluate avoidance and/or mitigation measures if burrowing owls are present. The Project site is located within the MSHCP Burrowing Owl Survey Area.

GLA biologists did not observe burrowing owls during the focused burrowing owl surveys performed in 2022 and 2024. Although the Project site contains multiple suitable burrows, no evidence of burrowing owls (e.g., cast pellets, preened feathers, or whitewash clustered at a burrow) were detected at any of the burrows. Therefore, the species was confirmed absent.

Fairy Shrimp – Five features that pond seasonally (4, 5, 46, E-1, and E-2) were surveyed for fairy shrimp. The non-listed versatile fairy shrimp (*Branchinecta lindahli*) was detected in just one of the five features during the wet season surveys (Feature 5), which consists of vehicle ruts within a dirt road. The dry season survey of Feature 5 detected *Branchinecta* cysts, which were successfully hatched and reared to identify individuals as the versatile fairy shrimp, thus corroborating the results of the wet season survey.

No fairy shrimp were detected in the other five features during the wet season surveys. Features 4, 46, and E-2 also consist of vehicle ruts in dirt roads. Feature E-1 corresponds with the large inundation area associated with Drainage Area A. No *Branchinecta* cysts were detected within Feature 4 and 46 during the 2023 dry season surveys. No *Branchinecta* cysts were detected within Features E-1 and E-2 during the 2025 dry season surveys. Fairy shrimp survey reports are provided as Appendices D, E, F and G.

4.5.4 Raptor Use

The Project site is disturbed and primarily used for agricultural purposes; however, it does provide suitable foraging habitat for a number of raptor species, including special-status raptors. Southern California holds a diversity of birds of prey (raptors), and many of these species are in decline. For most of the declining species, foraging requirements include extensive open, undisturbed, or lightly disturbed areas, especially grasslands. This type of habitat has declined severely in the region, affecting many species, but especially raptors. A few species, such as red-tailed hawk (*Buteo jamaicensis*) and American kestrel (*Falco sparverius*), are somewhat adaptable to low-level human disturbance and can be readily observed adjacent to neighborhoods and other types of development. These species still require appropriate foraging habitat and low levels of disturbance in the vicinity of nesting sites.

Many of the raptors that would be expected to forage and nest within western Riverside are fully covered species under the MSHCP with the MSHCP providing the necessary conservation of both foraging and nesting habitats. Some common raptor species (e.g., American kestrel and red-tailed hawk) are not covered by the MSHCP but are expected to be conserved with implementation of the Plan due to the parallel habitat needs with those raptors covered under the Plan. However, the MSHCP does not provide MBTA and Fish and Game Code take for raptors covered under the Plan.

Appendix B (faunal compendium) provides a list of the raptors detected over the course of the field studies (both onsite, but adjacent). These species include the red-tailed hawk (*Buteo jamaicensis*) and turkey vulture (*Cathartes aura*). In addition, the Cooper's hawk (*Accipiter cooperi*), red-shouldered hawk (*Buteo lineatus*), great horned owl (*Bubo virginianus*), barn owl (*Tyto alba*) and northern harrier (*Circus cyaneus*) were detected offsite, but adjacent to the Project site. In addition, the American kestrel (*Falco sparverius*), Ferruginous hawk (*Buteo regalis*), Swainson's hawk (*Buteo swainsoni*), white-tailed kite (*Elanus leucurus*), merlin (*Falco columbarius*), and peregrine falcon (*Falco peregrinus*) were not detected during field studies but would be expected to forage and/or winter within Project site opportunistically.

4.6 Bats

Eight species of bats were detected adjacent to the southern portion of the Project site during the focused bat survey: big brown bat (*Eptesicus fuscus*), California myotis (*Myotis californicus*), canyon bat (*Parastrellus hesperus*), Mexican free-tailed bat (*Tadarida brasiliensis*), western small-footed myotis (*Myotis ciliolabrum*), western mastiff bat (*Eumops perotis*), western yellow

bat (*Lasiurus xanthinus*), and Yuma myotis (*Myotis yumanensis*).[12]

The western mastiff bat and western yellow bat are both designated as CDFW Species of Special Concern and are designated by the WBWG as high priority species. The western yellow bat is strongly tied to palm trees which occur offsite, but adjacent to the southern Project site boundary. The western mastiff is strongly tied to cliff areas and is a strong flyer capable of flying over 24 kilometers in a night. The faint acoustic signatures detected from outside the Project site were indicative of individuals flying high over or near the Project site as part of their foraging foray. The Project site is generally devoid of trees and does not support suitable roosting habitat (including maternity roosts) for both species.

4.7 Nesting Birds

The Project site contains shrubs, ground cover and some trees that provide suitable habitat for nesting native birds. Mortality of native birds (including eggs) is prohibited under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code.[13]

4.8 Wildlife Linkages/ Corridors and Nursery Sites

Habitat linkages are areas which provide a connection between two or more other habitat areas which are often larger or superior in quality to the linkage. Such linkage sites can be quite small or constricted but still be vital to the long-term health of connected habitats. Linkage values are often addressed in terms of "gene flow" between populations, with movement taking potentially many generations.

Corridors are like linkages but provide specific opportunities for individual animals to disperse or migrate between areas, generally extensive but otherwise partially or wholly separated regions. Adequate cover and tolerably low levels of disturbance are common requirements for corridors. Habitat in corridors may be quite different than that in the connected areas, but if used by the wildlife species of interest, the corridor will still function as desired.

Wildlife nurseries are sites where wildlife concentrate for hatching and/or raising young, such as rookeries, spawning areas, and bat colonies. Nurseries can be important to both special-status species as well as commonly occurring species.

The Project site may provide for local movement by common urban-adapted mammal species such as coyote, striped skunk, raccoon, and opossum through the agricultural fields and disturbed areas. However, the Project site is not located within a regionally significant wildlife linkage or corridor. The Project site does not contain any wildlife nursery habitat.

---

[12] Because both the Yuma myotis and California myotis have very similar echolocation call signatures within the 45 to 50 kilohertz (kHz) range and are both known to occur in the general vicinity, both species are presumed present based on calls recorded and from individual echolocation calls that appear diagnostic for each species.

[13] The MBTA makes it unlawful to take, possess, buy, sell, purchase, or barter any migratory bird listed in 50 C.F.R. Part 10, including feathers or other parts, nests, eggs, or products, except as allowed by implementing regulations (50 C.F.R.21). In addition, Sections 3505, 3503.5, and 3800 of the California Department of Fish and Game Code prohibit the take, possession, or destruction of birds, their nests or eggs.

4.9 Critical Habitat

The Project site is not located within an area designated as critical habitat by USFWS.

4.10 Jurisdictional Waters

The Project site contains six ditches (Ditches A-F), Drainage Area A and a constructed agricultural basin (Basin A). Drainage Area A consists of a large inundation area that resulted from above-normal rainfall during the 2023 and 2024 wet seasons, supplemented by agricultural irrigation.

4.10.1 Corps Jurisdiction

No Corps jurisdiction is present within the Project site.

Ditches A, B, D, E, and F and Drainage Area A flow and/or collect water only in direct response to precipitation and were completely dry during the most recent field investigation. Therefore, they are not relatively permanent, standing or continuously flowing bodies of water and are not considered waters of the U.S. as defined in 33 CFR Part 328.3(a). Additionally, ditches that are excavated wholly in and draining only dry land and do not carry a relatively permanent flow of water, and artificial ponds used as stock watering, irrigation, and/or settling basins, are excluded from being waters of the waters of the U.S. pursuant to 33 CFR Part 328.3(b).

Basin A was constructed in uplands for the sole purpose of capturing and storing agricultural waste runoff from the adjacent active dairy operation. Similarly, Drainage C functions as a closed irrigation system, capturing irrigation runoff from adjacent irrigated row crop fields and transporting this runoff to irrigate row crop fields to the north and northeast. These features are also frequently modified (i.e. filled in, reconfigured) as a part of ongoing agricultural operations and are isolated and do not have a surface connection to jurisdictional resources. Therefore, these facilities are excluded from regulation as waters of the waters of the U.S. pursuant to 33 CFR Part 328.3(b) as Ditch C is a ditch that was excavated wholly in and draining only dry land and that does not carry a relatively permanent flow of water, and Basin A and Ditch C are artificially irrigated areas that would revert to dry land if the irrigation ceased.

4.10.2 Regional Water Quality Control Board Jurisdiction

Regional Board jurisdiction associated with the Project site totals 3.83 acres, none of which consist of wetland waters of the State. A total of 4,283 linear feet of ephemeral stream is present. Regional Board jurisdiction within the Project site is limited to Ditches A, B, D, E, and F, and Drainage Area A. These features exhibited flow sign indicators as demonstrated by changes in soil characteristics and incised channel banks. These features convey surface flow with the potential to support beneficial uses and therefore meet the definition of waters of the State as defined in Section 13050(e) of the Clean Water Code.

There are also two non-jurisdictional features constructed wholly in uplands that do not convey flows and/or or support any beneficial uses identified in the Regional Board Basin Plan. These

features were created specifically to capture agricultural runoff from the surrounding areas and do not represent regulated aquatic resources (See Section D, below). Such features are not considered waters of the State as defined in Section 13050(e) of the Clean Water Code and should not be regulated under Section 13260 of the CWC.

Table 4-4 below summarizes Regional Board jurisdiction associated with the Project site. The boundaries of Regional Board jurisdiction are depicted on the enclosed jurisdictional delineation map [Exhibit 13A].

Table 4-4. Summary of Regional Board Jurisdiction

Feature Name	Regional Board Non-Wetland Waters (acres)	Regional Board Jurisdictional Wetlands (acres)	Total Regional Board Jurisdiction (acres)	Length (linear feet)
Drainage Area A	3.30	0.00	3.30	-
Ditch A	0.17	0.00	0.17	980
Ditch B	0.03	0.00	0.03	302
Ditch D	0.11	0.00	0.11	2,303
Ditch E	0.04	0.00	0.04	279
Ditch F	0.18	0.00	0.18	419
Total	**3.83**	**0.00**	**3.83**	**4,283**

Drainage Area A

Regional Board jurisdiction associated with Drainage Area A totals 3.30 acres, none of which consists of State wetlands. Drainage Area A is located in the northwestern portion of the Project site. Drainage Area A consists of relatively flat undeveloped land that appears to have been disced as recently as December 2020, according to historic aerial imagery. Since then, it does not appear that this area has been planted or otherwise maintained. Instead, Drainage Area A conveys flows in a generally northwestern direction towards Drainage A during periods following heavy precipitation when adjacent agricultural ditches have flooded. Furthermore, corrugated metal culverts that convey flows within Drainage A under a dirt access road appear to have been clogged by debris, which likely contributes to backup of flood waters in Drainage Area A.

Drainage Area A was assessed for wetland indicators. Drainage Area A contained two dominant plant species, salt heliotrope (FACU) and alkali mallow (*Malvella leprosa*; FACU), which did not meet the parameters for hydrophytic vegetation. A 12-inch deep soil pit was dug within Drainage Area A which contained silty loam and a color of 2.5Y 3/2. No redox features or other

indicators of hydric soils were observed, however, soils within this area are strongly alkali. Primary indicators of hydrology were observed within Drainage Area A (i.e., surface soil cracks). Drainage Area A met the indicators for hydrology but lacked hydrophytic vegetation and hydric soils. Therefore, Drainage Area A was determined not to be a wetland. See Appendix A for further details regarding the wetland assessment.

Other vegetation associated with Drainage Area A consists of five horn bassia (*Bassia hyssopifolia*; FACU), London rocket (NI), perennial pepperweed (FAC), Canada horseweed (*Erigeron canadensis*; FACU), black mustard (NI), fiddleneck (NI), Bermuda grass (FACU), ripgut brome (NI), and red brome (UPL).

Ditch A

Regional Board jurisdiction associated with Ditch A totals 0.17 acre, none of which consists of State wetlands. Ditch A is located in the northwestern portion of the Project site. Ditch A consists of several man-made earthen ditches that together convey agricultural runoff in a northwestward direction for approximately 980 linear feet before continuing offsite and eventually terminating in a basin adjacent to Ramona Expressway, which ultimately conveys water downstream to the San Jacinto River. Ditch A exhibits an OHWM that ranges from one (1) to 15 feet in width.

Vegetation associated with Ditch A consists of non-native upland grasses and forbs including ripgut brome (NI), red brome (UPL), black mustard, fiddleneck, cheeseweed (NI), Russian thistle (FACU), stinknet (FACU).

Ditch B

Regional Board jurisdiction associated with Ditch B totals 0.03 acre, none of which consists of State wetlands. Ditch B is located in the center of the Project site. Ditch B is a man-made earthen ditch that crosses the alignment and conveys agricultural runoff in a northward direction for approximately 302 linear feet before leaving the Project site. Ditch B exhibits an OHWM that averages four (4) feet in width. The offsite portion of Ditch B, to the north of the alignment, appears to convey flows to Drainage Area A during periods of heavy precipitation. Ditch B is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle (FACU), Canada horseweed (FACU), and black mustard (NI) were observed immediately adjacent to the drainage along the top of the bank.

Ditch D

Approximately 0.11 acre of Regional Board jurisdiction is associated with Ditch D. Ditch D is located in the center of the Project site. Ditch D is a constructed earthen ditch that crosses the alignment along the western side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 2,303 linear feet before leaving the Project site. Ditch D exhibits a stream course that averages two feet in width. Ditch D is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated.

However, Russian thistle (FACU) and non-native grasses such as Bermuda grass (FACU) and red brome (UPL) were observed immediately adjacent to this ditch along the top of the bank.

Ditch E

Approximately 0.04 acre of Regional Board jurisdiction is associated with Ditch E. Ditch E is located in the center of the Project site. Ditch E is a constructed earthen ditch that crosses the alignment along the eastern side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 279 linear feet before leaving the Project site. Ditch E exhibits a stream course that averages six feet in width. Ditch E is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, five horn bassia (FACU), Russian thistle (FACU), stinknet (FACU), and non-native grasses such as red brome were observed immediately adjacent to the drainage along the top of the bank.

Ditch F

Regional Board jurisdiction associated with Ditch F totals 0.18 acre, none of which consists of State wetlands. Ditch F is located in the southeastern portion of the Project site. Ditch F is a man-made earthen ditch that conveys flows northward away from the San Jacinto Reservoir Overflow for approximately 419 linear feet before continuing offsite and terminating as sheet flow in an adjacent agricultural field. Ditch F exhibits an OHWM ranging from 10 to 30 feet in width. A rip-rap headwall and culvert previously existed separating the offsite riparian area to the south from the remainder of Ditch F to the north. Currently, the rip-rap headwall and culvert appear to have been destroyed and flows now bypass the culvert and continue around the riprap through a highly eroded area to the east of the culvert. According to historic aerial imagery, Ditch F is typically characterized by an ephemeral flow regime. However, at the time of the initial site visit, Ditch F contained surface water in the southernmost reach, immediately adjacent to the San Jacinto Reservoir Overflow area. Ditch F was completely dry during the most recent site visit.

Vegetation associated with Ditch F includes a mix of native and non-native species such as Bermuda grass (FACU), stinknet (FACU), annual yellow sweetclover (FACU), Canada horseweed (FACU), alkali mallow (FACU), cocklebur (FAC), and various other non-native grasses.

4.10.3 CDFW Jurisdiction

CDFW jurisdiction associated with the Project site totals 4.03 acres, none of which consists of riparian stream. A total of 4,283 linear feet of stream is present.

CDFW jurisdiction within the Project site is limited to Ditches A, B, D, E, and F and Drainage Area A. These features exhibited defined stream flow indictors (i.e., change in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, and/or incised channel banks). Since these features exhibited a discernable stream course and/or riparian vegetation, they are subject to regulation by the CDFW under Section 1600 of the Fish and Game Code.

There are also two features within the Project site that do not meet CDFW's definition of a river, stream, or lake, Basin A and Ditch C [Exhibit 13B – CDFW Jurisdictional Delineation Map]. These features were created specifically to capture runoff from the surrounding agricultural areas and were constructed wholly in the uplands, are not associated with any river, stream, or lake, and do not contain habitat or riparian resources upon which fish or wildlife depend for continued viability (See Section D, below). As a result, these features should not be subject to CDFW jurisdiction pursuant to Section 1600 of the California Fish and Game Code.

Table 4-5 below summarizes CDFW jurisdictional waters associated with the Project site. The boundaries of CDFW jurisdiction are depicted on the enclosed jurisdictional delineation map [Exhibit 13B].

Table 4-5. Summary of CDFW Jurisdiction

Feature Name	CDFW Non-Riparian Stream (acres)	CDFW Riparian Stream (acres)	Total CDFW Jurisdiction (acres)	Length (linear feet)
Drainage Area A	3.30	0.00	3.30	-
Ditch A	0.26	0.00	0.26	980
Ditch B	0.03	0.00	0.03	302
Ditch D	0.11	0.00	0.11	2,303
Ditch E	0.04	0.00	0.04	279
Ditch F	0.29	0.00	0.29	419
Total	**4.03**	**0.00**	**4.03**	**4,283**

Drainage Area A

CDFW jurisdiction associated with Drainage Area A totals 3.30 acres, none of which consists of riparian habitat. Drainage Area A is located in the northwestern portion of the Project site. Drainage Area A consists of relatively flat undeveloped land that appears to have been disced as recently as December 2020, according to historic aerial imagery. Since then, it does not appear that this area has been planted or otherwise maintained. Instead, Drainage Area A conveys flows in a generally northwestern direction towards Drainage A during periods following heavy precipitation when adjacent agricultural ditches have flooded. Furthermore, corrugated metal

culverts that convey flows within Drainage A under a dirt access road appear to have been clogged by debris, which likely contributes to backup of flood waters in Drainage Area A.

Vegetation associated with Drainage Area A consists of five horn bassia, London rocket, perennial pepperweed, Canada horseweed, black mustard, Bermuda grass, ripgut brome, red brome, salt heliotrope, and alkali mallow.

Ditch A

CDFW jurisdiction associated with Ditch A totals 0.26 acre, none of which consists of riparian habitat. Ditch A is located in the northwestern portion of the Project site. Ditch A consists of several man-made earthen ditches that together convey agricultural runoff in a northwestward direction for approximately 980 linear feet before continuing off site and eventually terminating in a basin adjacent to Ramona Expressway, which ultimately conveys water downstream to the San Jacinto River. Ditch A exhibits a stream course that ranges from one (1) to 25 feet in width.

Vegetation associated with Ditch A consists of non-native upland grasses and forbs including ripgut brome, red brome, black mustard, fiddleneck, cheeseweed, Russian thistle, and stinknet.

Ditch B

CDFW jurisdiction associated with Ditch B totals 0.03 acre, none of which consists of riparian habitat. Ditch B is located in the center of the Project site. Ditch B is a constructed earthen ditch that crosses the alignment and conveys agricultural runoff in a northward direction for approximately 302 linear feet before leaving the Project site. Ditch B exhibits a stream course that averages four (4) feet in width. The off-site portion of Ditch B, to the north of the alignment, appears to convey flows to Drainage Area A during periods of heavy precipitation. Ditch B is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle, Canada horseweed, and black mustard were observed immediately adjacent to the drainage along the top of the bank.

Ditch D

Approximately 0.11 acre of CDFW jurisdiction is associated with Ditch D, none of which consists of riparian habitat. Ditch D is located in the center of the Project site. Ditch D is a constructed earthen ditch that crosses the alignment along the western side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 2,303 linear feet before leaving the Project site. Ditch D exhibits a stream course that averages two feet in width. Ditch D is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle and non-native grasses such as Bermuda grass and red brome were observed immediately adjacent to this ditch along the top of the bank.

Ditch E

Approximately 0.04 acre of CDFW jurisdiction is associated with Ditch E, none of which consists of riparian habitat. Ditch E is located in the center of the Project site. Ditch E is a constructed earthen ditch that crosses the alignment along the eastern side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 279 linear feet before leaving the Project site. Ditch E exhibits a stream course that averages six feet in width. Ditch E is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, five horn bassia, Russian thistle, stinknet, and non-native grasses such as red brome were observed immediately adjacent to the drainage along the top of the bank.

Ditch F

CDFW jurisdiction associated with Ditch F totals 0.29 acre, none of which consists of riparian habitat. Ditch F is located in the southeastern portion of the Project site. Ditch F is a constructed earthen ditch that conveys flows northward away from the San Jacinto Reservoir Overflow for approximately 419 linear feet before continuing offsite and terminating as sheet flow in an adjacent agricultural field. Ditch F exhibits a stream course ranging from 10 to 30 feet in width. Based on the review of aerial imagery, Ditch F is typically characterized by an ephemeral flow regime. However, at the time of the initial site visit, Ditch F contained surface water in the southernmost reach, immediately adjacent to the San Jacinto Reservoir Overflow area. Ditch F was completely dry during the most recent site visit.

Vegetation associated with Ditch F includes a mix of native and non-native species such as Bermuda grass, stinknet, annual yellow sweetclover, Canada horseweed, alkali mallow, cocklebur, and various other non-native grasses.

4.10.4 Non-jurisdictional Agricultural Features

Table 4-6, below, summarizes one agricultural ditch (Ditch C) and an agricultural basin (Basin A), which both function as a closed agricultural system [Exhibit 13A – RWQCB Jurisdictional Delineation Map and Exhibit 13B – CDFW Jurisdictional Delineation Map].

Basin A was constructed in uplands for the sole purpose of capturing and storing agricultural waste runoff from the adjacent active dairy operation. Similarly, Drainage C functions as a closed irrigation system, capturing irrigation runoff from adjacent irrigated row crop fields and transporting this runoff to irrigate row crop fields to the north and northeast. These features are also frequently modified (i.e., filled in, reconfigured) as a part of ongoing agricultural operations and are isolated and do not have a surface connection to jurisdictional resources.

Therefore, these facilities are excluded from regulation as waters of the waters of the U.S. pursuant to 33 CFR Part 328.3(b) as Ditch C is a ditch that was excavated wholly in and draining only dry land and that does not carry a relatively permanent flow of water, and Basin A and Ditch C are artificially irrigated areas that would revert to dry land if the irrigation ceased. Similarly, Basin A and Ditch C are not considered jurisdictional under the Porter-Cologne Water

Quality Control Act or FGC Section 1600 et Seq. as closed agricultural systems dependent upon irrigation as an artificial water source and do not represent manipulated natural surface waters.

Table 4-6. Non-jurisdictional Agricultural Features

Feature Name	Area (acres)	Length (linear feet)
Ditch C	0.02	331
Basin A	0.13	--
Total	**0.15**	**331**

4.11 MSHCP Riparian/Riverine Areas and Vernal Pools

The Project site contains 4.03 acres of MSHCP non-riparian riverine areas, associated with six features (Ditches A, B, D, E, and F and Drainage Area A). These features exhibited defined stream flow indictors (i.e., change in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, and/or incised channel banks). Table 4-7 below summarizes the riverine areas associated with the Project site. The boundaries of riverine areas are depicted on the enclosed map [Exhibit 7 – MSHCP Riverine Areas].

Table 4-7. Summary of MSHCP Riverine Areas

Feature Name	Riverine (acres)	Riparian (acres)	Total (acres)
Drainage Area A*	3.30	0.00	3.30
Ditch A*	0.26	0.00	0.26
Ditch B	0.03	0.00	0.03
Ditch D*	0.11	0.00	0.11
Ditch E	0.04	0.00	0.04
Ditch F	0.29	0.00	0.29
Total	**4.03**	**0.00**	**4.03**

*Indicates MSHCP Riverine Areas that support smooth tarplant.

Drainage Area A

Approximately 3.30 acres of unvegetated riverine areas area associated with Drainage Area A. Drainage Area A is in the northwestern portion of the Project site. Drainage Area A consists of relatively flat undeveloped land that appears to have been disced as recently as December 2020, according to historic aerial imagery. Since then, it does not appear that this area has been planted or otherwise maintained. Instead, Drainage Area A conveys flows in a generally northwestern direction towards Drainage A during periods following heavy precipitation when adjacent

agricultural ditches have flooded. Furthermore, corrugated metal culverts that convey flows within Drainage A under a dirt access road appear to have been clogged by debris, which likely contributes to backup of flood waters in Drainage Area A.

Vegetation associated with Drainage Area A consists of five horn bassia, London rocket, perennial pepperweed, Canada horseweed, black mustard, Bermuda grass, ripgut brome, red brome, salt heliotrope and alkali mallow.

Ditch A

Approximately 0.26 acre of unvegetated riverine areas are associated with Ditch A. Ditch A is in the northwestern portion of the Project site. Ditch A consists of several man-made earthen ditches that together convey agricultural runoff in a northwestward direction for approximately 980 linear feet before continuing offsite and eventually terminating in a basin adjacent to Ramona Expressway. Ditch A exhibits a stream course that ranges from 1 to 25 feet in width.

Vegetation associated with Ditch A consists of non-native upland grasses and forbs including ripgut brome, red brome, black mustard, fiddleneck, cheeseweed, Russian thistle, stinknet.

Ditch B

Approximately 0.03 acre of unvegetated riverine areas are associated with Ditch B. Ditch B is located in the center of the Project site. Ditch B is a man-made earthen ditch that crosses the alignment and conveys agricultural runoff in a northward direction for approximately 302 linear feet before leaving the Project site. Ditch B exhibits a stream course that averages four feet in width. The offsite portion of Ditch B, to the north of the alignment, appears to convey flows to Drainage Area A during periods of heavy precipitation. Ditch B is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle, Canada horseweed, and black mustard were observed immediately adjacent to the drainage along the top of the bank.

Ditch D

Approximately 0.11 acre of unvegetated riverine areas are associated with Ditch D. Ditch D is located in the center of the Project site. Ditch D is a man-made earthen ditch that crosses the alignment along the western side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 2,337 linear feet before leaving the Project site. Ditch D exhibits a stream course that averages two feet in width. Ditch D is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle and non-native grasses such as Bermuda grass and red brome were observed immediately adjacent to this ditch along the top of the bank.

Ditch E

Approximately 0.04 acre of unvegetated riverine areas are associated with Ditch E. Ditch E is located in the center of the Project site. Ditch E is a man-made earthen ditch that crosses the

alignment along the eastern side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 279 linear feet before leaving the Project site. Ditch E exhibits a stream course that averages six feet in width. Ditch E is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, five horn bassia, Russian thistle, stinknet, and non-native grasses such as red brome were observed immediately adjacent to the drainage along the top of the bank.

Ditch F

Approximately 0.29 acre of unvegetated riverine areas are associated with Ditch F. Ditch F is in the southeastern portion of the Project site. Ditch F is a man-made earthen ditch that conveys flows northward away from the San Jacinto Reservoir Overflow for approximately 419 linear feet before continuing offsite and terminating as sheet flow in an adjacent agricultural field. Ditch F exhibits a stream course that averages approximately 10 feet in width. A rip-rap headwall and culvert previously existed separating the offsite riparian area to the south from the remainder of Ditch F to the north. Currently, the rip-rap headwall and culvert appear to have been destroyed and flows now bypass the culvert and continue around the riprap through a highly eroded area to the east of the culvert. According to historic aerial imagery, Ditch F is typically characterized by an ephemeral flow regime. However, at the time of the initial site visit, Ditch F contained surface water in the southernmost reach, immediately adjacent to the San Jacinto Reservoir Overflow area. Ditch F was completely dry during the most recent site visit.

Vegetation associated with Ditch F includes a mix of native and non-native species such as Bermuda grass, stinknet, annual yellow sweetclover, Canada horseweed, alkali mallow, and various other non-native grasses.

Approximately 1,670 smooth tarplant individuals were documented as occurring within portions of the Project site that support MSHCP Riparian/Riverine resources [Exhibit 7 – MSHCP Riverine Areas]. Smooth tarplant is a species identified by MSHCP Section 6.1.2 as being associated with MSHCP Riparian/Riverine resources. Therefore, these approximately 1,670 smooth tarplant individuals are considered as an MSHCP Riparian/Riverine resource in the context of the Project, occupying a total of approximately 0.50 acre occurring throughout Ditches A and D and Drainage Area A [Exhibit 7 – MSHCP Riverine Areas; Table 4-7. Summary of MSHCP Riverine Areas]. Additional smooth tarplant individuals were documented in upland areas and not associated with any of the features outlined on Table 4-6 and were therefore not considered as an MSHCP Riparian/Riverine resource, and are discussed in Section 5.1 of this document.

Table 4-7 summarizes one additional agricultural ditch (Ditch C) and an agricultural basin (Basin A) that are not riparian/riverine areas [Exhibit 7 – MSHCP Riverine Areas]. These features are frequently modified (i.e. filled in, recreated) as a part of ongoing agricultural operations and are isolated and do not drain to a downstream MSHCP Conservation Area (San Jacinto River).

Therefore, these facilities are not considered as MSHCP Riparian/Riverine Areas, as they are artificially created and do not provide biological functions supporting Section 6.1.2 species.

Table 4-7. Summary of Non-Riparian/Riverine Features

Feature	Acreage
Basin A	0.13
Ditch C	0.02
Total	**0.15**

Vernal Pools

The Project site does not contain MSHCP vernal pools. Five areas were noted as inundated within the Project site, corresponding to the five features (4, 5, 46, E-1 and E2) that are described below as having been evaluated through focused surveys for listed fairy shrimp. Features 4, 5, 46 and E-2 are all unvegetated vehicle ruts in dirt roads. Feature E-1 consists of a large, inundated area that is described above as Drainage Area A. Drainage Area A was determined not to exhibit all three parameters of a wetland, specifically the inundated area did not exhibit a predominance of hydrophytic vegetation, and therefore the feature is not considered as a vernal pool.

4.12 Local Policies or Ordinances

There are no local policies or ordinances that apply to the Project site.

5.0 IMPACT ANALYSIS

The following discussion examines the potential impacts to plant and wildlife resources that would occur as a result of the proposed project. Impacts (or effects) can occur in two forms, direct and indirect. Direct impacts are considered to be those that involve the loss, modification or disturbance of plant communities, which in turn, directly affect the flora and fauna of those habitats. Direct impacts also include the destruction of individual plants or animals, which may also directly affect regional population numbers of a species or result in the physical isolation of populations thereby reducing genetic diversity and population stability.

Indirect impacts pertain to those impacts that result in a change to the physical environment, but which is not immediately related to a project. Indirect (or secondary) impacts are those that are reasonably foreseeable and caused by a project but occur at a different time or place. Indirect impacts can occur at the urban/wildland interface of projects, to biological resources located downstream from projects, and other offsite areas where the effects of the project may be experienced by plants and wildlife. Examples of indirect impacts include the effects of increases in ambient levels of noise or light; predation by domestic pets; competition with exotic plants and animals; introduction of toxics, including pesticides; and other human disturbances such as

hiking, off-road vehicle use, unauthorized dumping, etc. Indirect impacts are often attributed to the subsequent day-to-day activities associated with project build-out, such as increased noise, the use of artificial light sources, and invasive ornamental plantings that may encroach into native areas. Indirect effects may be both short-term and long-term in their duration. These impacts are commonly referred to as "edge effects" and may result in a slow replacement of native plants by non-native invasive species, as well as changes in the behavioral patterns of wildlife and reduced wildlife diversity and abundance in habitats adjacent to project sites.

Cumulative impacts refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. A cumulative impact can occur from multiple individual effects from the same project, or from several projects. The cumulative impact from several projects is the change in the environment resulting from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

5.1 California Environmental Quality Act (CEQA)

5.1.1 Thresholds of Significance

Environmental impacts to biological resources are assessed using impact significance threshold criteria, which reflect the policy statement contained in CEQA, Section 21001(c) of the California Public Resources Code. Accordingly, the State Legislature has established it to be the policy of the State of California:

> Prevent the elimination of fish or wildlife species due to man's activities, ensure that fish and wildlife populations do not drop below self-perpetuating levels, and preserve for future generations representations of all plant and animal communities...

Determining whether a project may have a significant effect, or impact, plays a critical role in the CEQA process. According to CEQA, Section 15064.7 (Thresholds of Significance), each public agency is encouraged to develop and adopt (by ordinance, resolution, rule, or regulation) thresholds of significance that the agency uses in the determination of the significance of environmental effects. A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant. In the development of thresholds of significance for impacts to biological resources CEQA provides guidance primarily in Section 15065, Mandatory Findings of Significance, and the CEQA Guidelines, Appendix G, Environmental Checklist Form. Section 15065(a) states that a project may have a significant effect where:

> The project has the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to

eliminate a plant or wildlife community, reduce the number or restrict the range of an endangered, rare, or threatened species...

Therefore, for the purpose of this analysis, impacts to biological resources are considered potentially significant (before considering offsetting mitigation measures) if one or more of the following criteria discussed below would result from implementation of the proposed project.

5.1.2 Criteria for Determining Significance Pursuant to CEQA

Appendix G of the 2018 State CEQA guidelines indicate that a project may be deemed to have a significant effect on the environment if the project is likely to:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

5.2 Special-Status Species

Appendix G(a) of the CEQA guidelines asks if a project is likely to "have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service."

5.2.1 Special-Status Plants

The proposed Project will impact one special-status plant species: smooth tarplant. As described above, approximately 2,500 smooth tarplant individuals were detected within the Project site

during focused plant surveys. The plants are generally associated with disturbed areas adjacent to agricultural fields and/or roadways (Exhibit 8); however, approximately 1,670 of the plants detected are associated with disturbed ditches that are considered MSHCP riparian/riverine areas, and therefore the plants are considered as riparian/riverine resources.

The MSHCP provides coverage for the impacts to smooth tarplant, provided that the Project is consistent with requirements pertaining to the species. The Project site is not located within a survey area for smooth tarplant and therefore MSHCP avoidance/conservation requirements pursuant to *Section 6.3.2* do not apply to the Project. However, as noted above, just over half of the mapped smooth tarplant individuals are considered as MSHCP riparian/riverine resources and therefore impacts to these specific areas of must be addressed pursuant to the *Section 6.1.2* riparian/riverine policies. As described in the Project's DBESP, impacts to smooth tarplant associated with the riparian/riverine areas will be mitigated by incorporating smooth tarplant seed into the restoration plant palette of the HMMP that will address the overall mitigation for impacts to riparian/riverine areas.

5.2.2 Special-Status Animals

Based on the results of the biological studies performed for the Project site, the proposed Project will not directly impact special-status animals. Although the Project site does not contain nesting habitat for special-status bird species, the site could potentially be used for foraging by special-status birds as described below, including Swainson's hawk, tricolored blackbird, golden eagle, loggerhead shrike, northern harrier, purple martin, white-tailed kite and yellow-headed blackbird. In addition, the Project could result in indirect impacts to special-status animals that utilize the riparian habitat located immediately adjacent to the Project site at the southern end, including the least Bell's vireo, yellow-breasted chat and yellow warbler.

Special-status species evaluated in this section for impacts are organized below as either "listed" or "non-listed" species. "Listed" species refers to those designated as FESA and/or CESA Endangered or Threatened species, including Candidate species (CESA).

Impacts to Listed Species

Crotch's Bumble Bee – As noted above in Section 4.5.2, CBB was not detected at the Project site in 2025 during focused surveys. This establishes a CEQA biological baseline for CBB absence, supporting a determination that the Project, following that baseline, would not impact CBB. Furthermore, without CBB detected, there is no evidence that the Project would "take" CBB. However, because portions of the Project site contain floral resources to attract CBB for foraging and there is limited potential for nesting and/or overwintering uses, and the results of absence surveys are only valid for one season, it is possible for CBB to be present at the site when grading commences for the Project.

As the Project site has been heavily modified through agricultural practices and other land uses, even if CBB were to be detected in the future, the loss of habitat should not be construed as an adverse impact to CBB as a species, and therefore such habitat loss would not be potentially significant. Agriculture is recognized as one factor that has led to the decline of CBB as a species

and although agricultural sites (such as the Project site) can contain floral resources with the potential to attract CBB for foraging, the soil disturbance and management make it unlikely for nesting and/or overwintering uses, although those uses are theoretically possible. Furthermore, the suitable floral resources at the Project site are limited to a few annual/herbaceous species, including alfalfa (a crop plant), and due to ongoing plowing/planting, mowing/disking and other disturbances, the presence of suitable plant resources is limited and inconsistent.

If CBB were to be detected at the site in the same season that the site (or portions of the site) is to be disturbed for construction, assuming that CBB is a CESA-listed species at the time of disturbance, then the Project activities might cause "take" of CBB individuals. Any "take" of CBB would require authorization from CDFW through their issuance of an Incidental Take Permit (ITP). If CBB were to be detected, but the species is no longer CESA-listed, then an ITP would not apply. However, CBB also has a State Ranking of S2 ("imperiled"), which conveys special status to CBB under CEQA independent of its CESA status. But the loss of CBB habitat relative to the Project would not be substantial and adverse to the species. If CBB were to be confirmed absent from the site during the season that impacts would be completed, affirming the CEQA baseline, then no further actions would be required relative to those applicable portions of the Project site.

Since future potential action for the site relative to CBB would be limited to obtaining an ITP from CDFW predicated on the presence of CBB and its status of a CESA-listed species, then Section 6.0 of this report includes a measure to conduct updated focused CBB surveys at the site prior to disturbance of the site if the CBB remains CESA-listed at that time, and, if detected, to coordinate with CDFW to determine of an ITP would be needed. Any mitigation for loss of occupied habitat would be based on CESA authorization for "take" and would be determined during the ITP process.

Least Bell's Vireo – The Project does not contain riparian habitat to support the least Bell's vireo (LBV). As previously described, the southern (upstream) end of the proposed Project is adjacent to habitat occupied by LBV where overflows from the San Jacinto Reservoir would enter the proposed channel facility. Construction of the facility would not remove any riparian habitat; however, because of the adjacency there is a potential for temporary noise impacts during construction of the facility adjacent to the riparian habitat if work were to occur while LBV are present. Objective 3 of the MSHCP Species Conservation Objectives for LBV states that avoidance of occupied LBV habitat must include a 100-meter (approximately 300 feet) buffer, which is meant to address the potential for edge effects from development. The proposed Project limits are within 100 feet of the nearest occupied habitat for LBV, and although no indirect impacts would be anticipated after the completion of construction activities, temporary indirect effects are possible if construction activities occur within 300 feet. Because LBV is a federal listed species, noise from construction would have the potential to "harass" LBV individuals, which can constitute "take" under FESA. As such, temporary measures are recommended (described below in Section 6.0) to prevent the harassment of LBV individuals from construction noise.

Swainson's hawk – The Swainson's hawk was not detected during the biological surveys, and the Project site does not support suitable nesting habitat for the Swainson's hawk; however, the

Project will impact potential foraging habitat for the species. As the Swainson's hawk is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Tricolored blackbird –The tricolored blackbird was not detected during the biological surveys but is historically known to occur in the area. Tricolored blackbird colonies are not expected to nest at the site due to the lack of suitable habitat. However, the Project would impact potential foraging habitat for the species. As the tricolored blackbird is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Impacts to Non-Listed Species

In addition to the listed species discussed above, the proposed Project would impact (directly or indirectly) habitat for non-listed, special-status species that have either been observed within the Project footprint, or that have the potential to occur. The analysis presented in this section is split into those listed species covered by the MSHCP and those that are not covered by the MSHCP.

MSHCP Covered Species

Burrowing owl - The Project site is in the MSHCP burrowing owl survey area. GLA biologists conducted focused burrowing owl surveys in 2022 and 2024, and no burrowing owls were detected within the Project footprint. Based on the survey results, the Project will not impact burrowing owl habitat with long-term conservation value, and therefore MSHCP avoidance/mitigation requirements due not apply to the Project. However, because the Project site does contain suitable habitat, including burrows, a pre-construction burrowing owl survey is required by *Section 6.3.2* of the MSHCP. Refer to Section 6.0 for details.

The burrowing owl was recently designated by CDFW as a Candidate for listing as Endangered under CESA. However, because the burrowing owl is already a MSHCP covered species, the listing of the burrowing owl does not affect how projects covered by the MSHCP address impacts to burrowing owls. Projects are still required to comply with MSHCP objectives for burrowing owls, and if projects are consistent with those objectives, any "take" of burrowing owls pursuant to CESA would be covered.

Golden eagle – The golden eagle was not detected during the biological surveys. However, historical records show that the golden eagle occurs in the region. The Project site does not support suitable nesting habitat for the golden eagle; however, the Project will impact potential foraging habitat for the species. As the golden eagle is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Loggerhead shrike – The majority of the Project site consists of active agricultural fields and is therefore disturbed on a regular basis. The loggerhead shrike was not detected during the biological studies; however, this species is known to occur in the region. The proposed Project would impact potential foraging habitat for the shrike; however, due to the disturbed nature of the Project site from agricultural practices, there are limited nesting opportunities for the species. As the loggerhead shrike is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Northern harrier – One northern harrier was detected flying offsite within agricultural and the adjacent riparian areas during the biological surveys. The Project site does not support nesting habitat for northern harriers due to the historical and current land practices at the site; however, the Project will impact potential foraging habitat. As the northern harrier is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Purple martin – The purple martin was not detected during the biological studies but is historically known to occur in the area. The purple martin is not expected to nest on site due to the absence of trees with cavities. However, the Project will impact foraging habitat for the species. As the purple martin is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

White-tailed kite –The white-tailed kite was not detected during the biological studies but is historically known to occur in the area. The white-tailed kite is not expected to nest on site due to the absence of suitable trees; however, the Project will impact potential foraging habitat. As the white-tailed kite is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Yellow-breasted chat - The Project site does not contain riparian habitat to support the yellow-breasted chat. However, as discussed above, the Project is adjacent to riparian habitat where the yellow-breasted chat was observed. Although the Project will not remove habitat supporting the chat, there is a potential for temporary noise impacts during Project construction adjacent to the riparian habitat. Measures included below in Section 6.0 to address the least Bells' vireo during construction will also benefit the yellow-breasted chat to avoid or minimize indirect effects.

Yellow-headed blackbird – The yellow-headed blackbird was not detected during the biological studies but is historically known to occur in the area. The yellow-headed blackbird is not expected to nest on site due to most of the site being used for active agriculture; however, the Project will impact potential foraging habitat for this species. As the yellow-headed blackbird is a MSHCP covered species, no avoidance/mitigation requirements apply to the Project.

Yellow warbler – The Project site does not contain riparian habitat to support the yellow warbler. However, as discussed above, the Project is adjacent to riparian habitat where the yellow warbler was observed. Although the Project will not remove habitat supporting the warbler, there is a potential for temporary noise impacts during Project construction adjacent to the riparian habitat. Measures included below in Section 6.0 to address the least Bells' vireo during construction will also benefit the yellow warbler to avoid or minimize indirect effects.

Species That Are Not Covered by the MSHCP

Sensitive Bats – The Project site does not contain habitat to support roosting bats (including maternity roosting), including for sensitive bat species such as the western mastiff and the western yellow bat, which were both detected acoustically offsite in the adjacent riparian habitat located south of the Project footprint. Although the mastiff bat and yellow bat were not confirmed roosting offsite, potential roosting habitat including palm trees are located more than 200 feet from the Project's limits of disturbance. As such, the Project is not expected to indirectly affect roosting bats. The Project does have the potential to impact bat foraging habitat; however, the loss of foraging habitat would not be considered as a substantial adverse effect because of the presence of foraging habitat on surrounding lands.

5.3 Impacts to Raptor Use

Raptors include owls, hawks, eagles, and falcons. Common species of raptors (e.g. red-tailed hawk, American kestrel, great horned owl) have potential to forage on the Project site within the agricultural fields. The proposed Project would impact foraging habitat for raptors.

During the field studies, no raptors were observed nesting within the Project site as the majority vast majority of the Project site lacks trees. Two raptor species, the red-tailed hawk and turkey vulture, were detected flying over the site. Other common raptor species including the Cooper's hawk, red-shouldered hawk, northern harrier, great horned owl, and barn owl were detected offsite, but adjacent to the Project site and would be expected to also forage opportunistically onsite. The Project site also including the agricultural fields would provide potential foraging and/or wintering habitat for other common and sensitive species including the American kestrel, ferruginous hawk, Swainson's hawk, merlin, and golden eagle. However, except for burrowing owls, the MSHCP does not have requirement pertaining to these various raptor species, and the loss of foraging habitat would be covered by the MSHCP.

5.4 Sensitive Vegetation Communities

Appendix G of the CEQA guidelines asks if a project is likely to "have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service."

The proposed Project will not impact sensitive vegetation communities. The proposed Project would permanently impact approximately 87.10 acres of lands through grading, including areas of remedial grading that will not be restored to pre-project conditions. Permanent impacts include approximately 69.34 acres of agricultural fields, 8.49 acres of annual brome grasslands, 6.17 acres of disturbed and developed areas, and 3.10 acres of perennial pepper weed-prickly lettuce patches.

The proposed Project would also temporarily impact approximately 33.22 acres of lands through project implementation. The temporary impacts consist of narrow construction easements along either side of the proposed facilities where disturbance will be required to construct the facilities,

but there will not be any permanent structures in these areas. The temporary impact areas will be restored to pre-construction contours and can be hydroseeded with a native plant mix. The temporary impacts include approximately 25.07 acres of agricultural fields, 3.43 acres of annual brome grasslands, 4.26 acres of disturbed and developed areas, 0.03 acre of eucalyptus groves, and 0.44 acre of perennial pepper weed-prickly lettuce patches. Impacts to vegetation communities are summarized in Table 5-1 below.

Table 5-1. Summary of Vegetation/Land Use Impacts

Vegetation/Land Use Type	Direct Impacts		Total Project (Acres)
	Permanent (acres)	Temporary (acres)	
Agriculture Fields	69.34	25.07	94.41
Annual Brome Grasslands	8.49	3.43	11.92
Disturbed and Developed Areas	6.17	4.26	10.43
Eucalyptus Groves	0	0.03	0.03
Perennial Pepper Weed-Prickly Lettuce Patches	3.10	0.44	3.54
Total	**87.10**	**33.22**	**120.33**

5.5 Wetlands

Appendix G of the State CEQA guidelines asks if a project is likely to "have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means."

The Project site does not contain any state or federally protected wetlands.

5.6 Wildlife Movement and Native Wildlife Nursery Sites

Appendix G of the State CEQA guidelines asks if a project is likely to "interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites."

The Project site is not located within a regionally significant wildlife linkage or corridor, including any Core Areas or MSHCP existing or proposed Linkages. Additionally, the development of the Project would not preclude the movement of wildlife through the Project site. As such, the Project would not "interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors". The Project site does not contain any wildlife nursery sites.

The Project has the potential to impact active bird nests if vegetation is removed during the nesting season (February 1 to September 15). Impacts to nesting birds are prohibited by the

MBTA and California Fish and Game Code. The native birds with potential to nest on the Project site would be those that are extremely common to the region and highly adapted to human landscapes (e.g., house finch, killdeer). The number of individuals potentially affected by the Project would not significantly affect regional, let alone local populations of such species. A measure is identified in Section 6.0 of this report to avoid impacts to nesting birds.

5.7 Local Policies or Ordinances

Appendix G of the State CEQA guidelines asks if a project is likely to "conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance." The Project will not conflict with any local policies or ordinances protecting biological resources.

5.8 Habitat Conservation Plans

Appendix G of the State CEQA guidelines asks if a project is likely to "conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan." As discussed throughout this report, the Project is within the Western Riverside County MSHCP. Section 7.0 of this report analyzes compliance of the Project with the Reserve Assembly and species/habitat requirements of the MSHCP. Through compliance with the applicable requirements, the Project will not conflict with the provisions of the MSHCP.

5.9 Jurisdictional Waters

The Project will impact several drainage features during construction, at a maximum of 3.88 acres of direct impact. The purpose of the impacts is to re-route the flows into the proposed channel, although the general direction of flows from the southeast (starting at the San Jacinto Reservoir) to the northwest (across Ramona Expressway) will be maintained. The proposed Line E channel will be subject to flood control maintenance (vegetation management and structural repairs, as needed); however, the channel will have approximately 10.02 acres with a soft (unpaved) bottom and will function in the same or similar manner as the existing, human-altered drainage features. Nonetheless, the impacts to the existing drainage features will be considered permanent since the segments of the exact features will not be restored in the same configuration.

5.9.1 Corps Jurisdiction

No Corps jurisdiction is present within the Project site.

5.9.2 Regional Board Jurisdiction

The Project will impact 3.83 acres of Waters of the State Regional Board jurisdiction, none of which consists of wetlands. A total of 4,283 linear feet of ephemeral stream is present. Regional Board jurisdiction within the Project site is limited to Drainages A, B, C, and Drainage Area A. Because the waters are not Corps jurisdiction, the Project must process a dredge and fill permit (Waste Discharge Requirements) for impacts to Waters of the State.

5.9.3 CDFW Jurisdiction

The Project will impact 4.03 acres of CDFW jurisdiction, none of which supports riparian vegetation. A total of 4,283 linear feet of stream is present. CDFW jurisdiction within the Project site is associated with Ditches A, BD, E and F, and Drainage Area A. Impacts to CDFW jurisdiction will require a Section 1602 Streambed Alteration Agreement from CDFW.

5.10 MSHCP Riparian/Riverine Areas

The Project will impact all 4.03 acres of riverine features associated with the Project site. In each instance, the riverine areas will be replaced by the Line E drainage facilities, with the proposed channel re-routing the hydrology that will ultimately end up at the same location at the northwestern end of the Project alignment. As described above in Section 2.2, the proposed Line E channel would begin downstream of (north of) the San Jacinto Reservoir Spillway where it would extend north as an earthen trapezoidal channel parallel to, and east of, Sanderson Avenue, turning west underneath Sanderson Avenue, entering the SJCCSP property. The proposed channel would then turn north and then west just before Record Road, extending west to the proposed Confluence Basin. The outflows from the proposed Confluence Basin would be conveyed north in a concrete-lined channel across Casa Loma Barrel No. 1 and outflow to an existing low-flow drainage channel, representing the terminus of the proposed Line E facilities. Impacts to MSHCP riverine areas require the approval of a DBESP by the MSHCP Wildlife Agencies. A separate DBESP Analysis will be provided to the Wildlife Agencies for compliance with *Section 6.1.2* of the MSHCP.

Table 5-2 summarizes Project impacts to MSHCP Riparian/Riverine Areas, which include 3.49 acres of permanent impacts associated with the permanent Line E facility and 0.54 acres of temporary impacts associated with construction access. For the purpose of this analysis, both permanent and temporary impacts are proposed, as described in Section 5.10, to be mitigated entirely as permanent impacts at a 2:1 ratio.

Table 5-2. Summary of MSHCP Riverine Area Impacts

Feature Name	Riverine Permanent Impacts (acres)	Riparian Temporary Impacts (acres)
Drainage Area A	2.92	0.38
Ditch A	0.23	0.03
Ditch B	0.02	0.01
Ditch D	0.01	0.10
Ditch E	0.03	0.01
Ditch F	0.28	0.01
Total	**3.49**	**0.54**

5.11 Indirect Impacts to Biological Resources

In the context of biological resources, indirect effects are those effects associated with developing areas adjacent to adjacent native open space. The MSHCP requires that projects occurring adjacent to the MSHCP Conservation Area incorporate measures pursuant to the MSHCP Urban/Wildlands Interface Guidelines (*Volume I, Section 6.1.4* of the MSHCP). These guidelines are intended to address indirect effects associated with locating projects (particularly development) in proximity to the MSHCP Conservation Area. To minimize potential edge effects, the guidelines are to be implemented in conjunction with review of individual public and private development projects in proximity to the MSHCP Conservation Area. The Project will not be located adjacent to the MSHCP Conservation Area; however, the beginning (upstream) portion of the Line E will be located adjacent to existing riparian habitat that supports sensitive species and that will be enhanced/restored as mitigation for the proposed Project. The Project will implement measures pertaining to the adjacent riparian habitat consistent with the MSHCP guidelines to address the following, as applicable.

5.11.1 Drainage

Proposed projects in proximity to the MSHCP Conservation Area shall incorporate measures, including measures required through the National Pollutant Discharge Elimination System (NPDES) requirements, to ensure that the quantity and quality of runoff discharged to the MSHCP Conservation Area is not altered in an adverse way when compared with existing conditions. In particular, measures shall be put in place to avoid discharge of untreated surface runoff from developed and paved areas into the MSHCP Conservation Area. Stormwater systems shall be designed to prevent the release of toxins, chemicals, petroleum products, exotic plant materials or other elements that might degrade or harm biological resources or ecosystem processes within the MSHCP Conservation Area. This can be accomplished using a variety of methods including natural detention basins, grass swales or mechanical trapping devices. Regular maintenance shall occur to ensure effective operations of runoff control systems.

Although the proposed riparian mitigation will not be part of the MSHCP Conservation Area, best management practices (BMPs) will still apply. As the waters exiting the San Jacinto Reservoir and the existing riparian area flow to the northwest, which will be collected into the Line E channel, the drainage will continue to the northwest, i.e., away from the riparian habitat. Therefore, the Line E Project will not drain into the riparian habitat area and will not introduce pollutants to the riparian area. Nonetheless, the Project's contractor will develop a Stormwater Pollution Prevention Plan (SWPPP) to address runoff and water quality during construction.

5.11.2 Toxics

Land uses proposed in proximity to the MSHCP Conservation Area that use chemicals or generate bioproducts such as manure that are potentially toxic or may adversely affect wildlife species, habitat or water quality shall incorporate measures to ensure that application of such chemicals does not result in discharge to the MSHCP Conservation Area. Measures such as those employed to address drainage issues shall be implemented. As noted above, since drainage

occurs from the southeast to the northwest, i.e., away from the riparian habitat area, the Project is not expected to introduce toxics to the adjacent riparian habitat area. Nonetheless, the proposed Project will implement a SWPPP that will address runoff during construction.

5.11.3 Lighting

Night lighting shall be directed away from the existing riparian habitat proposed for enhancement/restoration to protect animal species from direct night lighting. If night lighting is required during construction, shielding shall be incorporated to ensure ambient lighting in the riparian habitat area is not increased. The Project will not require night lighting after construction.

5.11.4 Noise

As described above, the southern (upstream) end of the proposed Project is adjacent to riparian habitat occupied by least Bell's vireo (and other non-listed, but sensitive riparian birds). Because of the adjacency of the proposed Project, there is a potential for temporary noise impacts during construction of the portion of the facility adjacent to the existing riparian habitat, if work were to occur while the least Bell's vireo is present. The following measure is proposed to avoid or minimize temporary edge effects to the least Bell's vireo.

- To avoid indirect impacts to least Bell's vireo (LBV), project construction and site preparation activities including but not limited to vegetation clearing and grubbing within 300 feet of LBV habitat will be conducted outside of the LBV breeding season (March 15 to September 30), if feasible. This will require that a qualified biologist oversee the establishment of a highly visible and maintained 300-foot buffer. Maintenance of the buffer will be performed weekly, but more often if needed.

  If construction activities must occur during the breeding season and have not yet already begun within the 300-foot buffer by March 15 of any given year, pre-construction surveys will commence after March 15 and will occur once a week for three consecutive weeks to confirm the presence of LBV, with the last visit no more than 3 days prior to commencement of construction activities. The preconstruction survey visits will be conducted by a qualified biologist familiar with songs, whisper songs, calls, scolds, and plumage characteristics of adult and juvenile vireos. Surveys will be conducted between dawn and 11:00 am. Surveys will not be conducted during periods of excessive or abnormal cold, heat, wind, rain, or other inclement weather that individually or collectively may reduce the likelihood of detection. Prior to performing the preconstruction surveys, a map will be created illustrating the LBV habitat and all detections of LBV will be mapped and tracked.

  If LBV are not detected during the initial three preconstruction surveys, then weekly clearance surveys will continue following the same methodology stated above for the preconstruction surveys. Again, all detections of LBV are to be mapped with behavior tracked across detections/sightings. The qualified biologist must have experience with nesting ecology and behavior of LBV to determine pre-nesting/nesting behavior. The

MSHCP does not provide "take" of LBV which includes negatively modifying foraging and nesting behavior. If at any time it is determined by the qualified biologist that construction activities are negatively affecting LBV, including modification of behavior, work will be halted and CDFW and USFWS will be contacted on next steps. However, if LBV are not detected after a minimum of eight survey visits (three preconstruction surveys and five additional clearance surveys), then the weekly visits will cease and work within the 300-foot buffer will be allowed to continue without additional restrictions.

If construction activities within the 300-foot buffer have already begun before March 15, then the qualified biologist will simply initiate the weekly clearance surveys after March 15 while the construction activities continue, and if LBV are detected, then the additional measures will be implemented. However, if LBV are not detected after a minimum of nine clearance surveys, then as noted above, the weekly visits will cease and work within the 300-foot buffer will be allowed to continue without additional restrictions.

Daily noise monitoring will be required during the breeding season if LBV are detected at any point during preconstruction surveys or weekly clearance surveys. A qualified biological monitor must be present to measure noise levels at the edge of all suitable habitat and work shall cease if, at any time, noise levels exceed 60 dB due to construction activities, or the existing ambient level if that is over 60 dB. For areas where pre-construction ambient noise levels exceed 60 dB, pre-construction, ambient noise measurements can be taken by a qualified entity during the full daylight period (sunrise to sunset), and subsequently, the median average ambient noise level can be used as the baseline in lieu of 60 dB. For projects that need to perform nighttime construction activities the same would be done as above but with measurements taken during the full nighttime period (sunset to sunrise). Noise monitoring will continue throughout the breeding season or until construction activities have halted within 300 feet of occupied LBV habitat. CDFW and USFWS can be contacted on next steps if the project is not able to reduce the noise.

Although not proposed here, it may be prudent to construct a temporary noise wall between the construction area and the habitat to maximize avoidance of indirect effects to LBV and reduce potential for project halts. Preconstruction ambient noise levels will be taken into consideration by CDFW and USFWS when deciding whether noise attenuation measures are prudent. The preconstruction and clearance surveys will still be required to ensure full avoidance has been met by the project during the LBV breeding season unless USFWS and CDFW have confirmed in writing that such surveys are not necessary.

5.11.5 Invasive Species

Projects adjacent to the MSHCP Conservation Area shall avoid the use of invasive plant species in landscaping, including invasive, non-native plant species listed in Volume I, *Table 6-2* of the MSHCP. The Project facilities will not include any landscaping that will contain invasive species identified in MSHCP *Table 6-2*.

5.11.6 Barriers

Proposed land uses adjacent to the MSHCP Conservation Area shall incorporate barriers, where appropriate in individual project designs to minimize unauthorized public access, domestic animal predation, illegal trespass or dumping in the MSHCP Conservation Area. Such barriers may include native landscaping, rocks/boulders, fencing, walls, signage and/or other appropriate mechanisms. Although the proposed riparian restoration area will not be part of the MSHCP Conservation, since the restoration is proposed to satisfy mitigation requirements for impacts to MSHCP riverine areas, and will be preserved in perpetuity, the boundary between the Line E facility and the riparian habitat area will be managed to minimize unauthorized access. The HMMP to be provided to the Wildlife Agencies will describe fencing (or other barriers), signage, and/or other mechanisms to manage access.

5.11.7 Grading/Land Development

The MSHCP states that manufactured slopes associated with development shall not extend into the MSHCP Conservation Area. Although not part of the MSHCP Conservation Area, the Line E facilities will not encroach into the riparian habitat that will be proposed for protection via the conservation easement.

5.12 Cumulative Impacts to Biological Resources

Cumulative impacts are defined as the direct and indirect effects of a proposed project which, when considered alone, would not be deemed a substantial impact, but when considered in addition to the impacts of related projects in the area, would be considered potentially significant. “Related projects” refers to past, present, and reasonably foreseeable probable future projects, which would have similar impacts to the proposed project.

Anticipated cumulative impacts are addressed by the MSHCP, which, as currently adopted, addresses 146 “Covered Species” that represent a broad range of habitats and geographical areas within Western Riverside County, including threatened and endangered species and regionally or locally sensitive species that have specific habitat requirements and conservation and management needs. The MSHCP addresses biological impacts for take of Covered Species within the MSHCP area. Impacts to Covered Species and establishment and implementation of a regional conservation strategy and other measures included in the MSHCP are intended to address the federal, state, and local mitigation requirements for these species and their habitats. Specifically, Section 4.4 of the MSHCP states that:

> *The MSHCP was specifically designed to cover a large geographical area so that it would protect numerous endangered species and habitats throughout the region. It is the projected cumulative effect of future development that has required the preparation and implementation of the MSHCP to protect multiple habitats and multiple endangered species.*

As the construction of buildings, infrastructure, and all alterations of the land within areas that are outside of the Criteria Area are permitted under the MSHCP (see MSHCP Section 2.3.3),

cumulative impacts to biological resources (with the exception of MSHCP non-covered species) would be less than significant provided that the terms of the MSHCP are fully implemented (MSHCP Final EIR/EIS, Section 4.1.6). The Project would be required to pay the MSHCP mitigation fees. The MSHCP database was consulted for the proposed Project and the recommended focused surveys (rare plants, burrowing owl, least Bell's vireo, listed fairy shrimp, sensitive bats, and southwestern willow flycatcher) were conducted. The proposed Project would comply with the requirements of the MSHCP and thus would not conflict with its adopted policies.

6.0 RECOMMENDED AVOIDANCE, MINIMIZATION AND/OR MITIGATION MEASURES

As noted above, the SJV MDP was approved in 2013 by the City of San Jacinto and in 2015 by the Riverside County Flood Control and Water Conservation District. In 2008, GLA performed a general biological resource analysis for the SJV MDP, which included some focused surveys for portions of the MDP alignments. GLA recommended measures to be applied to future studies of specific facilities, such as Line E. The following recommended measures have been developed based on the current studies for Line E, which themselves were recommended as part of the original MDP analysis. The following measures are intended to avoid or minimize impacts to sensitive resources as a result of the development of the Line E Project, as well as a mitigation measures to offset impacts to jurisdictional waters/MSHCP riverine areas.

6.1 Burrowing Owl

The Project site contains suitable habitat for burrowing owls; however, burrowing owls were not detected onsite during focused surveys. MSHCP Objective 6 for burrowing owls requires pre-construction surveys prior to site grading. As such, the following measure is recommended to avoid direct impacts to burrowing owls and to ensure consistency with the MSHCP.

- A 30-day pre-construction survey for burrowing owls is required prior to future ground-disturbing activities (e.g., vegetation clearing, clearing and grubbing, tree removal, site watering, equipment staging, etc.) to ensure that no owls have colonized the site in the days or weeks preceding the ground-disturbing activities. If burrowing owls have colonized the project site prior to the initiation of ground-disturbing activities, the project proponent will immediately inform the Regional Conservation Authority (RCA) and the Wildlife Agencies and will need to coordinate in the future with the RCA and the Wildlife Agencies, including the possibility of preparing a Burrowing Owl Protection and Relocation Plan, prior to initiating ground disturbance. If ground-disturbing activities occur, but the site is left undisturbed for more than 30 days, a pre-construction survey will again be necessary to ensure that burrowing owl have not colonized the site since it was last disturbed. If burrowing owls are found, the same coordination described above will be necessary.

6.2 Crotch's Bumble Bee

Although CBB was not detected during focused surveys conducted in 2025, because the Project site has the potential to support CBB and absence results for CBB are only valid for one year, if CBB is still CESA-listed when Project-related disturbance is to begin at the site, then Project could potentially cause "take" of CBB individuals. The following measure includes steps to update focused CBB surveys, and if detected, to coordinate with CDFW to determine if an ITP might be required:

- If Crotch's bumble bee (CBB) is a California Endangered Species Act (CESA) Candidate or listed species when the Project is anticipated to start ground-disturbing activities, then a qualified CBB biologist (i.e., at least 1-2 years of experience performing CBB surveys, or, has a Memorandum of Understanding [MOU] with California Department of Fish and Wildlife [CDFW]) shall perform updated focused surveys for CBB. The surveys will follow the "Survey Considerations for California Endangered Species Act Candidate Bumble Bee Species" (CDFW 2023) or subsequent document that supersedes CDFW 2023. The focused surveys will be conducted during the CBB Colony Active Period (generally April to August) but focusing on the timeframe when floral resources at the Project site area blooming when the surveys are performed. If CBB is detected at the site, then the Project proponent will coordinate with CDFW to determine whether an ITP is recommended if determined that "take" of CBB is possible. If CBB is not detected, then ground-disturbing activities can proceed without additional coordination with CBB and provided compliance with any other applicable pre-construction measures. If the ground-disturbing activities are not completed before January 31 of the following year that updated CBB surveys are conducted, then the surveys will be repeated.

6.3 Least Bell's Vireo

The following measure is designed to avoid or minimize indirect effects to least Bell's vireo during construction activities adjacent to the occupied LBV habitat:

- To avoid indirect impacts to least Bell's vireo (LBV), Project construction and site preparation activities including but not limited to vegetation clearing and grubbing within 300 feet of LBV habitat will be conducted outside of the LBV breeding season (March 15 to September 30), if feasible. This will require that a qualified biologist oversee the establishment of a highly visible and maintained 300-foot buffer. Maintenance of the buffer will be performed weekly, but more often if needed.

  If construction activities must occur during the breeding season and have not yet already begun within the 300-foot buffer by March 15 of any given year, pre-construction surveys will commence after March 15 and will occur once a week for three consecutive weeks to confirm the presence of LBV, with the last visit no more than 3 days prior to commencement of construction activities. The preconstruction survey visits will be conducted by a qualified biologist familiar with songs, whisper songs, calls, scolds, and plumage characteristics of adult and juvenile vireos. Surveys will be conducted between dawn and 11:00 am. Surveys will not be conducted during periods of excessive or

abnormal cold, heat, wind, rain, or other inclement weather that individually or collectively may reduce the likelihood of detection. Prior to performing the preconstruction surveys, a map will be created illustrating the LBV habitat and all detections of LBV will be mapped and tracked.

If LBV are not detected during the initial three preconstruction surveys, then weekly clearance surveys will continue following the same methodology stated above for the preconstruction surveys. Again, all detections of LBV are to be mapped with behavior tracked across detections/sightings. The qualified biologist must have experience with nesting ecology and behavior of LBV to determine pre-nesting/nesting behavior. The MSHCP does not provide "take" of LBV which includes negatively modifying foraging and nesting behavior. If at any time it is determined by the qualified biologist that construction activities are negatively affecting LBV, including modification of behavior, work will be halted and CDFW and USFWS will be contacted on next steps. However, if LBV are not detected after a minimum of eight survey visits (three preconstruction surveys and five additional clearance surveys), then the weekly visits will cease and work within the 300-foot buffer will be allowed to continue without additional restrictions.

If construction activities within the 300-foot buffer have already begun before March 15, then the qualified biologist will simply initiate the weekly clearance surveys after March 15 while the construction activities continue, and if LBV are detected, then the additional measures will be implemented. However, if LBV are not detected after a minimum of nine clearance surveys, then as noted above, the weekly visits will cease and work within the 300-foot buffer will be allowed to continue without additional restrictions.

Daily noise monitoring will be required during the breeding season if LBV are detected at any point during preconstruction surveys or weekly clearance surveys. A qualified biological monitor must be present to measure noise levels at the edge of all suitable habitat and work shall cease if, at any time, noise levels exceed 60 dB due to construction activities, or the existing ambient level if that is over 60 dB. For areas where pre-construction ambient noise levels exceed 60 dB, pre-construction, ambient noise measurements can be taken by a qualified entity during the full daylight period (sunrise to sunset), and subsequently, the median average ambient noise level can be used as the baseline in lieu of 60 dB. For projects that need to perform nighttime construction activities the same would be done as above but with measurements taken during the full nighttime period (sunset to sunrise). Noise monitoring will continue throughout the breeding season or until construction activities have halted within 300 feet of occupied LBV habitat. CDFW and USFWS can be contacted on next steps if the project is not able to reduce the noise.

Preconstruction ambient noise levels will be taken into consideration by CDFW and USFWS when deciding whether noise attenuation measures are prudent. The preconstruction and clearance surveys will still be required to ensure full avoidance has been met by the project during the LBV breeding season unless USFWS and CDFW have confirmed in writing that such surveys are not necessary. If daily noise levels are expected to exceed 60 dB due to construction activities, a temporary noise wall will be

constructed between the construction area and the habitat to maximize avoidance of indirect effects to LBV.

6.4 Nesting Birds

The Project site contains vegetation with the potential to support native nesting birds. As discussed above, the California Fish and Game Code prohibits mortality of native birds, including eggs. The following measure is recommended to avoid mortality to nesting birds:

- As feasible, vegetation clearing should be conducted outside of the nesting season, which is generally identified as February 1 through September 15. If avoidance of the nesting season is not feasible, then a qualified biologist shall conduct a nesting bird survey within three days prior to any disturbance of the site, including disking, demolition activities, and grading. If active nests are identified, the biologist shall establish suitable buffers around the nests, and the buffer areas shall be avoided until the nests are no longer occupied and the juvenile birds can survive independently from the nests.

6.5 Jurisdictional Waters

As noted above, the Project will impact 3.83 acres of non-wetland waters regulated by the Regional Board and 4.03 acres of non-riparian streambed regulated by CDFW.

- Prior to impacting jurisdictional waters, the Project will obtain a Section 1602 Streambed Alteration Agreement from CDFW and will process a Waste Discharge Requirement (WDR) through the Regional Board.
- The proposed Line E channel will include at least 10.02 acres of soft-bottom channel that will function in the same or similar manner as the existing, human-altered drainage features. Although the Line E channel will be subject to flood control maintenance (vegetation management, clean out of debris, slope and bottom repairs, and access road maintenance and repair), the maintained channel will still partially mitigate impacts to the existing waters.
- The Project will additionally mitigate impacts to jurisdictional waters by restoring at a minimum 2:1 ratio over the CDFW impacts (at least 8.06 acres) lands within the existing San Jacinto River 100-year floodplain, immediately north of the Line E alignment and west of Sanderson Avenue within the City of San Jacinto. The proposed mitigation site contains alkaline soils that support a remnant alkali flora and/or that has the potential to support additional plants (including sensitive species) associated with alkali playa, meadow grassland, or other similar habitat types. A Habitat Mitigation and Monitoring Plan (HMMP) will be prepared that will detail the methods to implement the proposed restoration. The HMMP will identify the proposed plant palettes, maintenance, and monitoring efforts, and will propose success criteria.

6.6 MSHCP Riverine Areas

As noted above, the Project will impact 4.03 acres of MSHCP riverine areas, which are identical to the areas of CDFW jurisdiction.

- Prior to impacting MSHCP riverine areas, the Project will submit a DBESP Analysis to Wildlife Agencies (USFWS and CDFW) for review and approval.
- Mitigation for impacts to MSHCP riverine areas will be approved through the DBESP process.

7.0 MSHCP CONSISTENCY ANALYSIS

The purpose of this section is to provide an analysis of the proposed Project with respect to compliance with biological aspects of the Western Riverside County MSHCP. Specifically, this analysis evaluates the proposed Project with respect to the Project's consistency with MSHCP Reserve assembly requirements, *Section 6.1.2* (Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools), *Section 6.1.3* (Protection of Narrow Endemic Plant Species), *Section 6.1.4* (Guidelines Pertaining to the Urban/Wildlands Interface), and *Section 6.3.2* (Additional Survey Needs and Procedures).

7.1 Project Relationship to Reserve Assembly

The Project site is not in the MSHCP Criteria Area and therefore the Project is not subject to MSHCP Reserve Assembly requirements. Furthermore, Joint Project Review (JPR) will not be required.

7.2 Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools

The Project will impact 0.15 acre of non-riparian riverine areas. The purpose of the Project is to re-route the flows into the proposed Line E channel, although the general direction of MSHCP non-riparian riverine flows from the southeast (starting at the San Jacinto Reservoir) to the northwest (across Ramona Expressway) will be maintained after implementation of Line E. The proposed Line E channel will be subject to flood control maintenance (vegetation management and structural repairs, as needed); however, the channel will have at least 10.02 acres with a soft (unpaved) bottom and will function in the same or similar manner as the existing, human-altered drainage features. Nonetheless, the impacts to the existing drainage features will be considered permanent since the segments of the exact features will not be restored in the same configuration. Mitigation for impacts to MSHCP riverine areas will be approved through the DBESP process.

Approximately 1,670 smooth tarplant individuals were documented as occurring within portions of the Project site that support MSHCP Riparian/Riverine resources [Exhibit 7 – MSHCP Riverine Areas]. Smooth tarplant is a species identified by MSHCP Section 6.1.2 as being associated with MSHCP Riparian/Riverine resources. Therefore, these approximately 1,670 smooth tarplant individuals are considered as an MSHCP Riparian/Riverine resource in the context of the Project, occupying a total of approximately 0.50 acre occurring throughout Ditches A and D and Drainage Area A. Smooth tarplant seeds will be incorporated into the plant palette for the proposed restoration area. The Project's HMMP will also further detail the

incorporation of smooth tarplant in the plant palette and will identify success criteria for smooth tarplant.

The Project has the potential to indirectly effect least Bell's vireo within the riparian habitat located adjacent to the southern (upstream) end of the Project alignment due to construction noise. The measure proposed above in Section 6.3 is designed to avoid or minimize indirect effects to least Bell's vireo.

The Project will not impact any vernal pools, nor will the Project impact listed fairy shrimp.

7.3 Protection of Narrow Endemic Plants

Volume I, Section 6.1.3 of the MSHCP requires that within identified Narrow Endemic Plant Species Survey Areas (NEPSSA), site-specific focused surveys for Narrow Endemic Plants Species will be required for all public and private projects where appropriate soils and habitat are present.

Most of the Project site is located within the MSHCP Narrow Endemic Plant Species Survey Area (NEPSSA) [Exhibit 4B], except for approximately 3,000 linear feet of the Project alignment corresponding with the northeastern corner of the SJCCSP property. No NEPSSA plant species were detected during the focused surveys, and therefore the Project will not impact Narrow Endemic Plants.

7.4 Guidelines Pertaining to the Urban/Wildland Interface

The MSHCP Urban/Wildland Interface Guidelines are intended to address indirect effects associated with locating development in proximity to the MSHCP Conservation Area. As the MSHCP Conservation Area is assembled, development is expected to occur adjacent to the Conservation Area. Future development in proximity to the MSHCP Conservation Area may result in edge effects with the potential to adversely affect biological resources within the Conservation Area.

As described above, the Project will not be located adjacent to the MSHCP Conservation Area; however, the beginning (upstream) portion of the Line E will be located adjacent to existing riparian habitat that supports sensitive species and that will be enhanced/restored as mitigation for the proposed Project. Section 5.10 describes measures that will be implemented relative to the adjacent riparian habitat consistent with the MSHCP guidelines.

7.5 Additional Survey Needs and Procedures

The proposed Project site occurs within the burrowing owl survey area but does not occur within the amphibian or mammal survey areas, or within the CAPSSA. Focused burrowing owl surveys were conducted for the proposed Project site, and no burrowing owls were detected. As indicated in Section 6.1 of this report, preconstruction burrowing owl surveys shall be conducted within 30 days of site disturbance in compliance with MSHCP requirements.

7.6 Conclusion of MSHCP Consistency

As outlined above, the proposed Project will be consistent with the biological requirements of the MSHCP; specifically pertaining to the Project's relationship to reserve assembly, *Section 6.1.2* (Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools), *Section 6.1.3* (Protection of Narrow Endemic Plant Species), *Section 6.1.4* (Guidelines Pertaining to the Urban/Wildlands Interface), and *Section 6.3.2* (Additional Survey Needs and Procedures).

1.0 EXECUTIVE SUMMARY

This document provides an analysis in support of a Determination of Biologically Equivalent or Superior Preservation (DBESP) for the San Jacinto Valley Master Drainage Plan Line E Project (the Project) located in the City of San Jacinto, Riverside County, California, in regard to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) requirements for *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools (MSHCP Volume I, Section 6.1.2)*. The Project area evaluated is approximately 120 acres.

This document has been prepared following the MSHCP DBESP Report Template created by the Western Riverside County Regional Conservation Authority (RCA), to demonstrate that with the appropriate mitigation, the Project will represent a "biologically equivalent or superior" alternative to avoidance. This document summarizes the findings of general biological surveys, habitat assessments, and vegetation mapping, as they relate to riparian and vernal pool resources, and species with MSHCP survey requirements.

The proposed Project (Line E) is an implementing project of the San Jacinto Valley Master Drainage Plan (SJV MDP). The SJV MDP was prepared and approved in 2013 by the City of San Jacinto and Riverside County Flood Control and Water Conservation District. Facilities associated with the Line E Project include a channel, basin, training berms, and access roads. The Project is a planned regional drainage facility that would provide a service to an approximately 1,870-acre tributary area.

The proposed Project, through grading and reconfiguration, will impact 4.03 acres of existing riverine areas consisting of ditches within agricultural areas. These include five ditch segments, Ditch A (0.26 acre), Ditch B (0.03 acre), Ditch D (0.11 acre), Ditch E (0.04 acre), Ditch F (0.29 acre), and an area between Drainages A and B, referred to as Drainage Area A (3.30 acres) where, due to constructed berms, flood waters from cumulative rain events spread into a broad inundation area. None of these areas contain riparian vegetation; however, Ditches A and D and Drainage Area A support smooth tarplant (*Centromadia pungens* ssp. *laevis*), a MSHCP *Section 6.1.2* species. Functionally, these drainage features convey water that ultimately connects downstream (north) to the San Jacinto River, nearly three miles offsite from the terminus of the Project. The proposed channel will contain approximately 8.50 acres of earthen streambed that will provide the same functions of the drainage features to be impacted, but at a larger scale. As such, the proposed Project will be biologically equivalent or superior to the existing drainage conditions as it pertains to the hydrologic functions.

The Project site does not support least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), or western yellow-billed cuckoo (*Coccyzus americanus occidentalis*). However, the Project site is adjacent to riparian habitat where focused surveys were conducted for least Bell's vireo and southwestern willow

flycatcher in order to evaluate indirect impacts. Vireos were detected in the adjacent riparian habitat, but the flycatcher was absent. The adjacent riparian habitat does not have the potential to support western yellow-billed cuckoo. This DBESP includes measures to avoid indirect noise effects to least Bell's vireo if construction of the southern end of the Project alignment would occur while vireos are present in the adjacent habitat.

The Project site does not contain vernal pools or listed fairy shrimp. Focused wet and dry season fairy shrimp surveys were conducted for several seasonally inundated features within the Project site, and no listed fairy shrimp were detected. Furthermore, the seasonally inundated areas did not exhibit the three parameters for a wetland, and therefore are not considered as MSHCP vernal pools pursuant to the MSHCP.

Volume I, Section 6.1.3 of the MSHCP requires that within identified Narrow Endemic Plant Species Survey Areas (NEPSSA), site-specific focused surveys for Narrow Endemic Plants Species are conducted for all public and private projects where appropriate soils and habitat are present. The majority of the Project site is within the NEPSSA. To satisfy MSHCP survey requirements, focused plant surveys were performed on the Project site, including for the following target Narrow Endemic Plant species:

- Munz's onion (*Allium munzii*)
- San Diego ambrosia (*Ambrosia pumila*)
- Slender-horned spineflower (*Dodecahema leptoceras*)
- Many-stemmed dudleya (*Dudleya multicaulis*)
- Spreading navarretia (*Navarretia fossalis*)
- California Orcutt grass (*Orcuttia californica*)
- Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*).

None of the NEPSSA plant species were detected during focused surveys and were determined absent from the site.

Volume I, Section 6.3.2 of the MSHCP requires that within identified Criteria Area Plant Species Survey Areas (CAPSSA), site-specific focused surveys for Criteria Area Plant Species are conducted for all public and private projects where appropriate soils and habitat are present. The Project site is not in the CAPSSA and therefore focused surveys are not required for CAPSSA plants. Smooth tarplant was detected during plant surveys; however, because the Project site is not in the CAPSSA, then impacts to smooth tarplant are covered without project-specific avoidance or mitigation requirements. A proportion of the smooth tarplant individuals are associated with the Riparian/Riverine Resources, and mitigation proposed to address impacts to Riparian/Riverine Areas pursuant to MSHCP *Section 6.1.2* will incorporate smooth tarplant.

The Project site is within the MSHCP burrowing owl survey area. To comply with MSHCP survey requirements pursuant to *Volume I, Section 6.3.2*, focused burrowing owl surveys were performed for the Project site. Burrowing owls were confirmed absent from the site. However, because of the potential suitability to support burrowing owls, consistent with the MSHCP burrowing owl survey guidelines and MSHCP objectives for the burrowing owls, pre-construction surveys will be conducted no more than 30 days prior to ground disturbance within all areas of suitable habitat.

2.0 INTRODUCTION

2.1 Project Area

The San Jacinto Valley Master Drainage Plan (SJV MDP) Line E Project (the Project) consists of an approximately 14,000-linear-foot drainage alignment covering approximately 120.33 acres. The Project site is in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map], depicted on the U.S. Geological Survey (USGS) Lakeview, California 7.5" topographic quadrangle map [Exhibit 2 – Vicinity Map]. The Project is within Sections 29, 20, 19, 18, Township 4 South, Range 1 West. The Project is comprised of Assessor Parcel Numbers (APNs) 430-100-013, 430-100-002, 430-100-009, 430-010-012, 430-100-018, 432-030-006, 432-030-012, 432-030-010, 436-010-003, 436-030-004 and 436-170-001. The entire Project site is outside the MSHCP Criteria Area.

The Project is approximately 120.33 acres. Approximately 87.11 acres of the Project footprint will consist of permanent impacts, with approximately 33.22 acres of temporary impacts [Exhibit 3A – Aerial Map]. The temporary impacts consist of approximately 50-foot-wide construction easements along either side of the proposed facilities where disturbance will be required to construct the Line E channel, however there will not be any permanent structures in these areas. The temporary impact areas utilized only for construction activities will be restored to pre-construction contours and can be hydroseeded with a native plant mix.

The overall 120.33-acre Project site was not all studied in a single year. The middle portion of the Project alignment (approximately 67.26 acres), from Sanderson Avenue on the east to the proposed Confluence Basin to the west, was surveyed in 2022 and 2023 as a part of studies for a separate development project, whose study area overlapped with the current Line E Project limits [Exhibit 3B – Survey Areas]. The 2022/2023 studies included focused surveys for Narrow Endemic Plants, burrowing owls and listed fairy shrimp, as well as evaluations for riparian/riverine areas and vernal pools. The southeastern portion of the Project alignment (between the San Jacinto Reservoir and Sanderson Avenue) and the northwestern portion of the Project

alignment were surveyed in 2024 (approximately 53.07 acres) for the same resources as referenced above for the 2022/2023 surveys.

2.2 Project Description

For this report, the term “Project site” is defined as the 120.33 acres of land that is proposed for direct impact by the Project [Exhibit 3A – Aerial Map]. The Project site consists of Assessor's Parcel Numbers (APNs): 430-100-002, 430-100-009, 430-100-012, 430-100-013, 430-100-018, 432-030-006, 432-030-010, 432-030-012, 436-010-003, 436-010-005, 436-030-004, and 436-170-001.

The proposed Project (Line E) is an implementing project of the San Jacinto Valley Master Drainage Plan (SJV MDP). The SJV MDP was prepared and approved in 2015 by the City of San Jacinto and Riverside County Flood Control and Water Conservation District. Facilities associated with the Line E Project include a channel, basin, training berms, and access roads. The Project is a planned regional drainage facility that would provide a service to an approximately 1,870-acre tributary area.

Starting north of the San Jacinto Reservoir, the Project includes two training berms, continuing north as an earthen trapezoidal channel parallel to, and east of, Sanderson Avenue, turning west underneath Sanderson Avenue onto the northern portion of the proposed San Jacinto Commerce Center Specific Plan (SJCCSP) property and turning north, then west to the proposed MDP Line E-Y-Z Confluence Basin (Confluence Basin), which will be located on the site proposed to be the SJCCSP, continuing north from the Confluence Basin as a concrete channel and crossing over a buried pipeline known as Casa Loma Barrel No. 1, which is owned and operated by The Metropolitan Water District of Southern California (MWD). Access roads would be provided on both sides of the Line E Channel and the training berms. The Confluence Basin will not be lined with concrete and will include a pump station to drain the basin.

The Line E channel alignment will consist of an earthen channel with a 65-foot base width, heights up to 10 feet, side slopes inclined at 4:1 (Horizontal:Vertical), and several sloped rip-rap drops along the nearly three-mile alignment.

The Project design includes 20-foot-wide access roads (included within the permanent impacts) located on both sides of the channel along with reinforced concrete box (RCB) culverts, one of which will intersect Sanderson Avenue, while the remaining culverts will intersect future roadways. Storm water flow will generally occur from southeast to northwest. To maintain as much of the existing flow patterns at the southern end of the alignment, at the outlet of the San Jacinto Reservoir, training berms are proposed as opposed to channelization.

At the northern portion of the alignment the proposed earthen channel terminates at a proposed Confluence Basin and the remainder of the alignment converts to a concrete trapezoidal channel with a 155 -foot base width, height up to 5.5 feet, and side slopes

inclined at 1.5:1 (H:V). At the northern end of the proposed concrete channel portion, the proposed alignment crosses the existing MWD buried pipeline (Casa Loma Siphon No. 1) via a bridge-type structure to avoid adding loads to the existing pipeline.

Since the Project will be a regional flood control facility pursuant to the adopted SJV MDP, the Riverside County Flood Control and Water Conservation District (Flood Control) will need to be able to maintain the channel and access roads throughout the life of the facility. Maintenance activities include vegetation management, clean out of debris, slope and bottom repairs, access road maintenance and repair. All of the intended maintenance areas have been coordinated with and are included within the permanent impact acreages reported herein. Given the sensitivity of the biological resources in the area, the Flood Control District will not use rodenticides or pesticides for vegetation management; rather mechanical and hand removal of vegetation will be utilized.

2.3 Existing Conditions

The Project site is flat and supports active agricultural uses throughout the majority of the alignment. Elevation ranges from approximately 1,488 feet above mean sea level (AMSL) to 1,446 feet AMSL. A review of historical aerial photography confirmed that since the late 1960's, that the majority of the Project site and environs has been used for agricultural purposes. As a result, the agricultural lands cycle between periods of being vegetation with field crops and periods where the lands are generally unvegetated due to tilling. Other fields that are not consistently farmed are vegetated with a mixture of non-native ruderal plant species and remnant crop plants. The edge areas of the agricultural fields are dominated by non-native plant species. The Project site also contains disturbed/developed areas including unpaved roadways. The Project site contains agricultural ditches (Ditches A-F) that convey storm runoff and irrigation water through portions of the Project site, as well as an area where constructed berms and debris-clogged culverts result in a backup of storm flows and irrigation runoff (Drainage Area A). These drainage features are further discussed below in Section 3.0.

GLA mapped five distinct vegetation/land use types for the Project site, including *Bromus hordeaceus* Herbaceous Semi-Natural Alliance (Annual Brome Grasslands), Disturbed Agricultural Areas (Agricultural Fields), Disturbed/Developed Areas (Disturbed and Developed Areas), *Eucalyptus globulus* Woodland Semi-Natural Alliance (Eucalyptus Groves) and *Lepidium latifolium* - *Lactuca serriola* Herbaceous Semi-Natural Alliance (Perennial Pepper Weed - Prickly Lettuce Patches). Table 2-1 provides a summary of the vegetation types and their corresponding acreage. A Vegetation Map is attached as Exhibit 5. Photographs depicting the Project site are shown in Exhibit 10.

Table 2-1. Summary of Vegetation/Land Use Types for the Project Site

Vegetation/Land Use Type	Permanent (acres)	Temporary (acres)	Total (acres)
Annual Brome Grasslands	8.49	3.43	**11.92**
Agricultural Fields	69.35	25.07	**94.42**
Disturbed and Developed Areas	6.17	4.25	**10.42**
Eucalyptus Groves	0	0.03	**0.03**
Perennial Pepper Weed - Prickly Lettuce Patches	3.10	0.44	**3.54**
Total	**87.11**	**33.22**	**120.33**

3.0 RIPARIAN/RIVERINE MITIGATION (SECTION 6.1.2)

3.1 Methods

3.1.1 Riparian/Riverine Areas

The MSHCP defines riparian areas as “lands which contain habitat dominated by trees, shrubs, persistent emergent mosses and lichens, which occur close to, or which depend upon soils moisture from a nearby fresh water source. In the absence of riparian habitat, the MSHCP defines riverine areas as areas with fresh water flow during all or a portion of the year.”

The Project site was evaluated for riparian/riverine areas on May 23 and 24, June 27, and September 20, 2024.

3.1.2 Vernal Pools

The MSHCP defines vernal pools as “seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indictors of hydrology and/or vegetation during the drier portion of the growing season.”

GLA surveyed the Project site for vernal pools as part of the jurisdictional delineation to identify seasonal wetlands in conjunction with wet season fairy shrimp surveys (described below). GLA biologists evaluated the topography of the site, including whether the site contained depressional features/topography with the potential to become inundated; whether the site contained soils associated with vernal/seasonal pools; and whether the site supported plants that suggested areas of localized ponding. The Project site was evaluated for vernal pools during fairy shrimp survey visits in 2022, 2023 and 2024, as well as during plant survey visits and wetland delineation visits in 2023 and 2024.

3.1.3 Fairy Shrimp

The Project site contains a total of five features/inundation areas that were surveyed by GLA biologists to determine the presence/absence of listed fairy shrimp. Three of the features, identified as #4, 5 and 46, were surveyed in 2021/2022 (wet season) and 2023 (dry season) as part of fairy shrimp surveys for a separate project whose study area overlapped with that of the Line Project site (see Exhibit 11 – Sheets 2, 3 and 4). The other two features, identified as E-1 and E-2, were surveyed in 2023/2024 (wet and dry seasons) for the Project (see Exhibit 11 – Sheets 1 and 5).

Wet Season Surveys

The 2021/2022 wet season surveys (Features 4, 5 and 46) were conducted by GLA biologist Frank Wegscheider (TE-038716-4). The 2023/2024 wet season surveys (Features E-1 and E-2) were conducted by GLA biologists Stephanie Cashin (TE-20280D-0) and Chris Waterston (ESPER-2380694), assisted by GLA field staff David Smith and Velvet Park [Appendix D – 2021/2022 Wet Season Fairy Shrimp Report].

The wet season surveys were performed in accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods* (Survey Guidelines) dated November 13, 2017. Prior to the initiation of sampling, site visits were conducted following rainfall events to identify those features meeting the minimum hydrologic conditions for sampling. The Survey Guidelines generally consider that features containing a minimum of three centimeters (cm) of ponding at least 24 hours after rain events should be evaluated for surveys, but more specifically, sampling is required for any features ponded for at least seven days, and every seven days thereafter until the features are dry or have remained inundated continuously for 120 days. Surveys are to be re-initiated for any features that dry up and re-inundate.

Sampling for the presence of fairy shrimp was performed using a dip net within representative portions of the depression bottom, edges, and vertical water column when there was adequate ponding. Specimens were placed into vials, with labels containing identifying each depression with its unique identifying number. The vials contained a 95% ethanol solution to preserve the specimens. Specimens were identified in the field when feasible, otherwise identification was completed in a lab setting.

Dry Season Surveys

Dry season surveys for Features 4, 5 and 46 were initiated in October 2023 with the collection of soil samples by GLA biologist David Moskovitz (PER0010680-0), with assistance from Stephanie Cashin and Chris Waterston, and from GLA trainees David Smith and Velvet Park (under supervision). Soil processing and culturing was performed by Brent Helm (TE-795930-12) [Appendix E – 2023 Dry Season Fairy Shrimp Report]. The dry season surveys for Feature E-1 and E-2 were initiated in September

2024 with the collection of soil samples by Stephanie Cashin and Chris Waterston. Soil processing and culturing was performed by Frank Wegscheider (TE-038716-4) [Appendix G – 2024 Dry Season Fairy Shrimp Report]. No cysts of the genus *Branchinecta* or *Streptocephalus*, including listed species, were identified in samples from Feature E-1 and E-2. No cyst culturing was necessary as no cysts were detected during processing. Therefore, no listed species were detected.

Soil sample collection followed the USFWS *Survey Guidelines for the Listed Large Branchiopods* (Survey Guidelines).[1] Soil samples were collected when the pools were dry using a hand trowel to collect intact chunks of soil from the top 1–3 cm of pool sediment. The number of soil samples collected from each of features was based on feature size according to the Survey Guidelines. Starting at the edge of each depression, samples were taken from equidistant points along the longest transect and widest transect of each depression. Additional samples were taken at the deepest part of each feature. Soil samples of approximately 100 milliliters (ml) each were removed at each sub-sample location using a hand trowel and were combined into a labeled bag for each feature with the collection date, location and feature ID, and name of collector for future processing.

3.1.4 Riparian Birds

The MSHCP requires habitat assessments and focused surveys (if suitable habitat is present) for least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), and western yellow-billed cuckoo (*Coccyzus americanus occidentalis*). The Project site does not contain any riparian habitat with the potential to support the above-referenced species. However, riparian habitat is located adjacent to the Project footprint (to the south) that was acknowledged as having the potential to support least Bell's vireo and southwestern flycatcher. As such, to address the potential for indirect effects from the Project, focused surveys were performed for the adjacent habitat in 2024.

Least Bell's Vireo

GLA biologists Joseph Vu, Chris Waterston, Hannah Craddock and Stephanie Cashin conducted focused surveys for the least Bell's vireo (LBV) for riparian habitat adjacent to (south of) the Project footprint. Surveys were conducted in accordance with the 2001 USFWS survey guidelines, which stipulate that eight surveys should be conducted between April 10 and July 31, with a minimum of ten days separating each survey visit.

Focused surveys were conducted on April 11 and 23, May 7, June 12 and 27, and July 9, 19 and 29, 2024. Pursuant to the survey guidelines, the surveys were conducted

[1] USFWS. *Survey Guidelines for the Listed Large Branchiopods*, Revised: November 13, 2017.

between sunrise and 11:00 a.m. Weather conditions during the surveys were conducive to a high level of bird activity. Table 3-1 summarizes the vireo survey visits. The results of the vireo surveys are summarized below.

Table 3-1. Summary of LBV Survey Dates and Weather Conditions

Survey Date	Biologist	Start/End Time	Start/End Temperature (degree F)	Wind Speed Range (mph)	Cloud Cover (%)
4/11/24	JV	0645/1100	52/80	2-6	100
4/23/24	JV	0630/1100	50/58	1-4	100
5/7/24	JV	0645/1100	56/72	4-9	0
6/12/24	CW	0650/1100	61/73	1-4	100
6/27/24	CW	0600/1030	63/78	2-5	0
7/9/24	HC	0730/1030	77/95	2-6	0
7/19/24	HC	0630/0900	74/82	1-5	0
7/29/24	SC	0645/1045	75/87	1-4	0

JV = Joseph Vu; CW = Chris Waterston; HC = Hannah Craddock; SC = Stephanie Cashin

Southwestern Willow Flycatcher

Surveys for the southwestern willow flycatcher (SWFL) were conducted for riparian habitat adjacent to (south of) the Project footprint [Appendix H – Southwestern Willow Flycatcher Survey Report]. Surveys were conducted in accordance with the 2010 U.S. Fish and Wildlife Service (USFWS) guidelines, which stipulate that five surveys (divided into three survey periods) shall be conducted in all areas of suitable habitat. One survey was conducted during the first survey period (May 15 to May 31). Two surveys were conducted during the second survey period (June 1 to June 24), and two surveys were conducted during the third survey period (June 25 to July 17). GLA biologist Jeff Ahrens (TE 052159-6) conducted SWFL surveys on May 20, June 11, June 21, June 27, and July 3, 2024. Mr. Ahrens was accompanied by GLA biologist Chris Waterston (non-permitted) on June 27, 2024.

All surveys were conducted during the morning hours and were completed before 10:45 A.M. No surveys were conducted during extreme weather conditions (i.e., winds exceeding 15 miles per hour, rain, or temperatures in excess of 95ºF). All areas of suitable habitat were surveyed on foot by walking slowly and methodically. Taped vocalizations primarily using the WIFL's main contact call "fitz-bew" were used to elicit responses from WIFLs that might be present on site. The detection of WIFLs on site was based on both sight and call.
Weather conditions during the SWFL surveys was conducive to a high level of bird activity. Temperatures ranged from approximately 52 degrees Fahrenheit to 90 degrees

Fahrenheit. Wind speeds ranged from 1-5 miles per hour during the surveys. Table 3-2 summarizes the survey dates and weather information for each survey date. The results of the flycatcher surveys are summarized below in Section 3.2.4.

Table 3-2. Summary of SWFL Survey Dates and Weather Conditions

Date	Survey	Start/End Time	Surveyor	Temp ºF, (start/end)	Wind Speed (MPH) (start/end)	% Cloud Cover (start/end)
5/20/24	SWFL	0555/1030	JA	52/62	2-4/3-5	100/100
6/11/24	SWFL	0600/1030	JA	80/90	3-5/2-4	20/20
6/21/24	SWFL	0550/1045	JA	61/84	1-3/2-3	0/0
6/27/24	SWFL	0600/1030	JA/CW	63/78	2-3/2-5	0/0
7/03/24	SWFL	0605/1030	JA	68/88	2-4/2-5	10/10

3.2 Results

3.2.1 Riparian/Riverine Areas

The Project site contains 4.03 acres of MSHCP non-riparian riverine areas, associated with four features (Ditches A, B, D, E, and F and Drainage Area A). These features exhibited defined stream flow indictors (i.e., change in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, and/or incised channel banks). Table 3-3 below summarizes the riverine areas associated with the Project site. The boundaries of riverine areas are depicted on the enclosed map [Exhibit 7].

Table 3-3. Summary of MSHCP Riverine Areas

Feature Name	Riverine (acres)	Riparian (acres)	Total (acres)
Drainage Area A*	3.30	0.00	3.30
Ditch A*	0.26	0.00	0.26
Ditch B	0.03	0.00	0.03
Ditch D*	0.11	0.00	0.11
Ditch E	0.04	0.00	0.04
Ditch F	0.29	0.00	0.29
Total	**4.03**	**0.00**	**4.03**

*Indicates MSHCP Riverine Areas that support smooth tarplant.

Drainage Area A

Approximately 3.30 acres of unvegetated riverine areas area associated with Drainage Area A. Drainage Area A is in the northwestern portion of the Project site. Drainage Area A consists of relatively flat undeveloped land that appears to have been disced as recently as December 2020, according to historic aerial imagery. Since then, it does not appear that this area has been planted or otherwise maintained. Instead, Drainage Area A conveys flows in a generally northwestern direction towards Drainage A during periods following heavy precipitation when adjacent agricultural ditches have flooded. Furthermore, corrugated metal culverts that convey flows within Drainage A under a dirt access road appear to have been clogged by debris, which likely contributes to backup of flood waters in Drainage Area A.

Vegetation associated with Drainage Area A consists of five horn bassia (*Bassia hyssopifolia*), London rocket (*Sisymbrium irio*), perennial pepperweed (*Lepidium latifolium*), Canada horseweed (*Erigeron canadensis*), black mustard, Bermuda grass (*Cynodon dactylon*), ripgut brome, red brome, salt heliotrope (*Heliotropium curassavicum*) and alkali mallow (*Malvella leprosa*).

Ditch A

Approximately 0.26 acre of unvegetated riverine areas are associated with Ditch A. Ditch A is in the northwestern portion of the Project site. Ditch A consists of several man-made earthen ditches that together convey agricultural runoff in a northwestward direction for approximately 980 linear feet before continuing offsite and eventually terminating in a basin adjacent to Ramona Expressway. Ditch A exhibits a stream course that ranges from 1 to 25 feet in width.

Vegetation associated with Ditch A consists of non-native upland grasses and forbs including ripgut brome (*Bromus diandrus*), red brome (*Bromus rubens*), black mustard (*Brassica nigra*), fiddleneck (*Amsinckia menziesii*), cheeseweed (*Malva parviflora*), Russian thistle (*Salsola tragus*), stinknet (*Oncosiphon piluliferum*).

Ditch B

Approximately 0.03 acre of unvegetated riverine areas are associated with Ditch B. Ditch B is located in the center of the Project site. Ditch B is a man-made earthen ditch that crosses the alignment and conveys agricultural runoff in a northward direction for approximately 302 linear feet before leaving the Project site. Ditch B exhibits a stream course that averages four feet in width. The offsite portion of Ditch B, to the north of the alignment, appears to convey flows to Drainage Area A during periods of heavy precipitation. Ditch B is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle, Canada horseweed, and black mustard were observed immediately adjacent to the drainage along the top of the bank.

Ditch D

Approximately 0.11 acre of unvegetated riverine areas are associated with Ditch D. Ditch D is located in the center of the Project site. Ditch D is a man-made earthen ditch that crosses the alignment along the western side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 2,337 linear feet before leaving the Project site. Ditch D exhibits a stream course that averages two feet in width. Ditch D is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, Russian thistle and non-native grasses such as Bermuda grass and red brome were observed immediately adjacent to this ditch along the top of the bank.

Ditch E

Approximately 0.04 acre of unvegetated riverine areas are associated with Ditch E. Ditch E is located in the center of the Project site. Ditch E is a man-made earthen ditch that crosses the alignment along the eastern side of Sanderson Avenue and conveys agricultural runoff and rainfall in a northward direction for approximately 279 linear feet before leaving the Project site. Ditch E exhibits a stream course that averages six feet in width. Ditch E is ephemeral and at the time of the surveys did not contain any surface water and was generally unvegetated. However, five horn bassia, Russian thistle, stinknet (*Oncosiphon piluliferum*), and non-native grasses such as red brome were observed immediately adjacent to the drainage along the top of the bank.

Ditch F

Approximately 0.29 acre of unvegetated riverine areas are associated with Ditch F. Ditch F is in the southeastern portion of the Project site. Ditch F is a man-made earthen ditch that conveys flows northward away from the San Jacinto Reservoir Overflow for approximately 419 linear feet before continuing offsite and terminating as sheet flow in an adjacent agricultural field. Ditch F exhibits a stream course that averages approximately 10 feet in width. A rip-rap headwall and culvert previously existed separating the offsite riparian area to the south from the remainder of Ditch F to the north. Currently, the rip-rap headwall and culvert appear to have been destroyed and flows now bypass the culvert and continue around the riprap through a highly eroded area to the east of the culvert. According to historic aerial imagery, Ditch F is typically characterized by an ephemeral flow regime. However, at the time of the initial site visit, Ditch F contained surface water in the southernmost reach, immediately adjacent to the San Jacinto Reservoir Overflow area. Ditch F was completely dry during the most recent site visit.

Vegetation associated with Ditch F includes a mix of native and non-native species such as Bermuda grass, stinknet, annual yellow sweetclover (*Melilotus indicus*), Canada horseweed, alkali mallow, and various other non-native grasses.

Approximately 1,670 smooth tarplant individuals were documented as occurring within portions of the Project site that support MSHCP Riparian/Riverine resources [Exhibit 7 – MSHCP Riverine Areas]. Smooth tarplant is a species identified by MSHCP Section 6.1.2 as being associated with MSHCP Riparian/Riverine resources. Therefore, these approximately 1,670 smooth tarplant individuals are considered as an MSHCP Riparian/Riverine resource in the context of the Project, occupying a total of approximately 0.50 acre occurring throughout Ditches A and D and Drainage Area A [Exhibit 7 – MSHCP Riverine Areas; Table 3-3. Summary of MSHCP Riverine Areas]. Additional smooth tarplant individuals were documented in upland areas and not associated with any of the features outlined on Table 3-3, and were therefore not considered as an MSHCP Riparian/Riverine resource, and are discussed in Section 5.1 of this document.

Table 3-4 summarizes one additional agricultural ditch (Ditch C) and an agricultural basin (Basin A) that are not riparian/riverine areas [Exhibit 7 – MSHCP Riverine Areas]. These features are frequently modified (i.e. filled in, recreated) as a part of ongoing agricultural operations and are isolated and do not drain to a downstream MSHCP Conservation Area (San Jacinto River). Therefore, these facilities are not considered as MSHCP Riparian/Riverine Areas, as they are artificially created and do not provide biological functions supporting Section 6.1.2 species.

Table 3-4. Summary of Non-Riparian/Riverine Features

Feature	Acreage
Basin A	0.13
Ditch C	0.02
Total	**0.15**

Table 3-4 summarizes Project impacts to MSHCP Riparian/Riverine Areas, which include 3.49 acres of permanent impacts associated with the permanent Line E facility and 0.54 acres of temporary impacts associated with construction access. For the purpose of this analysis, both permanent and temporary impacts are proposed, as described in Section 3.3, to be mitigated entirely as permanent impacts at a 2:1 ratio.

Table 3-5. Summary of MSHCP Riverine Area Impacts

Feature Name	Riverine Permanent Impacts (acres)	Riparian Temporary Impacts (acres)
Drainage Area A	2.92	0.38
Ditch A	0.23	0.03
Ditch B	0.02	0.01
Ditch D	0.01	0.10
Ditch E	0.03	0.01
Ditch F	0.28	0.01
Total	**3.49**	**0.54**

3.2.2 Vernal Pools

The Project site does not contain any MSHCP vernal pools. Five areas were noted as inundated within the Project site, corresponding to the five features (4, 5, 46, E-1 and E2) that are described below as having been evaluated through focused surveys for listed fairy shrimp. Features 4, 5, 46 and E-2 are all unvegetated vehicle ruts in dirt roads. Feature E-1 consists of a large, inundated area that is described above as Drainage Area A. Drainage Area A was determined not to exhibit all three parameters of a wetland, specifically the inundated area did not exhibit a predominance of hydrophytic vegetation, and therefore the feature is not considered as a vernal pool.

3.2.3 Fairy Shrimp

A total of five features (4, 5, 46, E1 and E2) were surveyed for fairy shrimp. The non-listed versatile fairy shrimp (*Branchinecta lindahli*) was detected in just one of the five features during the wet season surveys (Feature 5), which consists of vehicle ruts within a dirt road. The dry season survey of Feature 5 detected *Branchinecta* cysts, which were successfully hatched and reared to identify individuals as the versatile fairy shrimp, thus corroborating the results of the wet season survey.

No fairy shrimp were detected in the other four features during the wet season surveys. Features 4, 46 and E-2 also consist of vehicle ruts in dirt roads. Feature E-1 corresponds with the large inundation area associated with Drainage Area A. No *Branchinecta* cysts were detected within Feature 4 and 46 during the 2023 dry season surveys. No cysts of the genus *Branchinecta* or *Streptocephalus*, including listed species, were identified in samples from Feature E-1 and E-2 during 2024 dry season

surveys. No cyst culturing was necessary as no cysts were detected during processing. Therefore, no listed fairy shrimp species were detected.

Fairy shrimp survey reports are provided as Appendices D, E F, and G.

3.2.4 Riparian Birds

The southwestern willow flycatcher was not detected within the adjacent (offsite) riparian habitat during the focused surveys. GLA biologists detected three least Bell's vireo territories within the adjacent riparian habitat, as depicted on Exhibit 12.

3.3 Impacts, Mitigation and Equivalency

3.3.1 Direct Effects

The Project will impact all 4.03 acres of riverine features associated with the Project site. In each instance, the riverine areas will be replaced by the Line E drainage facilities, with the proposed channel re-routing the hydrology that will ultimately end up at the same location at the northwestern end of the Project alignment. As described above in Section 2.2, the proposed Line E channel would begin downstream of (north of) the San Jacinto Reservoir Spillway where it would extend north as an earthen trapezoidal channel parallel to, and east of, Sanderson Avenue, turning west underneath Sanderson Avenue, entering the SJCCSP property. The proposed channel would then turn north and then west just before Record Road, extending west to the proposed Confluence Basin. The outflows from the proposed Confluence Basin would be conveyed north in a concrete-lined channel across Casa Loma Barrel No. 1 and outflow to an existing low-flow drainage channel, representing the terminus of the proposed Line E facilities.

Where the proposed Line E facility begins at the San Jacinto Reservoir, an existing earthen drainage ditch (Ditch F) conveys flows to the north. Figure 11 of the Line E Preliminary Design Report (Appendix C of this DBESP Analysis) depicts the existing flow patterns coming away from the San Jacinto Reservoir. In the existing condition, Ditch F conveys flows northwards until the drainage ditch terminates and flows are conveyed to the northwest via sheet flow until crossing under Sanderson Avenue and extending west (south of the MWD Casa Loma facility) to where the terminus of the Line E channel is proposed. The proposed Project would directly impact 0.29 acre of Ditch F and flows from the San Jacinto Reservoir would enter the Line E channel, where as described above the channel would extend in a generally northwesterly direction and flows that currently extend farther north and then west would be re-routed through the northern portion of the SJCCSP property to the proposed Confluence Basin and then northwards to the proposed terminus where flows would leave Line E into the existing drainage channel (part of Drainage A described above). As such, the flows will still reach the same area to the northwest, just following a different route. Section 3 of Appendix C details the existing and proposed MDP hydrology. As depicted in Table 1

and Figure 7 of Appendix C, the total existing Q_{100} flows is 24,279 cfs from the San Jacinto Reservoir to northerly side of the MWD right-of-way. In the proposed Line E condition, the total Q_{100} flows increases to only 25,315 cfs (Table 2 and Figure 9 of Appendix C) at this same location. Figure 15 from Appendix C depicts the pre-project and post-project floodplain.

Prior to reaching the proposed Confluence Basin, the Line E channel would cross another three MSHCP Riverine ditches (identified above as Ditches B, D, and E). Flows from these ditches currently extend through the SJCCSP property past the northern boundary and into an area identified in this DBESP Analysis as Drainage Area A. As described above, flows from these ditches extend north and west through Drainage Area A before crossing through culverts into Drainage A to the north. The culverts appeared to be clogged by debris, contributing to the back up of water within Drainage Area A during peak storm flows, resulting in a large inundation area. The proposed Line E will directly impact 0.03 acre of Ditch B, 0.11 acre of Ditch D, 0.04 acre of Ditch E, and then 3.30 acres of the inundation area associated with Drainage Area A. However, the flows/runoff that otherwise enter Drainage Area A via these ditches will under the proposed development be collected into the Confluence Basin and then outlet north through a proposed concrete portion of Line E where it will then terminate at Drainage A. Line E will intersect the existing agricultural ditch along the east side of Sanderson Avenue (Ditch E) and pick up the flows in that ditch coming from the south [Exhibit 7 – MSHCP Riverine Areas]. The existing flows in the ditch along the west side of Sanderson (Ditch D; Exhibit 7 – MSHCP Riverine Areas) south of the Line E intersect will be incorporated into the onsite storm drain system of the SJCCSP, which is analyzed separately for that project. Again, the hydrology data summarized above addresses the proposed re-routing of flows.

The functions of the various ditches impacted by the construction of Line E are all hydrologic and particularly of hydrologic conveyance as that is what the constructed ditches are designed to accomplish. The proposed Line E channel will accomplish the same functions as these agricultural ditches but with a larger drainage area. As noted above, the Line E design will maintain roughly the same flows provided by the existing flow condition. The modification to the floodplain was contemplated in the SJV MDP, which was designed to confine the 100-year floodplain into the MDP facilities. Localized flows during rainfall events on areas outside the Line E channel will still sheet flow and be conveyed through the agricultural ditches as they do in the current condition. The conveyance of flows through the Project area are still being conveyed to the same location, ending up on the northern side of Ramona Expressway. Overall, because of these essentially unchanged conditions and for being consistent with the SJV MDP, the Project will maintain hydrologic connections into downstream MSHCP Conservation areas north of Ramona Expressway. However, because these riverine features will still be altered, the additionally proposed enhancement/restoration of the existing alkali habitat will increase the biological functions associated with the alkali habitat.

The proposed Line E channel will be subject to flood control maintenance (vegetation management and structural repairs, as needed); however, the channel will have at least 10.02 acres with a soft (unpaved) bottom and will function in the same or similar manner as the existing, human-altered drainage features. Nonetheless, the impacts to the existing drainage features, with the exception of the temporary construction access areas [Exhibit 7 – MSHCP Riverine Areas], will be considered permanent since the segments of the exact features will not be restored in the same configuration.

The proposed Line E channel will partially offset the loss of the existing riverine areas by maintaining the riverine functions, through the continued conveyance of water to the MSHCP Conservation Area downstream of the Project, providing attenuation of pollutants such as nutrients, as well as provide a degree of groundwater recharge, etc. In addition, the Project proposes to replace impacts to 4.03 acres of MSHCP riparian/riverine areas through the restoration of 8.06 acres (2:1 ratio) of lands within the existing San Jacinto River 100-year floodplain, immediately north of the Line E alignment and west of Sanderson Avenue within the City of San Jacinto. The proposed mitigation site contains alkaline soils that support a remnant alkali flora and/or that has the potential to support additional plants (including sensitive species) associated with alkali playa, meadow grassland, or other similar habitat types. With the combination of the proposed Line E facility and the proposed mitigation, the proposed Project will be biologically equivalent or superior to the existing conditions.

The Project proponent will acquire the mitigation property and will place a Conservation Easement for a conservation entity to hold in perpetuity. Possible conservation entities include the Rivers and Lands Conservancy or the San Jacinto Valley Resource Conservation District. The Project proponent will provide a non-wasting endowment to fund the management of the mitigation site in perpetuity.

The proposed mitigation will include the removal of non-native vegetation and re-vegetation with native species. Smooth tarplant seeds will be incorporated into the plant palette for the restoration area.

The Project proponent will develop a Habitat Mitigation and Monitoring Plan (HMMP) that will be provided to the City of San Jacinto, RCA and Wildlife Agencies for review and approval prior to any initiation of ground disturbance associated with the Project. The HMMP will document all aspects of the proposed habitat restoration, including site preparation, installation, maintenance and monitoring. The restoration program will consist of a two-phase program. Phase 1, or “Site Preparation Phase”, includes initial invasive species removals and two years of follow-up weed abatement. Phase 2, or “Installation, Maintenance, and Monitoring Phase”, includes a planting plan (native seed and container stock) and five years of follow-up maintenance and monitoring. The HMMP will also further detail the incorporation of smooth tarplant in the plant palette and will identify success criteria for smooth tarplant as will be approved by the RCA and Wildlife Agencies. The proposed restoration program presented here is conceptual and may be modified through the HMMP.

Phase 1 – Site Preparation Phase (2 Years)

Site preparation shall consist of restoration area topsoil scraping, decompaction and contouring, and clearing and controlling all exotic plants, installation of irrigation components (above-ground), removing trash and debris, preparing planting holes, and doing any other work necessary to prepare the area for planting.

1. Restoration Area Topsoil Scraping and Contouring

Site preparation within the restoration area includes the removal of any debris associated with prior land uses including scraping and hauling offsite the top two inches of soil for purposes of clearing unnatural debris, decompaction, and contouring. Grading and soil removals would also function as an initial weed clearing and would remove existing non-native seed bank in the topsoil. Minor contouring throughout the site will provide hydrological surface conditions to support the alkaline plant species to be included in the restoration plant palette. Creation of micro-topography will support seasonal ponding and otherwise restore or enhance shallow inundation of the site.

2. Non-native Plant Control

Invasive species, as defined by the California Invasive Plant Council (Cal-IPC) as “high” or “moderate” invasiveness ranking will be targeted for removal from the restoration area. Eradication of ubiquitous annual grasses is not realistic in large parcels of open space, but these species will be controlled and suppressed significantly such that they don’t interfere with the establishment and/or functioning of the restored alkali plant communities.

The abundance of non-native grasses and forbs within and surrounding the proposed restoration area requires a persistent and prolonged site preparation regime to 1) clear the non-native biomass from the site, and 2) suppress the existing non-native seed bank in the soil prior to introduction of native plant material to the site. Quarterly treatment is recommended to suppress non-native species within the restoration area.

Work is recommended to commence following the initial scraping/contouring in the fall/winter months outside of avian breeding season, between September 1 and February 14 with follow-up treatments for at least two full years to treat seasonal weeds in their appropriate growth period and allow for re-treatment of the invasive species and thatch removal as much as possible prior to hydroseeding with native seeds.

A "grow and kill" cycle will be established during the two-year site preparation period. Grow and kill is a cycle of applying water, germinating the non-native, invasive species, and spraying with the appropriate chemical. This allows a large portion of the seed load currently present in the soil to be removed. Removing the competition early in the life cycle of native plants helps to ensure more rapid growth and cover of the native species.

Phase 2 – Installation, Maintenance, and Monitoring Phase (5 Years)

1. Installation

Following the two-year site preparation phase, the restoration area will be planted. Planting shall consist of installing container stock with plant protection devices (if necessary), and hydroseeding. No planting shall be done in any area until the area concerned has been prepared in accordance with the HMMP and presents an appearance satisfactory to the Project Biologist. The Project Biologist shall be on-site during plant installation. The restoration area will be planted and seeded with a proposed alkali playa/meadow/grassland plant palette identified in the HMMP. The plant palette will be diverse with a variety of halophytic grasses, forbs, and shrubs that occur in alkaline soil conditions present within the restoration site. As discussed further below, smooth tarplant will be a component of the restoration.

Sources of all propagules and seed used for the restoration area will be from wild sources within Western Riverside and San Bernardino Counties to preserve regional genetic integrity. Contract growing of all container plants shall be by a local experienced native plant nursery. Substitution of plant material at the time of planting depends upon the discretion of the Project Biologist in coordination with the RCA and Wildlife Agencies. Plants must be ordered at least six months in advance of the scheduled planting date(s) to make sure the required quantities are available or can be custom grown for the Project.

All plant materials will be inspected by the Project Biologist and approved as healthy, disease and pest free, and of proper size prior to planting. Overgrown, root-bound container stock will be rejected. Container stock will be laid out in such a manner that mimics natural plant distribution (i.e., in clusters and islands) to emulate regional reference sites. Prior to container stock installation, the Project Biologist will flag individual plant locations in the field with pin-flags that will be color coded as to plant species. A list of species with their appropriate color code will be provided to the Contractor prior to plant installation.

Container stock will be thoroughly watered the day before planting. One-gallon container stock will be planted in a hole measuring at least twice the diameter of the container and twice the depth. Backfill the hole with native soil to a proper planting depth for placement of the plant within the hole so the top of the root ball will be set one inch above finish grade. The container will be upended into the palm of the hand to avoid damage to the root structure and placed in the planting hole. The planting hole will be backfilled with native soil. Container stock will be watered immediately after installation.

Due to relatively easy accessibility of the proposed restoration areas, hydroseed application will occur following the site preparation period. Hydroseeding will proceed after the Project Biologist has certified that restoration areas are adequately prepared

by clearing of non-native species. Seeding will occur in September or October, prior the onset of the first rain event. Hydroseeding will be performed only during low wind conditions.

2. Irrigation Plan

Supplemental irrigation is to be used solely for establishing the plant palette and seasonal wetland hydrology in the restoration area and intended to be temporary in nature. The goal of the irrigation program during the initial site preparation phase is to implement a grow and kill program to exhaust as much as possible the existing non-native seed bank prior to installation of native container stock and hydroseed. Post-plant installation, the goal of irrigation will be to obtain germination and pooling hydrology mimicking that of seasonal wetlands.

The container stock will be irrigated as long as necessary to establish the alkali meadow, probably two or three summers. Irrigation will occur from November to April to ensure monthly rainfall is equal to or exceeds the 30-year average for each month. Within the shallow inundation areas created for supporting seasonal ponding within the restoration area, irrigation should be sufficient to create ponding in the months of November and December continuing through March, at a minimum. These areas would then be allowed to dry out naturally. No irrigation will be applied from June through October.

The restoration area will initially be supported by a short-term automatic overhead irrigation system. The irrigation system will be installed as early as possible during the two-year site preparation phase to aid in the grow and kill weed abatement regime to prepare planting sites. The main line will be installed below-grade. All lateral lines will be installed above-grade for ease of removal and inspection.

When the plantings are sufficiently established and no longer require supplemental irrigation, the Project Biologist shall request the Contractor to cut and cap the main line and remove all above-grade irrigation system components from the mitigation site.

3. Maintenance

Maintenance will occur for a five-year period within the restoration site post-installation. The Project Biologist will monitor all aspects of the restoration work to address any problems at an early state. Potential problems could arise from erosion, vandalism, competition from weeds and non-native species, disease, and predation. The HMMP identifies maintenance guidelines specifically tailored for native plant establishment. The maintenance personnel will be fully informed regarding the habitat establishment program, so they understand the goals of the effort and the maintenance requirements. A landscape contractor with experience and knowledge in native plant habitat restoration will supervise all maintenance personnel.

4. Monitoring

The purpose of the monitoring program is to assess the effectiveness of the prescribed restoration activities. Qualitative monitoring will occur during the two years of site preparation and weed abatement. The quantitative monitoring program will begin after the complete installation of native plant container stock and seed for a period of five years or until sign-off by the RCA and Wildlife Agencies.

Restoration success is defined as the establishment of alkali playa/meadow/grassland habitats. The means of determining successful restoration will be by a series of measurements for cover by native species composition and cover. Native species composition and cover should generally increase each year, while non-native species will be targeted such that their cover decreases each year and remain below 10-percent of relative cover at the end of the five-year monitoring period.

Invasive species, as defined by the California Invasive Plant Council (Cal-IPC) as “high” and “moderate” invasiveness ranking will be removed from all restoration areas as a part of this Plan. Eradication of ubiquitous species such as annual grasses is not realistic in large parcels of open space, but these species will be controlled and suppressed within the restoration areas to less than 10-percent of relative cover and such that they don’t interfere with habitat functions of alkali playa and alkali meadow plant communities.

Qualified habitat restoration specialists, biologists, or horticulturists with appropriate credentials and experience in native habitat restoration shall perform monitoring. Continuity within the personnel and methodology of monitoring will be maintained insofar as possible to ensure comparable assessments. The HRMP provides details regarding performance standards, qualitative monitoring, and quantitative monitoring.

5. Reporting

Annual status reports will be submitted to the City of San Jacinto, RCA and the Wildlife Agencies during the two-year site preparation period. Post-installation, at the end of each year within the five-year monitoring period, an annual report will be prepared for submittal to the City, RCA and the Wildlife Agencies describing the condition of restoration areas subject to monitoring. Reports will be submitted by December 31 of each monitoring year. These reports will assess both attainment of yearly target success criteria and progress toward final success criteria. These reports shall include a characterization of percent cover of native and non-native vegetation, plant species diversity data, and wildlife utilization. Additional details related to reporting will be provided in the HMMP.

3.3.2 Indirect Effects

The proposed Project will result in indirect impacts to the northern/downstream portions of Ditches B, D, E, and F because Line E will intercept upstream flows and redirect into Line E. While the overall watershed size for each of these four features will be reduced, each of these features are still expected to convey localized rainfall and agricultural runoff from the surrounding reduced watershed. Importantly, as stated above, the flows currently conveyed by the upstream portions of these features will still reach the same area to the northwest, just following a different route. Therefore, this indirect effect will not result in a loss of hydrologic contribution to the downstream MSHCP Conservation Area.

As described above, the southern (upstream) end of the proposed Project is adjacent to habitat occupied by least Bell's vireo where flows from the San Jacinto Reservoir would enter the proposed channel facility [Exhibit 12]. Construction of the facility would not remove any riparian habitat; however, because of the adjacency there is a potential for temporary noise impacts during construction of the facility adjacent to the San Jacinto Reservoir, if work were to occur while vireos are present. The following measure is proposed to avoid or minimize temporary edge effects to the least Bell's vireo.

> To avoid indirect impacts to least Bell's vireo (LBV), project construction and site preparation activities including but not limited to vegetation clearing and grubbing within 300 feet of LBV habitat will be conducted outside of the LBV breeding season (March 15 to September 30), if feasible. This will require that a qualified biologist oversee the establishment of a highly visible and maintained 300-foot buffer. Maintenance of the buffer will be performed weekly, but more often if needed.
>
> If construction activities must occur during the breeding season and have not yet already begun within the 300-foot buffer by March 15 of any given year, pre-construction surveys will commence after March 15 and will occur once a week for three consecutive weeks to confirm the presence of LBV, with the last visit no more than 3 days prior to commencement of construction activities. The preconstruction survey visits will be conducted by a qualified biologist familiar with songs, whisper songs, calls, scolds, and plumage characteristics of adult and juvenile vireos. Surveys will be conducted between dawn and 11:00 am. Surveys will not be conducted during periods of excessive or abnormal cold, heat, wind, rain, or other inclement weather that individually or collectively may reduce the likelihood of detection. Prior to performing the preconstruction surveys, a map will be created illustrating the LBV habitat and all detections of LBV will be mapped and tracked.
>
> If LBV are not detected during the initial three preconstruction surveys, then weekly clearance surveys will continue following the same methodology stated above for the preconstruction surveys. Again, all detections of LBV are to be

mapped with behavior tracked across detections/sightings. The qualified biologist must have experience with nesting ecology and behavior of LBV to determine pre-nesting/nesting behavior. The MSHCP does not provide “take” of LBV which includes negatively modifying foraging and nesting behavior. If at any time it is determined by the qualified biologist that construction activities are negatively affecting LBV, including modification of behavior, work will be halted and CDFW and USFWS will be contacted on next steps. However, if LBV are not detected after a minimum of eight survey visits (three preconstruction surveys and five additional clearance surveys), then the weekly visits will cease and work within the 300-foot buffer will be allowed to continue without additional restrictions. If construction activities within the 300-foot buffer have already begun before March 15, then the qualified biologist will simply initiate the weekly clearance surveys after March 15 while the construction activities continue, and if LBV are detected, then the additional measures will be implemented. However, if LBV are not detected after a minimum of nine clearance surveys, then as noted above, the weekly visits will cease and work within the 300-foot buffer will be allowed to continue without additional restrictions.

Daily noise monitoring will be required during the breeding season if LBV are detected at any point during preconstruction surveys or weekly clearance surveys. A qualified biological monitor must be present to measure noise levels at the edge of all suitable habitat and work shall cease if, at any time, noise levels exceed 60 dB due to construction activities, or the existing ambient level if that is over 60 dB. For areas where pre-construction ambient noise levels exceed 60 dB, pre-construction, ambient noise measurements can be taken by a qualified entity during the full daylight period (sunrise to sunset), and subsequently, the median average ambient noise level can be used as the baseline in lieu of 60 dB. For projects that need to perform nighttime construction activities the same would be done as above but with measurements taken during the full nighttime period (sunset to sunrise). Noise monitoring will continue throughout the breeding season or until construction activities have halted within 300 feet of occupied LBV habitat. CDFW and USFWS can be contacted on next steps if the project is not able to reduce the noise.

Although not proposed here, it may be prudent to construct a temporary noise wall between the construction area and the habitat to maximize avoidance of indirect effects to LBV and reduce potential for project halts. Preconstruction ambient noise levels will be taken into consideration by CDFW and USFWS when deciding whether noise attenuation measures are prudent. The preconstruction and clearance surveys will still be required to ensure full avoidance has been met by the project during the LBV breeding season unless USFWS and CDFW have confirmed in writing that such surveys are not necessary.

Furthermore, as described above, the Project is not expected to change the regional hydrology related to downstream resources and ultimate conveyance to the San Jacinto River. The Project will result in local hydrologic effects by re-routing flows as described above, but the hydrologic functions will be maintained within the proposed Line E channel and the flows to downstream resources will be maintained in the post-project condition.

4.0 NARROW ENDEMIC PLANT SPECIES MITIGATION (SECTION 6.1.3)

Volume I, Section 6.1.3 of the MSHCP requires that within identified Narrow Endemic Plant Species Survey Areas (NEPSSA), site-specific focused surveys for Narrow Endemic Plants Species will be required for all public and private projects where appropriate soils and habitat are present. Most of the Project site is located within NEPSSA [Exhibit 4B], except for approximately 3,000 linear feet of the Project alignment corresponding with the northeastern corner of the SJCCSP property. As shown on Exhibit 4B, the northwestern and southeastern portions of the Project alignment occur within the NEPSSA for the following target species:

- Munz's onion (*Allium munzii*)
- San Diego ambrosia (*Ambrosia pumila*)
- Slender-horned spineflower (*Dodecahema leptoceras*)
- Many-stemmed dudleya (*Dudleya multicaulis*)
- Spreading navarretia (*Navarretia fossalis*)
- California Orcutt grass (*Orcuttia californica*)
- Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*).

4.1 Methods

GLA biologists performed focused plant surveys for the Project site in 2022 (middle segment) and 2024 (northwestern and southeastern segments). In 2022, GLA biologist Jillian Stephens performed surveys on March 2, April 13, and May 30. In 2024, GLA biologist Ian Rhodes performed surveys on April 8 and June 25/26.

Surveys were conducted in accordance with accepted botanical survey guidelines (CDFW 2018, CNPS 2001, Nelson 1984, USFWS 2000). As applicable, surveys were conducted at appropriate times based on precipitation and flowering periods. An aerial photograph, a soil map, and/or a topographic map were used to determine the community types and other physical features that may support sensitive and uncommon taxa or communities within the Project site. Surveys were conducted by following meandering transects within target areas of suitable habitat. All plant species encountered during the field surveys were identified and recorded following the above-referenced guidelines. A complete list of the plant species observed is provided in

Appendix A. Scientific nomenclature and common names used in this report follow Baldwin et al. (2012), and Munz (1974).

4.2 Results/Impacts

The Project will not impact Narrow Endemic Plants. None of the Narrow Endemic Plant species were detected during the 2022 and 2024 focused plant surveys. For many of these species, potentially suitable habitat was limited and marginal. The relatively highest potential for occurrence for many of the species was in the areas mapped as containing Traver soils in the northwestern and southeastern portions of the Project site, although microhabitats were lacking altogether for several of the species, i.e., vernal pools, and were generally not expected to occur.

4.3 Mitigation and Equivalency

Mitigation is not required for Narrow Endemic Plants.

5.0 ADDITIONAL SURVEY NEEDS (SECTION 6.3.2)

Pursuant to MSHCP *Volume I, Section 6.3.2*, the MSHCP requires habitat assessments and focused surveys (within areas of suitable habitat) for certain species as determined by a project's occurrence in a designated survey area, including Criteria Area Plant Species Survey Area (CAPSSA), burrowing owl survey area, amphibian survey area, and mammal survey area.

5.1 Criteria Area Species Survey Area - Plants

The Project site is not located within the CAPSSA (Exhibit 4B). As such, focused surveys are not required for Criteria Area Plants. One Criteria Area Plant Species, smooth tarplant (*Centromadia pungens* ssp. *laevis*) was detected within the Project site [Exhibit 8]. However, because the Project site does not occur within the CAPSSA, the MSHCP requirements pertaining to CAPSSA species such as smooth tarplant do not apply to the Project.

Approximately 1,670 smooth tarplant individuals were documented as occurring within portions of the Project site that support MSHCP Riverine resources and are discussed under Section 3.3 Riparian/Riverine Mitigation (Section 6.1.2), above.

5.2 Burrowing Owl

5.2.1 Methods

The Project site is within the MSHCP Burrowing Owl (*Athene cunicularia*) Survey Area [Exhibit 4B] and therefore a habitat assessment is required (in accordance with the

2006 MSHCP Burrowing Owl Survey Instructions) to determine if focused burrowing owl surveys are warranted for the Project site. The Burrowing Owl Survey Instructions are divided into three components: Step I (habitat assessment), Step II-A (focused burrow survey), and Step II-B (focused burrowing owl survey). The Step I habitat assessment is used to determine if a Project site exhibits the base-habitat conditions for burrowing owls, i.e., whether a site contains open habitats with the potential to contain fossorial mammal burrows to support burrowing owls.

Burrowing owl surveys were performed in 2022 for the middle portion of the Project alignment and in 2024 for the northwestern and southeastern portions of the Project [Exhibit 9 – Burrowing Owl Survey Map]. Step I habitat assessments were conducted by Stephanie Cashin and Wanisa Jaikwang on March 7, 2022, and by Jeff Ahrens on March 20, 2024. The Step I habitat assessments were conducted by walking meandering transects throughout the Project site to identify small mammal burrows or man-made structures that may be used by owls, as well as assessing the vegetation for suitability (i.e., areas of low growing grassland vegetation and/or lacking dense scrub). Additionally, a 500 feet buffer zone around the project boundary was visually inspected with binoculars.

Focused burrow surveys (Step II-A) were conducted on March 7, 2022, and March 20, 2024, concurrent with the first focused survey visits (Step II-B). The remaining focused survey visits for the respective survey areas were conducted on March 14, April 6, April 18, May 4, May 9, June 6 and June 13, 2022 (Amy Black, Stephanie Cashin, Brinna Lee, David Smith, Wanisa Jaikwang, and Joseph Vu), and on April 18, May 9, and July 8, 2024 (David Smith and Brinna Lee). The burrowing owl survey visits are to be conducted during a period from one hour prior to sunrise to two hours after sunrise or two hours before sunset to one hour after sunset. All survey visits were conducted in the morning within the allotted timeframe. The surveys were conducted during weather that was conducive to observing owls outside their burrows and detecting burrowing owl sign, and not during rain, high winds (> 20 mph), dense fog, or temperatures over 90 °F. Additionally, all work was performed more than 5 days after a rain event.

Focused burrowing owl surveys were conducted by walking meandering transects throughout areas of suitable habitat. Transects were spaced between 22 feet and 65 feet apart, adjusting for vegetation height and density, in order to provide adequate visual coverage of the survey areas. At the start of each transect, and at least every 320 feet along transects, binoculars were used to scan the survey area for burrowing owls. All suitable burrows were inspected for diagnostic owl sign (e.g., pellets, prey remains, whitewash, feathers, bones, and decoration) in order to identify potentially occupied burrows. Exhibit 9 identifies the burrowing owl survey areas, transect locations, and the 500-foot buffer area. Table 5-1 summarizes the 2022 burrowing owl survey visits and Table 5-2 summarizes the 2024 burrowing owl survey visits.

Table 5-1. Summary of 2022 Burrowing Owl Surveys

Survey Number	Survey Date	Biologist	Start/End Temperature (°F)	Start/End Wind Speed (mph)	Cloud Cover (%)
1	3/7/2022	SC/WJ	51/53	0-2	0
1	3/14/22	SC/BL	45/54	0-1	0
2	4/6/2022	SC/JV	57/63	0-2	0
2	4/18/2022	JV/WJ	52/59	0-6	100
3	5/4/2022	AB/DS	48/56	0-1	0
3	5/9/2022	SC/WJ	47/52	0-6	100
4	6/6/2022	SC/WJ	57/70	0-1	0
4	6/13/2022	SC/WJ	61/65	0-5	100
SC = Stephanie Cashin, WJ = Wanisa Jaikwang, BL = Brinna Lee, JV = Joseph Vu, AB = Amy Black, DS = David Smith					

Table 5-2. Summary of 2024 Burrowing Owl Surveys

Survey Number	Survey Date	Biologist	Start/End Temperature (°F)	Start/End Wind Speed (mph)	Cloud Cover (%)
1	3/11/2024	JA	48/62	2-4	50
2	4/18/2024	DS	68/70	0	100
3	5/9/2024	DS	64/70	0	100
4	7/8/2024	BL	66/72	0-4	0
JA = Jeff Ahrens, DS = David Smith, BL = Brinna Lee					

Surveys were conducted by walking meandering transects throughout areas of suitable habitat. Exhibit 11 identifies the areas surveyed at the Project site, including a 500-foot visual survey area around the Project site. Transects were spaced at a maximum of 30 meters (100 feet) apart from each other, adjusting for vegetation height and density, to provide adequate visual coverage of the survey areas. At the start of each transect, and at least every 100 meters along the transects, the survey area was scanned for burrowing owls using binoculars. All suitable burrows were inspected for diagnostic owl sign (e.g., pellets, prey remains, whitewash, feathers, bones, and/or decoration) to identify potentially occupied burrows. The 500-foot visual survey area was at least inspected with binoculars but was also accessed on foot where feasible.

5.2.2 Results/Impacts

No burrowing owls were detected within the Project site during focused surveys. Exhibit 9 provides the locations of areas surveyed, including approximate transect locations as well as the locations of suitable burrows that were mapped. No burrowing owl sign was observed at any of the burrows.

5.2.3 Mitigation and Equivalency

Although burrowing owls were not detected during focused surveys, because the site has the potential to support burrowing owls, pre-construction surveys will be required to prevent harm to burrowing owls, should individuals occupy the site in the future. The following burrowing owl measure will apply to the Project:

- Pre-construction burrowing owl surveys will be conducted in areas of suitable habitat not more than 30 days prior to the initiation of ground disturbance (e.g., vegetation clearing, clearing and grubbing, tree removal, site watering, equipment staging, grading, etc.) to ensure that no owls have colonized the site in the days or weeks preceding the ground-disturbing activities. If burrowing owls have colonized the project site prior to the initiation of ground-disturbing activities, the project proponent will immediately inform the Regional Conservation Authority (RCA) and the Wildlife Agencies and will need to coordinate further with RCA and the Wildlife Agencies, including the possibility of preparing a Burrowing Owl Protection and Relocation Plan, prior to initiating ground disturbance. If ground-disturbing activities occur, but the site is left undisturbed for more than 30 days, a pre-construction survey will again be necessary to ensure burrowing owl has not colonized the site since it was last disturbed. If burrowing owl is found, the same coordination described above will be necessary.

5.3 Mammals

The Project site is not located within a mammal survey area. As such, focused surveys are not required for designated mammal species and there are no other requirements applicable to the Project for mammals.

5.4 Amphibians

The Project site is not located within an amphibian survey area. As such, focused surveys are not required for designated amphibian species and there are no other requirements applicable to the Project for amphibians.

6.0 DELHI SANDS FLOWER-LOVING FLY

The Project site is not located within Delhi soils mapped within the MSHCP baseline data, and therefore habitat assessments/focused surveys are not required for the Delhi Sands flower-loving fly (*Rhaphiomidas terminatus abdominalis*).

Appendix A

Floral Compendium

Appendix A

Floral Compendium

Taxonomy sourced from The Jepson Manual (Baldwin et al. 2012) and Jepson eFlora (2023) and, for sensitive species, the California Native Plant Society's Rare Plant Inventory, Online Edition v-9.5 (CNPS 2024). Common plant names are taken from Hickman (1993), Munz (1974), Roberts et al. (2004), and Roberts (2008).

* Non-native/introduced species; + Detected offsite, but within the overall Study Area.

SCIENTIFIC NAME	COMMON NAME	SPECIAL STATUS
MONOCOTS		
Arecaceae – Palm Family		
+ *Phoenix canariensis	Canary island date palm	
+ *Washingtonia robusta	Mexican fan palm	
Poaceae – Grass Family		
Avena barbata	slim oat	
Bromus diandrus	ripgut brome	
Bromus hordeaceus	soft chess	
Bromus rubens	red brome	
Ehrharta erecta	upright veldt grass	
Hordeum marinum	Seaside barley	
Hordeum vulgare	common barley	
Schismus barbatus	Old han schismus	
Triticum aestivum	common wheat	
Typhaceae – Cattail Family		
+ Typha domingensis	cattail	
EUDICOTS		
Amaranthaceae – Amaranth Family		
Amaranthus blitoides	prostrate pigweed	
Anacardiaceae – Sumac Family		
Schinus molle	Peruvian pepper tree	
Asteraceae – Sunflower Family		
+ Baccharis salicifolia	mule fat	
Centromadia pungens ssp. laevis	Smooth tarplant	CRPR 1B.1

***Cirsium vulgare**	bullthistle	
***Erigeron canadensis**	Canada horseweed	
***Helianthus annuus**	hairy leaved sunflower	
***Lactuca serriola**	prickly lettuce	
***Matricaria discoidea**	Pineapple weed	
***Oncosiphon pilulifer**	stinknet	
***Pseudognaphalium californicum**	Ladies' tobacco	
***Senecio vulgaris**	common groundsel	
Boraginaceae – Borage		
***Amsinckia menziesii**	fiddleneck	
***Cryptantha intermedia**	common cryptanth	
***Plagiobothrys leptocladus**	Alkali plagiobothrys	
Brassicaceae – Mustard Family		
***Capsella bursa-pastoris**	Shepherd's purse	
***Hirschfeldia incana**	mustard	
***Lepidium latifolium**	perennial pepperweed	
***Sisymbrium irio**	London rocket	
Chenopodiaceae – Goosefoot Family		
***Atriplex semibaccata**	Australian saltbush	
***Bassia hyssopifolia**	five horn bassia	
***Chenopodium album**	Lambs quarters	
***Chenopodium murale**	nettle leaf goosefoot	
Convolvulaceae – Morning Glory Family		
***Convolvulus arvensis**	field bindweed	
Crassulaceae – Stonecrop Family		
***Crassula connata**	sand pygmy weed	
Fabaceae – Legume Family		
***Melilotus indicus**	annual yellow sweetclover	
***Parkinsonia aculeata**	Jerusalem thorn	
Geraniaceae – Geranium Family		
***Erodium cicutarium**	coastal heron's bill	
Hydrophyllaceae – Waterleaf Family		
***+Phacelia ramosissima**	branching phacelia	

Malvaceae – Mallow Family		
***Malva parviflora**	cheeseweed	
Myrtaceae – Myrtle Family		
***Eucalyptus globulus**	blue gum	
Polygonaceae – Buckwheat Family		
***Rumex crispus**	curly dock	
Salicaceae – Willow Family		
+*Populus fremontii	Fremont cottonwood	
+*Salix exigua	narrowleaf willow	
+*Salix exigua var. exigua	narrowleaf willow	
***Salix gooddingii**	Gooding's willow	
+*Salix laevigata	polished willow	
+*Salix lasiolepis	Arroyo willow	
Solanaceae – Nightshade Family		
***Nicotiana glauca**	tree tobacco	
Tamaricaceae – Tamarisk Family		
***+*Tamarix ramosissima**	tamarisk	
Urticaceae – Nettle Family		
***Urtica urens**	annual stinging nettle	

Special Status Designations

Federal
FE – Federally Endangered
FT – Federally Threatened
FC – Federal Candidate

State
SE – State Endangered
ST – State Threatened
SR – State Rare

CNPS
Rank 1A – Plants presumed extirpated in California and either rare or extinct elsewhere.
Rank 1B – Plants rare, threatened, or endangered in California and elsewhere.
Rank 2A – Plants presumed extirpated in California, but common elsewhere.
Rank 2B – Plants rare, threatened, or endangered in California, but more common elsewhere.
Rank 3 – Plants about which more information is needed (a review list).
Rank 4 – Plants of limited distribution (a watch list).

Threat Code extension

.1 – Seriously endangered in California (over 80% occurrences threatened)

.2 – Fairly endangered in California (20-80% occurrences threatened)

.3 – Not very endangered in California (<20% of occurrences threatened or no current threats known)

Appendix B

Faunal Compendium

Appendix B

Faunal Compendium

Taxonomy and common names sourced from the California Wildlife Habitat Relationships System (CDFW 2016), the CNDDB for special status species, and the following taxa-specific sources: American Ornithological Society (2024) for birds; Collins and Taggart (2009) and Crother (2017) for reptiles and amphibians; and Wilson and Reeder (2005) for mammals.

* Non-native/introduced species; + Detected offsite, but within the overall Study Area.

SCIENTIFIC NAME	COMMON NAME	SPECIAL STATUS
INVERTEBRATES		
+Bombus crotchii	Crotch's bumble bee	SCE
AMPHIBIANS		
Bufonidae – True Toads		
+Anaxyrus boreas halophilus	California toad	
Hylidae – Treefrogs and Allies		
+Pseudacris hypochondriaca	Baja California treefrog	
REPTILES		
Phrynosomatidae – Phrynosomatid Lizards		
Sceloporus occidentalis longipes	Great Basin fence lizard	
BIRDS		
Accipitridae – Hawks, Eagles, Kites		
+ Accipiter cooperii	Cooper's hawk	
Buteo jamaicensis	red-tailed hawk	
+Buteo lineatus	red-shouldered hawk	
+ Circus hudsonius	northern harrier	SSC
Aegithalidae – Bushtits		
Psaltriparus minimus	bushtit	
Alaudidae – Larks		
Eremophila alpestris	horned lark	

Anatidae – Swans, Geese, Ducks		
+Anas platyrhynchos	mallard	
Apodidae – Swifts		
Aeronautes saxatalis	white-throated swift	
Ardeidae – Herons and Bitterns		
+Ardea alba	great egret	
+Bubulcus ibis	cattle egret	
+Butorides virescens	green heron	
+Egretta thula	snowy egret	
+Nycticorax nycticorax	black-crowned night heron	
Cardinalidae – Cardinals		
+Passerina amoena	lazuli bunting	
+Passerina caerulea	blue grosbeak	
+Pheucticus melanocephalus	black-headed grosbeak	
Cathartidae – American Vultures		
Cathartes aura	turkey vulture	
Charadriidae – Plovers and Relatives		
Charadrius vociferus	killdeer	
Columbidae – Pigeons, Doves		
****+Columbia livia***	rock pigeon	
****+Streptopelia decaocto***	Eurasian collared-dove	
Zenaida macroura	mourning dove	
Corvidae – Crows, Jays		
+Aphelocoma californica	California scrub-jay	
Corvus brachyrhynchos	American crow	
Corvus corax	common raven	
Emberizidae – Old World Buntings		
+Melospiza lincolnii	Lincoln’s sparrow	
Melospiza melodia	song sparrow	
+Melozone crissalis	California towhee	
Passerculus sandwichensis	savannah sparrow	
+Pipilo maculatus	spotted towhee	
Fringillidae – Finches		
Spinus psaltria	lesser goldfinch	
Haemorhous mexicanus	house finch	

+Spinus lawrencei	Lawrence's goldfinch	
+Spinus tristis	American goldfinch	
Hirundinidae – Swallows, Martins		
Hirundo rustica	barn swallow	
Petrochelidon pyrrhonota	cliff swallow	
Tachycineta bicolor	tree swallow	
Tachycineta thalassina	violet-green swallow	
Icteridae – Blackbirds		
+Agelaius phoeniceus	red-winged blackbird	
Euphagus cyanocephalus	Brewer's blackbird	
Icterus bullockii	Bullock's oriole	
Icterus cucullatus	hooded oriole	
+Molothrus ater	brown-headed cowbird	
Sturnella neglecta	western meadowlark	
Mimidae – Mockingbirds, Thrashers		
Mimus polyglottos	northern mockingbird	
Parulidae – Wood Warblers		
Geothlypis trichas	common yellowthroat	
+Icteria virens	yellow-breasted chat	SSC
+Setophaga petechial	yellow warbler	SSC
+Leiothlypis celata	orange-crowned warber	
Picidae – Woodpeckers		
+Colaptes auratus	northern flicker	
+Melanerpes formicivorus	acorn woodpecker	
+Picoides nuttallii	Nuttall's woodpecker	
Rallidae – Rails, Gallinules and Coots		
+Fulica americana	American coot	
+Porzana carolina	sora	
+Rallus limicola	Virginia rail	
Recurvirostridae – Avocets and Stilts		
+Himantopus mexicanus	black-necked stilt	
Regulidae – Kinglets		
+Corthylio calendula	ruby-crowned kinglet	
Strigidae – Typical Owls		
+Bubo virginianus	great-horned owl	

Sturnidae – Starlings and Mynahs		
***Sturnus vulgaris**	European starling	
Trochilidae – Hummingbirds		
Archilochus alexandri	black-chinned hummingbird	
Calypte anna	Anna's hummingbird	
Selasphorus sasin	Allen's hummingbird	
Troglodytidae –Wrens		
Thryomanes bewickii	Bewick's wren	
Troglodytes aedon	house wren	
Turdidae – Thrushes		
Sialia mexicana	western bluebird	
Tyrannidae – Tyrant Flycatchers		
+Empidonax difficilis	western flycatcher	
Sayornis nigricans	black phoebe	
Sayornis saya	Say's phoebe	
Tyrannus verticalis	western kingbird	
Tyrannus vociferans	Cassin's kingbird	
Tytonidae – Barn Owls		
Tyto alba	barn owl	
Vireonidae – Vireos		
+Vireo bellii pusillus	least Bell's vireo	
+Vireo huttoni	Hutton's vireo	
MAMMALS		
Canidae – Dogs, Wolves, and Foxes		
Canis domesticus	domestic dog	
Canis latrans	coyote	
Leporidae – Rabbits and Hares		
Sylvilagus adubonii	desert cottontail	
Mephitidae – Skunks		
+Mephitis mephitis	striped skunk	
Molossidae – Free-Tailed Bats		
+Eumops perotis	western mastiff bat	SSC
+Tadarida brasilensis	Mexican free-tailed bat	

Sciuridae – Squirrels, Chipmunks, Marmots		
Otospermophilus beecheyi	California ground squirrel	
Vespertilionidae – Evening Bats		
+Eptesicus fuscus	big brown bat	
+Lasiurus cinereus	hoary bat	
+Lasiurus xanthinus	western yellow bat	SSC
+Myotis californicus	California myotis	
+Myotis ciliolabrus	western small-footed myotis	
+Myotis yumanensis	Yuma myotis	
+Parastrellus hesperus	canyon bat

Section 1 Background

The Master Drainage Plan (MDP) for the San Jacinto Valley was adopted in October 2015 by the Board of Supervisors for the Riverside County Flood Control & Water Conservation District (RCFC&WCD). The MDP encompasses portions of the cities of San Jacinto and Hemet as well as parts of unincorporated Riverside County. The MDP is bounded by the San Jacinto River to the north, Florida Avenue to the south, Meridian Street to the east, and Warren Road to the west as shown in ***Figure 1***.

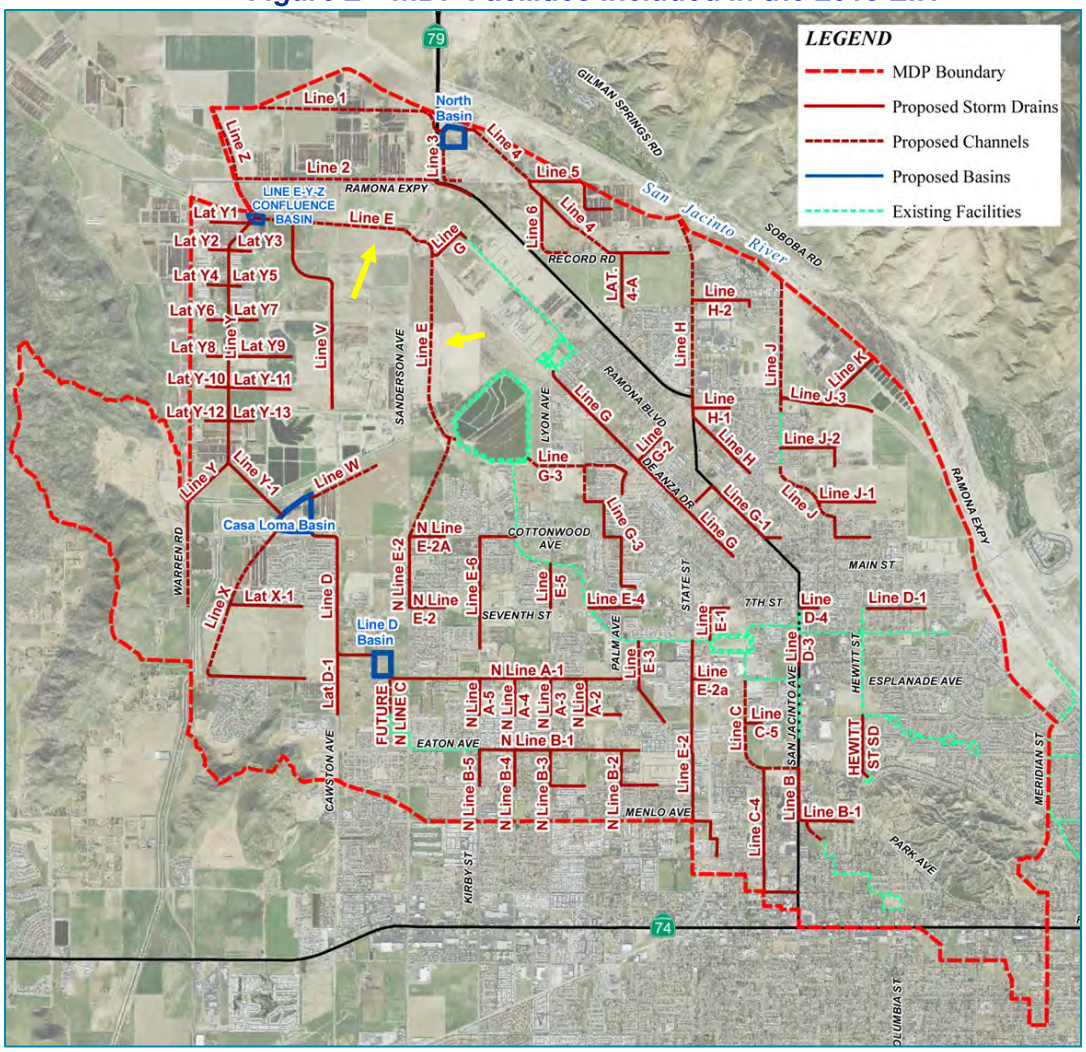

Figure 1 – Boundary of San Jacinto Valley Master Drainage Plan

Master Drainage Plans, by their very nature, are living documents. They provide a baseline strategy that can be modified as areas build out. Such is the case with the San Jacinto Valley MDP.

An Environmental Impact Report (EIR) for the San Jacinto Valley MDP and the San Jacinto Regional Area Drainage Plan (ADP) Amendment was certified by the San Jacinto City Council on January 14, 2013 (WEBB(a)). The certified EIR analyzed the MDP facilities shown in ***Figure 2*** (State Clearinghouse No. 2009041077). Note the yellow arrows in ***Figure 2*** pointing out Line E.

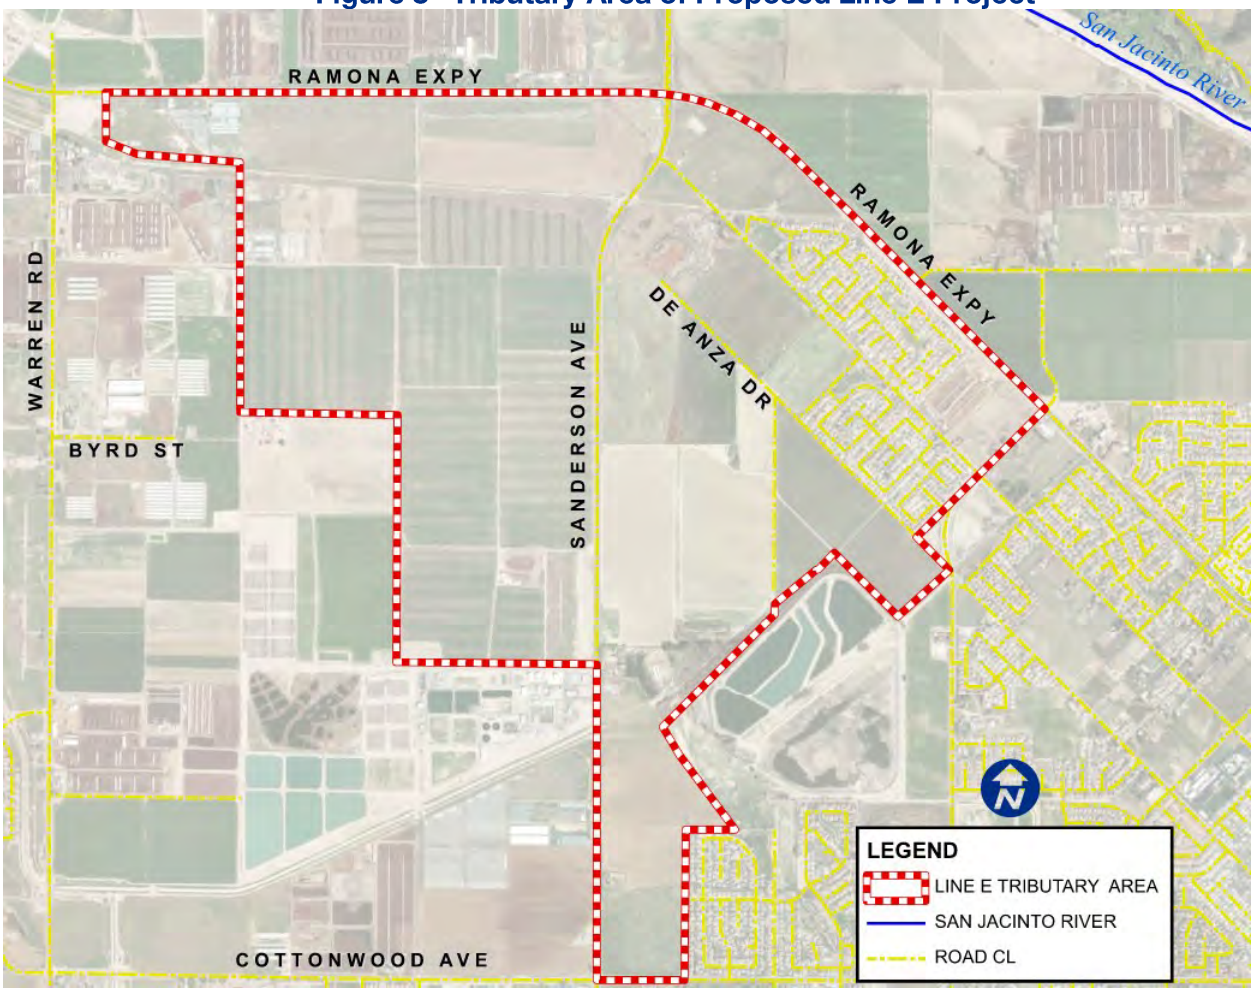

Figure 2 – MDP Facilities Included in the 2013 EIR

San Jacinto Master Developer, LLC (SJMD, LLC) submitted a development application to the City of San Jacinto for the proposed "San Jacinto Commerce Center Specific Plan" (SJCCSP or Specific Plan), which is located within the San Jacinto Valley MDP and a portion of the tributary area of Line E (***Figure 3***). Line E is a planned regional drainage facility that would provide a service to an approximately 1,870-acre tributary area that includes the 510-acre SJCCSP parcels in addition to many other property owners. As a major stakeholder relying on proper drainage of the area, SJMD, LLC will lead the planning, design, and construction of Line E on behalf of the City of San Jacinto.

SJMD, LLC retained the services of Albert A. Webb Associates (WEBB) to prepare the long-axis plan and this Preliminary Design Report (PDR) for the construction of Line E. The long-axis plan is located in **Appendix A.** RCFC&WCD will review this PDR and long-axis plan in order for SJMD, LLC to construct said facilities. This PDR is based on a 30% long-axis plan. Upon completion of CEQA and approval of this PDR for Line E, final engineering will commence.

Figure 3– Tributary Area of Proposed Line E Project

1.1 Scope of Work

To design the backbone MDP components to flood-protect the proposed SJCCSP, WEBB undertook the following scope of work:

1. Review existing MDP Line E flows and alignment;
2. Determine project design constraints with additional potholing, and topographic data;
3. Develop the proposed alignment considering design constraints and stakeholder input;
4. Obtain geotechnical and structural engineering design support;
5. Update MDP hydrology based on proposed layout;
6. Build hydraulic model of proposed alignment and updated flow rates;
7. Develop long-axis plan and kickoff environmental studies; and
8. Document results in PDR report.

1.2 Stakeholder Involvement

As part of the design of the proposed Project, WEBB held multiple meetings with the City of San Jacinto, RCFC&WCD, MWD, EMWD, SJMD LLC, and Riverside County Transportation Commission (RCTC) to solicit input on the proposed design. In addition, the alignment, hydraulics, and hydrology for the Project underwent two rounds of review with RCFC&WCD prior to submittal of this PDR; the first comment letter dated October 20, 2023, *MS 212 San Jacinto MDP Line E Plan Check No. 1* (LAN, Inc.), and the second comment letter dated December 18, 2023, *MS 212 MDP Line E Plan Check No. 2* (LAN, Inc.).

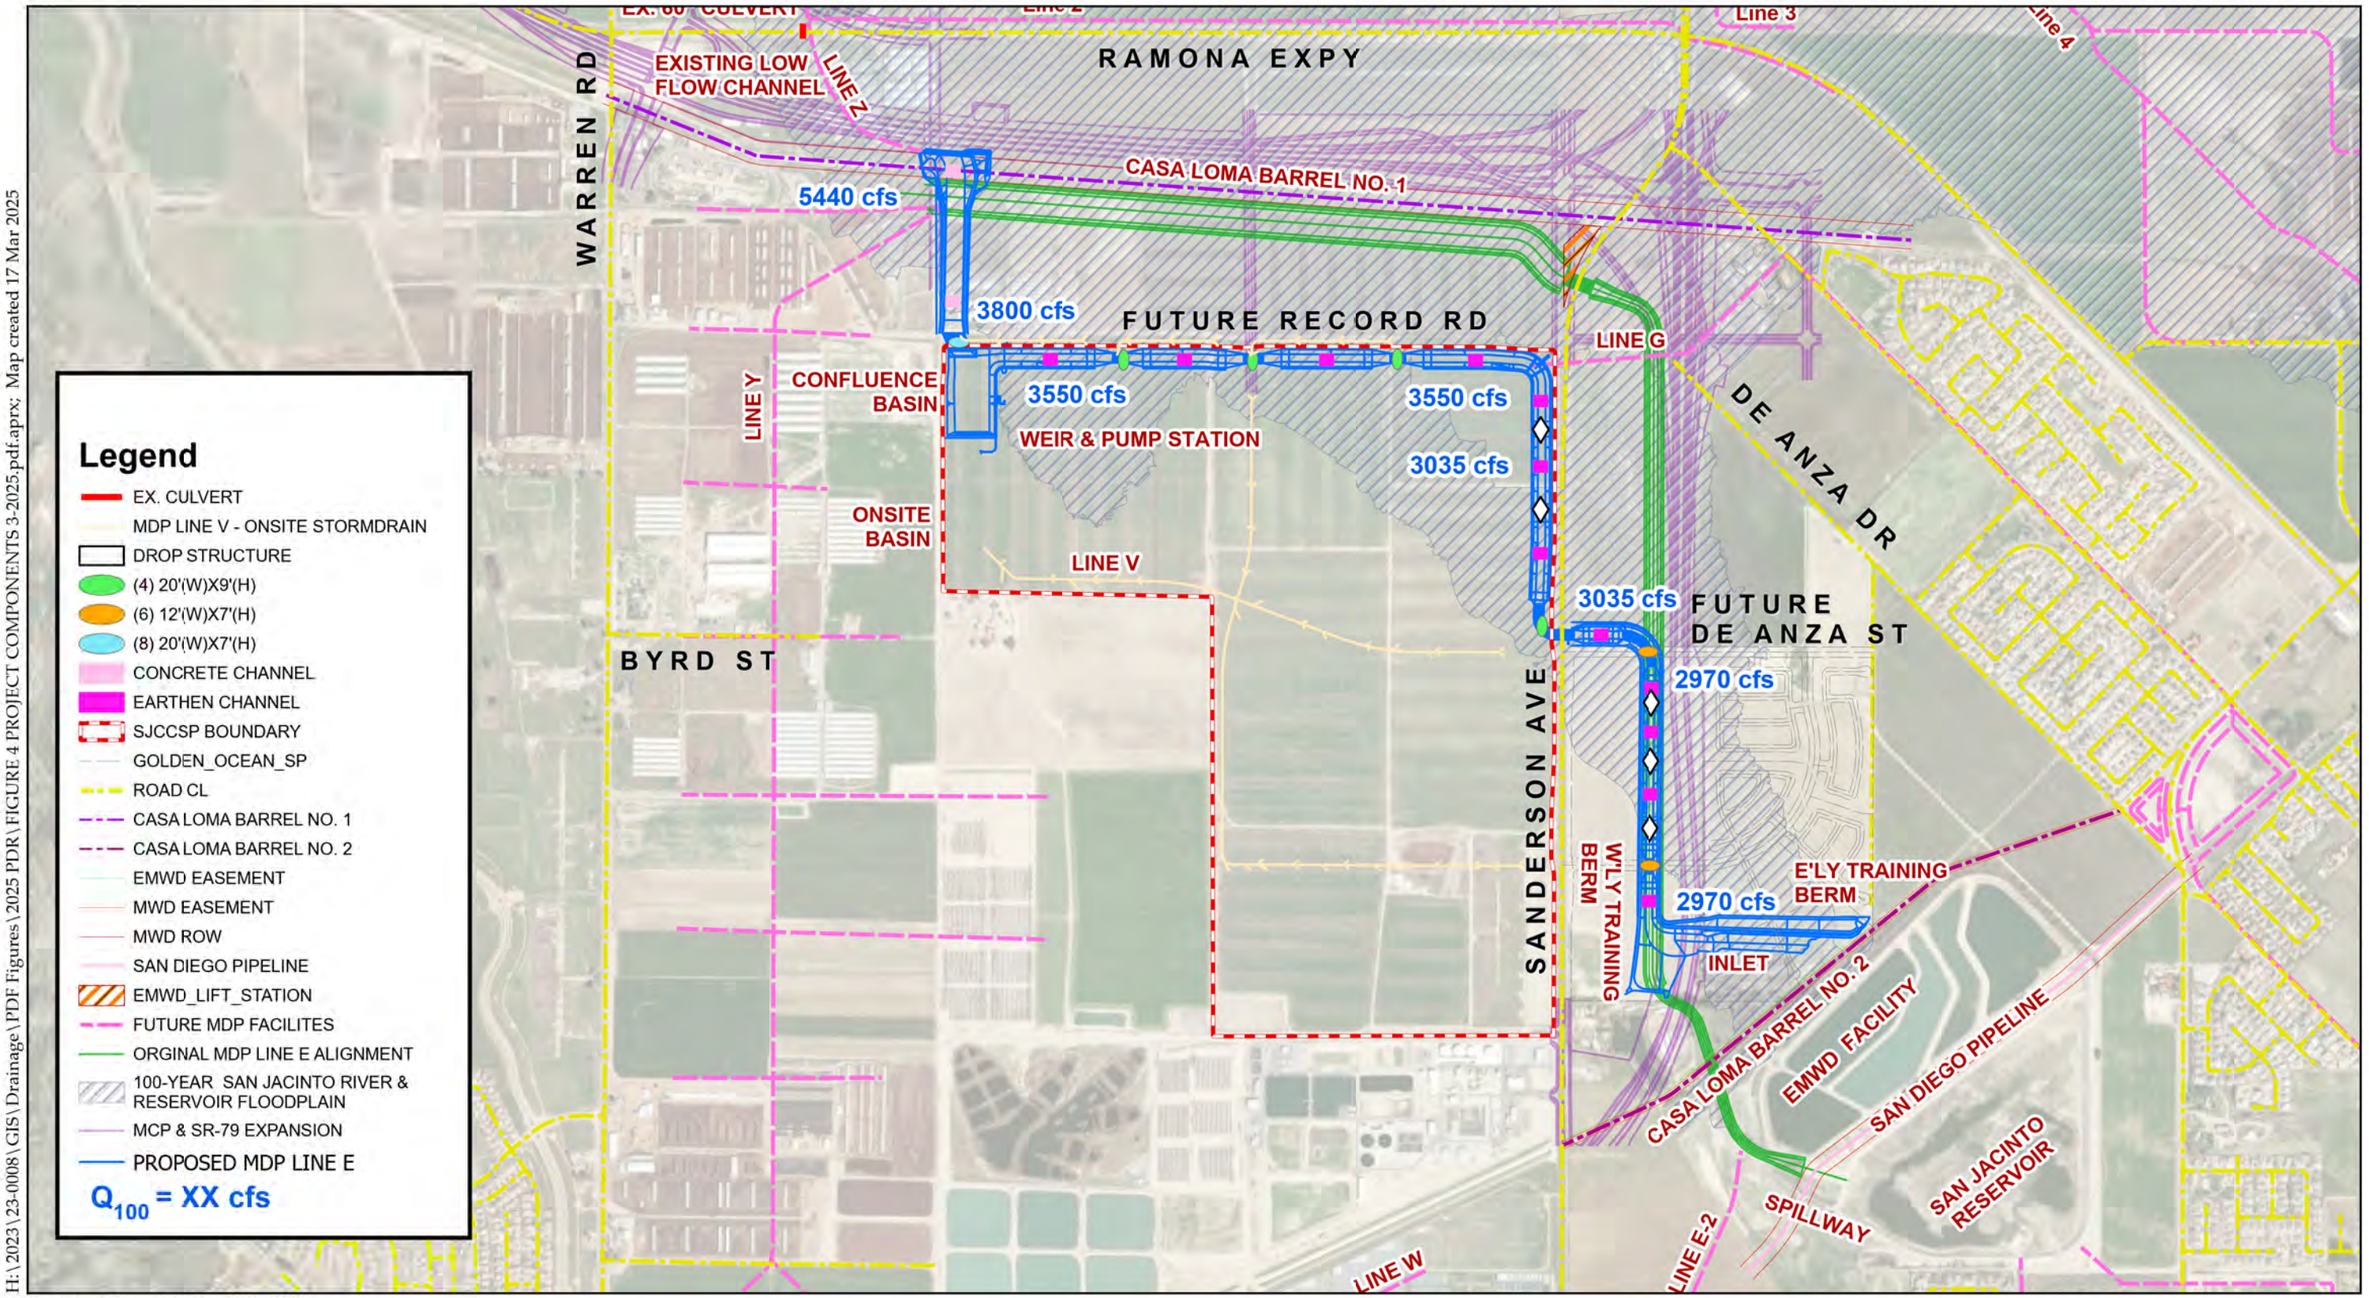
RCFC&WCD reviewed the full PDR via a comment letter dated February 9, 2024, MS 212 MDP Line E Plan Check No. 3 (LAN, Inc.). An additional review was completed in April 16. 2024. A maintenance, revised alignment, and hydraulics review was completed by RCFC&WCCD via Check No. 4 dated October 3, 2024.

There have been 2 reviews conducted by MWD. The first submittal to MWD was on November 8, 2024, where MWD reviewed the PDR, Geotechnical Report, and Structural Report. MWD gave technical comments on the Geotechnical and Structural Report. The second submittal to MWD was on February 14, 2025, with MWD approval on March 3, 2025. See **Appendix B** for approval email from MWD substructures group.

Section 2 Proposed Project

Line E is an implementing project of the MDP and has been analyzed at a programmatic level in a 2013 EIR and will be analyzed at a project level in a forthcoming EIR addendum. Construction of Line E does not remove properties from the 100-Year floodplain of the San Jacinto River. This will be accomplished by elevating them from the San Jacinto River Floodplain.

2.1 Location



The study components of this PDR are shown in ***Figure 4*** ("Project"). Line E begins downstream of the San Jacinto Reservoir Spillway and north of the Casa Loma Barrel No. 2 easement,[1] continuing north as an earthen trapezoidal channel parallel to, and east of, Sanderson Avenue through an agricultural property owned by Golden Ocean Realty (APN 436-030-001), turning west underneath Sanderson Avenue and turning north, then west before Record Road on the SJCCSP property to the proposed Confluence Basin (a proposed MDP facility). The outflows from the proposed Confluence Basin are conveyed northerly across Casa Loma Barrel No. 1 and outflow to an existing low-flow drainage channel that will, at some point in the future, be constructed as an ultimate MDP facility (Line Z) but is currently in interim condition.

The Project components are summarized as follows and shown on ***Figure 4***:

- 200 linear feet of concrete trapezoidal channel outside of the SJCCSP property crossing the MWD Casa Loma Barrel No. 1 right-of-way with 20-foot-wide access roads on both sides of the channel, a channel base width of 155 feet, channel height of up to 5.5-feet, and channel side slopes that vary from 10:1 to 23:1 ratio, and 560-feet MWD easement width. This segment of the channel will provide access to easterly and westerly MWD access roads from Record Road;
- 1,122 linear feet of concrete trapezoidal channel outside of the SJCCSP property with 20-foot-wide access roads on both sides of the channel, a channel base width of 155-feet, channel height of up to 5.5-feet, and channel side slopes with 1.5:1 ratio, and total right-of-way width of 270-feet for segment Record Road to MWD RW;
    - Includes a set of eight-cell 20-feet wide by 7-feet high RCB crossing Record Rd.;
- One (1) MDP Confluence Basin with 57.5 acre-feet capacity over an area of 6.25 acres, with 72-hour drawdown;
    - Includes a City maintained pump station located on the Confluence Basin parcel to drain the Confluence Basin as well as the SJCCSP Onsite Basin;

[1] Casa Loma Barrel (or "Siphon") Nos. 1 and 2 are buried water pipelines owned and operated by The Metropolitan Water District of Southern California (MWD).

FIGURE 4 - PROJECT COMPONENTS

MDP LINE E

ALBERT A. WEBB ASSOCIATES

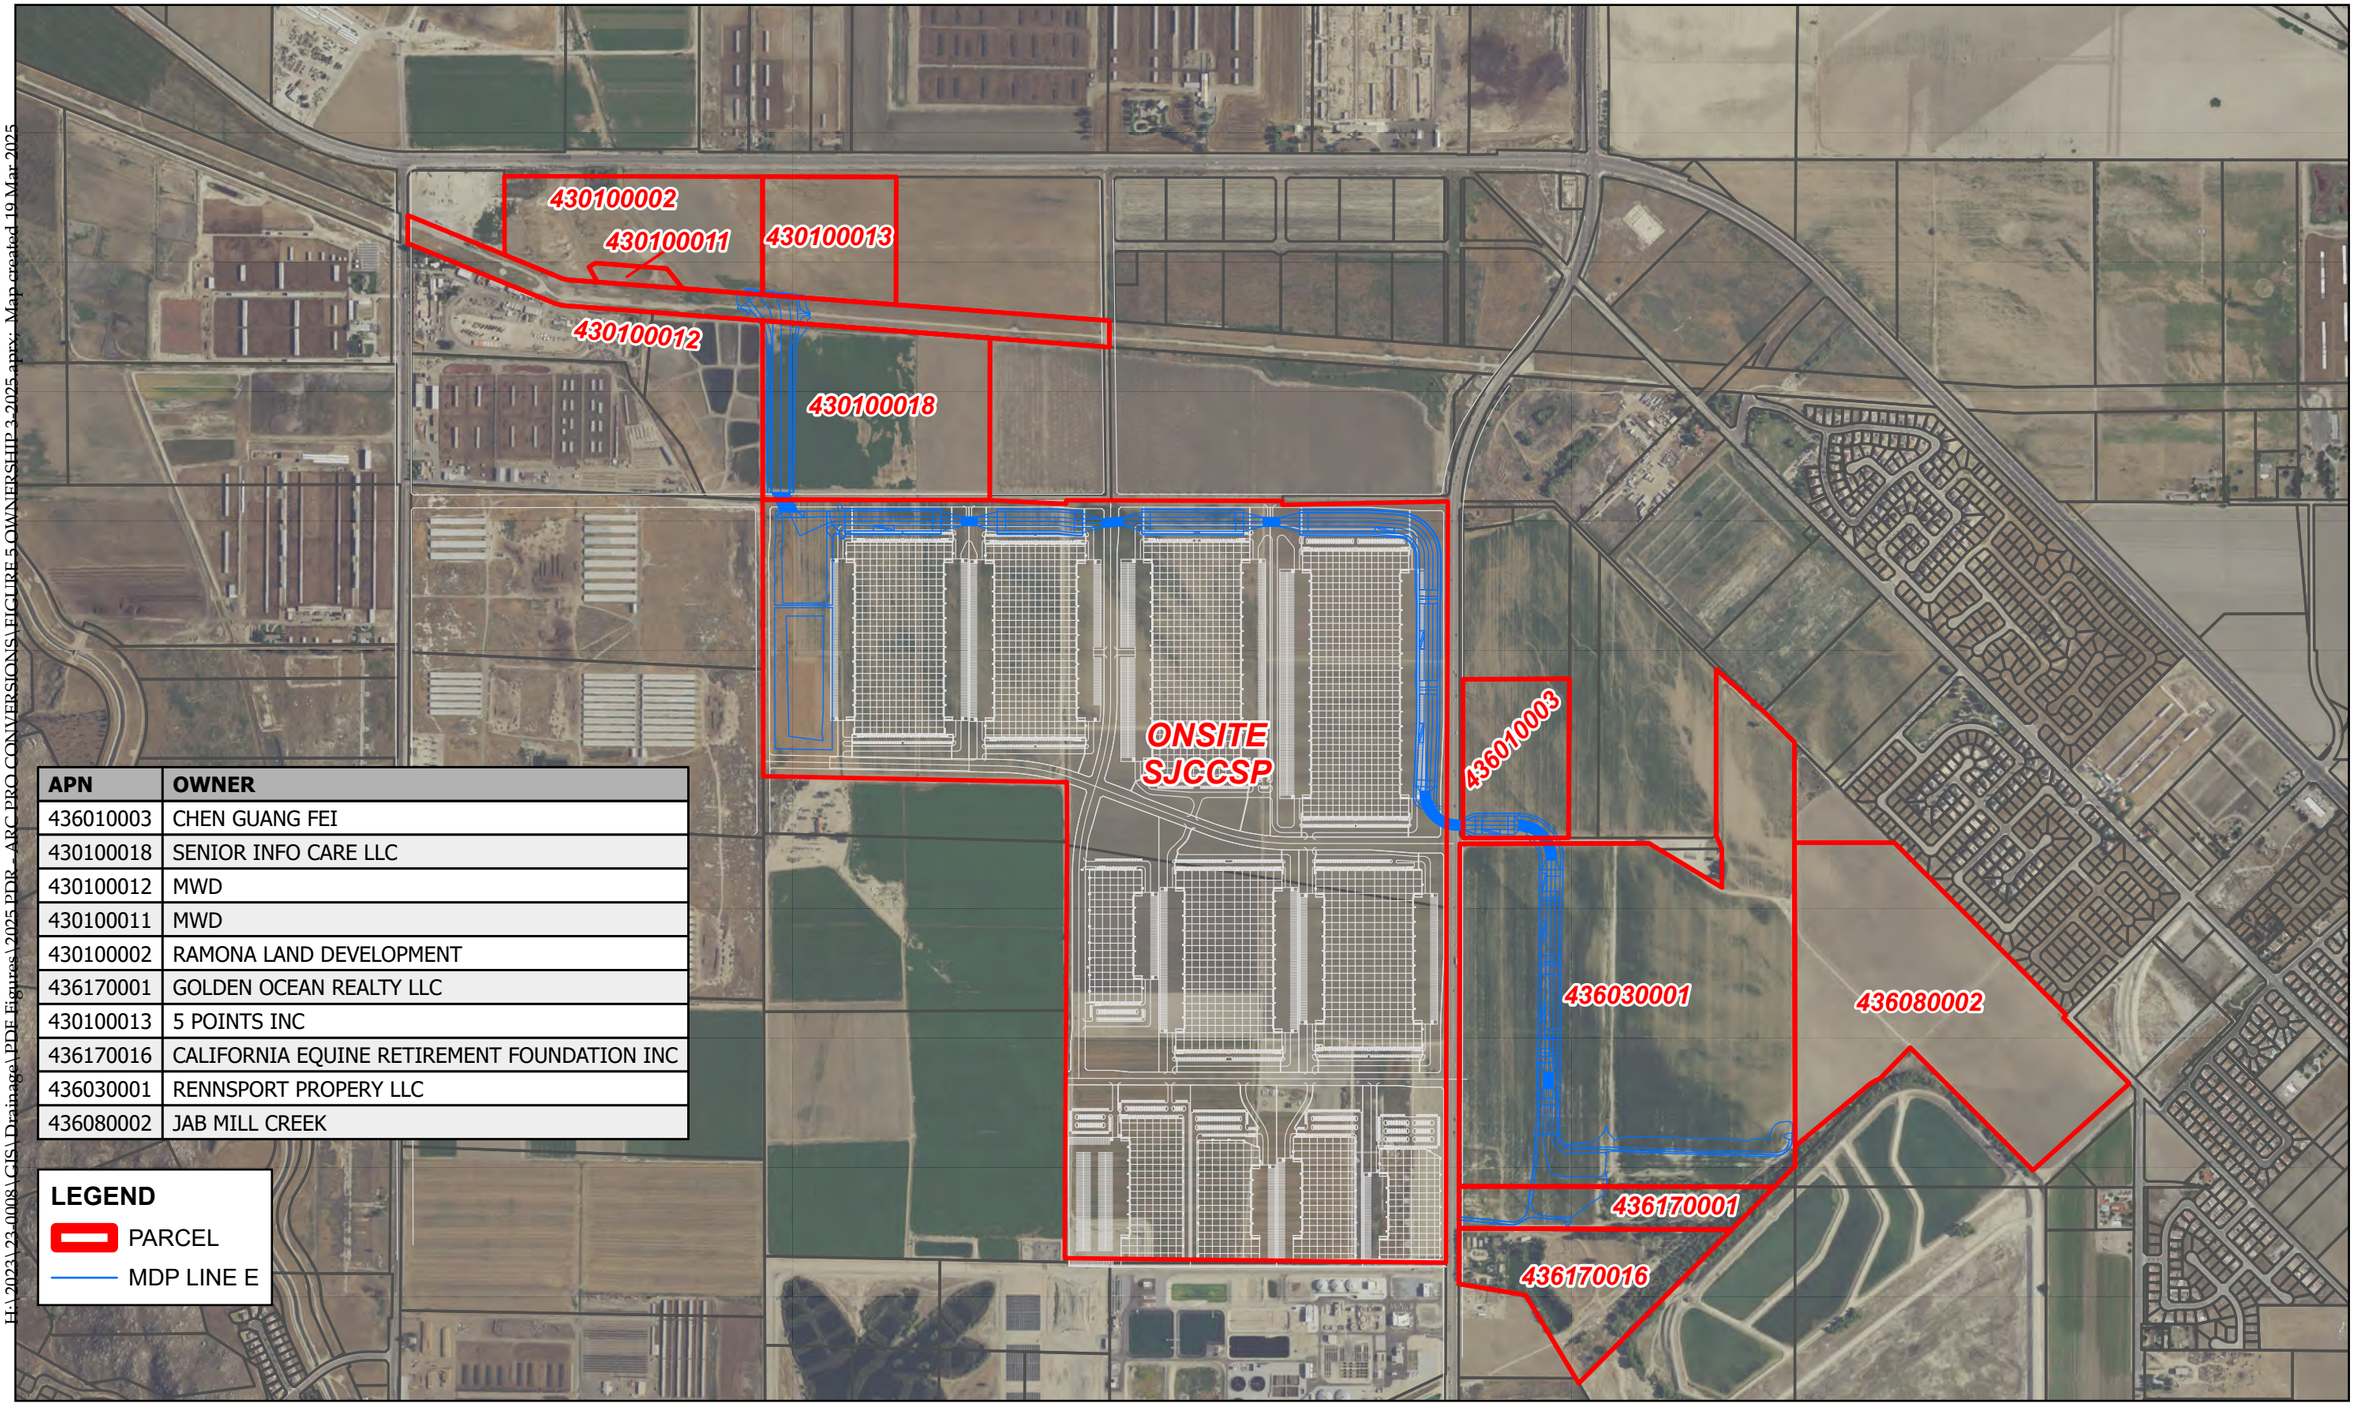
- 4,468 linear feet of earthen trapezoidal channel within the SJCCSP property with 15-foot-wide access roads on both sides of channel, a channel base width of 65-feet, channel height of up to 10-feet, and channel side slopes with 4:1 ratio, and total right-of-way width of 200-feet wide;
    - Includes three sets of four-cell 20-feet wide by 9-feet high RCB and concrete transition structures;
    - Dead storage within the channel is 7.1 acre-ft for approximately 5,180-ft of channel length;
- 1,398 linear feet of earthen trapezoidal channel outside of the SJCCSP property with 20-foot-wide access roads on both sides of channel, a channel base width of 65-feet, channel height of up to 10-feet, and channel side slopes with 4:1 ratio, and total right-of-way width of 200-feet wide east of Sanderson Avenue;
    - Includes three sets of six-cell 12-feet wide by 7-feet high RCB and concrete transition structures, each for future road crossings;
- Two (2) earthen training berms with 20-foot-wide access roads on top of each and each with 2:1 slope on the wet side of the training berms and 20:1 slope on the dry side of the berms: approximately 900 linear feet of Westerly Training Berm and approximately 1,514 linear feet of Easterly Training Berm;
- Five (5) sloped rip-rap drop structures;
- One (1) 14-feet wide by 7-feet high stub-out RCB connection for future MDP Line G and includes channel paving and scour protection; and
- The geotechnical and structural engineering details for the Line E crossing over Casa Loma Barrel No. 1 will be provided in **Appendix B**. WEBB is currently processing an easement application with MWD on behalf of RCFC&WCD for review and approval of the crossing of MWD's right-of-way. More details will be provided in the final design (Kleinfelder).

The proposed on-site drainage system for SJCCSP is identified as the "Line V onsite system" and includes an "Onsite Basin" for onsite runoff (see ***Figure 4***). Outflows from the SJCCSP Onsite Basin will outlet to the proposed Confluence Basin and downstream Line E, as described herein.

2.2 Design Rationale

The proposed Project presents a slightly different alignment than what was originally included in the MDP. This is the result of a process to engineer around constraints that were identified during stakeholder meetings (see *Section 1.1*) in order to improve the design from what was originally proposed. Specifically, the proposed alignment intentionally avoids the EMWD and MWD easements for pipelines located near the Project inlet, and, at the same time avoids the riparian habitat around the north side of the San Jacinto Reservoir. This has resulted in no hard connection between Line E and the San Jacinto Reservoir Spillway, as well as no hard connection between Line E and Line E-2. Maintenance access within private property has been considered and provided for in the Project, as discussed herein. There is preliminary evidence of biological resources on the Chen Fei property (APN 436-010-003) located north of the proposed Golden Ocean Realty properties (APNs 436-030-001 and 436-170-001), as well as

potentially environmentally sensitive areas along the south side of the Casa Loma Barrel No. 1 MWD right-of-way west of Sanderson Avenue, both of which the Project will avoid with the proposed design. Evaluations of sensitive biological resources have been conducted as part of the Project CEQA analysis and are not included herein. Because WEBB is preparing the CEQA documentation on behalf of the City, this information is provided quickly to WEBB engineers working on this design. The proposed Project also took into consideration several future projects planned by public agencies in the same area, such as RCTC and EMWD and was realigned to avoid conflicts with major sewer infrastructure located at where the MDP planned a crossing of Sanderson Avenue near the De Anza Lift Station. Furthermore, through the willingness of SJMD, LLC to allow part of the Project on its SJCCSP property, right-of-way acquisition is simplified and better controlled. The City will maintain Line E Channel within the SJCCSP property, the proposed Confluence Basin and pump station. The proposed Project has different flow rates than the MDP, which are presented and justified herein. The result of the proposed Project meets the objective to remove flooding risk to the area from the upstream tributary area and Line E conveys up to and including the modeled 100-Year flow rates within the design parameters required by RCFC&WCD.



WEBB researched the location of existing utilities in the Project area and they are shown on the Long-Axis Plan in **Appendix A**. The existing utilities in conflict with the proposed RCB's crossing Sanderson Avenue will be relocated and relocation plans will be prepared during the final design phase. Proposed utility crossings will be coordinated with adjacent developers and projects during final design, to the extent that information is available when the design is being prepared.

2.3 Access and Easements

The Project includes 20-foot-wide access roads for vehicle access to these MDP components located outside of the SJCCSP: the training berms, channel and RCBs. Additionally (2) 20-foot-wide access roads will be provided to access the easterly and westerly maintenance roads within MWD's fee right-of-way. Proposed MDP facilities within the SJCCSP will have 15-foot-wide access roads. RCFC&WCD does not own the land where the MDP facilities are proposed, as shown on ***Figure 5***. Therefore, dedication of rights-of-way by each property will be required and will be completed in final design.

SJMD, LLC and Golden Ocean Realty have indicated their intentions to dedicate a fee parcel on their respective properties to RCFC&WCD. Other private parcels are being evaluated. The selected alignment substantially reduces the number of private parcels and potential for eminent domain. The proposed Line G stub out will require an easement if located outside of RCFC&WCD right-of-way.

An easement will also be required across the MWD property at Casa Loma Barrel No. 1, estimated at 200 feet long by 600 feet wide. Procuring the easement from MWD will be completed in the final design phase.

2.4 FEMA Flood Plain Zone

A portion of the study area is located within FEMA flood plain zone AE corresponding to the San Jacinto River flood zone, as shown in ***Figure 6***. Zone AE represents areas in the 100-Year event flood plain with a Base Flood Elevation (BFE) or depth. This flood plain zone is designated consistent with the Letter of Map Revision (LOMR) no. 21-09-1682P, effective November 9, 2022.

The San Jacinto Reservoir is identified as FEMA flood plain zone A, which represents a 100-Year flood plain without BFE.

As part of the development of the SJCCSP and after approval of this PDR, a Conditional Letter of Map Revision (CLOMR) will be submitted to the Federal Emergency Management Agency (FEMA) requesting a Letter of Map Revision (LOMR) to revise the current National Flood Insurance Plan (NFIP) map to change the flood plain boundaries such that the SJCCSP site is no longer within a flood hazard zone. A portion of the SJCCSP will have to be elevated in order to remove it from the San Jacinto River 100-Year floodplain; however, that is not a part of this PDR.

2.5 Methodology

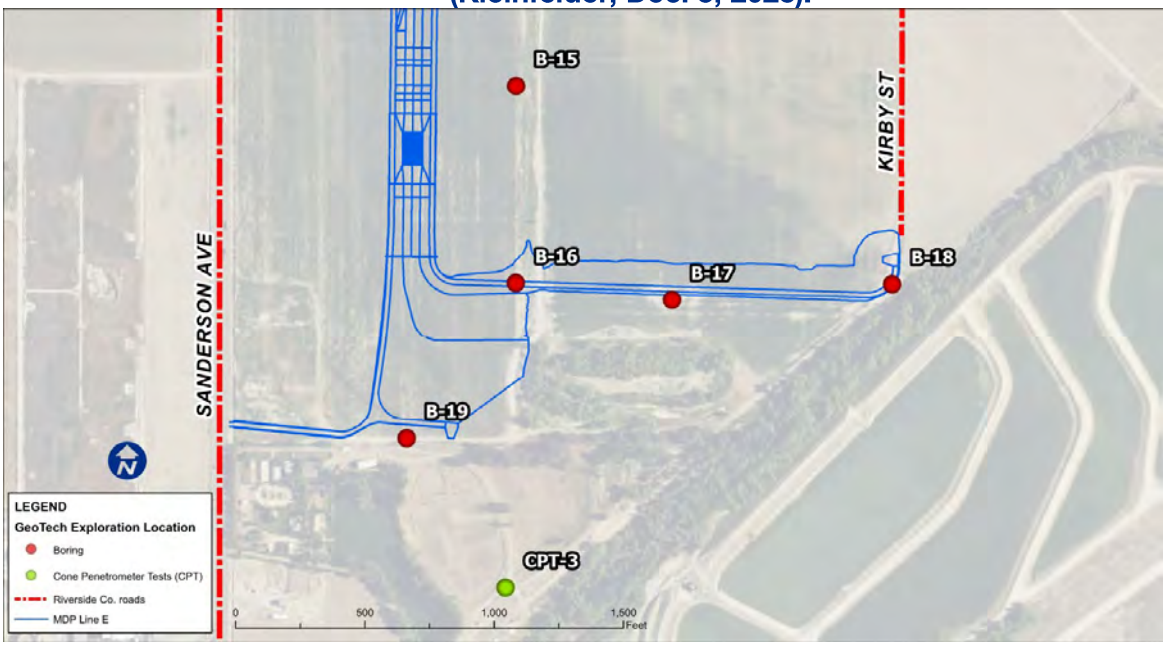
Pursuant to the RCFC&WCD Design Manual (March 2024) and L.A. County Hydraulic Design Manual (March 1982), the Project design is based on the required design manuals and design standards for a steady, stable, and open earthen, non-leveed channel that conveys 100-Year flow rate considering capacity and scour potential (i.e., with and without vegetation scenarios). The San Jacinto River 100-Year floodplain was used as the starting water surface elevation (WSE). The proposed SJCCSP drainage system and design methodology are analyzed under separate cover as part of entitlement with the City of San Jacinto.

2.5.1 Hydrology

Hydrologic calculations were performed consistent with the RCFC&WCD Hydrology Manual, dated April 1978. The rational method and synthetic unit hydrograph methods were used to determine peak flow rates. Rational method and synthetic unit hydrograph calculations were performed using CivilDesign® software, which incorporates the hydrological parameters outlined in the RCFC&WCD Hydrology Manual. Hydrological parameters (i.e., rainfall values and soil types) were determined from the RCFC&WCD Hydrology Manual.

2.5.2 Hydraulics

Water Surface Pressure Gradient (WSPG) is a hydraulic model from CivilDesign® used to preliminarily size the proposed channel. The various Project constraints were then evaluated against the results of the WSPG model. Stakeholder input on the proposed design led to the development of additional hydraulic modeling to verify the results. Hydrologic Engineering Centers River Analysis System (HEC-RAS) Version 6.3 developed by the U.S. Army Corps of Engineers was used to model the hydraulics of water flow through the channels. Two different HEC-RAS models were used in this study: one-dimensional (1D) HEC-RAS for the proposed channel and two-dimensional (2D) for the proposed channel inlet and proposed low flow channel located at the channel outlet.



The RCFC&WCD Hydraulic Design Manual, the L.A. County Hydraulic Design Manual dated March 1982, and the U.S. Department of Transportation HEC 14-Hydraulic Design of Energy Dissipators for Culverts and Channels dated July 2006 were used for this study.

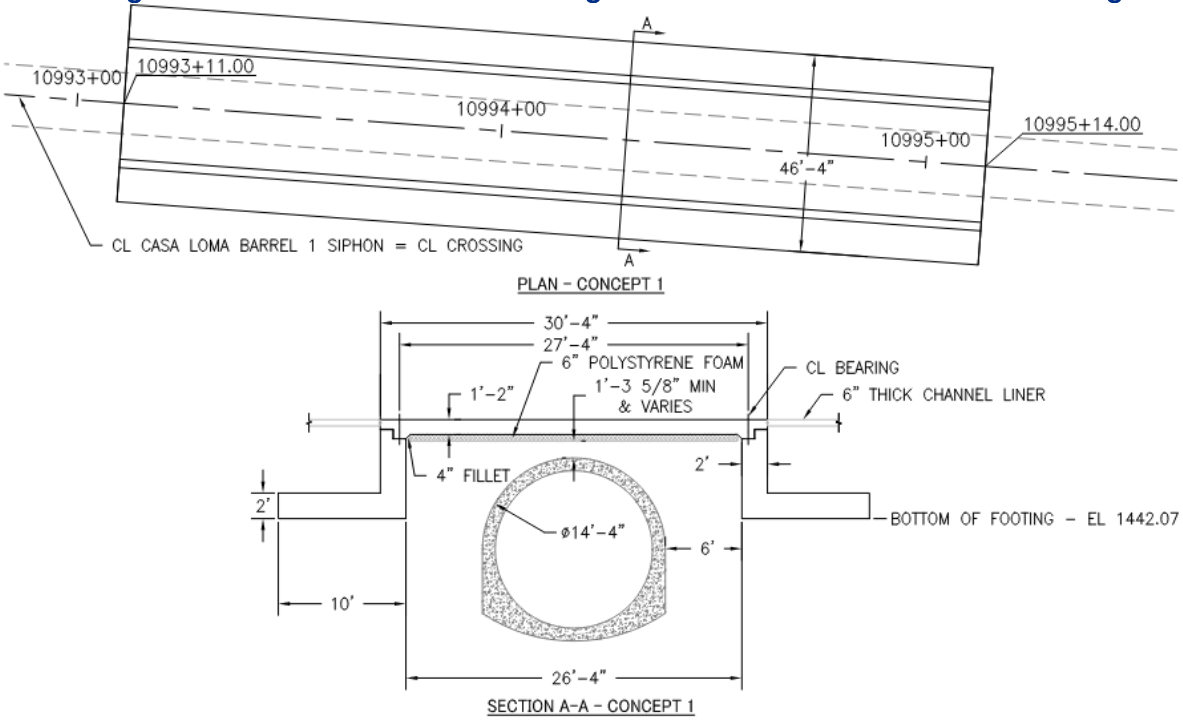
2.5.3 Geotechnical Considerations

A Geotechnical Investigation Report for the San Jacinto Line E Storm Drain project was prepared by Kleinfelder, Inc. (a copy of the report is included in **Appendix B**). The purpose of the investigation was to evaluate surface and subsurface conditions in the area of planned improvements and to provide geotechnical recommendations for earthwork, design, and construction considerations (Kleinfelder, p. 1). The study found depth to groundwater varies in the project area but was found to be below the invert of the proposed Line E channel for the majority of its length. The exception is at the southern end where the groundwater is 8-9 feet deep below existing ground at Boring B-16, which is located several hundred feet to the east of the proposed channel alignment. However, Boring B-19 at the Line E inlet shows a

depth of 17 feet. Additional investigation will be conducted during final design to confirm the depth of groundwater at the channel, and what mitigation methods, if any, are needed. Also, the depth of groundwater at the easterly training berm (Borings B-17 and B-18) is shallow, which will need to be accounted for during the construction of any cutoff walls and resolved in final design. The groundwater based on these borings is plotted on the Long Plot in **Appendix A**.

Excerpt showing locations of borings from "Figure 2 - Exploration Location Map" (Kleinfelder, Dec. 5, 2023).

The Geotechnical Study also provided data on soil classifications, which is used to determine the appropriate Manning's "n" values with the RCFC Design Manual. The borings drilled adjacent to the northerly MWD right-of-way (Casa Loma Barrel No. 1) will inform preliminary designs of a crossing structure, the MWD-approved geotechnical report (and structural) can be found in **Appendix B**.



Based on the results of the field explorations, laboratory testing, and engineering analyses conducted during the geotechnical study, it is the professional opinion of Kleinfelder, Inc. that the proposed project is geotechnically feasible provided the recommendations presented in the report are incorporated into the project design and construction (Kleinfelder, p. 14).

2.5.4 MWD Casa Loma Barrel No. 1 Crossing

At the outlet of this project, we cross MWD fee property and MWD facility Casa Loma Barrel No. 1 which was constructed in the 1920s and provides half of the potable water from the Colorado River. Casa Loma Barrel No. 1 is a critical facility that MWD requires near zero settlement and rebound. Kleinfelder completed a preliminary geotechnical investigation and a preliminary structural design report. The result of the geotechnical and structural design report was that the crossing is feasible and constructible. The preferred structural crossing of Casa Loma Barrel No. 1 is shown in ***Figure 7*** below. The concept is a spread footing with a slab

(similar to a bridge deck) spanning Casa Loma Barrel 1. This design will allow future work on Casa Loma Barrel No. 1 without reconstructing the entire crossing. MWD approved the geotechnical and structural reports in March 2025, the approval email and reports are included in **Appendix B**. It should be noted that there is scour protection in the form of the sloped cutoff wall at the downstream edge of the MWD right of way. Paralleling the MWD right of way there is a concrete channel that will convey all low flows northerly.

Figure 7 - Preferred structural design of Casa Loma Barrel No. 1 crossing.

`

Section 3 Hydrology

3.1 Existing MDP Hydrology

The existing MDP hydrology is based on the *Master Drainage Plan Update for San Jacinto Valley West Area* prepared by WEBB and dated May 2007 (updated October 2008). The hydrology analysis for Line E segment related to the SJCCSP began with the existing MDP model flow rates and facilities to represent the "existing condition." Contributing flows to Line E include overflows from the San Jacinto Reservoir, tributary flows from MDP N Line E-2 located south of Line E, future MDP Line G, future MDP Line V, and future MDP Line Y. The existing conditions for Line E flow rates have accounted for the following contributing flows (refer to ***Figure 8*** and **Appendix C**):

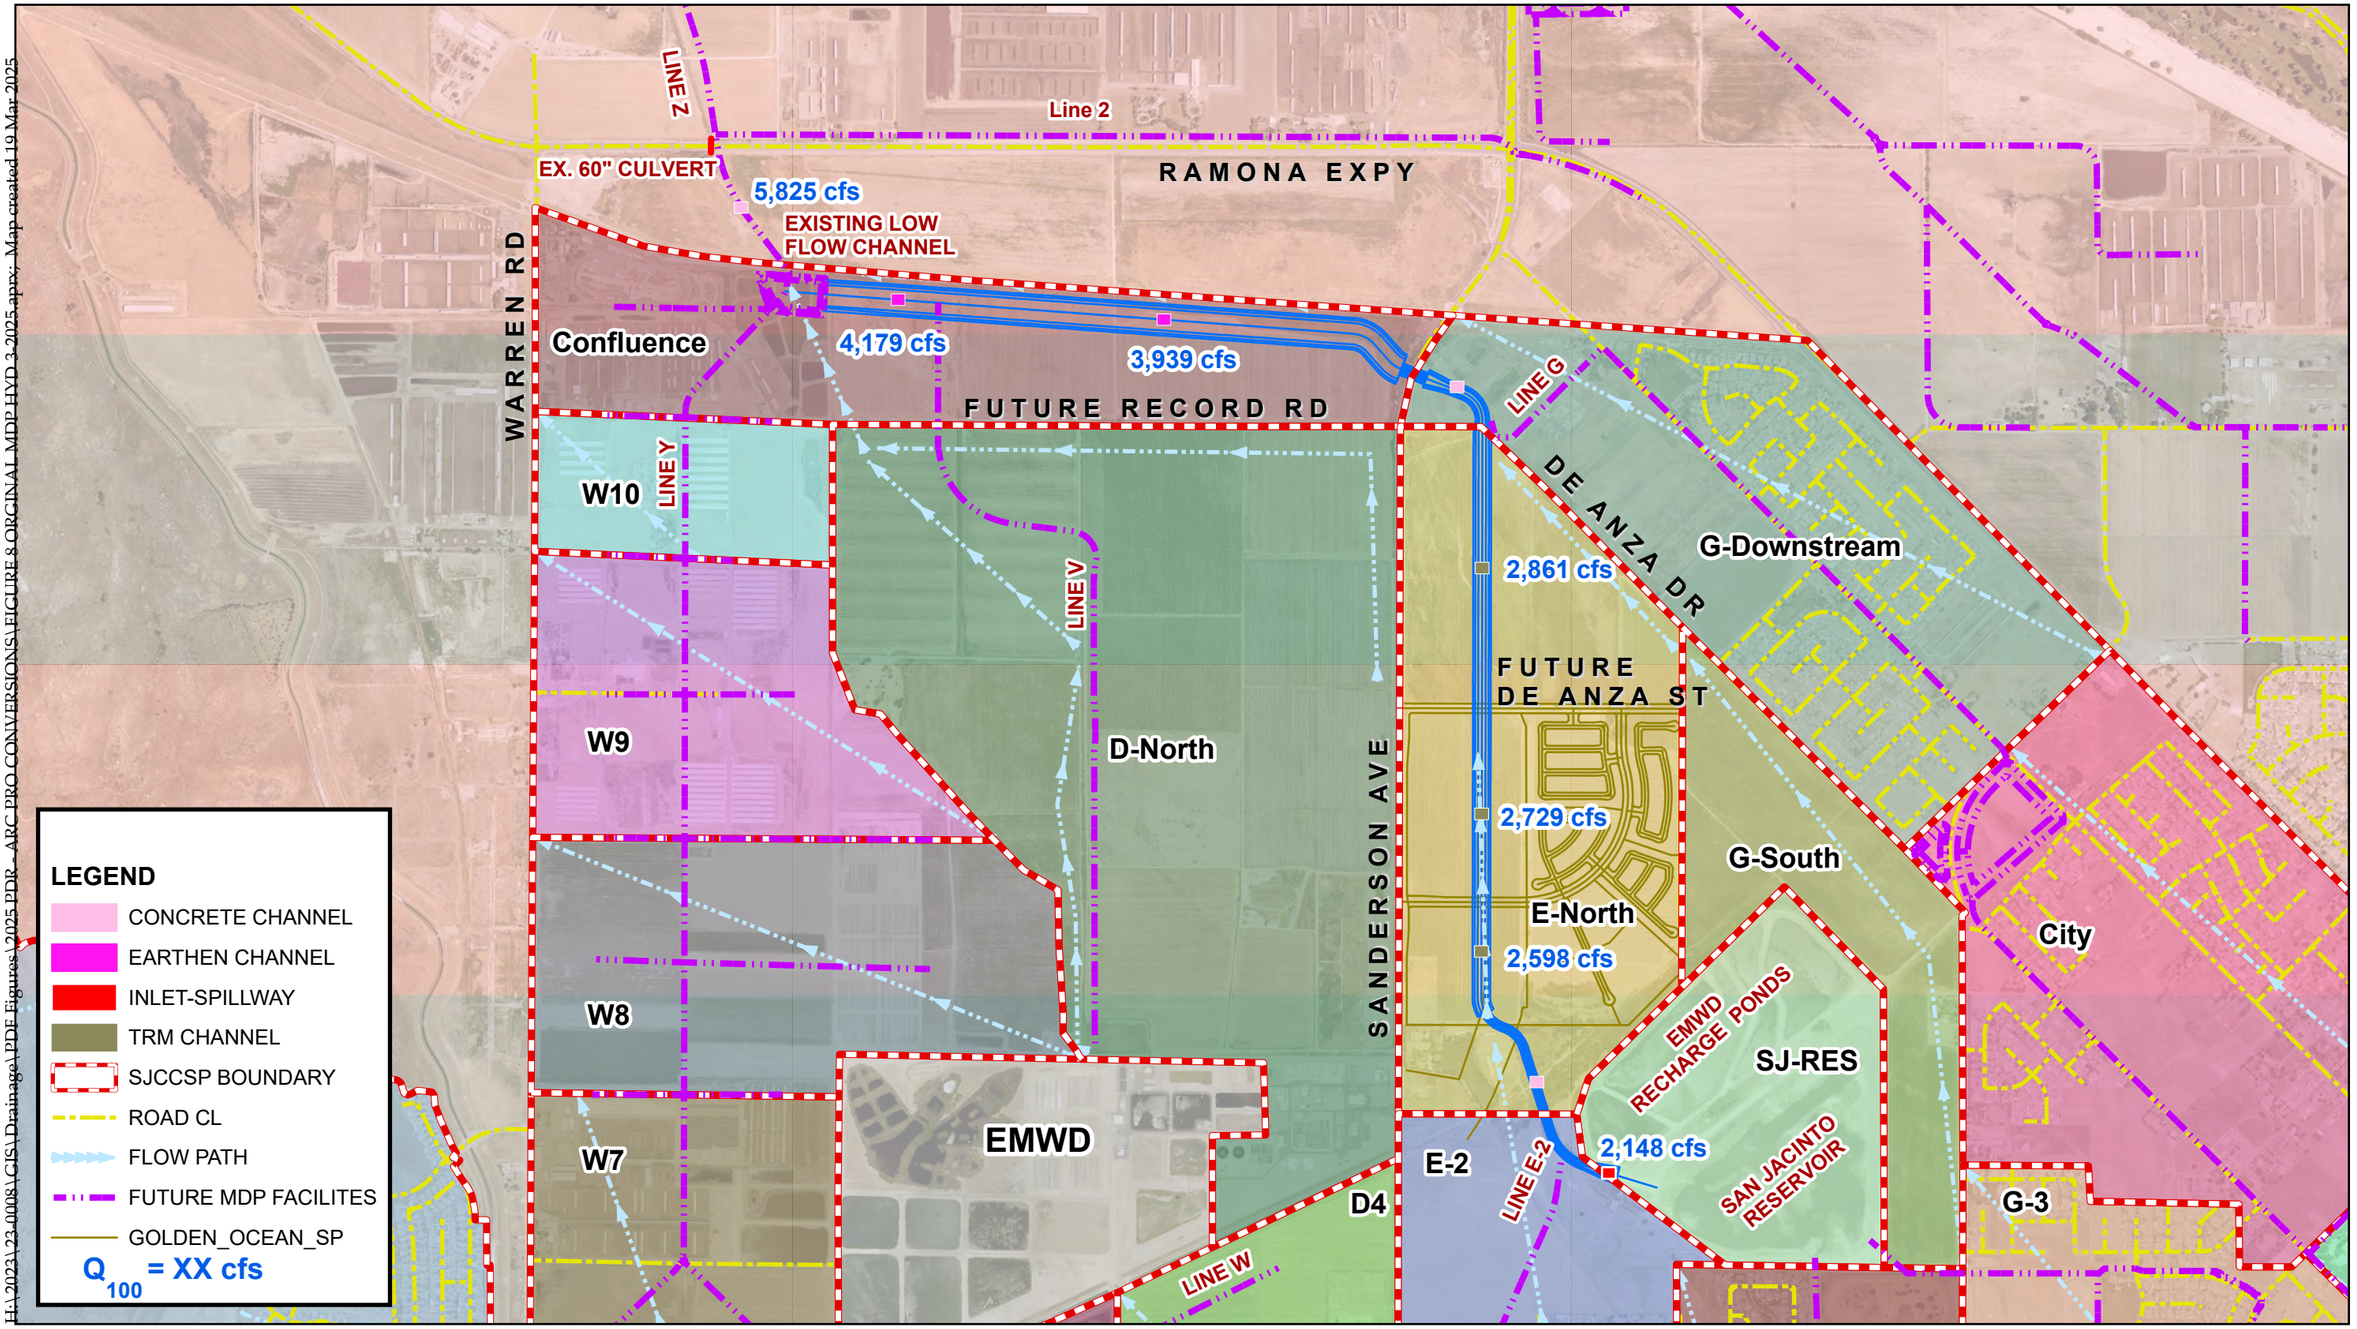


Table 1 – Existing MDP Hydrology

MDP Components	Existing MDP Flow Rates
Overflow from San Jacinto Reservoir	Q_{100} = 2,148 cfs
MDP N Line E-2	Q_{100} = 686 cfs; Trap B=6', D=6', Z=1.5
Golden Ocean Property contribution	Q_{100} = 521 cfs, RCP 14' (W) x 7' (H), assuming slope = 0.1%
MDP Line G	Q_{100} = 518 cfs; RCB 8' (W) x 4' (H)
MDP Line V On-Site System	Q_{100} = 962 cfs; Trap B=60', D=5', Z=4
MDP Line Y	Q_{100} = 1,646 cfs
Channel Segments	
Spillway to Line E-2	Q_{100} = 2,148 cfs
Line E-2 to Golden Ocean Property	Q_{100} = 2,598 cfs
Golden Ocean Property to Future De Anza St	Q_{100} = 2,729 cfs
Future De Anza St to Line G	Q_{100} = 2,861 cfs
Line G to Line V	Q_{100} = 3,939 cfs
Line V to Confluence Basin	Q_{100} = 4,179 cfs
Flow over Northerly MWD ROW	Q_{100} = 5,825 cfs

Note: cfs = cubic feet per second; MDP = Master Drainage Plan; RCP = reinforced concrete pipe; RCB = reinforced concrete box; W = width; H = height; Trap = trapezoidal.

(a) "Q_{100}" means the flow rate in a 100-Year storm event.

MDP LINE E

ALBERT A. WEBB ASSOCIATES

3.2 Proposed MDP Hydrology

The unit hydrograph analyses in this report were prepared in accordance with the methodology outlined in the RCFC&WCD Hydrology Manual dated April 1978. Because the Hydrology Manual includes precipitation data that has been superseded, the rainfall values used in the 2007 MDP Update as well as this study come from the NOAA Atlas 14 Version 4.0. All hydrology is based on a 100-Year 24-hour flood event.

The same watershed subareas that were delineated in the 2007 MDP Update are also used for this study, as shown on ***Figure 9*** and Appendix C; however, with some updates, as follows:

- Subarea E-2 land use updated to reflect actual site conditions of horse property;
- The land use was updated from residential to commercial for the SJCCSP property; and
- Subarea D-North of the wastewater treatment plant property was removed because runoff from this area will be collected and treated by the wastewater facility.

The result of these updates is a decreased flow rate reaching Line E compared to the 2007 MDP Update. The proposed Line E design rearranged how tributary flows will be collected, as follows:

- With the proposed design, tributary flows from the south are directed to Subarea D-North-A and then into a proposed Onsite Basin or Confluence Basin to be pumped out to Line E north of Record Road (***Figure 9***);
- Proposed MDP Line Y will no longer join the Confluence Basin and will instead join Line E upstream of Casa Loma Barrel No. 1;
- Flows from the Confluence Subarea are being added to Line E in the area of Casa Loma Barrel No. 1, which was previously coming into Line E at Sanderson Avenue under the prior MDP;
- Line G is proposed on the opposite side of Sanderson Avenue as compared to the MDP;

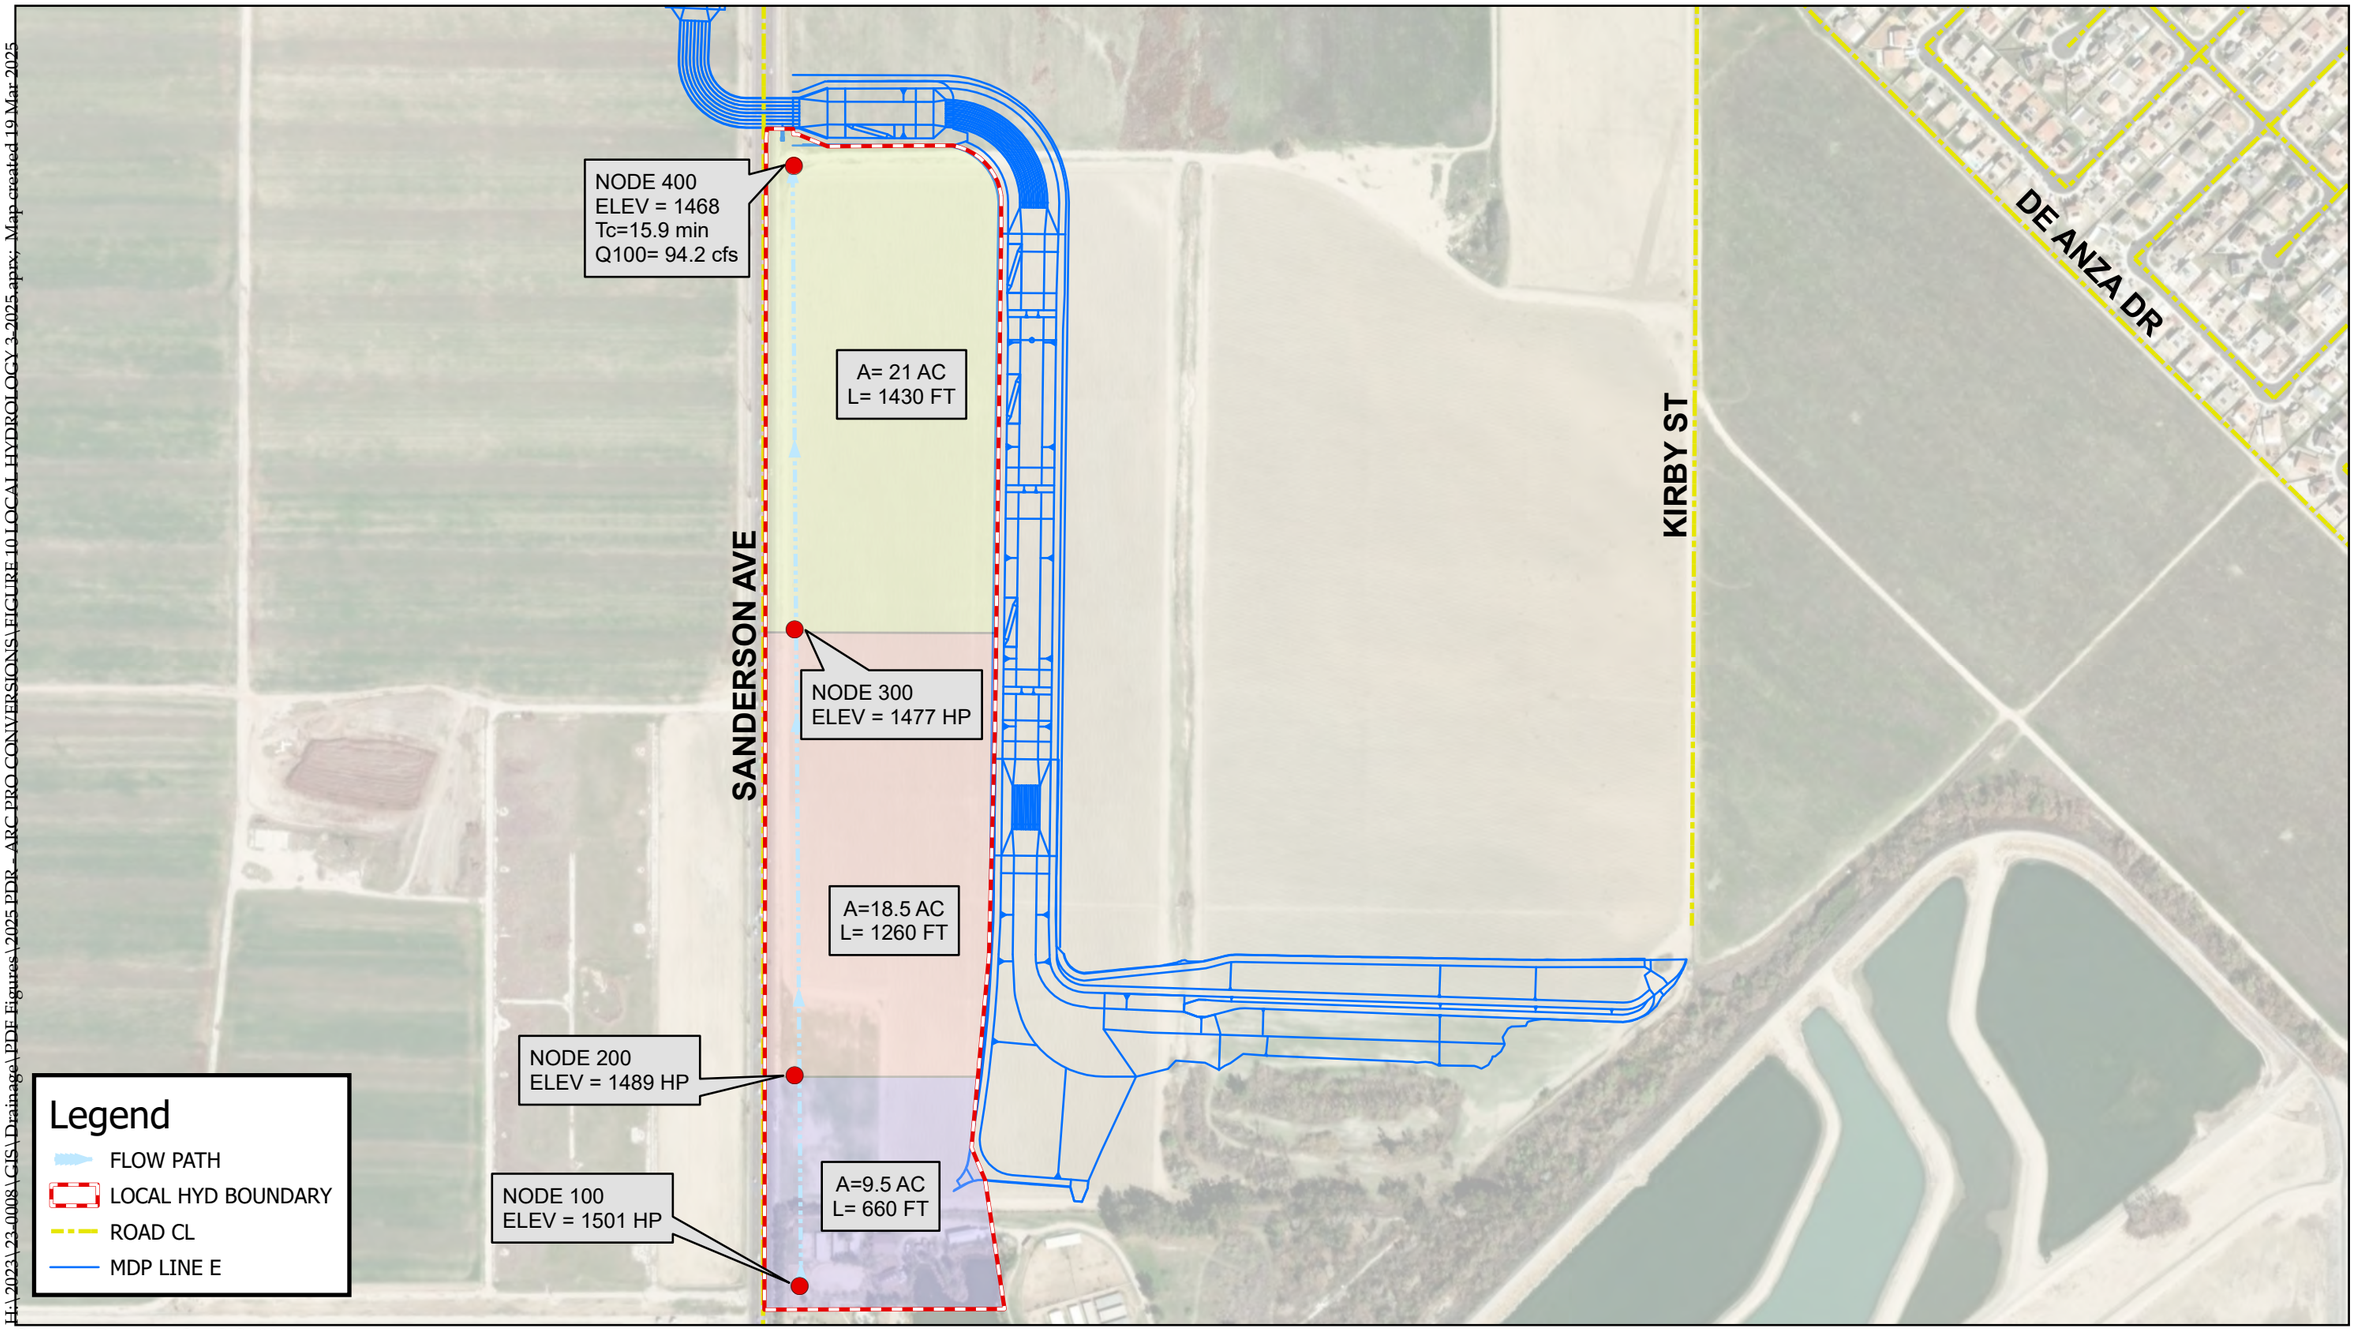
MDP Line Y	Q_{100} = 1,646 cfs
Proposed Channel Segments	
Inlet to Future De Anza St	Q_{100} = 2,970 cfs
Future De Anza St to Future Record Rd	Q_{100} = 3,035 cfs
Future Record Rd to Confluence Basin	Q_{100} = 3,550 cfs
Line Y Confluence	Q_{100} = 3,800 cfs
Confluence Basin to Northerly MWD ROW	Q_{100} = 5,440 cfs

Note: cfs = cubic feet per second; MDP = Master Drainage Plan



(a) "Q_{100}" means the flow rate in a 100-year storm event.

3.2.2 Local Hydrology Analysis at Sanderson Avenue

A roadside ditch conveys stormwater along the east side of Sanderson Avenue as shown in the image below. Because the proposed Line E channel would cross Sanderson Avenue and intersect with the existing ditch, the contribution of flow from this roadside ditch to proposed Line E channel was analyzed as part of this study. Results suggest that 49 acres drain to the roadside ditch, as shown in ***Figure 10***. The hydrology subareas are already accounted for in the overall MDP hydrology. A rate of 95 cfs of runoff was generated and was used to size an inlet and 54" RCP lateral to Line E channel. See **Appendix C** for the rational method model results.

3.2.3 Local Flow Pattern at Casa Loma Barrel No. 1

The local drainage pattern is similar to the flow paths illustrated in ***Figure 11***. During small rain events, a significant amount of runoff sheet flows to either side of Sanderson Avenue and is conveyed northerly. As shown in ***Figure 11***, the local existing drainage pattern flows northeasterly eventually to two existing culverts that cross the MWD Casa Loma Barrel No. 1 right of way. Both culverts are 24-inch corrugated metal pipes that sit atop the MWD Casa Loma Barrel No. 1. During any rain event that generates flooding, these culverts are responsible for draining the area south of MWD Casa Loma Barrel No. 1 and bounded by Sanderson Avenue and the EMWD ponds. In the post-project condition, the existing drainage patterns north of Record Road and east of Sanderson Avenue (i.e., east of Line E) will remain. The Project will replace the existing low-flow (2) 24-inch diameter corrugated metal pipes, with (2) 24-inch diameter reinforced concrete pipes that directly outlet into the downstream concrete channel.

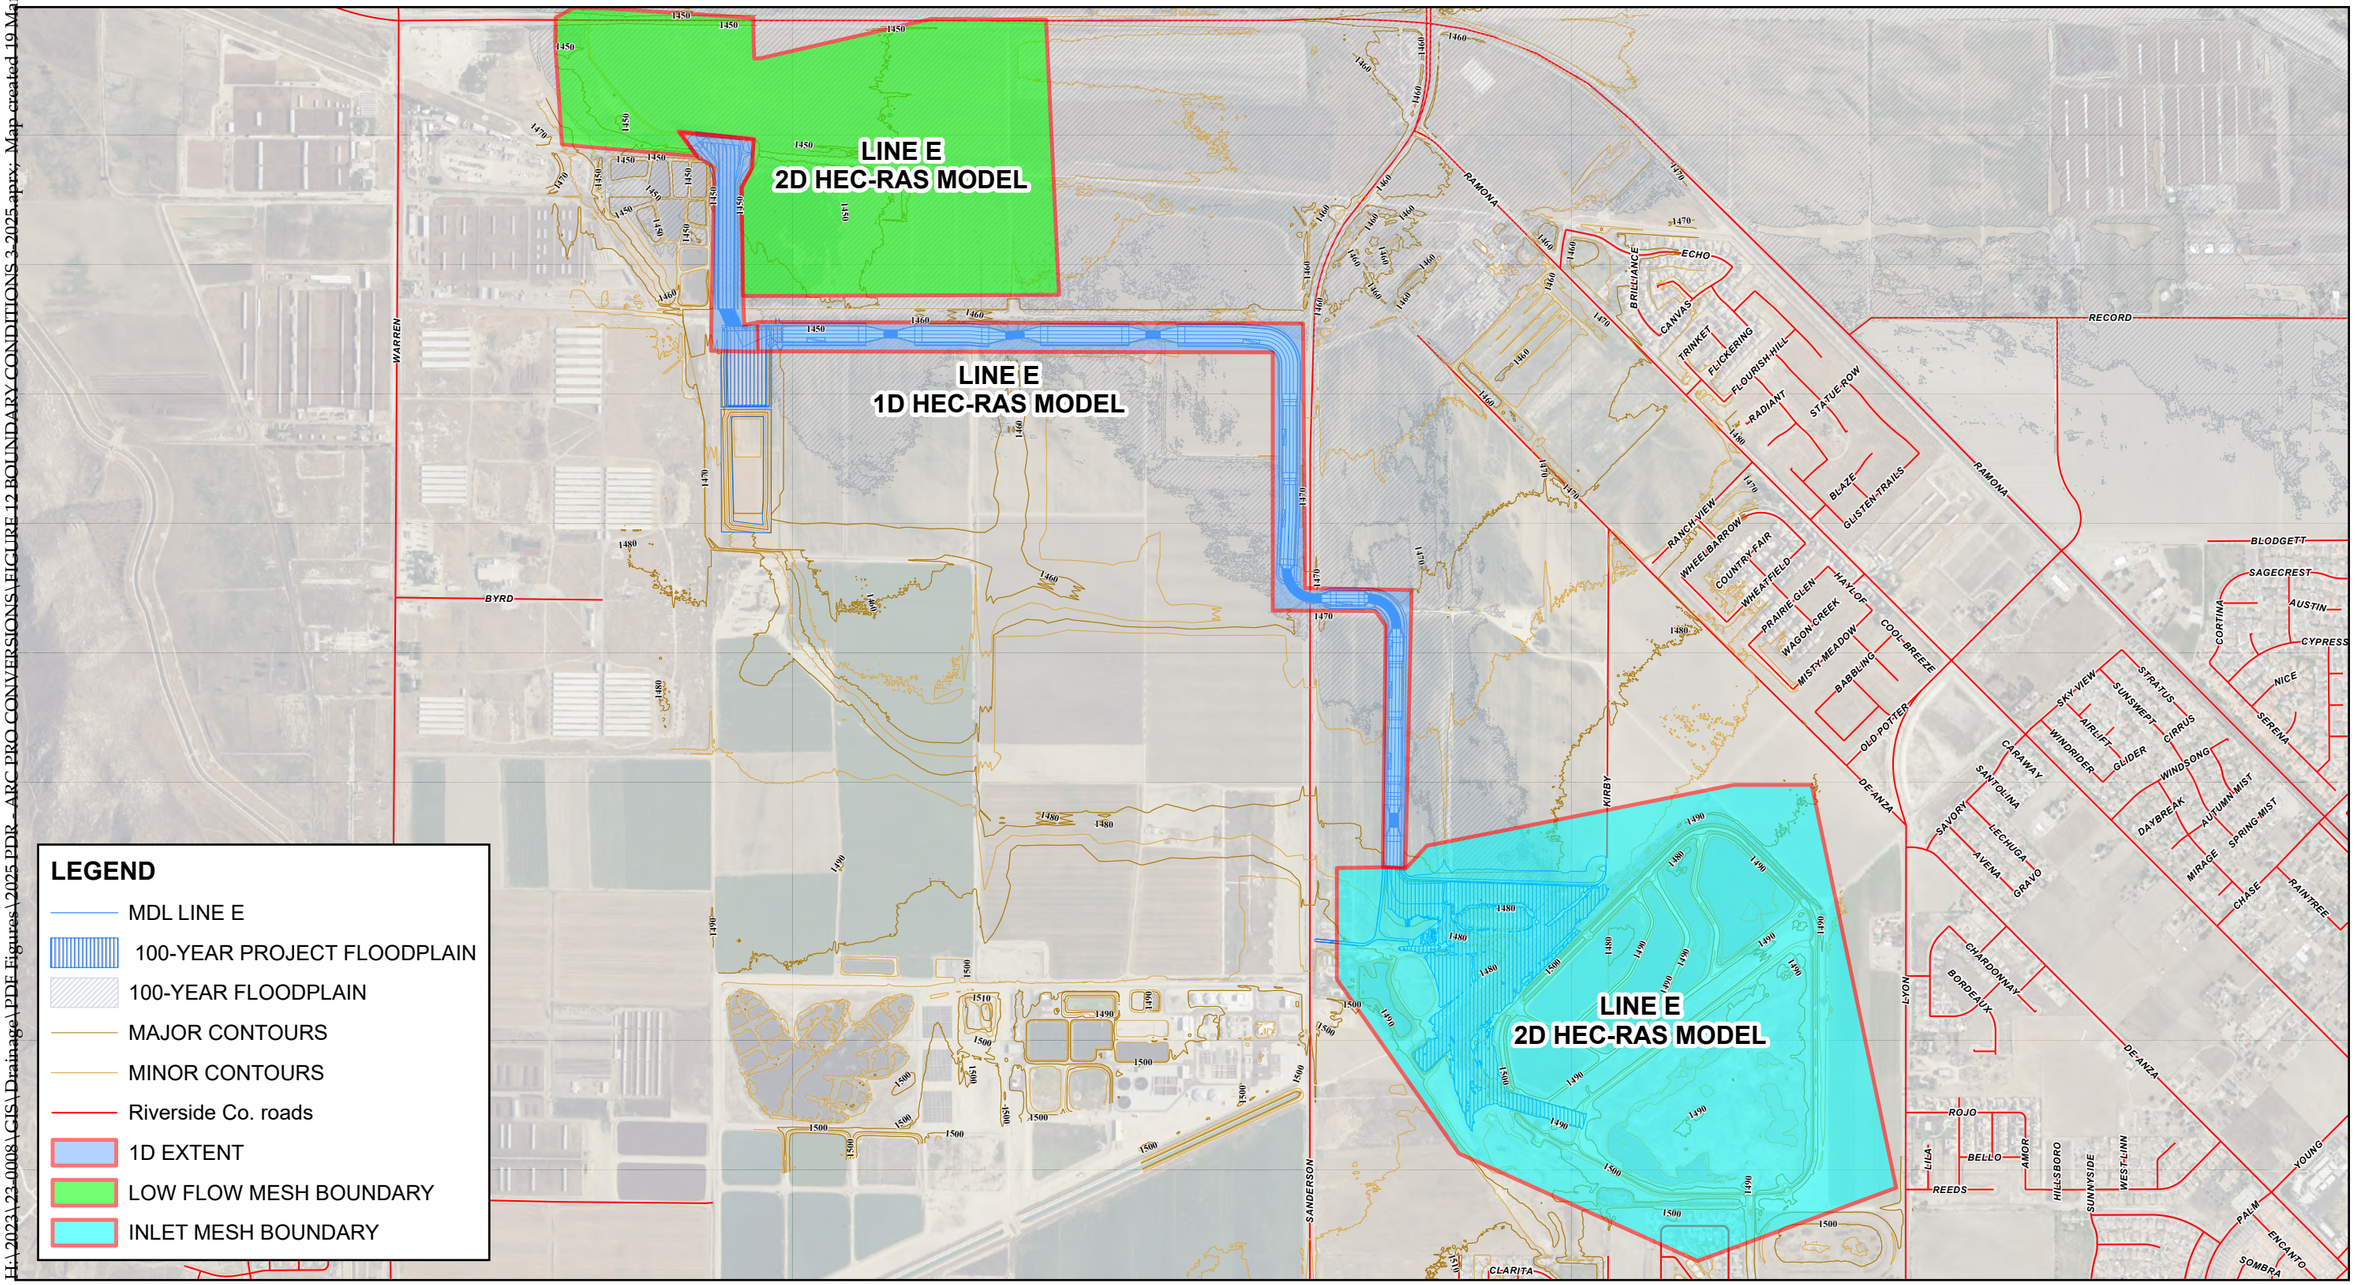
Section 4 Hydraulics

Based upon the design flow rates established in *Section 3* of this report, hydraulic analyses were then conducted to size the proposed updated facilities. One-dimensional (1D) HEC-RAS and WSPG were both used to model the hydraulics of the proposed channel and drop structures. Two-dimensional (2D) HEC-RAS was used to model the hydraulics of the proposed training berms at the upstream end of the project and the low flow channel at the downstream end of the project. Transition length sizing is included in **Appendix D** of this report.

In the existing condition, the San Jacinto Valley MDP is mostly unbuilt, and the Line E piece proposed in this study is upstream and downstream of other planned MDP elements to be constructed by others in the future. Refer to the long-axis plot located in **Appendix A** for the preliminary plan and profile of Line E.



4.1 Model Parameters

4.1.1 Boundary Conditions

This study includes three different HEC-RAS models and a WSPG model, with each model having different boundary conditions. See ***Figure 12*** for a visual of each model's spatial extent. The downstream boundary condition for this study is the 100-Year San Jacinto River floodplain elevation (i.e., 1,452.93 feet amsl) and the starting water surface elevation (WSE) for the Line E earthen channel is dictated by the Confluence Basin (i.e., 1456± feet amsl). Below is the breakdown for each model's boundary conditions. See ***Appendix D*** for HEC-RAS exhibits, modeling parameters, and results.

- WSPG Model
  - Starting water surface elevation is 1452.93 ft for northerly MWD ROW crossing (Casa Loma Barrel No. 1)
  - Starting water surface elevation is 1456.15 ft for Line E earthen channel
- 1D HEC-RAS Line E Channel
  - Starting water surface elevation is 1452.93 ft for MWD ROW crossing (Casa Loma Barrel No. 1)
  - Starting water surface elevation is 1456.10 ft for Line E earthen channel
  - Rating curve at Section 13089.04 used for 2D HEC-RAS boundary condition
    - Flows range from 0 to 2,740 cfs, and resulting WSE is used in Rating Curve
- 2D HEC-RAS Line E Inlet
  - Inflow hydrograph from Node 130
  - Inflow location is located at the spillway, Q_{100} = 2,675 cfs to simplify modeling
  - Rating Curve at Section 13089.04

FIGURE 12 - BOUNDARY CONDITIONS

MDP LINE E

FOR MORE DETAILS ON BOUNDARY CONDITIONS PLEASE SEE HEC-RAS EXHIBITS

ALBERT A. WEBB ASSOCIATES

- Low Flow
    - Several flow profiles, flows range from 0 cfs to 36 cfs to simulate typical operations.

This study includes three different HEC-RAS models, with each model having different boundary conditions. Starting upstream, the existing and proposed 2D HEC-RAS inlet model uses an inflow hydrograph for the MDP Line E. The inflow hydrograph is based on the updated hydrology at Node 130. For the existing condition, the downstream boundary is the normal depth of the existing flowline at the end of the mesh. In the proposed 2D HEC-RAS inlet model, the downstream boundary condition is a rating curve based on the MDP Line E 1D HEC-RAS model, run with different flow rates to establish comprehensive flow and WSE profiles. See ***Appendix D*** for HEC-RAS exhibits and results.

The second HEC-RAS model of Line E channel is a 1D HEC-RAS model within the limits shown in ***Figure 12***. The upstream boundary is a normal depth with a slope of 0.001. At the Confluence Basin, the two segments of MDP Line E meet at a WSE of 1456.10 ft. The downstream boundary condition is the San Jacinto River floodplain with an elevation of 1452.93 ft. See ***Appendix D*** for HEC-RAS exhibits and results.

The third HEC-RAS model for Line E is a low-flow analysis looking at the effects of pumping the 100-year dead storage from the Confluence Basin and the SJCCSP onsite basin of a flowrate of 36 cfs for 72 hours. The analysis also looked at a 5 cfs interval to the 100-year max of 36 cfs. The interval flow rates are intended to show how lower storm events will impact the downstream. North of the MWD right of way is an existing open channel that will be concreted (in the proposed condition) when parallel to the MWD right of way. This existing channel alignment is where the future MDP Line Z is slated to be constructed. This existing channel conveys low flows northerly to an existing 60-inch culvert at Ramona Expressway. It should be noted that the limiting facility is the existing 60-inch RCP that crosses Ramona Expressway, due to the culvert being nearly flat (slope). Webb surveyed the city-maintained 60-inch culvert and surrounding area to model the downstream correctly. See ***Appendix D*** for HEC-RAS exhibits and results.

4.1.2 Model Domain and 2D Grid

The model domains for the existing and proposed inlets have the same domain and inflow location, as shown in ***Table 3***. The range of adaptive 2D grid sizes and the total number of cells are also provided. Please refer to the existing and proposed work maps in **Appendix D**.

Table 3– Model Domains

	Adaptive 2D Face Area	Mesh Properties	
	avg-min-max [ft^2]	Dx-Dy	cells
EXISTING INLET	97 - 2 - 186	10 -10	147,655
PROPOSED INLET	97 - 2 - 186	10 - 10	147,554
LOW FLOW	219 – 19 - 396	15 - 15	40,352

4.1.3 Topology

The existing condition topology is based on two different areal topographic maps. See **Appendix D** for signed areal topographic maps used in the HEC-RAS modeling and used in design. The topology has a vertical accuracy of 1-foot. For critical design elements such as the Casa Loma Barrel No. 1, surveyors have completed field surveys to verify the elevations used for design.

4.1.4 Manning's "n" Value

The Manning's roughness coefficient ("n") is used to calculate flow in open channels. Higher "n" values represent rougher conduits with higher friction. The Manning's "n" values used in this study are summarized in ***Table 4***.

Table 4 – Roughness Coefficients Used in this Study

Manning's Roughness Coefficient, "n"	Roughness Description
n = 0.013	Reinforced concrete pipe (RCP)
n = 0.014	Reinforced concrete boxes (RCBs)
n = 0.020	Bare earth channel with no vegetation
n = 0.030	Minimum vegetation density within channel
n = 0.043	One-quarter ton riprap (Class V)
n = 0.044	Three-eighths ton riprap (Class VI)
n = 0.046	One ton riprap (Class VIII)
n = 0.015 to 0.032	Low flow channel assuming no maintenance and moderate to very heavy vegetation at the inlet (2D HEC-RAS models)

Source: RCFC&WCD, May 2023 *Draft Hydraulic Manual.*

4.1.5 Model Time Step

The modeling of the inlet of Line E used an adaptive step with a computational interval of 5 seconds, and in this case, the Courant Methodology was utilized. A computational interval of 1 second was used for the Low Flow outlet scenario so this model does not utilize the Courant Methodology. ***Table 5*** below outlines the time steps each 2D HEC-RAS model utilized. It should be noted that this is not relevant to 1D HEC-RAS and WSPG models.

Table 5 – Model Time Steps

Model	Computational Interval [sec]	Adaptive Time Step [sec]		Time Steps		
		Max	Min	Min Doubling	Max Doubling	Max Halving
EXISTING INLET[(a)]	-	4	1	1	2 (20 sec)	5 (0.16 sec)
PROPOSED INLET[(a)]	-	4	1	1	2 (20 sec)	5 (0.16 sec)
LOW FLOW	1	-	-	-	-	-

Notes:
(a) Courant Methodology

4.1.6 Model Error

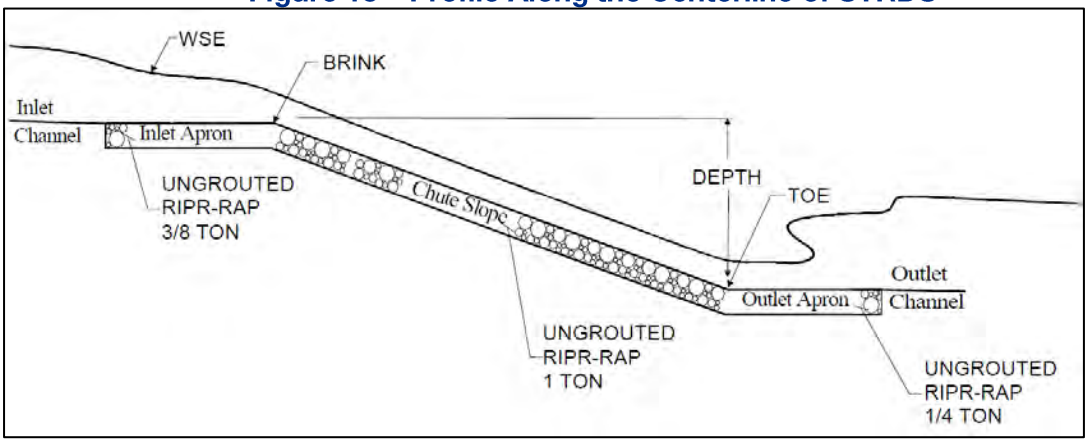
The percent error for the 2D HEC-RAS model is shown below in ***Table 6***. The percent error is calculated on the model's stability and ability to converge to an answer. The modeling error is reasonable and due to the topography, some volume will remain within the model domain.

Table 6– 2D HEC-RAS Model Error

Model	Percent Error	Mass Balance [acre-ft]	
		In	Out
EXISTING INLET	.000745	946.6	921.8
PROPOSED INLET	.00239	946.6	929.3
LOW FLOW[(a)]	.0001 to .0012	27.7 to 152.2	25.3 to 148.3

[(a)]The Low Flow model consists of several pumping regimes

4.2 Modeled Project Design Features



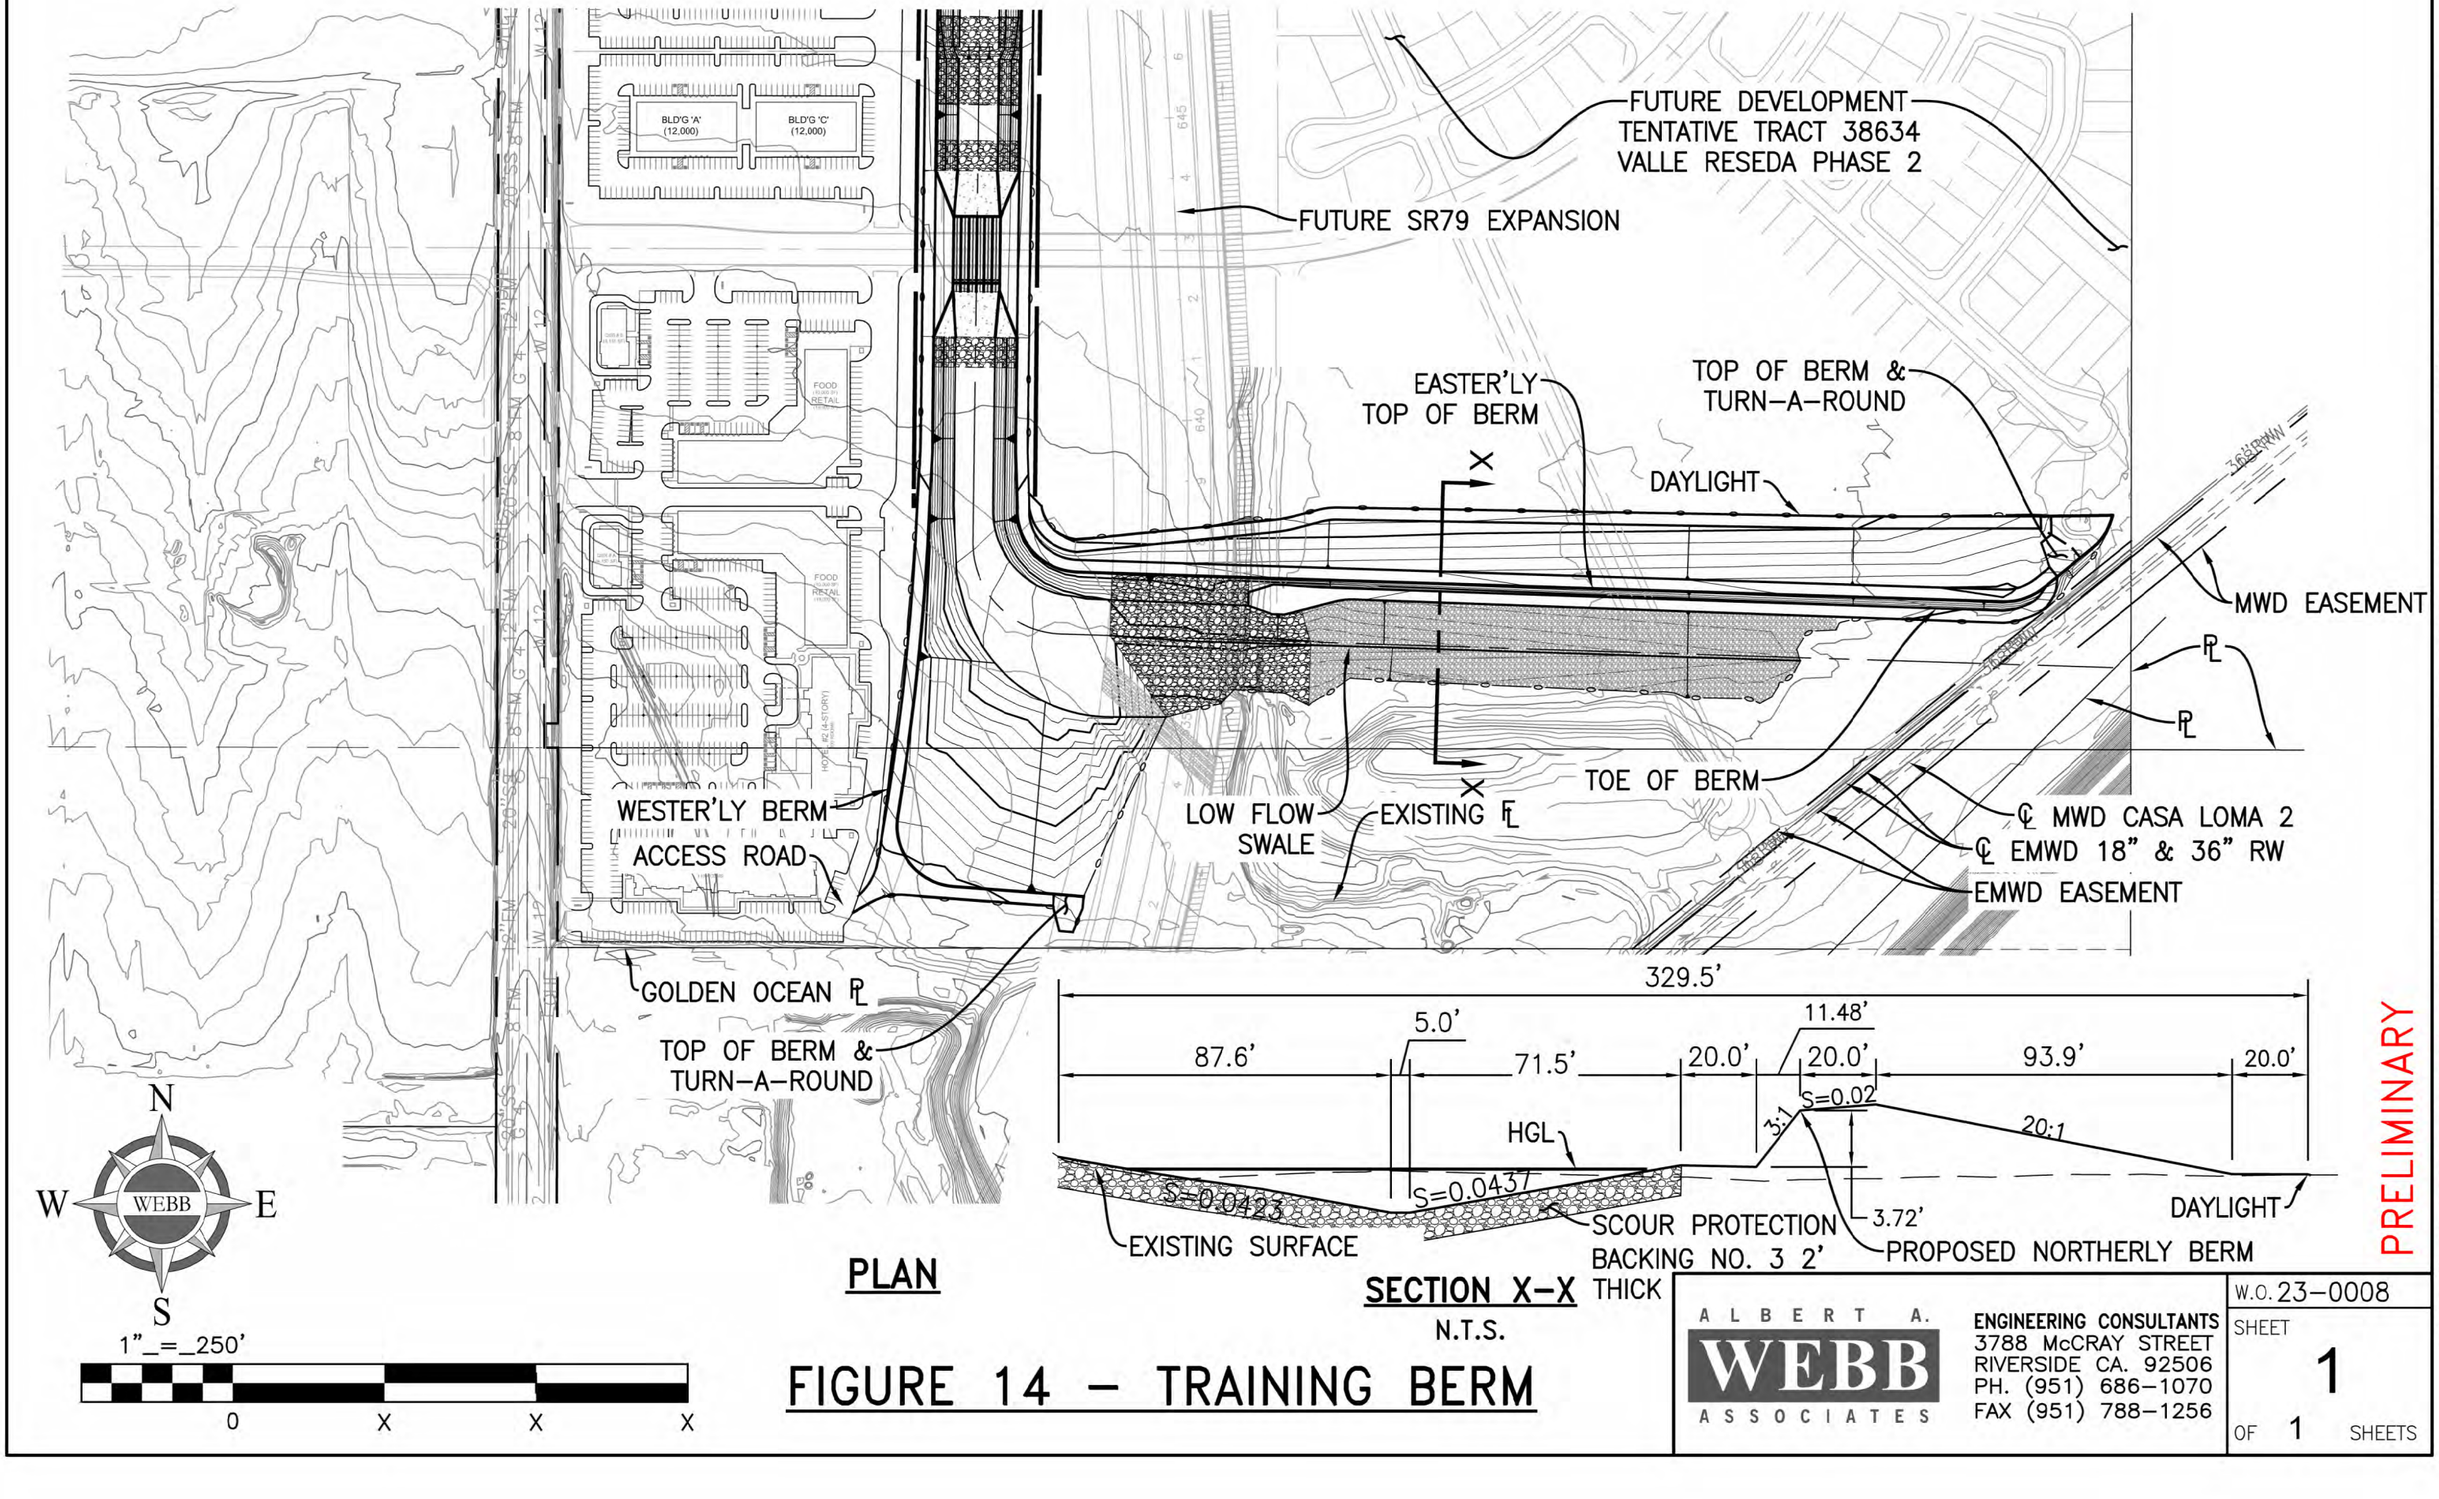
4.2.1 Freeboard

The draft RCFC&WCD Hydraulic Design Manual states that a subcritical channel needs a minimum of 1-foot of freeboard for a subcritical earthen channel. The Froude numbers within the proposed earthen channel sections range from 0.26 to 0.77. At the brink of the drop structures (see ***Figure 13***), the Froude number is 1. At the end of the outlet apron of each drop structure, the Froude number is less than 0.5. In the concrete portion of Line E, the typical Froude number is around 1. The training berms are intended to be conservatively designed with 2-feet of freeboard.

4.2.2 Drop Structures

The original MDP assumed the use of Turf Reinforcement Mat (TRM) for lining the Line E channel as protection against velocity-induced scour. However, RCFC&WCD has since excluded the use of TRM in MDP facilities. Therefore, the design of Line E will instead use Sloped Trapezoidal Rock Drop Structures (STRDS) to reduce channel velocities within the proposed earthen Line E channel.

Figure 13 – Profile Along the Centerline of STRDS



A total of five STRDS are proposed for Line E (**Figure 13**). The upstream and downstream rock-lined channel lengths establish the normal depth (aka steady flow). The downstream length also considers the hydraulic jump length and to be conservative, this study applied a 1.5 safety factor to the apron length.

HEC-RAS was then used to size the STRDS riprap and the sizes of the upstream and downstream ungrouted riprap aprons. The HEC-RAS results are discussed in *Section 4.3*. All riprap in this study is assumed to be ungrouted. Manning's "n" values for the riprap sizes are shown in ***Table 4***. The 3/8-ton riprap will be used in the upstream section of the STRDS, which induces normal depth velocity for the approach. Then, flows drop down inducing critical depth. One-ton riprap is used on the slope where the fastest velocity occurs, and at the end of the grade break, one-quarter ton riprap is used for a slower velocity and returns to normal depth at the end of the downstream apron.

4.2.3 Training Berms

Training berms are proposed to direct flows from the San Jacinto Reservoir Spillway and the sheet flows from the south/southwest into the proposed Line E channel. The Project will have no direct connection to the San Jacinto Reservoir Spillway. The placement of the training berms allows avoidance of MWD Casa Loma Barrel No. 2 easement and EMWD pipeline easement which are located at the end of the easterly training berm (***Figure 14***). Based on the coordination with the City of San Jacinto, the training berm is not considered a levee because the WSE is within 1± foot of the dry side of the Training Berm. In addition, the City of San Jacinto approved a technical memorandum on the hydraulics of MDP Line E Inlet, see **Appendix F**.

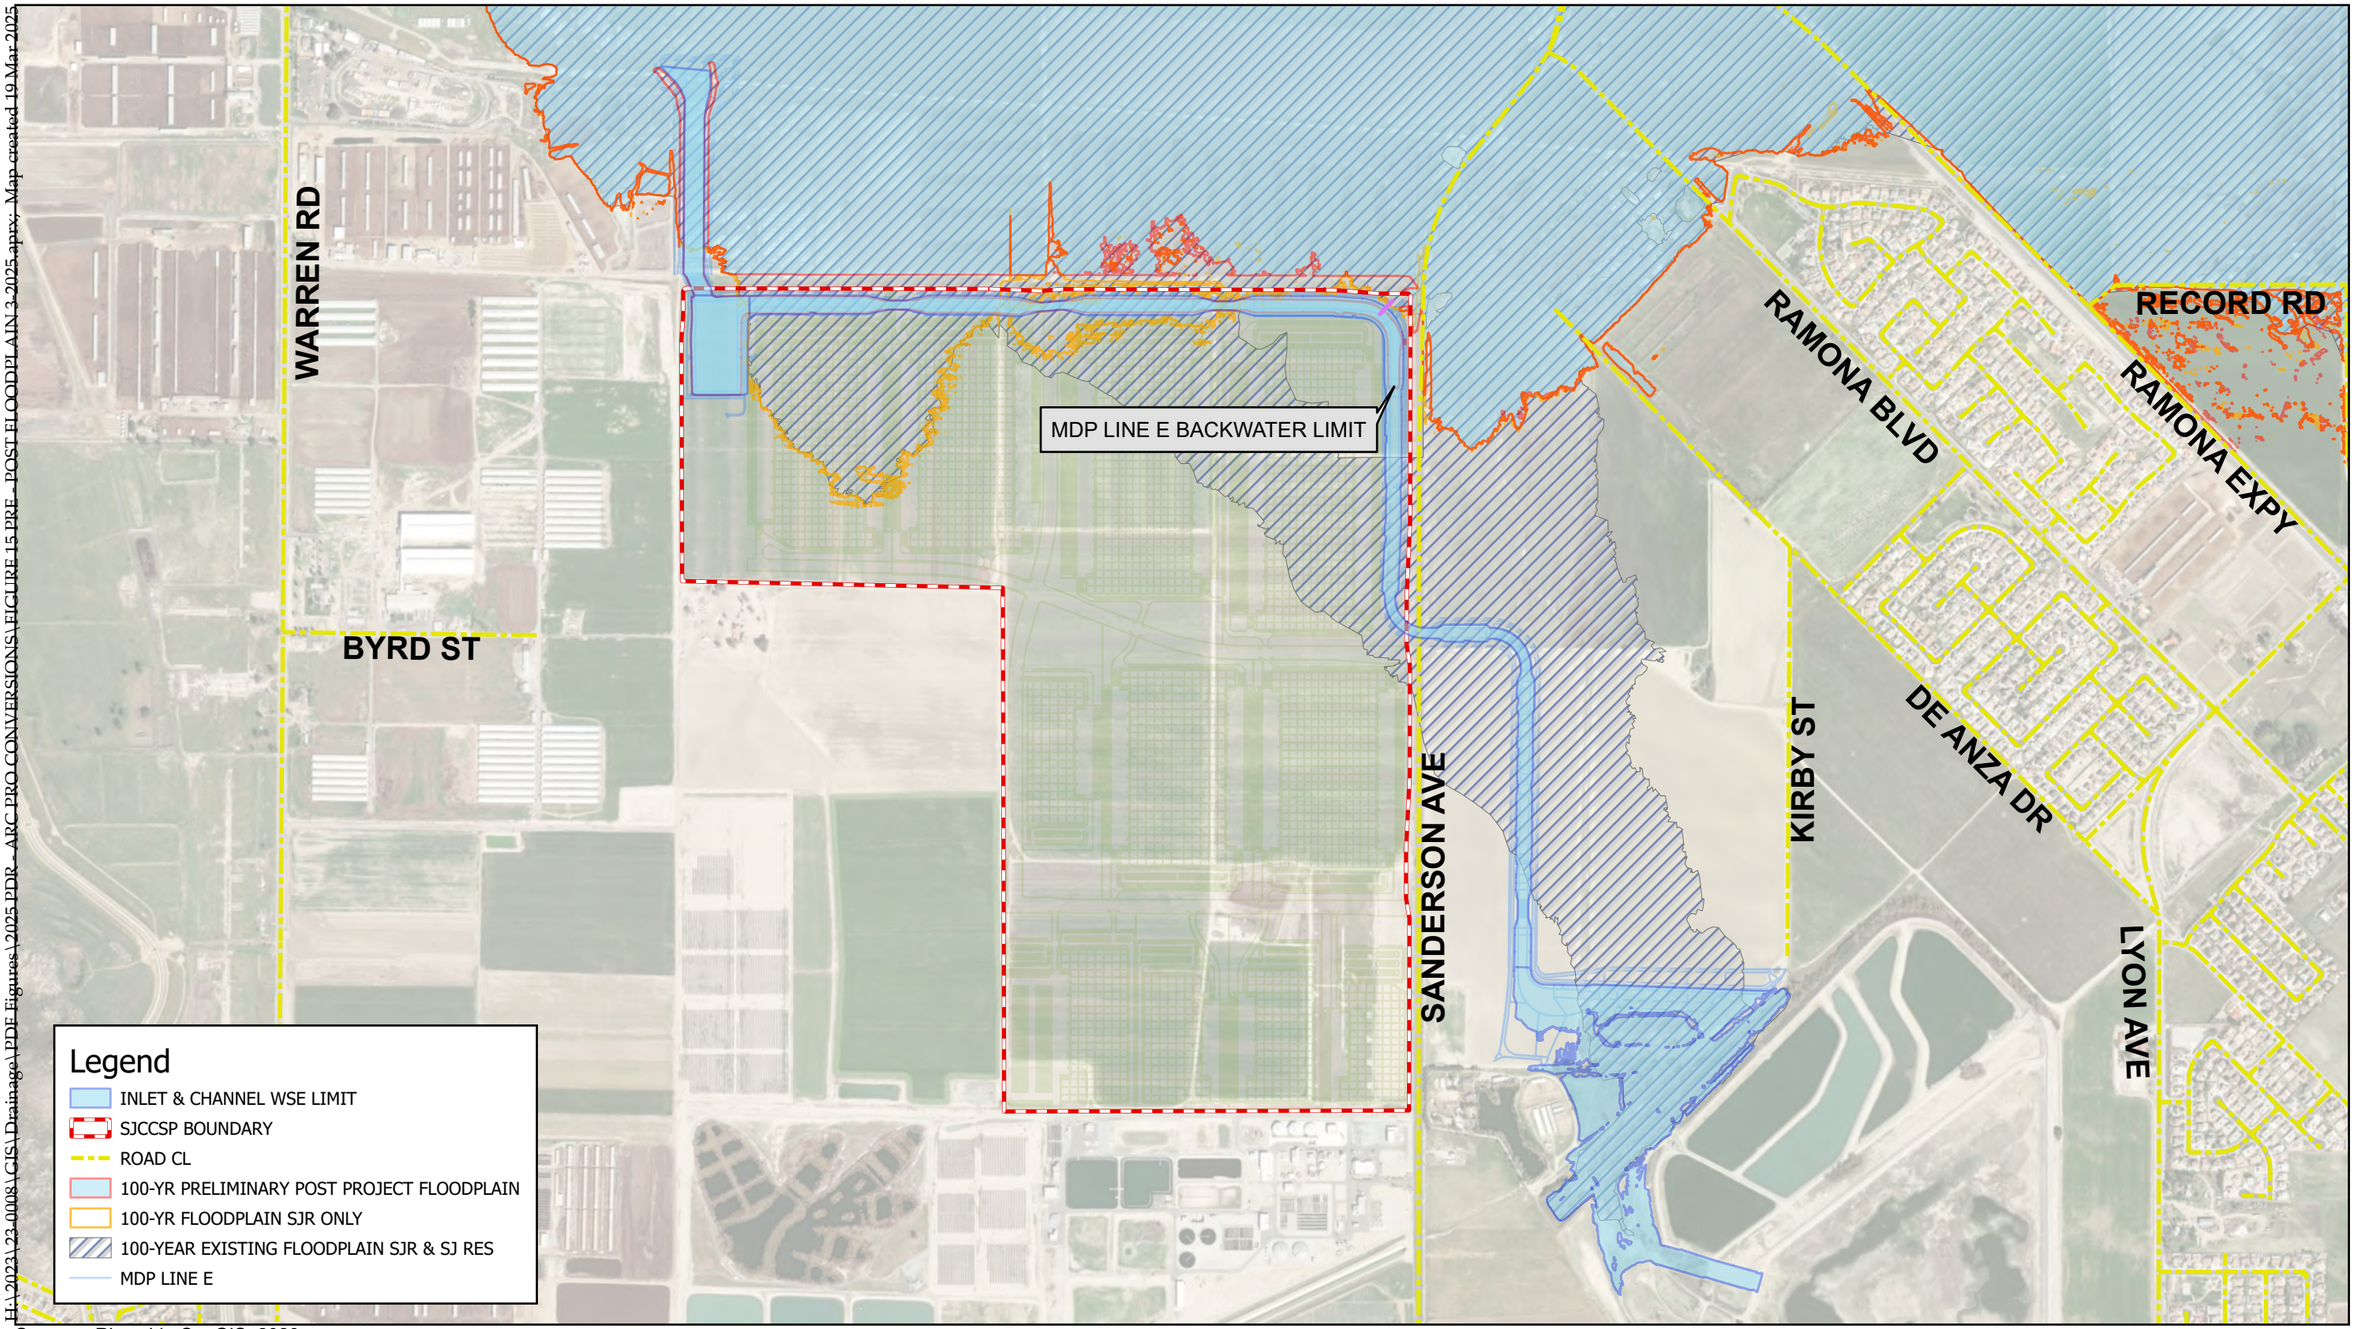
2D HEC-RAS modeling is used to demonstrate that pre- and post-project velocities will be essentially equal over the EMWD and MWD easements and the existing cover over the EMWD and MWD pipes will not be scoured. The pre-project (existing condition) water surface elevations and velocities are shown in **Appendix D** 2D HEC-RAS Inlet Existing Model and proposed post-project water surface elevations and velocities are shown in **Appendix D** 2D HEC-RAS Inlet Proposed Model. Modeling results indicate slow velocities and shallow depths in the 100-Year event scenario. However, where velocities exceed 6 fps, the slope of the training berm will be armored with riprap or a cutoff wall to protect against scour – the specifics of which will be determined in the final design. Modeling results of the 2D HEC-RAS analysis are in **Appendix D**. The 100-Year floodplain limits within the Line E footprint are shown in ***Figure 15***.

The placement of the training berms was chosen to avoid disturbing the riparian habitat that is in the area below the spillway. Indeed, the training berms are placed an additional 50 to 100 feet from the riparian habitat to account for temporary construction impacts that might occur from building the berms.



4.2.4 Scour Potential

HEC-RAS was used to model flows in the following three scenarios:

- To assess the highest scour potential conditions, such as in a freshly excavated bare earth unvegetated channel, an “n” value of 0.02 was used. All of the proposed scour mitigation measures will be designed using n = 0.02.
- To assess the post-project condition with a vegetated channel of minimal vegetation density, an “n” value of 0.03 was used, and n = 0.04 was used to represent flows in a vegetated channel with maximum vegetation density. It should be noted that a “n” value of 0.03 was used to plot the HGL on the long plot in **Appendix A**.

4.2.5 Onsite Basin, Confluence Basin, and Pump Station

The SJCCSP proposes an “Onsite Basin” to capture onsite stormwater and nuisance flows, which works with the proposed MDP Confluence Basin and both basins will be pumped out by a proposed pump station to be located on the SJCCSP property, which will discharge flows into a downstream segment of Line E (***Figure 16***).

H:\2023\23-0008\GIS\Drainage\PDF Figures\2025 PDR - ARC PRO CONVERSIONS\FIGURE 15 PRE - POST FLOODPLAIN 3-2025.aprx; Map created 19 Mar 2025

0 500 1,000 1,500 Feet

FIGURE 15 - EXISTING FLOODPLAIN & PRELIMINARY POST PROJECT FLOODPLAIN

MDP LINE E

ALBERT A. WEBB ASSOCIATES

Onsite Basin

The Onsite Basin that is proposed for the SJCCSP property is designed to mitigate the effects of hydromodification that the SJCCSP project poses to areas downstream. Flows will be released from the Onsite Basin via pumps, at a rate no greater than 110% of the pre-development runoff condition's 2-year, 24-hour peak flow rate. Per the city water quality requirements the Onsite Basin dimensions and capacity are not set by this requirement, but rather they were set as a result of the storm drain invert elevations running from the southernmost portion of the SJCCSP site. Under the spillway elevation, the Onsite Basin can hold roughly 145 acre-feet (47.3 million gallons). A 20-foot-wide maintenance access road is provided along the top perimeter of the entire basin. Please refer to the SJCCSP Hydrology and Hydraulics Report prepared by WEBB for details on the onsite storm drain system.

MDP Confluence Basin

The MDP includes a Confluence Basin at the downstream end of the earthen portion of Line E. The basin is earthen with 4:1 side slopes. The RCB outlet of the of Confluence Basin is 4.4± feet higher than the bottom of the basin (1446.50-feet amsl basin bottom). The Confluence Basin has 57± acre-feet capacity over an area of 6.25 acres, with 72-hour drawdown. To pump out the dead storage, the basin parcel includes a pump station. When entitlement is completed for the SJCCSP, the proposed Confluence Basin will be dedicated as its own parcel within the SJCCSP, the parcel will be owned by the City of San Jacinto. The pump station will be located on the Confluence Basin parcel.

Pump Station

A pump station is proposed on the SJCCSP property that will house pumps to drain both the Onsite Basin and the Confluence Basin back into Line E downstream of the basins (***Figure 16***). ***Table 7*** summarizes the pumps that would be required to pump the dead storage volumes from both basins. The primary design criterion for the pumps is to draw down both basins within 72 hours. The total pump station combined flow rate is 36 cfs that will outlet into the RCB's crossing Record Rd. Pump station details will be provided in the final design. The conceptual cost of the pump station is approximately $9.1 million.

Downstream Perched Channel & Levee Concern

The concrete downstream of Line E from the confluence basin to the northerly MWD right of way is a perched channel. During a review of the PDR RCFC&WCD noted that the City will need to make the determination if this portion of Line E is a leveed channel. The City made the determination in an email dated 11-27-24 where the city determined the channel is not leveed. A copy of the email will be included in **Appendix F**.

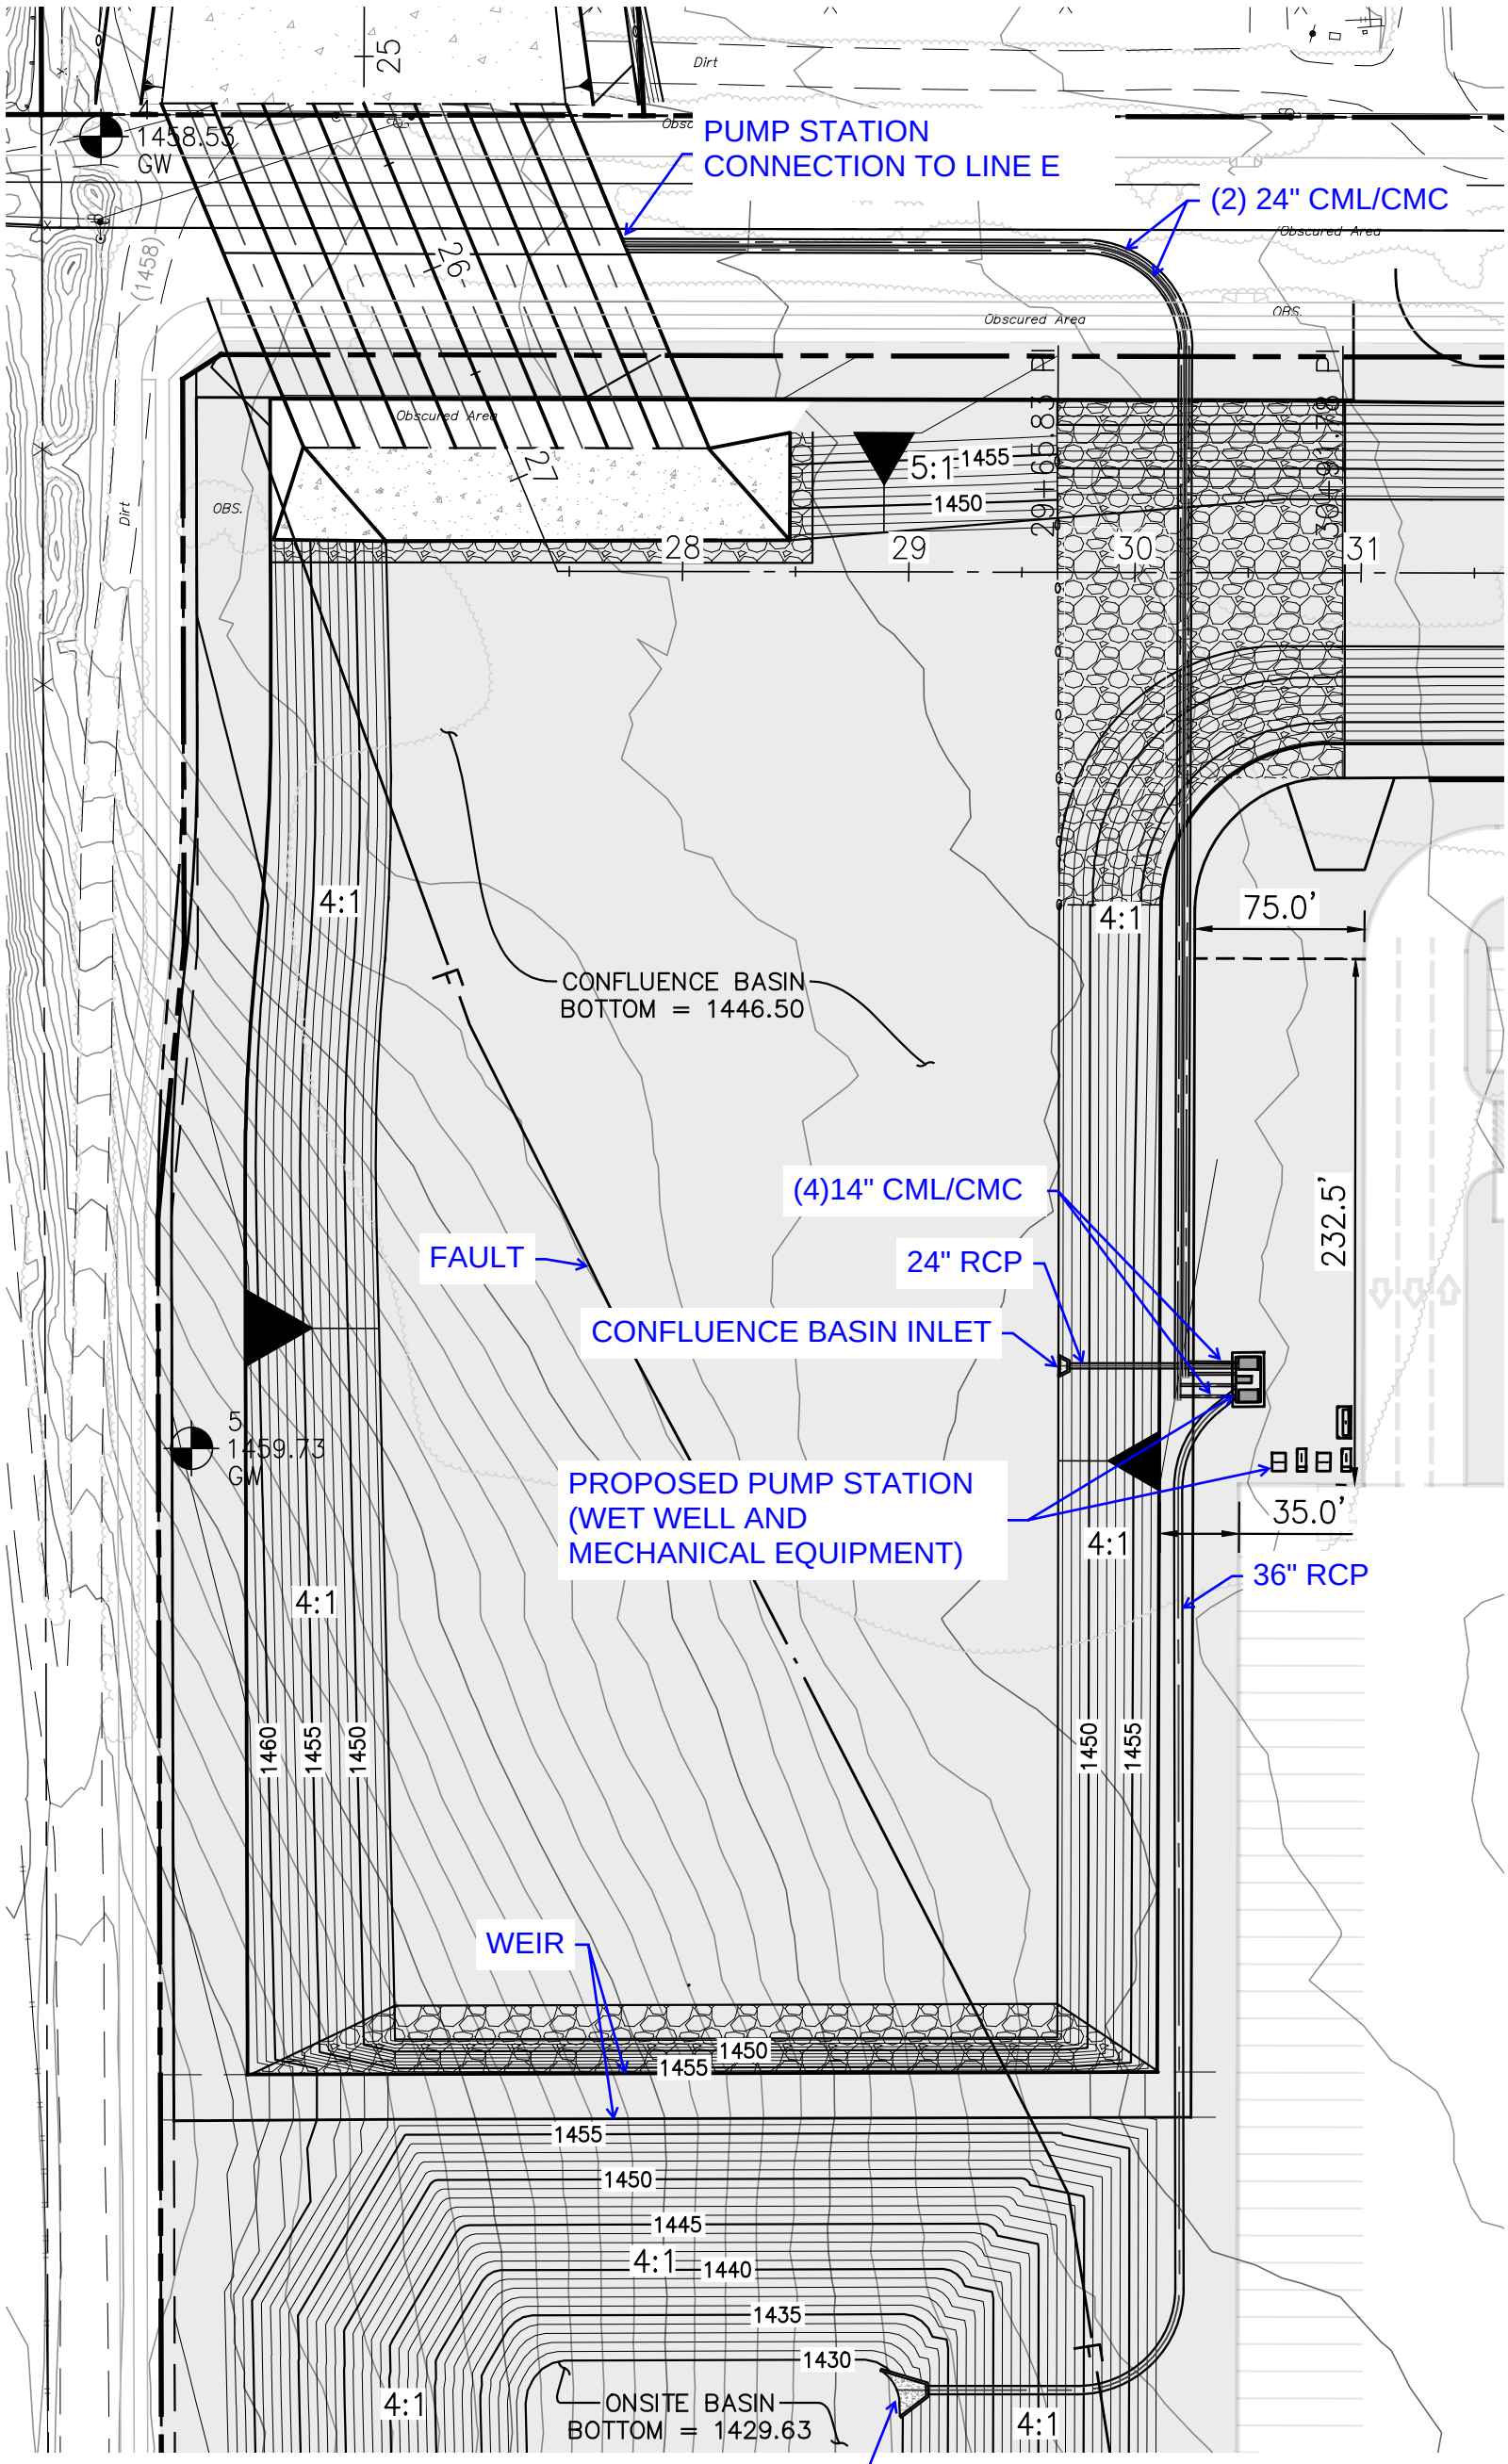

Table 7 -Basin's & Pump Station Details

Confluence Basin

4.3 Hydraulic Model Results

The results of the hydraulic modeling suggest that post-project flow conditions approximate existing pre-project flow conditions through the MWD and EMWD rights-of-way near the San Jacinto Reservoir Spillway.

In addition, model results suggest the proposed Line E channel has sufficient capacity when an "n" value of 0.04 is applied (i.e., maximum vegetation density) while also sufficiently designed for no scour occurring at the "n" value of 0.03 (i.e., minimum vegetation density).

The velocity profiles along Line E depend on the modeling method used. Both WSPG and HEC-RAS produce similar results for slow and steady flow (see **Appendix A**, Long Plot, Sheets 2 & 3). However, as the flow transitions to unsteady conditions, the models begin to diverge.

This divergence is particularly evident at the STRDS drop structures, where WSPG struggles to accurately compute energy dissipation. WSPG predicts a high-energy hydraulic jump (as shown on Sheet 5 of the Long Plot), while HEC-RAS models a submerged hydraulic jump. The submerged jump is expected due to the downstream water surface elevation being higher than the upstream brink elevation.

Additionally, the Long Plot shows that approach velocities calculated by WSPG are approximately ±2 fps higher than those from HEC-RAS. This suggests that the approach apron in WSPG simulations would, in some cases, experience increased velocities.

Furthermore, the proposed drop structures (STRDS) reduce the 100-Year maximum channel velocities effectively. Model results show the same hydraulics occur downstream of and upstream of each drop structure. Because the net change in flow rates from the upstream and downstream areas of each drop structure is zero, scour is mitigated, and capacity maintained in the proposed channel. The design target velocity is 4 fps for the unvegetated channel and 4 to 6 fps for the vegetated channel. The proposed design has either concrete or ungrouted riprap armor in all locations where velocities are more than 6 fps. Indeed, the modeled velocities for the segment of the proposed Line E channel within the SJCCSP are 6 fps and less, (at the approach of one drop structure the approach velocity reaches 7 fps). Where velocities exceed 4 fps and are below 6 fps, hydroseed will be used for erosion control (refer to **Appendix E** for hydroseed mix provided by RFC&WCD).

Likewise, the low flow model results for pumping out the Confluence Basin and Onsite Basin suggest the downstream (offsite) system is not impacted during pumping out of the dead storage. Based on the model results, the (off-site) low flow channel has a capacity of 75 cfs before spilling over. However, the city-maintained 60" RCP culvert crossing Ramona Expressway, is undersized. Webb surveyed the existing culvert to include the actual culvert slope and length for the Low Flow Analysis, see **Appendix D** for result exhibits.

On the other hand, where the concrete-lined portion of Line E outlets to the existing downstream/offsite low flow channel to the north of the Project, as shown in ***Figure 11***, the velocity increases to more than existing. In addition, if the San Jacinto Reservoir overflows, but the San Jacinto River is not overflowing and flooding the area, the functionality of the 60-inch diameter RCP culvert under Ramona Expressway that drains the low flow channel to which the Project drains, is absolutely critical to successful drainage of the study area. However, that capacity is limited and by the time the peak flow from Line E arrives to the culvert at Ramona Expressway, the area will already be inundated. Detailed analysis of offsite downstream properties is not included in this study.

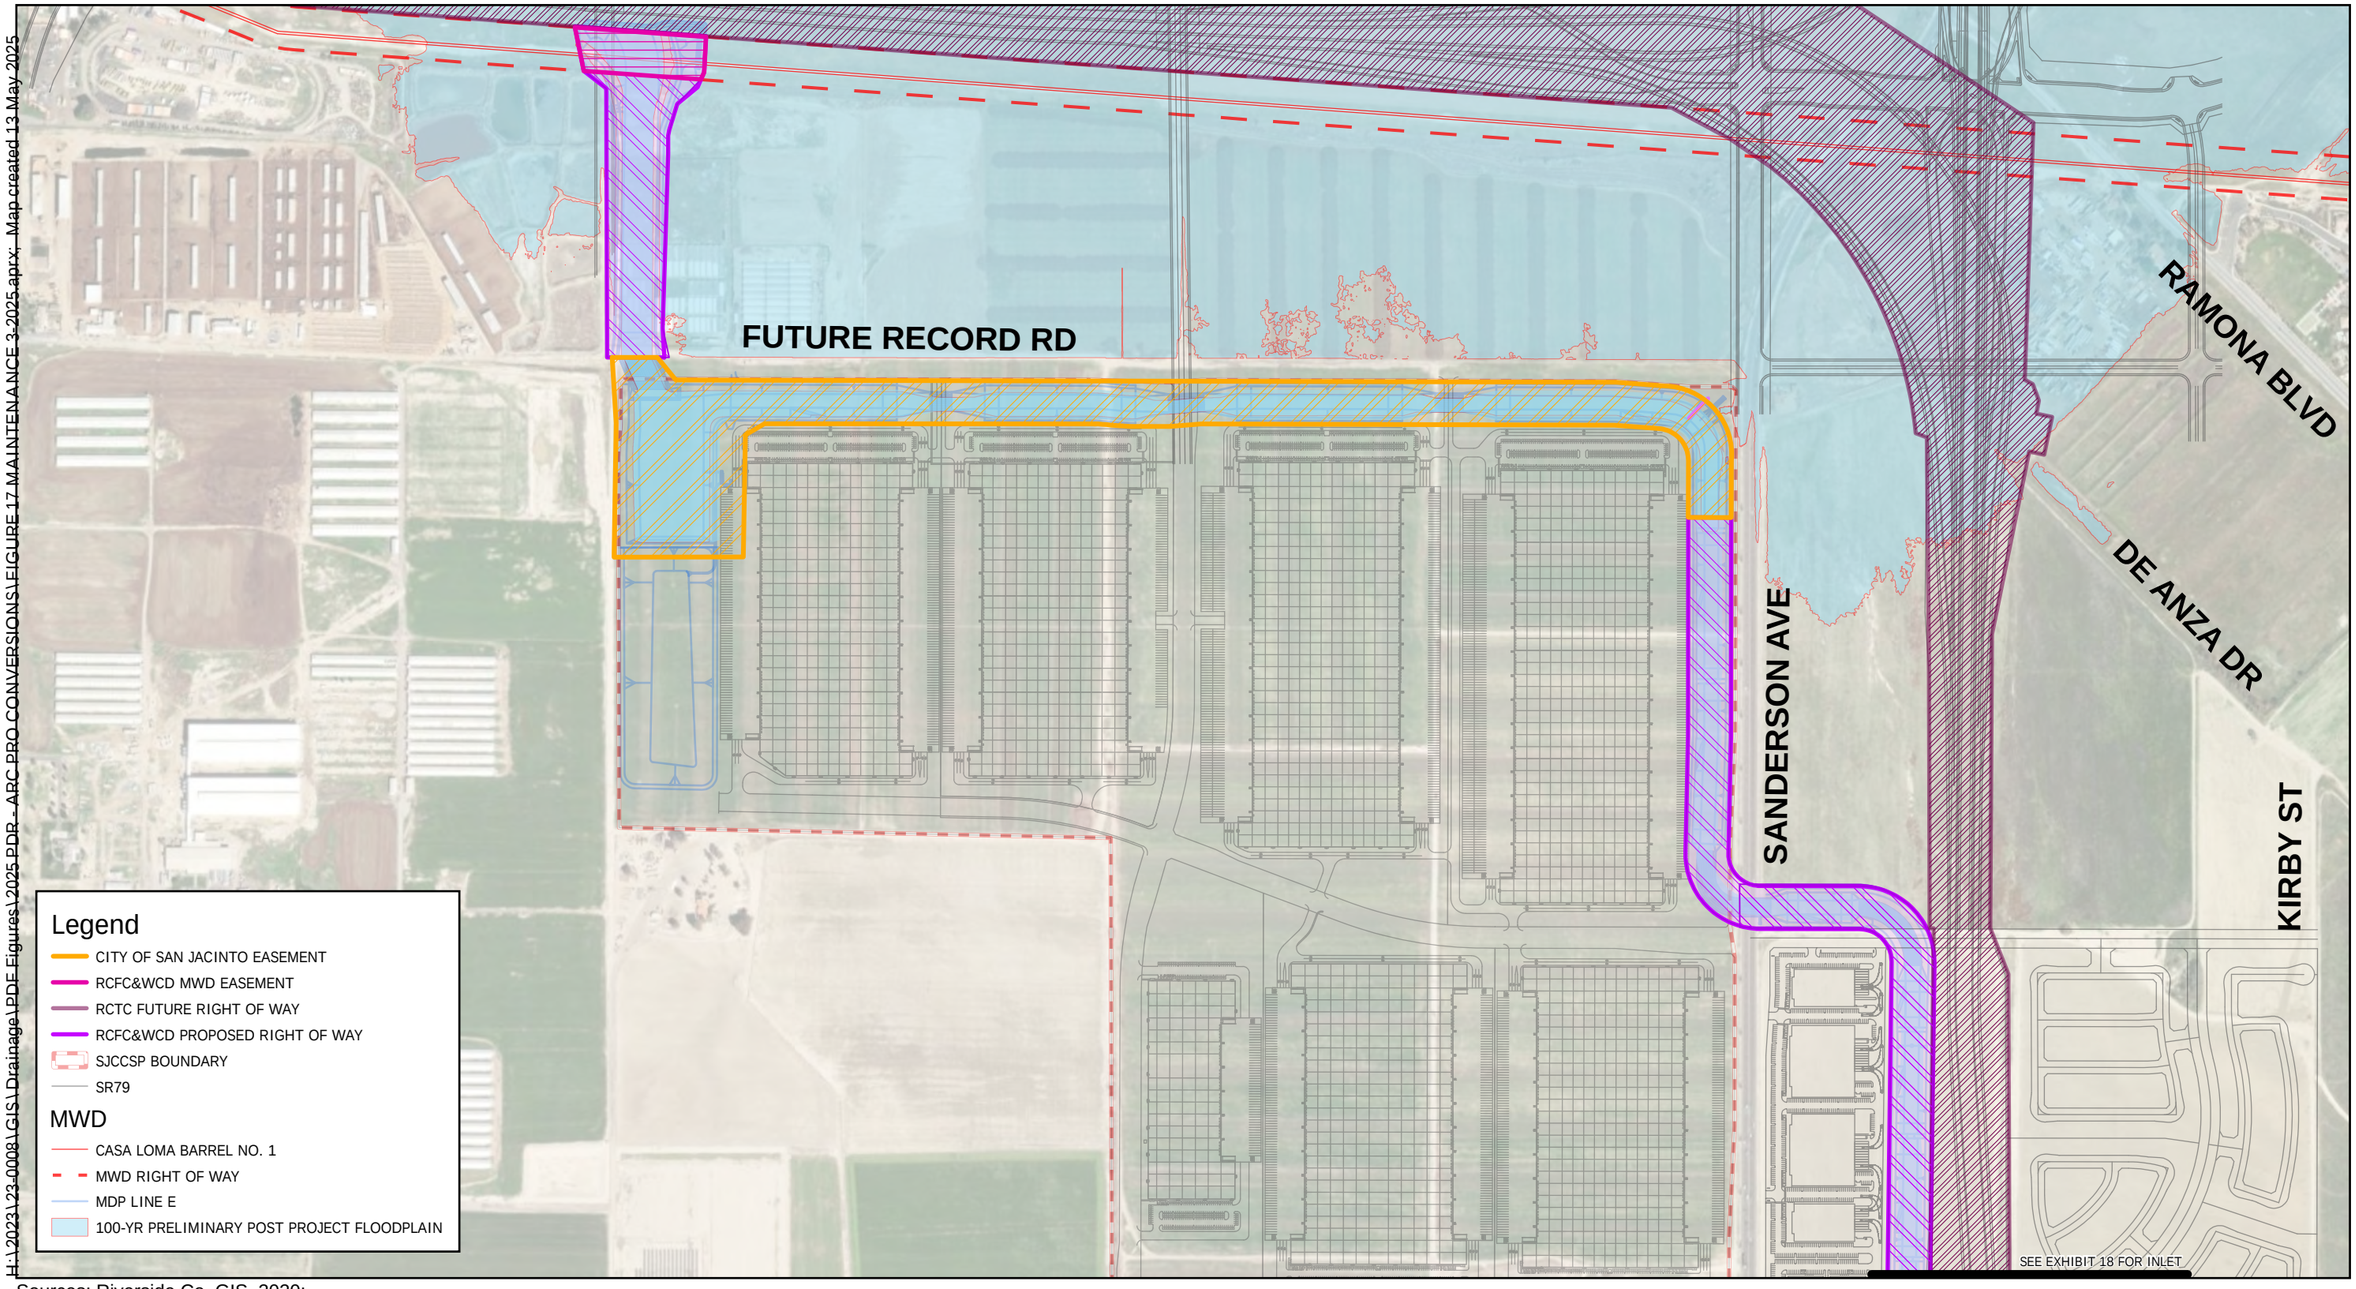
Section 5 Right of Way & Maintenance

Maintenance obligations are currently expected to be assigned as follows, overall maintenance and easement areas are defined in ***Figure 17*** MDP Line E Lower Reach (outlet) and ***Figure 18*** MDP Line E Upper Reach (Inlet):

- Riverside County Flood Control & Water Conservation District

  Project Components

  RCFC&WCD would maintain Training Berms & inlet line and grade via a drainage easement and slope easement, Line E channel (with 20-foot access roads) and owned right of way (includes Line E downstream of confluence basin to MWD right of way and starting from station 80+95 per the Long Plot in **Appendix A** (from station 80+95 to 82+25 access road transitions from a 15' to 20'), RCBs, and drop structures within Right of Way, Line E and over the Casa Loma Barrel No. 1 & MWD right-of-way via a maintenance easement, geotechnical and structural measures to protect Casa Loma Barrel No 1.



- City of San Jacinto

  Project Components

  City of San Jacinto would maintain the Line E channel segment (with 15-foot access roads) within the SJCCSP boundary via a drainage easement, onsite water quality basin, Confluence Basin, and Pump Station. The city-maintained segment of Line E ends at the downstream end of the first drop structure, which is station 80+95 per the Long Plot in **Appendix A**.

It should be noted that MWD will not maintain structural (structural protection of Casa Loma No. 1) or geotechnical (lightweight fill) design components of this project.

Section 6 Recommendations

Based on the analysis presented herein, it is recommended that the City and RCFC&WCD approve the proposed modifications to the MDP Line E alignment. It is also recommended that Line V be removed because this drainage area will now be accommodated by an onsite system on the SJCCSP site. MDP Line E-2 will have to cross MWD Casa Loma Barrel No. 2 to connect to MDP Line E. Feasibility of MDP Line E-2 is not within the scope of this project.

Final design of the Line E system will take place in conjunction with the development of the SJCCSP, *Section 7* outlines the final design items. Other future projects will design downstream MDP facilities, Line G and Line E-2 as well as other backbone facilities throughout the City. It should also be noted that the connection of MDP Line E to the San Jacinto Spillway while crossing Casa Loma Barrel No. 2 and the San Diego Pipeline, is planned as a future project. It is recommended that the flow rates established in this report be utilized for the Final Design of Line E and Line G.

Section 7 Next Steps

Following the approval of the PDR the following items will need to be developed, coordinated, or designed in the final design stage of MDP Line E development. The following list includes long lead items but is not exhaustive of all design elements.

- MWD
  - Finalize structural design for Casa Loma Barrel No. 1 for final design
  - Finalize geotechnical analysis for final design
  - Casa Loma Barrel No. 1 blowoff manhole structural design to proposed grade
  - Lightweight fill extents and protection extents
  - Obtain final MWD approval on structural and geotechnical construction plans and reports
  - Easement for construction and RCFC&WCD to maintain Line E from MWD's Real Estate Group

- City of San Jacinto
  - Onsite & Confluence Basin
    - Size, freeboard, weir design, and scour protection
  - Pump Station
    - Final pump selection, mechanical selection, electrical plan, Structural design of wet well
  - Easement for the City of San Jacinto to maintain Line E

- RCFC&WCD
  - Obtain RCFC&WCD approval of freeboard for MDP Line E for areas outside of SJCCSP boundary and within adjacent developments to verify offsite drainage
  - 20' access roads within the SJCCSP boundary
  - Non-standard RCB structural design, transition structures structural design
  - Low flow channel per RCFC&WCD CH324, extents and design to be determined
  - Right of Way Acquisition and Easements for Line E Maintenance (including MWD)
  - Additional groundwater investigations near inlet
  - Construction phasing
- Environmental
  - Complete the CEQA process with the City of San Jacinto and obtain regulatory permits for the construction and maintenance of Line E.
  - City of San Jacinto, as CEQA lead agency adopts Addendum
  - RCFC&WCD as a CEQA-responsible agency makes Responsible Agency Findings
  - Implement mitigation measures identified in the Addendum's Clarified Mitigation Monitoring and Reporting Program (Clarified MMRP)

SUBJECT: Report of Findings for 2021-2022 Wet-Season Survey for Listed Branchiopods Conducted for the Villages of San Jacinto Project Site, an Approximately 514-Acre Site Located in the City of San Jacinto, Riverside County, California

Dear Ms. Love:

Glenn Lukos Associates, Inc. (GLA) conducted wet-season surveys for listed branchiopods (fairy shrimp) of 58 potential seasonally ponded features at the Villages of San Jacinto Project Site (Property), a 514-acre property located in the City of San Jacinto, Riverside County, California.

Frank Wegscheider (TE-038716-4) conducted the 2021-2022 wet season survey with the objective of determining the presence or absence of federally-listed Riverside fairy shrimp (*Streptocephalus woottoni*), San Diego fairy shrimp (*Branchinecta sandiegonensis*), and vernal pool fairy shrimp (*Branchinecta lynchi*).

The versatile fairy shrimp (*Branchinecta lindahli*) was detected in 7 of the 42 features that ponded sufficiently to conduct sampling. No listed branchiopods were detected on site.

I. SITE LOCATION AND DESCRIPTION

The Project site is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within Sections 19, 30, and unsectioned portions of Township 4 South, and Range 1 West and Section 24 of Township 4 South, and Range 2 West of the Lakeview, California USGS 7.5-minute quadrangle map [Exhibit 2 – Vicinity Map].

The Study Area, including the main development parcels and additional offsite road improvement areas, is generally bounded by Ramona Expressway, commercial nursey, and agricultural fields to the north, North Sanderson Avenue and agricultural fields to the east, the San Jacinto Valley Sewage Plant to the south, and an egg farm and a dairy to the west. Universal

Transverse Mercator (UTM) coordinates approximately corresponding to the Study Area are 499080 mE and 3740693 mN.

The 2021-2022 wet season survey area consists primarily of active agricultural fields and surrounding roads and an inactive dairy facility. The majority of depressional features consisted of un-vegetated road ruts. A few features support non-native species including red brome (*Bromus madritensis* ssp. *rubens*), foxtail barley (*Hordeum murinum*), London rocket (*Sisymbrium irio*), common wheat (*Triticum aestivum*) and Russian thistle (*Salsola tragus*).

Exhibit 3 depicts the 2021-2022 wet season fairy shrimp survey area.

II. METHODOLOGY

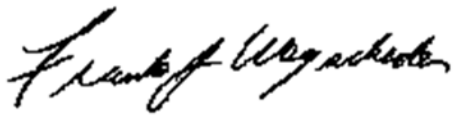
GLA biologist David Moskovitz provided a written notification to commence wet and dry season surveys to the U.S. Fish and Wildlife Service (USFWS), Carlsbad Field Office on December 1, 2021. Rain on December 14, 2021, initiated mapping of features, conducted by Frank Wegscheider, on December 15 and 17, 2021. Several features sustained ponding or were frequently re-inundated due to irrigation run-off.

In accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods* (Survey Guidelines) dated November 13, 2017[1], site visits were conducted within 24 hours of rain events to determine whether features contained a minimum of three centimeters (cm) of ponding. Under typical conditions, sampling commences within seven days of initial ponding. Sampling continued weekly until the feature was dry or had been inundated continuously for 120 days. If dried features were re-inundated, sampling would begin again as above. Sampling for the presence of fairy shrimp was performed using a dip net within representative portions of the depression bottom, edges, and vertical water column when there was adequate ponding. Specimens were placed into vials, with unique depression information, containing 95% ethanol solution. Specimens were identified in the field. Datasheets are attached as Appendix 1.

IV. RESULTS

A total of 58 features were identified as potentially suitable fairy shrimp habitat. A total of 49 features ponded and were sampled during the 2021-2022 wet season. The remaining 9 features never ponded to allow for sampling. Of the 49 features sampled, seven features supported fairy shrimp. The common, versatile fairy shrimp (*Branchinecta lindahli*) was detected in the seven features. No listed species were detected. Table 1 includes the wet season fairy shrimp survey

[1] USFWS. *Survey Guidelines for the Listed Large Branchiopods*, Revised: November 13, 2017.



results. Exhibit 4 depicts the fairy shrimp wet season survey results map. Site photographs are depicted in Exhibit 5.

Appendix 1. U.S. Fish and Wildlife Service – Data Sheet for Wet Season Surveys For Listed Large Branchiopods

Site or Project Name: Villages of San Jacinto	County: Riverside	Quad: Lakeview	Township:	Range:	Section:

SURVEYOR / Permit Number: Frank Wegscheider (TE-038716-4)

Date:12/17/2021 | Time: | Weather Conditions:

Feature ID #	UTM (Northing, Easting, Datum)	Temp (°C)		Depth (cm)		Surface Area (m x m)		Crustaceans					Insects				Platyhelminths (flatworms)	Habitat Condition	Notes / Voucher information
		Air	Water	Average	Est. Max.	Present	Est. Max.	Anostracans	Notostracans	Copepods	Ostracods	Cladocera	Coleoptera	Hemiptera	Diptera Culicidae	Diptera Chironomidae			
29																		DRY	Road rut
30																		DRY	Road rut
31					4.0		1x1												Road rut
32					14.0		6x12												Road rut

Notes: Fill in abbreviated names of Anostracans and Notostracans, for all others indicate presence with a check mark. Anostracan and Notostracan Abbreviations: Use first two letters of genus and species name (e.g., LIOC = *Linderiella occidentalis*, BRLI = *Branchinecta lindahli)*.

For habitat conditions use two letter abbreviation as follows: NP = Natural Pool, CP = Constructed Pool; UD = undisturbed, D = disturbed: with TT = tire tracks, T = trash, P = plowed; G = grazed, UG = ungrazed by: C = cattle, H = horses, S = sheep; AB = Algal blooms present.

(Estimate grazing regime by height of grasses and forbs and density of hoof prints) LG = light grazing, MG = moderate grazing, HG = heavy grazing.

47																		DRY	Road rut
48																		DRY	Road rut

Notes: Fill in abbreviated names of Anostracans and Notostracans, for all others indicate presence with a check mark. Anostracan and Notostracan Abbreviations: Use first two letters of genus and species name (e.g., LIOC = *Linderiella occidentalis*, BRLI = *Branchinecta lindahli)*.

For habitat conditions use two letter abbreviation as follows: NP = Natural Pool, CP = Constructed Pool; UD = undisturbed, D = disturbed: with TT = tire tracks, T = trash, P = plowed; G = grazed, UG = ungrazed by: C = cattle, H = horses, S = sheep; AB = Algal blooms present.

(Estimate grazing regime by height of grasses and forbs and density of hoof prints) LG = light grazing, MG = moderate grazing, HG = heavy grazing.

43			20.6		1.5	0.25x0.25													Road rut, irigation run off
44 to 46																		DRY	Road rut
47			19.7		6.0	2x2													Road rut, irigation run off
48 to 54																		DRY	Road rut
55			22.1		1.5	4x3													Road rut, irigation run off

Notes: Fill in abbreviated names of Anostracans and Notostracans, for all others indicate presence with a check mark. Anostracan and Notostracan Abbreviations: Use first two letters of genus and species name (e.g., LIOC = *Linderiella occidentalis*, BRLI = *Branchinecta lindahli*).

For habitat conditions use two letter abbreviation as follows: NP = Natural Pool, CP = Constructed Pool; UD = undisturbed, D = disturbed: with TT = tire tracks, T = trash, P = plowed; G = grazed, UG = ungrazed by: C = cattle, H = horses, S = sheep; AB = Algal blooms present.

(Estimate grazing regime by height of grasses and forbs and density of hoof prints) LG = light grazing, MG = moderate grazing, HG = heavy grazing.

2023 Dry Season Fairy Shrimp Report

GLENN LUKOS ASSOCIATES
Regulatory Services

October 7, 2024

Ms. Stacey Love
U.S. Fish and Wildlife Service
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

SUBJECT: Dry Season Survey Results for Listed Branchiopods Conducted for the San Jacinto Commerce Center Specific Plan (formerly the Villages at San Jacinto) Project Site, City of San Jacinto, Riverside County, California

Dear Ms. Love:

This letter report documents the results of a dry season survey conducted by Glenn Lukos Associates, Inc. (GLA) for 89 depressional features at the San Jacinto Commerce Center Specific Plan Project Site (formerly the Villages at San Jacinto), an approximately 660-acre site (514-acre onsite area and 146-acre offsite area; hereafter, Study Area) located in the City of San Jacinto, Riverside County, California. GLA notified the U.S. Fish and Wildlife Service (USFWS) of the intent to perform the dry season surveys on December 1, 2021, and a revised notification was sent on November 14, 2023, to clarify changes in project acreages. Dry season soil collection was conducted on October 9, 2023.

GLA biologist David Moskovitz (PER0010680-0) performed the soil collection from the features, with assistance from GLA biologist Stephanie Cashin (TE-20280D-0) and Chris Waterston (ESPER-2380694), and from GLA trainees David Smith and Velvet Park (under supervision). Brent Helm (TE-795930-12) processed the soil samples to determine cyst presence/absence and species identification through culturing. Appendix A summarizes the results of soil analysis, which was provided to GLA in final form on August 2, 2024.

I. SITE LOCATION AND DESCRIPTION

The Study area is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within Sections 19, 30, and unsectioned portions of Township 4 South and Range 1 West, and Section 24 of Township 4 South, and Range 2 West of the Lakeview, California USGS 7.5-minute quadrangle map [Exhibit 2 – Vicinity Map]. The Study Area, including the

main development parcels and additional offsite road improvement areas, is generally bounded by Ramona Expressway, commercial nursey, and agricultural fields to the north, North Sanderson Avenue and agricultural fields to the east, the San Jacinto Valley Sewage Plant to the south, an egg farm and a dairy to the west. Universal Transverse Mercator (UTM) coordinates approximately corresponding to the Study Area are 499080 mE and 3740693 mN [Exhibit 3 – Fairy Shrimp Survey Area Map].

II. DESCRIPTION OF THE DEPRESSIONAL FEATURES

A total of 89 ponded features were included for dry season soil sampling. The features were characterized as unvegetated or vegetated. Unvegetated features include road ruts, dirt parking areas, and an agricultural fields. Vegetated features included agricultural and roadside ditches and basins. One ponded feature (Pool 95) that was included in wet season sampling was not able to be included in dry soil sampling as this feature remained ponded from irrigation run-off on the dry season sampling date.

Unvegetated (Road Ruts, Dirt Parking Areas, and Agricultural Fields)

Of the 89 features included in dry season soil sampling, 70 features can be described as road ruts, dirt parking areas, and agricultural fields which were all unvegetated. Of the 70 unvegetated features, 58 features were road ruts and represented the majority of the ponded features at the Project (Pools 1,2, 4-16, 25, 26, 28, 31-56, 58, 74, 84-94, and 100). The dirt parking area included ten ponded features (Pools 63 through 72). There were two ponded features (Pools 20 and 21) associated with a flooded agricultural field.

Vegetated (Agricultural and Roadside Ditches and Basins)

Of the 89 features included in dry season soil sampling, 19 features can be described as agricultural and roadside ditches and basins (Pools 22, 59-62, 73, 75-83, and 96-99) that supported at least some vegetation. Most of the ditches and basins were sparsely vegetated, commonly supporting weedy annual species including five-hook bassia (*Bassia hyssopifolia*), stinknet (*Oncosiphon piluliferum*), Russian thistle (*Salsola tragus*), lamb's quarters (*Chenopodium album*), cheeseweed (*Malva parviflora*), black mustard (*Brassica nigra*), and annual brome grasses (*Bromus sp.*). Native species including Coulter's goldfields (*Lasthenia glabrata ssp. coulteri*) and smooth tarplant (*Centromadia pungens* ssp. *laevis*) were observed in a few features, as well as Goodding's willow (*Salix gooddingii*), mulefat (*Baccharis salicifolia*), and Canada horseweed (*Erigeron canadensis*) was observed in some of the basins.

III. METHODOLOGY

A. Soil Collection

Soil sample collection and processing followed the USFWS *Survey Guidelines for the Listed Large Branchiopods*, November 13, 2017 (USFWS 2017). Soil sample collection was conducted by GLA biologist David Moskovitz with assistance from Stephanie Cashin and Chris Waterston; and GLA biologists, David Smith and Velvet Park (under supervision) on October 9, 2023.

The number of samples collected for the ponded features is summarized in Table 1 below, which follows the Table 1 - Soil Sample Summary in the USFWS 2017 Survey Guidelines. Soil sub-sampling locations were distributed in a grid pattern to cover the entire feature with targeted collection in the lowest topographic areas that would potentially exhibit past aquatic invertebrate accumulation.

Soil samples of approximately 100 milliliters each were removed at each sub-sample location using a hand trowel and were combined into a labeled bag for each feature with the collection date, location, feature ID, name of collector, and stored for future processing. Samples were stored in a dry location out of direct sunlight until shipped for processing.

Table 1 – Soil Sample Summary

Feature Size		Number of Samples Collected per Pool	Number of Pools of Each Feature Size Class
Square Meters	Approx. Acreage		
< 2.5	0.0005	As appropriate	6
2.5–24	0.005	10	28
25–235	0.05	25	45
236–2300	0.5	50	9
2300–23,225	5.0	100	1
Total Pools Sampled			89

B. Soil Processing and Culturing Analysis

Soil sample processing is described in the soil analysis and cyst culturing report [Appendix A] and summarized that soil samples were prepared for analysis by dissolving the clumps of soil in a brine solution while breaking clumps by hand, then skimming and placing floating material into stacked sieves, 600-micron atop 75-micron, pushing material through the sieve by rinsing

with lukewarm water and gentle rubbing with brush, and finally removing material from 75-micron sieve and spread thinly into petri dishes. The sieved material was examined under a microscope for large branchiopod cysts (embryonic eggs). Cyst identification was assisted using a cyst reference collection and scanning electron micrographs of cysts (Belk 1989, Brendock *et al*. 2008, Gilchrist 1978, Hill and Shepard 1998, Mura 1991, Thiery *et al.* 1995, and Rabet 2010).

Isolated cysts were cultured and fairy shrimp were grown until mature and identified using keys and diagrams from "Fairy Shrimps of California's Puddles, Pools, and Playas" (Eriksen and Belk 1999) and recent publications concerning identification of San Diego fairy shrimp (*Branchinecta sandiegonesis*) (Simovish *et al.* 2013, Patel *et al.* 2018). If listed large branchiopods were identified, mature shrimp were sacrificed in 95% ethyl alcohol as species vouchers.

IV. RESULTS OF DRY SEASON SURVEY

A total of 89 features were sampled during the 2023 dry season surveys. Of the 89 features sampled, cysts of the genus *Branchinecta* were identified from 54 features. The versatile fairy shrimp (*Branchinecta lindahli*) was hatched and identified from 32 of the 54 features with *Branchinecta* cysts. No listed *Branchinecta* species were hatched. *Streptocephalus* cysts were not present in any of the features [Appendix A]. No listed species were detected. Table 2 includes the results of 2023 dry season fairy shrimp soil analysis and cyst culturing. Exhibit 4 depicts the results of the 2023 dry season soil analysis and successful cyst culturing. Representative site photographs are included as Exhibit 5.

DRY SOIL ANALYSIS AND CYST CULTURING FOR THE DETECTION OF FEDERALLY-LISTED LARGE BRANCHIOPODS AT THE VILLAGES OF SAN JACINTO, RIVERSIDE COUNTY, CALIFORNIA

INTRODUCTION

Helm Biological Consulting (HBC), a division of Tansley Team, Inc., was contracted by Glenn Lukos Associates, Inc. (GLA) to perform an analysis of soils collected from dry seasonally-inundated depressions (hereafter "features") at the Villages of San Jacinto (hereafter "Project"), for the presence of large branchiopods (fairy shrimp, tadpole shrimp) that are listed as threatened or endangered under the federal Endangered Species Act (e.g., the threatened vernal pool fairy shrimp [*Branchinecta lynchi*], the endangered Riverside fairy shrimp [*Streptocephalus woottoni*]). In addition, HBC was contracted by GLA to culture large branchiopod cysts (hatch cysts and rear hatchlings to maturity for positive identification of species) obtained from the soil analysis.

The Project is located in the City of San Jacinto, Riverside County, California, south of Ramona Expressway, east of North Warren Road, west of North Sanderson Avenue, and north of Cottonwood Avenue (Figure 1). The Project resides in the southern ½ of Section 18, part of the southern ½ of Section 17, NE ¼ of Section 19, western ½ of Section 20 and a thin strip along the edge of the western ½ of Section 29 of the San Bernardino Base & Meridian of the U.S. Geological Survey's (USGS') Lakeview 7.5-minute quadrangle map (Figure 1). Decimal degrees of the World Geodetic System 1984 corresponding to the center of the Project are Latitude: 33.810613° and Longitude: -117.011966°.

The remainder of this report discusses the methods and results of the soil examinations and cyst culturing to determine the presence of federally-listed large branchiopods at the Project.

"We certify that the information in this survey report and attached exhibits fully and accurately represents our work."

METHODS

Methods followed U.S. Fish and Wildlife Service's (USFWS 2017) *Survey Guidelines for Listed Large Branchiopods* for dry-season sampling and consisted of first soil collection, second soil processing and analysis, and last cyst culturing as described below.

SOIL COLLECTION

Dry soils were collected on October 9, 2023 by David Moskovitz (PER0010680-0) and Stephanie Cashin (TE-20280D-0), as authorized by USFWS Section 10(a)(1)(A) of the federal Endangered Species Act (ESA), 16 U.S.C. 1531 et seq., and its implementing regulations (Appendix A). The collected soils were delivered to HBC for subsequent processing and analysis as described below.

SOIL PROCESSING AND ANALYSIS

Soil samples obtained from GLA, on October 24, 2023, were processed and analyzed by Dr. Brent Helm of HBC as authorized by the USFWS under recovery permit number TE-795930-12 of Section 10(a)(1)(A) of the federal ESA, 16 U.S.C. 1531 et seq., and its implementing regulations. In HBC's laboratory, a brine solution was prepared by mixing table salt (NaCl) with lukewarm tap water in a large container. The collected soil material was placed in the brine solution. The soil material was then gently worked by hand to breakdown any persistent soil structure. The organic material rising to the top of the brine solution was skimmed off and placed in a 600-micron diameter pore-size sieve stacked atop a 75-micron diameter pore-size sieve. The soil material was processed through the top sieve by flushing it with lukewarm tap water while gently rubbing it with a soft-bristle brush. The soil retained from the 75-micron diameter pore size sieve was then removed and thinly (≈1.0 mm) spread into plastic petri dishes.

The contents of each petri dish were examined under a 10 to 252-power zoom binocular microscope. A minimum of 0.5-hour was spent searching the contents of each petri dish for large branchiopod cysts (embryonic eggs). Dr. Helm's large branchiopod cyst reference collection and scanning electron micrographs of cysts (Belk 1989, Brendock *et al*. 2008, Gilchrist 1978, Hill and Shepard 1998, Mura 1991, Thiery *et al.* 1995, and Rabet 2010) were used to identify and compare any cysts observed within the soil samples. This processing method (described above) favors the detection of cysts belonging to the genera *Branchinecta*, *Lepidurus*, and *Streptocephalus* since these three genera have species that are federally listed. The presence of other aquatic macroinvertebrates encountered was also noted on the laboratory data sheet.

Because there are several species within the genus *Branchinecta* that could occur or are known to occur within the vicinity of the Project, cysts belonging to the genus *Branchinecta* observed within the soils, were cultured to determine species as described below.

CYST CULTURING

Petri dishes containing soils with *Branchinecta* cysts were placed into individual six-quart plastic containers. The soils were saturated with 50° F well water (non-chlorinated) and allowed to dry. This saturation and drying process was repeated three times. The soils were then inundated completely with 50° F well water. The containers holding the inundated soils were inserted into an environmental chamber. The environmental chamber controls were set to mimic the winter light, humidity, and temperature fluctuations of the Project's vicinity. The contents of the containers were monitored daily for fairy shrimp hatchlings (instars).

If no hatchlings were observed after ten (10) days, the containers were removed from the environmental chamber and the soils were allowed to completely dry before reinitiating the hatching process described above. A total of three hatching attempts were performed on each soil sample.

Fairy shrimp hatchlings were feed ground fish food and reared in the environmental chamber until they were mature enough to be identified using dichotomous keys and diagrams from "Fairy Shrimps of California's Puddles, Pools, and Playas" (Eriksen and Belk 1999) and two more recent publications concerning the identification of San Diego fairy shrimp (*Branchinecta sandiegonensis*) (Simovich *et al.* 2013, Patel *et al.* 2018); along with comparisons to Dr. Helm's large branchiopod reference collection. Representative mature listed large branchiopods specimens were obtained from each container and preserved in 95% ethanol as species vouchers.

RESULTS

SOIL COLLECTION

Soil samples collected from a total of 89 dry features (Exhibit 1A – 1J) by GLA were processed and analyzed by HBC.

SOIL PROCESSING AND ANALYSIS

Visual examinations of the processed soils revealed the presence of cysts belonging to the genus *Branchinecta* in 54 of the soils collected from 89 features (Table 1). No evidence of cysts belonging to the genus *Streptocephalus* were observed in the processed soils. Representative photographs of the features sampled using dry-season techniques are provided in Appendix B.

CYST CULTURING

The non-special status versatile fairy shrimp (*Branchinecta lindahli*) was successfully hatched and raised to maturity from 32 of the 54 feature soils that were observed to have *Branchinecta* cysts. After three hatching attempts, a total of 1,505 fairy shrimp were hatched and 213 were raised to maturity and identified as the versatile fairy shrimp (Table 2).

X = Results

*Abundance categories are derived from USFWS's Survey Guidelines for the Listed Large Branchiopods - Section VI(d) (none = no cysts found in sample; low abundance = estimate of 1-10 cysts/100 ml soil; medium abundance = estimate of 11-50 cysts/100 ml soil; high abundance = estimate of more than 50 cysts/100 ml soil)

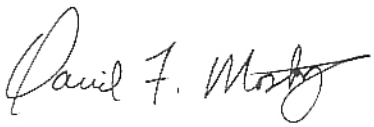
SUBJECT: Revised Notification to Commence Dry Season Surveys for Listed Fairy Shrimp at the Villages of San Jacinto Project Site, an Approximately 660-Acre Site Located in the City of San Jacinto, Riverside County, California

Dear Ms. Love:

Please accept this letter and attachments as a revised notification to conduct dry season surveys for listed fairy shrimp at the Villages of San Jacinto Project Site, an approximately 660-acre site (514-acre onsite area and 146-acre offsite area) located in the City of San Jacinto, Riverside County, California (Study Area).

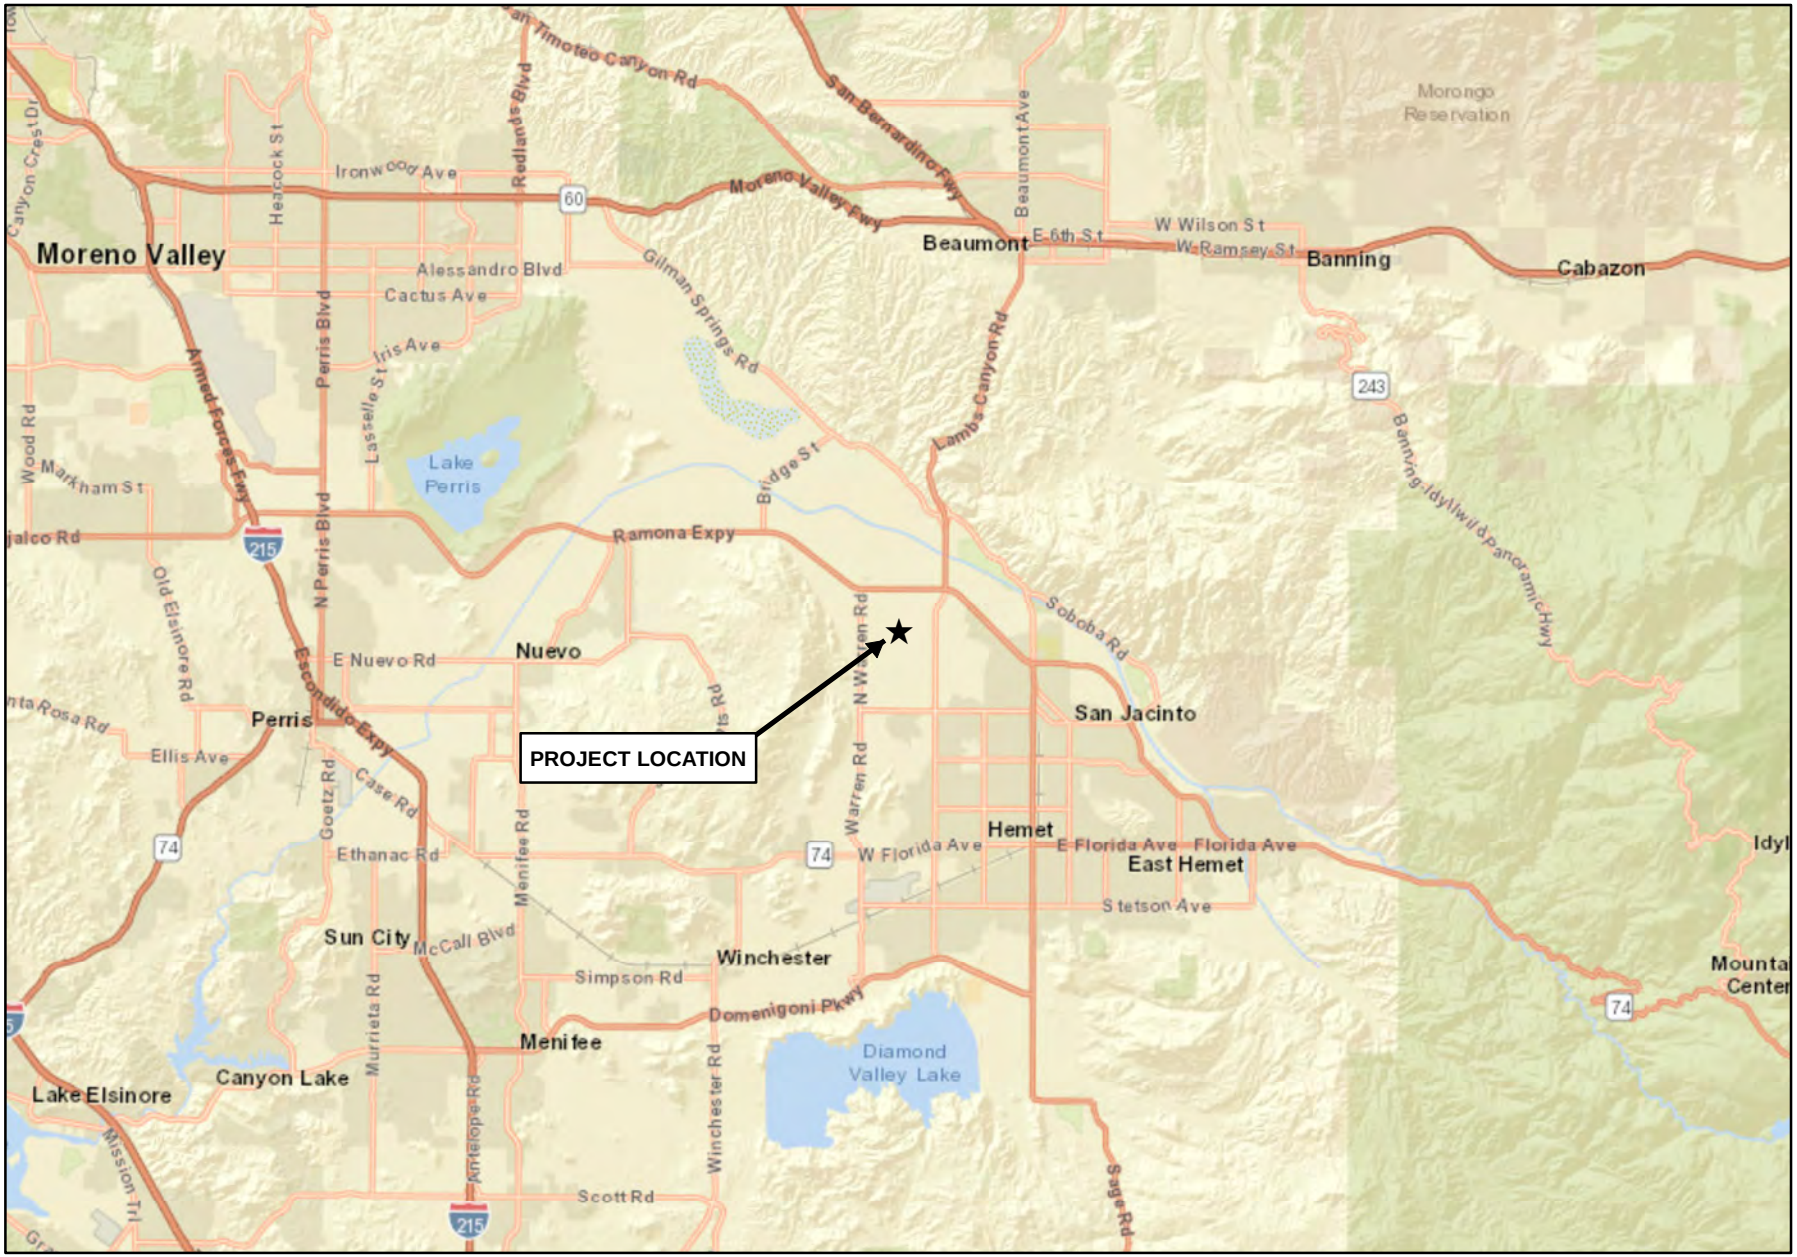
Pursuant to the original 2021 notification, GLA performed wet season surveys for both the onsite (2021-2022) and offsite (2022-2023) areas. Also pursuant to the original notification, dry season surveys were initiated with soil sample collection on October 9, 2023 for those features sampled during the wet season surveys. Soil samples were collected by David Moskovitz (PER0010680-0), supervising Stephanie Cashin (TE-20280D-0), per the USFWS survey protocol entitled ***Survey Guidelines for the Listed Large Branchiopods*** (dated November 13, 2017). This revised notification is being submitted to identify that soil processing and cyst culturing will be performed by Brent Helm (TE-795930-12) of Helm Biological Consulting. Within 90 days of completing the processing, a report will be submitted to USFWS documenting the dry season survey results.



The Project site is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within Sections 19, 30, and unsectioned portions of , Township 4 South, and Range 1 West and Section 24 of Township 4 South, and Range 2 West of the Lakeview, California USGS 7.5-minute quadrangle map [Exhibit 2 – Vicinity Map]. The Study Area, including the main development parcels and additional offsite road improvement areas, is generally bounded by Ramona Expressway, commercial nursey, and agricultural fields to the north, North Sanderson Avenue and agricultural fields to the east, the San Jacinto Valley Sewage

Plant to the south, and an egg farm and a dairy to the west. Universal Transverse Mercator (UTM) coordinates approximately corresponding to the Study Area are 499080 mE and 3740693 mN [Exhibit 3 – Aerial Map].

If you have any questions regarding this request, please contact me at (949) 340-2562 or via email at dmoskovitz@wetlandpermitting.com.



Sincerely,

GLENN LUKOS ASSOCIATES, INC.

SUBJECT: Report of Findings for a Wet-Season Survey for Listed Branchiopods Conducted for the Master Drainage Plan (MDP) Line E Project, an Approximately 14,000 Linear-Foot Drainage Alignment in the City of San Jacinto, Riverside County, California

Dear Ms. Love:

Glenn Lukos Associates, Inc. (GLA) conducted wet-season surveys for listed branchiopods (fairy shrimp) of three seasonally ponded features within the Master Drainage Plan (MDP) Line E Project (Project) located in the City of San Jacinto, Riverside County.

GLA biologists Stephanie Cashin (TE-20280D-0) and Chris Waterston (ESPER-2380694) conducted the wet season surveys, assisted by GLA field staff David Smith and Velvet Park, with the objective of determining the presence or absence of federally-listed Riverside fairy shrimp (*Streptocephalus woottoni*), San Diego fairy shrimp (*Branchinecta sandiegonensis*), and vernal pool fairy shrimp (*Branchinecta lynchi*).

No large branchiopods, including listed species, were detected within these features.

I. SITE LOCATION AND DESCRIPTION

The Project site is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within Sections 19, 30, and unsectioned portions of Township 4 South, and Range 1 West and Section 24 of Township 4 South, and Range 2 West of the Lakeview, California USGS 7.5-minute quadrangle map [Exhibit 2 – Vicinity Map].

The Study Area includes two portions of the MDP Line E Project (Project) alignment in the northwest and southeast. The proposed Project alignment will extend through the San Jacinto Commerce Center Specific Plan (SJCCSP) property, formerly named the Villages at San Jacinto

Project, which GLA has surveyed separately. The Project is generally bounded by Ramona Expressway and agricultural fields to the north, the San Jacinto Reservoir, agricultural fields, and the SJCCSP property to the east and south, agricultural fields, dairy farms, and Warren Road to the west. Universal Transverse Mercator (UTM) coordinates approximately corresponding to the Study Area are 499535 mE and 3741019 mN.

The wet season survey area consists of road ruts, riparian areas, and agricultural fields. The road ruts were unvegetated. The agricultural fields were either bare and tilled or planted with watermelon. Feature E-1 was partially vegetated with weedy species including non-native species including fivehorn smotherweed (*Bassia hyssopifolia*), perennial pepperweed (*Lepidium latifolium*), red brome (*Bromus madritensis* ssp. *rubens*), foxtail barley (*Hordeum murinum*), , Russian thistle (*Salsola tragus*), and alkali mallow (*Malvella leprosa*)

Exhibit 3 depicts the wet season fairy shrimp survey area.

II. METHODOLOGY

GLA provided a written notification to commence wet season surveys to the U.S. Fish and Wildlife Service (USFWS), Carlsbad Field Office on November 9, 2023. Rain initiated hydrological monitoring on November 20, 2023. Storms in late December 2023 and early January 2024 initiated mapping of features. Sampling of Features E-2 and E-3 began on January 5, 2024. Feature E-1 began to sustain ponding after storms between January 19 – 23, 2024, with sampling beginning January 26, 2024. Features E-2 and E-3 dried and re-ponded several times and were completely dry on April 12, 2024. Feature E-1 remained ponded past 120 days with the last visit on May 22, 2024.

In accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods* (Survey Guidelines) dated November 13, 2017[1], site visits were conducted within 24 hours of rain events to determine whether features contained a minimum of three centimeters (cm) of ponding. Under typical conditions, sampling commences within seven days of initial ponding. Sampling continued weekly until the feature was dry or had been inundated continuously for 120 days. If dried features were re-inundated, sampling would begin again as above. Sampling for the presence of fairy shrimp was performed using a dip net within representative portions of the depression bottom, edges, and vertical water column when there was adequate ponding. Specimens were placed into vials, with unique depression information, containing 95% ethanol solution. Specimens were identified through microscopy and using the “Key to California Fairy

[1] USFWS. *Survey Guidelines for the Listed Large Branchiopods*, Revised: November 13, 2017.

Shrimps" found in Eriksen and Belk (1999, Revised 2016).[2] Datasheets are attached as Appendix A.

III. RESULTS

A total of three features ponded and were sampled during the wet season within the Study area. No fairy shrimp, including listed species, were detected. Table 1 includes the wet season fairy shrimp survey results. Exhibit 4 depicts the wet season survey results map. Representative site photographs are depicted in Exhibit 5.

Table 1 Wet Season Fairy Shrimp Survey Results

Pool ID	Fairy Shrimp Present	SURFACE AREA MAX (MxM)	DEPTH MAX (cm)	11N

Notes: Fill in abbreviated names of Anostracans and Notostracans, for all others indicate presence with a check mark. Anostracan and Notostracan Abbreviations: Use first two letters of genus and species name (e.g., LIOC = Linderiella occidentalis, BRLI = Branchinecta lindahli).

For habitat conditions use two letter abbreviation as follows: NP = Natural Pool, CP = Constructed Pool; UD = undisturbed, D = disturbed: with TT = tire tracks, T = trash, P = plowed; G = grazed, UG = ungrazed by: C = cattle, H = horses, S = sheep; AB = Algal blooms present.

(Estimate grazing regime by height of grasses and forbs and density of hoof prints) LG = light grazing, MG = moderate grazing, HG = heavy grazing.

Carlsbad, California 92008

SUBJECT: Dry Season Survey Results for Listed Branchiopods Conducted for the Master Drainage Plan (MDP) Line E Project, an Approximately 14,000 Linear-Foot Drainage Alignment, City of San Jacinto, Riverside County, California

Dear Mr. Sattler:

This letter report documents the results of a dry season survey conducted by Glenn Lukos Associates, Inc. (GLA) for three depressional features at the Master Drainage Plan (MDP) Line E Project (Project), an Approximately 14,000 Linear-Foot Drainage Alignment located in the City of San Jacinto, Riverside County, California. GLA notified the U.S. Fish and Wildlife Service (USFWS) of the intent to perform the dry season surveys on September 3, 2024, with an email approval received on September 10, 2025. Dry season soil collection was conducted on September 20, 2024.

GLA biologist Chris Waterston (ESPER-2380694) performed the soil collection from the features, with assistance from GLA biologist Stephanie Cashin (PER11730977-1) and from GLA trainee Velvet Park (under supervision). Frank Wegscheider (TE-038716-4) processed the soil samples to determine cyst presence/absence.

I. SITE LOCATION AND DESCRIPTION

The Project site is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within Sections 19, 30, and unsectioned portions of Township 4 South, and Range 1 West and Section 24 of Township 4 South, and Range 2 West of the Lakeview, California USGS 7.5-minute quadrangle map [Exhibit 2 – Vicinity Map]. The Study Area includes two portions of the MDP Line E Project alignment in the northwest and southeast. The proposed Project alignment will extend through the San Jacinto Commerce Center Specific Plan (SJCCSP) property, formerly named the Villages at San Jacinto Project, which GLA has

surveyed separately. The Project is generally bounded by Ramona Expressway and agricultural fields to the north, the San Jacinto Reservoir, agricultural fields, and the SJCCSP property to the east and south, agricultural fields, dairy farms, and Warren Road to the west. Universal Transverse Mercator (UTM) coordinates approximately corresponding to the Study Area are 499535 mE and 3741019 mN [Exhibit 3 – Fairy Shrimp Survey Area Map].

II. DESCRIPTION OF THE DEPRESSIONAL FEATURES

A total of three ponded features were included for dry season soil sampling. The features were characterized as unvegetated or vegetated. Unvegetated features included road ruts. The vegetated feature included an agricultural field basin.

Unvegetated (Road Ruts, Dirt Parking Areas, and Agricultural Fields)

Of the three features included in dry season soil sampling, two features were described as road ruts (E-2 and E-3) which were unvegetated.

Vegetated (Agricultural and Roadside Ditches and Basins)

Of the three features included in dry season soil sampling, one feature can be described as an agricultural basin (Pool E-1) that supported at least some vegetation. The basin included weedy annual species including five-hook bassia (*Bassia hyssopifolia*), stinknet (*Oncosiphon piluliferum*), Russian thistle (*Salsola tragus*), lamb's quarters (*Chenopodium album*), cheeseweed (*Malva parviflora*), black mustard (*Brassica nigra*), and annual brome grasses (*Bromus sp.*).

III. METHODOLOGY

A. Soil Collection

Soil sample collection and processing followed the USFWS *Survey Guidelines for the Listed Large Branchiopods*, November 13, 2017 (USFWS 2017). Soil sample collection was conducted by GLA biologist Chris Waterston with assistance from Stephanie Cashin; and GLA biologist Velvet Park (under supervision) on September 20, 2024.

The number of samples collected for the ponded features is summarized in Table 1 below, which follows the Table 1 - Soil Sample Summary in the USFWS 2017 Survey Guidelines. Soil sub-sampling locations were distributed in a grid pattern to cover the entire feature with targeted

collection in the lowest topographic areas that would potentially exhibit past aquatic invertebrate accumulation.

Soil samples of approximately 100 milliliters each were removed at each sub-sample location using a hand trowel and were combined into a labeled bag for each feature with the collection date, location, feature ID, name of collector, and stored for future processing. Samples were stored in a dry location out of direct sunlight until shipped for processing.

Table 1 – Soil Sample Summary

Feature Size		Number of Samples Collected per Pool	Number of Pools of Each Feature Size Class
Square Meters	Approx. Acreage		
< 2.5	0.0005	As appropriate	0
2.5–24	0.005	10	2
25–235	0.05	25	0
236–2300	0.5	50	0
2300–23,225	5.0	100	1
Total Pools Sampled			3

B. Soil Processing

Soil analyses were conducted by USFWS-approved branchiopod biologist Frank Wegscheider. Soil samples were placed into a one-gallon plastic container and allowed to pre-soak in water. The resulting slurry was slowly poured into a graded set of stacked U.S. standard 8-inch soil sieves (710, 300, and 150 micron), while concurrently being gently washed with flowing water. Water was directed through the samples for a time period sufficient to wash all of the resting eggs (cysts) into the 150-micron sieve. Soil remaining in the 150-micron and 300-micron sieves was used for analysis. The Project site lies outside of the currently documented range of the federally endangered vernal pool tadpole shrimp (*Lepidurus packardi*), which is endemic to California's Central Valley (Rogers, 2001); therefore, it was not necessary to examine the 300-micron samples. Nonetheless, the 300-micron samples were examined for the presence of Cladoceran *Ephippia*. To facilitate the analyses, the 150-micron samples were transferred to a 150 ml beaker, whereupon the organic components were thrice-decanted. The remaining organic contents were then examined under a Celestron dissecting microscope at 10-30X for the presence of Anostracan cysts.

IV. RESULTS OF DRY SEASON SURVEY

A total of three features were sampled during the 2024 dry season surveys. No cysts of the genus *Branchinecta or Streptocephalus*, including listed species, were identified from the three features. No cyst culturing was necessary as no cysts were detected during processing. No listed species were detected. Table 2 includes the results of 2024 dry season fairy shrimp soil analysis. Exhibit 4 depicts the results of the 2024 dry season soil analysis.

Table 2 – Dry Season Fairy Shrimp Results Summary

Pool ID	*BRANCHINECTA CYSTS* DETECTED 2024	*B. LINDAHLI* CULTURED 2024	ZONE 11N		FEATURE TYPE
			EASTING	NORTHING	
E-1	No	n/a	497815.82	3742124.27	basin
E-2	No	n/a	499464.94	3740100.66	road rut
E-3	No	n/a	499691.02	3740089.77	road rut

I certify that the information in this survey report and the attached exhibits fully and accurately represent my work.

Southwestern Willow Flycatcher Survey Report

GLENN LUKOS ASSOCIATES
Regulatory Services

August 17, 2024

Stacey Love
U.S. Fish and Wildlife Service
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

SUBJECT: Submittal Report for Southwestern Willow Flycatcher Surveys for the MDP Line E Project, Located in the City of San Jacinto, Riverside County, California.

Dear Ms. Love:

This letter report summarizes the methodology and findings of presence/absence surveys for the federally listed endangered southwestern willow flycatcher (***Empidonax traillii extimus***) ("SWFL") conducted by Glenn Lukos Associates, Inc. (GLA) within the above referenced property located in the City of San Jacinto, Riverside County, California.

SWFL surveys were conducted from May 20 through July 3, 2024, in all areas of suitable habitat in accordance with U.S. Fish and Wildlife Service (USFWS) guidelines. The SWFL was not detected during the focused surveys. In addition, three least Bell's vireo (***Vireo bellii pusillus***) "LBV" territories were detected onsite during the focused surveys.

1.0 INTRODUCTION

Southwestern Willow Flycatcher (SWFL)

The SWFL is a small, migratory songbird, which inhabits riparian habitats throughout southern California and is one of four subspecies of willow flycatcher (WIFL) currently recognized. It was officially designated as a state-endangered species on January 2, 1991, and federally designated as endangered on March 29, 1995. The SWFL measures about 5.75 inches (15 cm) in length and weighs only about 0.4 ounces (12 g). Overall, it is roughly the size of a small sparrow. Both sexes look alike. Its appearance is overall greenish or brownish gray above, with a white throat that contrasts with a pale olive breast. The belly is pale yellow. Two white wing bars are visible, but the eye ring is faint or absent. The upper mandible is dark and the lower mandible light (USGS). It closely resembles the other races of willow flycatcher, and several other species of the ***Empidonax*** genus, particularly the closely related Alder flycatcher (***Empidonax alnorum***).

The SWFL breeds in relatively dense riparian habitats in all or parts of seven southwestern states, from near sea level to over 2,000 m (6,100 ft). More specifically, the SWFL breeds in riparian habitats along rivers, streams, or other wetlands, where relatively dense growths of trees and shrubs are established, near or adjacent to surface water or underlain by saturated soil (McCabe 1991). Common tree and shrub species comprising nesting habitat include willow (***Salix*** sp.), boxelder (***Acer negundo***), tamarisk (***Tamarix ramosissima***), and Russian olive (***Eleagnus angustifolia***) (USFWS 2002).

Habitat characteristics such as plant species composition, size and shape of habitat patch, canopy structure, vegetation height, and vegetation density vary across the subspecies range. However, regardless of the plant species composition or height, occupied sites usually consist of dense vegetation in the patch interior, or an aggregate of dense patches interspersed with openings. In most cases this dense vegetation occurs within the first 3-4 m (10-13 ft) above ground. These dense patches are often interspersed with small openings, open water or marsh, or shorter/sparser vegetation creating a mosaic that is not uniformly dense (USFWS 2002). The SWFL winters in Mexico and Central America and northern South America (Phillips 1948, Gorsiki 1969, McCabe 1991, Koronkiewicz et al. 1998, Unitt 1999).

2.0 SITE LOCATION AND DESCRIPTION

The Project site is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within Sections 19, 30, and unsectioned portions of Township 4 South, and Range 1 West and Section 24 of Township 4 South, and Range 2 West of the Lakeview, California USGS 7.5-minute quadrangle map [Exhibit 2 – Vicinity Map]. Exhibit 3 identifies the general study area for the Project. Specifically, the Universal Transverse Mercator (UTM) coordinates corresponding to the site are 499923.20 mE and 3740091.36 mN.

Dominant species within the survey area included the following species: black willow (***Salix gooddingii***) with sandbar willow (***Salix exigua***), Fremont's cottonwood (***Populus fremontii***), arroyo willow (***Salix lasiolepis***), mulefat (***Baccharis salicifolia***), western sycamore (***Platanus racemosa***), and gum trees (***Eucalyptus*** sp). Dominant understory species on site includes broadleaved pepperweed (***Lepedium latifolium***) and yerba mansa (***Anemopsis californica***). Other species occurring within or adjacent to the riparian habitat includes salt cedar (***Tamarix ramosissima***), giant reed (***Arundo donax***), castor bean (***Ricinus communis***), shortpod mustard (***Hirschfeldia incana***), branching phacelia (***Phacelia ramosissima***), southern bush monkeyflower (***Diplacus longiflorus***), rough cocklebur (***Xanthium strumarium***), and Spanish sunflower (***Pulicaria paludosa***).

3.0 METHODOLOGY

Surveys for the SWFL were conducted in accordance with the 2010 U.S. Fish and Wildlife Service (USFWS) guidelines[1], which stipulate that five surveys (divided into three survey periods) shall be conducted in all areas of suitable habitat. One survey was conducted during the first survey period (May 15 to May 31). Two surveys were conducted during the second survey period (June 1 to June 24), and two surveys were conducted during the third survey period (June 25 to July 17). GLA biologist Jeff Ahrens (TE 052159-6) conducted SWFL surveys on May 20, June 11, June 21, June 27, and July 3, 2024. Mr. Ahrens was accompanied by GLA biologist Chris Waterston (non-permitted) on June 27, 2024.

All surveys were conducted during the morning hours and were completed before 10:45 A.M. No surveys were conducted during extreme weather conditions (i.e., winds exceeding 15 miles per hour, rain, or temperatures in excess of 95ºF). All areas of suitable habitat were surveyed on foot by walking slowly and methodically. Taped vocalizations primarily using the WIFL's main contact call "fitz-bew" were used to elicit responses from WIFLs that might be present on site. The detection of WIFLs on site was based on both sight and call.

Weather conditions during the SWFL surveys was conducive to a high level of bird activity. Temperatures ranged from approximately 52 degrees Fahrenheit to 90 degrees Fahrenheit. Wind speeds ranged from 1-5 miles per hour during the surveys. Table 1 summarizes the survey dates and weather information for each survey date.

Table 1. Summary of SWFL Survey Dates and Weather Conditions

Date	Survey	Start/End Time	Surveyor	Temp ºF, (start/end)	Wind Speed (MPH) (start/end)	% Cloud Cover (start/end)
5/20/24	SWFL	0555/1030	JA	52/62	2-4/3-5	100/100
6/11/24	SWFL	0600/1030	JA	80/90	3-5/2-4	20/20
6/21/24	SWFL	0550/1045	JA	61/84	1-3/2-3	0/0
6/27/24	SWFL	0600/1030	JA/CW	63/78	2-3/2-5	0/0

JA = Jeff Ahrens, CW (non-permitted)

[1] ***A Natural History Summary and Survey Protocol for the Southwestern Willow Flycatcher***, prepared by the USGS.

4.0 RESULTS

The SWFL was not detected on site during the focused surveys. GLA biologists detected three least Bell's vireo (***Vireo bellii pusillus;*** LBV) territories on site during the focused surveys. Based on observed behavior, all three LBV territories appeared to be paired and nesting. The brown-headed cowbird (***Molothrus ater***) was detected on site and is a known nest parasite of the LBV and other riparian bird species.

Bird commonly observed during the focused surveys included the following: song sparrow (***Melospiza melodia***), mourning dove (***Zenaida macroura***), bushtit (***Psaltriparus minimus***), Nuttall's woodpecker (***Picoides nuttallii***), Anna's hummingbird (***Calypte anna***), common yellowthroat (***Geothlypis trichas***), house finch (***Carpodacus mexicanus***), lesser goldfinch (***Spinus psaltria***), black phoebe (***Sayornis nigricans***), Allen's hummingbird (***Selasphorus sasin***), northern mockingbird (***Mimus polyglottos***) and house wren (***Troglodytes aedon***). An avian compendium is included in Appendix A.

Data sheets and an avian compendium listing all avian species detected during the focused surveys is included at the end of this report. Exhibits 3 and 4 depict the survey area and LBV locations on an aerial map and topographic map, respectively.

I certify that the information in this survey report and attached exhibits fully and accurately represents my work.

APPENDIX A

AVIAN COMPENDIUM

The avian compendium lists bird species identified on the Site.

* = non-native species

ACCIPITERIDAE	**Hawks, Old World Vultures and Harriers**
Accipiter cooperii	Cooper's hawk
Buteo jamaicensis	red-tailed hawk
Buteo lineatus	red-shouldered hawk
Circus cyaneus	northern harrier
AEGITHALIDAE	**Bushtit**
Psaltriparus minimus	bushtit
ALAUDIDAE	**Larks**
Eremophila alpestris	horned lark
ANATIDAE	**Ducks, Geese, and Swans**
Anas platyrhynchos	mallard
APODIDAE	**Swifts**
Aeronautes saxatalis	white-throated swift
ARDEIDAE	**Herons, Egrets and Bitterns**
Ardea alba	great egret
Bubulcus ibis	cattle egret
Butorides virescens	green heron
Egretta thula	snowy egret
Nycticorax nycticorax	black-crowned night heron
CARDINALIDAE	**Cardinals, Grosbeaks, and Buntings**
Pheucticus melanocephalus	black-headed grosbeak
CATHARTIDAE	**New World Vultures**
Cathartes aura	turkey vulture
CHARADRIIDAE	**Plovers**
Charadrius vociferus	killdeer
COLUMBIDAE	**Pigeons and Dove**
* ***Columbia livia***	rock dove
* ***Streptopelia decaocto***	Eurasian collared dove
Zenaida macroura	mourning dove

CORVIDAE	**Jays, Magpies and Crows**
Aphelocoma californica	California scrub-jay
Corvus brachyrhynchos	American crow
Corvus corax	common raven
EMBERIZIDAE	**Emberizines**
Melospiza lincolnii	Lincoln's sparrow
Melospiza melodia	song sparrow
Melozone crissalis	California towhee
Passerculus sandwichensis	savannah sparrow
Pipilo maculatus	spotted towhee
FRINGILLIDAE	**Finches**
Carduelis psaltria	lesser goldfinch
Carpodacus mexicanus	house finch
Spinus lawrencei	Lawrence's goldfinch
Spinus tristis	American goldfinch
HIRUNDINIDAE	**Swallows and Martins**
Hirundo rustica	barn swallow
Petrochelidon pyrrhonota	cliff swallow
Tachycineta bicolor	tree swallow
Tachycineta thalassina	violet-green swallow
ICTERIDAE	**Blackbirds**
Agelaius phoeniceus	red-winged blackbird
Icterus bullockii	Bullock's oriole
Icterus cucullatus	hooded oriole
Molothrus ater	brown-headed cowbird
Sturnella neglecta	western meadowlark
MIMIDAE	**Mockingbirds and Thrashers**
Mimus polyglottos	northern mockingbird
PARULIDAE	**Wood Warblers and Relatives**
Geothlypis trichas	common yellowthroat
Icteria virens	yellow-breasted chat
Setophaga petechial	yellow warbler
Vermivora celata	orange-crowned warbler
PICIDAE	**Woodpeckers**
Colaptes auratus	northern flicker
Melanerpes formicivorus	acorn woodpecker
Picoides nuttallii	Nuttall's woodpecker

RALLIDAE	**Rails**
Fulica americana	American coot
Porzana carolina	sora
Rallus limicola	Virginia rail
RECURVIROSTRIDAE	**Stilts and Avocets**
Himantopus mexicanus	black-necked stilt
STRIGIDAE	**True Owls**
Bubo virginianus	great-horned owl
STURNIDAE	**Starlings**
* ***Sturnus vulgaris***	European starling
TROCHILIDAE	**Hummingbirds**
Calypte anna	Anna's hummingbird
Selasphorus sasin	Allen's hummingbird
TROGLODYTIDAE	**Wrens**
Thryomanes bewickii	Bewick's wren
Troglodytes aedon	house wren
TURDIDAE	**Thrushes**
Sialia mexicana	western bluebird
TYRANNIDAE	**Tyrant Flycatchers**
Empidonax difficilis	western flycatcher
Sayornis nigricans	black phoebe
Sayornis saya	Say's phoebe
Tyrannus vociferans	Cassin's kingbird
TYTONIDAE	**Barn Owls**
Tyto alba	barn owl
VIREONIDAE	**Vireos**
Vireo bellii pusillus	least Bell's vireo
Vireo huttoni	Hutton's vireo

Attachments:	image001.png

Good morning,

The U.S. Fish and Wildlife Service and the California Department of Fish and Wildlife, hereafter referred to jointly as the Wildlife Agencies, have reviewed the revised Determination of Biologically Equivalent or Superior Preservation (DBESP) for the San Jacinto Valley Master Drainage Plan Line E Project (Project), which we received from the City of San Jacinto on February 23, 2026 with our review and comment period ending on 4/24/2026.

The Wildlife Agencies appreciate the efforts in addressing our comments and providing a comparison of functions and values presented in the revised DBESP. We have reviewed the revised DBESP (dated January 2026), and we agree that the Project's assessment of the onsite impacts (4.03 acre of permanent impacts associated with Ditches A, B, D, E, F, and Drainage A area) to riparian/riverine resources and the associated mitigation strategy would be biologically equivalent or superior to a complete preservation alternative.

Please condition the Project to provide a Habitat and Mitigation and Monitoring Plan (HMMP) to the Wildlife Agencies for review and approval for the restoration of 8.06 acres riparian/riverine mitigation area at least 60 days prior to the initiation of project activities.

We have no further comments to submit to the City of San Jacinto on the DBESP. This concludes our review of the revised DBESP for the San Jacinto Valley Master Drainage Plan Line E Project.

Sincerely,

Good Evening: Below is a link to the revised DBESP for the Line E project, which was prepared in response to the attached comment letter. The Line E project is a separate project from the San Jacinto Commerce Center Specific Plan, and the city requests a standalone DBESP review on the Line E DBESP.

SUBJECT: Results of Focused Surveys for Crotch's Bumble Bee Conducted for the MDP Line E Project, an Approximately 14,000 Linear-Foot Alignment in the City of San Jacinto, Riverside County, California

Dear Ms. Standerfer:

This letter report documents the results of focused Crotch's bumble bee (*Bombus crotchii*; CBB) surveys conducted by Glenn Lukos Associates (GLA) for the MDP Line E Project. The CBB surveys were conducted in accordance with CDFW's 2023 *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species*. The CBB was not detected onsite.

1.0 SITE LOCATION

The MDP Line E Project (Project site) is located in the City of San Jacinto, Riverside County, California [Exhibit 1 – Regional Map] within unsectioned portions of Township 4 South, and Range 1 West of the Lakeview and San Jacinto, California USGS 7.5-minute quadrangle maps [Exhibit 2 – Vicinity Map]. The Project site is generally bounded by the San Jacinto Reservoir to the south, North Sanderson Avenue to the east and west, and Ramona Expressway to the north. Exhibit 3 identifies the Project site. Specifically, the Universal Transverse Mercator (UTM) coordinates corresponding to the site are 499923.20 mE and 3740091.36 mN.

2.0 EXISTING CONDITIONS

The Project site is flat and predominantly supports active agricultural fields that are rotated regulary, and therefore the lands are dominated by plants associated with crop areas as well as

non-native vegetation associated with disturbed/ruderal areas. At the time of the survey some fields were fallow and some fields were planted with watermelon (*Citrullus lanatus*).

The 120.33-acre Project site consists of 94.41 acres of agricultural fields, 11.92 acres of annual brome grasslands, 10.43 acres of disturbed and developed areas, 0.03 acre of eucalyptus groves, and 3.54 acres of perennial pepperweed-prickly lettuce patches. Exhibit 3 provides an aerial image of the site, including the property boundary, which represents the CBB Survey Area. Site photographs depicting the Project site are included in Exhibit 4.

3.0 METHODOLOGY

GLA biologists Jeff Ahrens, Stephanie Cashin and Ian Rhodes performed focused foraging surveys for the CBB in suitable habitat areas of the Project during the 2025 survey period. All three biologists are familiar with bumble bee natural history, bumble bee species identification and have detected the CBB on numerous sites throughout southern California. In addition, Ms. Cashin (S-202690004-20273-001) holds a Scientific Collecting Permit (SCP) and a Section 2081(a) permit authorizing capture and release of CESA Candidate and/or TVPICP List bumble bees, including CBB.

Surveys generally followed the methods described by CDFW (2023) in *Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species*, which is not a mandated survey protocol, but instead "is intended to assist CDFW staff, project proponents, and consultants in developing, proposing, and evaluating survey protocols and surveys on a project- and site-specific basis." The *Survey Considerations* provides an overview of and incorporates the methodology of established protocols (e.g. the USFWS rusty patched bumble bee protocol [USFWS 2019]), while allowing for modifications to the number and type of surveys based on factors including the size of a Project site, the vegetation alliances and the phenology of the floral resources present within those alliances, and the patchiness of suitable habitat. The *Survey Considerations* state that survey efforts should include multiple survey visits, with the timing of the visits determined on a project-by-project basis based on seasonality and when CBB utilization will most likely occur. The timing of the surveys may vary depending on the location, elevation, seasonal rainfall, average ambient air temperatures, and local seasonal weather conditions.

To increase probability of detecting foraging bumble bees, survey efforts at the Project site were conducted during peak bloom periods that encompass the queen flight season (February through March) as well as the Colony Active Period (April through August) when the queen, daughters, and males are generally active. Surveys were spaced at least two to four weeks apart throughout

the queen flight season and Colony Active Period to take advantage of the different blooming periods of floral resources.

The Project site supports both annual and perennial floral resources with the potential for utilization by CBB. The annual floral resources onsite (that CBB are known to use) consisted of common fiddleneck (*Amsinckia intermedia)*, which was located primarily east of North Sanderson Avenue and along the edges of agricultural areas within the western portion of the site. Other annual species including smooth tarplant (*Centromedia pungens* ssp.), which have not been documented to be utilized by CBB were also surveyed. Perennial floral resources onsite with potential to be utilized by CBB was limited to alfalfa (*Medicago sativa*). Alfalfa is generally considered to be a perennial plant as it can live for more than two years, but at the Project site, alfalfa is generally grown as a short-season annual row crop that is rotated. Alfalfa within the Project site occurred west of North Sanderson Avenue. In addition to alfalfa, a small patch of branching phacelia (*Phacelia ramosissima*) was detected immediately offsite along the southeasternmost portion of the Project site within riparian habitat and was visually monitored when it was flowering as CBB is known to forage on it. GLA biologists surveyed the Project site in March, April, May, and June to capture the peak blooming periods of both annual and perennial floral resources.

Because of the patchy distribution of floral resources at the Project site, the location of which exhibited spatial and temporal variation depending on the particular species in bloom at any given time, each survey visit consisted of large meandering transects incorporating patches of floral resources across the landscape. During these transects, the surveyor spent approximately one person-hour of visual survey effort per three acres of suitable blooming habitat, which comprised multiple separate patches of suitable habitat totaling up to three acres rather than a single three-acre patch. In addition to floral resources, rodent burrows and other suitable features with potential to be used for nesting were examined for evidence of nesting activity including high levels of bee movements from the suspected nest location. The survey continued at a pace of approximately three acres of suitable habitat/blooming floral resources per survey hour as long as weather conditions were favorable for *Bombus* activity. Minimal time was spent in lesser quality habitat. All *Bombus* observations and floral resources used were recorded using GPS.

Photo vouchers of *Bombus* species were obtained by photographing bumble bees in situ from multiple angles with a professional level telephoto zoom lens and a camera body with a sensor capable of producing highly detailed images to ensure sufficient detail of identifying characteristics. Pursuant to the survey guidelines, the surveys were conducted between an hour after sunrise up until two hours before sunset, during times when weather conditions during the surveys are conducive to a high level of bee activity with temperatures generally 52-90 degrees Fahrenheit and wind less than seven miles per hour. Table 1 summarizes the CBB survey visits. The results of the CBB surveys are documented in Section 3.0 of this report.

Table 1. Summary of Survey Dates and Weather

Survey Date	Biologist(s)	Start/End Time	Start/End Temperature (°F)	Start/End Wind Speed (mph)	Cloud Cover (%)

JA = Jeff Ahrens, SC = Stephanie Cashin, IR = Ian Rhodes					

3.0 RESULTS

No bumble bee species, including the CBB were detected at the Project site. One bumble bee species, the California bumble bee (*Bombus fervidus californicus*) was observed during the June 12, 2025 survey using the branching phacelia offsite. Table 2 summarizes the survey results during all six focused surveys. General site photographs of the Project site are included in Exhibit 4.

USGS Lakeview and San Jacinto 7.5′ topographic quadrangles,
Sects. 18, 19, 20, 29 T4S R1W and the San Jacinto Viejo land grant, SBBM
Level of Investigation: CEQA Phase I
Keywords: City of San Jacinto; ~1,920 acres surveyed

MANAGEMENT SUMMARY

The City of San Jacinto (City) proposes the construction of a three-mile-long corridor for the San Jacinto Master Drainage Plan Line E Project (Project). The Project involves development within Assessor's Parcel Numbers 430-100-009, -012, -015, and -018; 430-130-043, -044, -073, -075, and -079; 436-010-002, -003, and -004; 436-030-001; and 436-170-001, -008, and -016 (approximately 1,920 acres), south of Ramona Expressway and east of Sanderson Avenue, in the city of San Jacinto, Riverside County, California. Under contract to the Albert A. Webb Associates, Applied EarthWorks, Inc. (Æ) conducted a cultural resource study of the Project in accordance with the California Environmental Quality Act (CEQA). The City is the lead agency for compliance with CEQA.

This report summarizes the methods and results of the cultural resource study, including a records search and literature review, communication with Native American Tribal representatives, and an archaeological survey of the Project area. The purpose of the study was to determine the potential for the proposed Project to impact historical resources eligible for or listed in the California Register of Historical Resources (CRHR).

The literature and records search at the Eastern Information Center of the California Historical Resources Information System indicated eight cultural resources have been documented within a 0.5-mile radius of the Project area. One of these previously identified cultural resources, a segment of the Colorado River Aqueduct, is located within the Project area.

Results of the Native American Heritage Commission (NAHC) Sacred Lands File search were negative for Native American cultural resources within the Project area. Per the NAHC's request, Æ contacted 15 Native American individuals and organizations to elicit information on Native American resources within the Project area and received responses from representatives of seven tribes—Agua Caliente Band of Cahuilla Indians, Augustine Band of Cahuilla Indians, Cahuilla Band of Indians, Pechanga Band of Indians, Rincon Band of Luiseño Indians, San Manuel Band of Mission Indians, and Soboba Band of Luiseño Indians.

Æ archaeologist Andrew DeLeon completed an intensive pedestrian archaeological survey of the Project area on November 29, 2023. DeLeon revisited the location of the single subterranean cultural resource mapped within the Project area during the survey. No other cultural resources were identified within the Project area.

Although the Project area is disturbed and soil sensitivity appears low, the cultural resources identified adjacent to the Project area suggest some potential for subsurface archaeological deposits. In addition, it is Æ's experience in this region that buried deposits can be found near the San Jacinto River. Therefore, Æ recommends archaeological monitoring during surface grubbing or clearing and initial grading within the Project area.

Field notes documenting the current study are on file at Æ's Hemet office. A copy of this report will also be submitted to the Eastern Information Center.

1
INTRODUCTION

The City of San Jacinto proposes the design and construction of a three-mile-long corridor for the San Jacinto Master Drainage Plan Line E Project (Project). The Project involves development within Assessor's Parcel Numbers 430-100-009, -012, -015, and -018; 430-130-043, -044, -073, -075, and -079; 436-010-002, -003, and -004; 436-030-001; and 436-170-001, -008, and -016 (approximately 1,920 acres), south of Ramona Expressway and east of Sanderson Avenue, in the city of San Jacinto, Riverside County, California. Under contract to the Albert A. Webb Associates, Applied EarthWorks, Inc. (Æ) conducted a cultural resource study of the Project in accordance with the California Environmental Quality Act (CEQA). The City is the lead agency for compliance with CEQA.

Æ Principal Investigator M. Colleen Hamilton (M.A., Registered Professional Archaeologist [RPA] 12588) was responsible for overall quality control for the Project. Æ Senior Archaeologist Joan George (B.S., Registered Archaeologist 28093) served as project manager. The report was compiled and written by Jessica Cochran (B.A.). Fieldwork was conducted by Æ Associate Archaeologist Andrew DeLeon (M.A., RPA 17087).

1.1 PROJECT LOCATION AND DESCRIPTION

The Project is within the western portion of the city of San Jacinto in Riverside County (Figure 1-1). Specifically, the Project is mapped within Sections 19, 20, and 29, Township 4 South, Range 1 West of the San Bernardino Baseline and Meridian, and the San Jacinto Viejo land grant as shown on the U.S. Geological Survey (USGS) Lakeview and San Jacinto, California 7.5-minute topographic quadrangle maps (Figure 1-2). The elevation is approximately 1,467 feet above mean sea level.

The Project involves the design and construction of Line E as part of the San Jacinto Valley Master Drainage Plan (MDP), which aims to provide flood protection to the San Jacinto Commerce Center Specific Plan. The Project consists of a three-mile storm-drain channel that starts at the outlet channel of a joint flood control and confluence basin and ends at the existing Metropolitan Water District of Southern California (MWD) aqueduct right-of-way. A three-mile earthen channel with inclined side slopes at 4:1 and 20-foot-wide access roads on both sides will be constructed for stormwater to flow from south to north. Seven reinforced concrete box culverts, one of which will intersect Sanderson Avenue, will be installed. Berms will replace channelization at the southern end, while a concrete trapezoidal channel with inclined side slopes at 1.5:1 and up to 10 feet high will be built at the northern end. A bridge-type structure will be used to cross an existing MWD buried pipeline, Casa Loma Siphon No.1, to prevent adding loads to the existing pipeline. The maximum depth of ground disturbance during Project construction is not expected to exceed 20 feet.

DRAFT

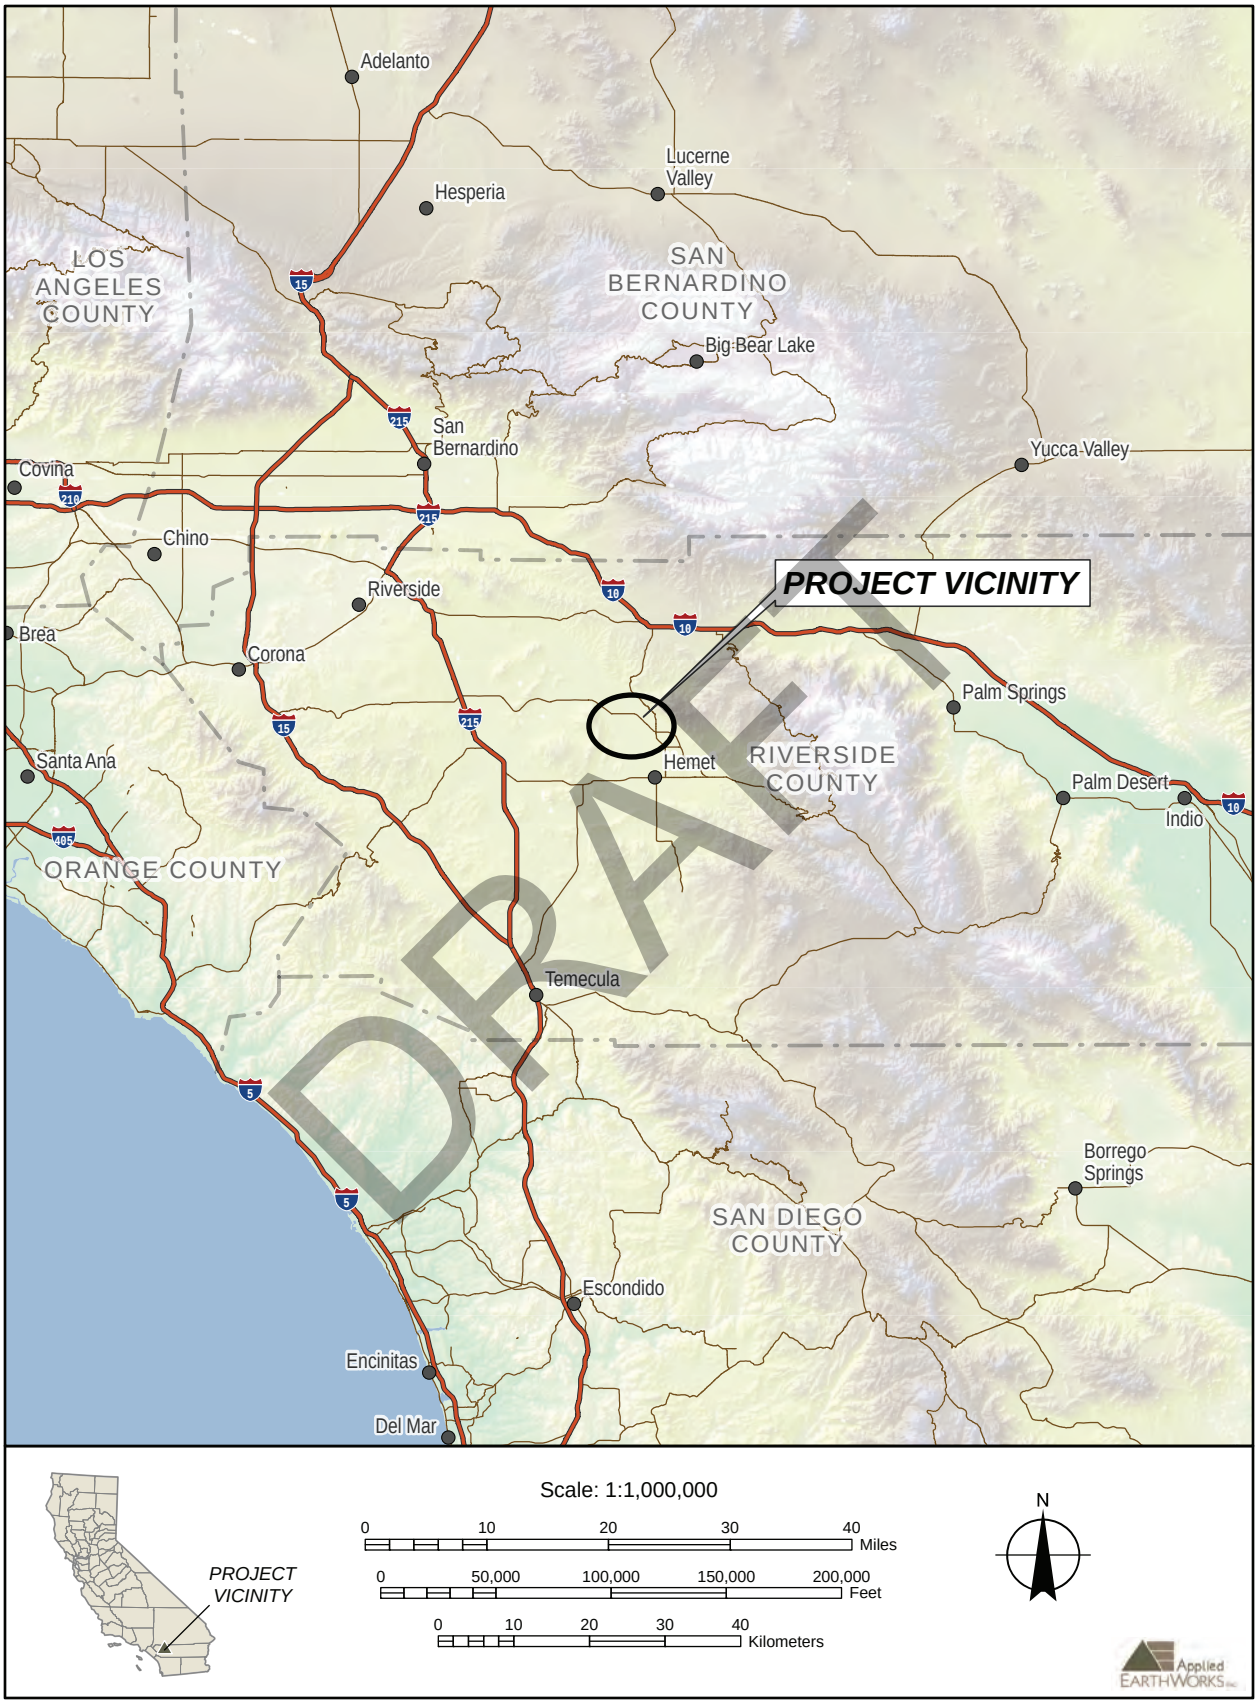

Figure 1-1 Project vicinity in Riverside County, California.

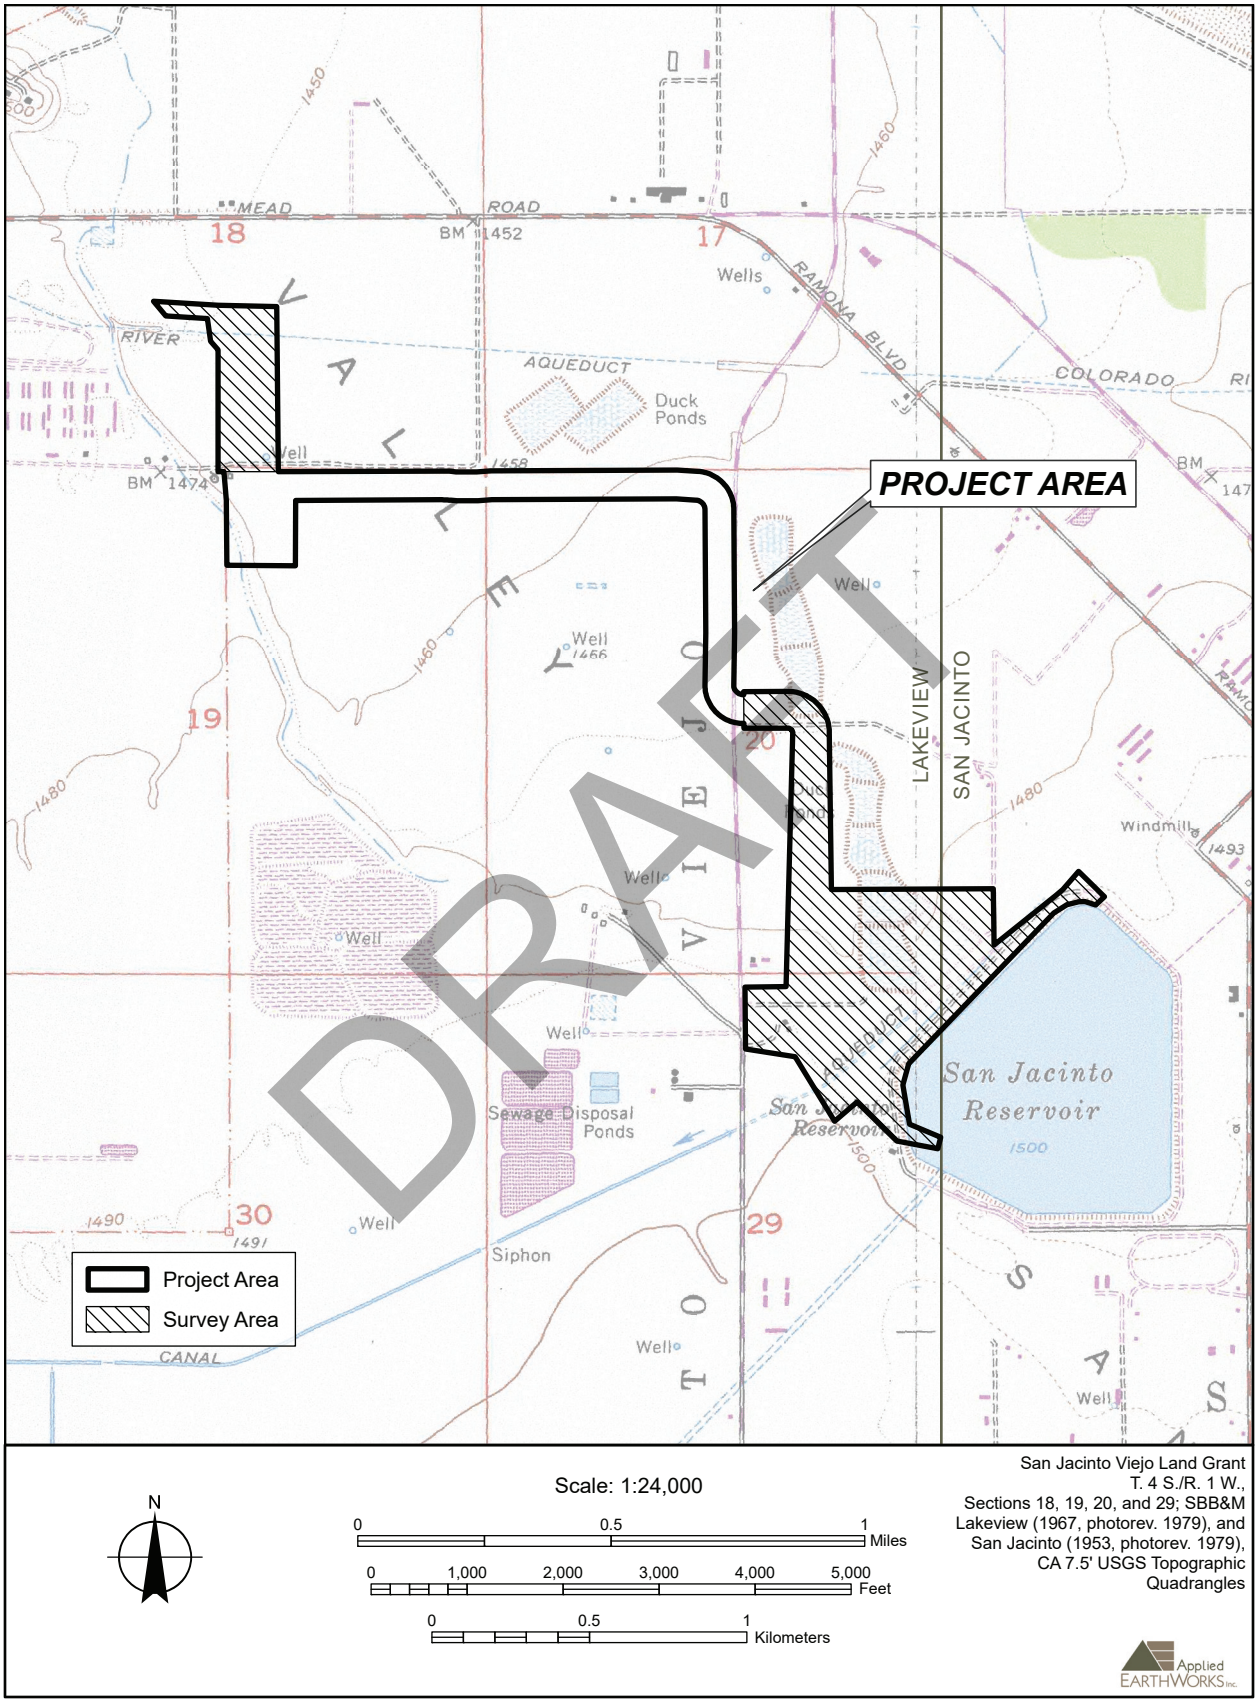

Figure 1-2 Project location on USGS Lakeview and San Jacinto 7.5-minute topographic quadrangles.

1.2 REGULATORY CONTEXT

1.2.1 California Environmental Quality Act

The Project requires discretionary approval from the City and is therefore subject to the requirements of CEQA. The CEQA Statute and Guidelines directs lead agencies to determine whether a project will have a significant impact on historical resources. A cultural resource considered "historically significant" is considered a "historical resource," if it is over 50 years of age, is included in a local register of historical resources, or is listed in or determined eligible for listing in the California Register of Historical Resources (CRHR) under any one of the following criteria (California Code of Regulations [CCR], Title 14, Section 15064.5):

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or,
4. Has yielded, or may be likely to yield, information important in prehistory or history.

Compliance with CEQA's cultural resource provisions typically involves several steps. Briefly, archival research and field surveys are needed, and identified cultural resources are inventoried and evaluated in prescribed ways. Prehistoric and historic archaeological sites as well as standing structures, buildings, and objects deemed historically significant and sufficiently intact (i.e., historical resources) must be considered in project planning and development.

A project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant impact on the environment (14 CCR 15064.5[b]) and the lead agency is responsible for identifying potentially feasible measures to mitigate significant adverse changes in the significance of a historical resource (14 CCR 15064.5[b]4).

1.3 REPORT ORGANIZATION

This report documents the results of a cultural resource study of the proposed Project area. Chapter 1 describes the Project and its location, defines the scope of the cultural resource study, and states the regulatory context. Chapter 2 summarizes the natural and cultural setting of the Project area and surrounding region. Chapter 3 presents the results of the archaeological literature and records search. Chapter 4 summarizes the Sacred Lands File search with the Native American Heritage Commission (NAHC) and Native American communications. The field survey methods and results are discussed in Chapter 5. Cultural resource management recommendations are provided in Chapter 6, and bibliographic references are cited in Chapter 7. Results of the Sacred Lands File search and correspondence with Native American groups are included as Appendix A.

DRAFT

2
SETTING

This chapter describes the prehistoric, ethnographic, and historic cultural setting of the Project area to provide a context for understanding the nature and significance of cultural resources identified within the region. Prehistorically, ethnographically, and historically, the nature and distribution of human activities in the region have been affected by such factors as topography and the availability of water and natural resources. Therefore, prior to a discussion of the cultural setting, the environmental setting of the area is summarized below.

2.1 ENVIRONMENTAL SETTING

The Project is in western Riverside County within the greater San Jacinto Valley. This area is in the Southern California batholith, a massive geological intrusion of granite that is part of the Peninsular Range formed in the late Cretaceous and uplifted in the early Tertiary. This mountain range extends from the San Gabriel Mountains to southern Baja Mexico. The physiography of the province is characterized by three northwest-trending mountainous regions composed of stable crustal blocks, separated by active fault zones, including (from east to west) the San Jacinto Mountains, the Perris Block, and the Santa Ana Mountains (Morton et al. 2006). The San Jacinto and Elsinore fault zones separate the three regions. The Project area is within the Perris Block, which consists of bedrock highlands and isolated hills separated by alluvium-filled valleys.

The primary drainage in the San Jacinto Valley is the San Jacinto River, the headwaters of which are in the San Jacinto Mountains; a portion of this river flows through the Project area and in the past, would have meandered across or near the Project area. The river flows northwesterly through the San Jacinto Valley and then west and southwest until it empties into Lake Elsinore, a sink in the Elsinore fault zone. Levees built between 1919 and 1939 altered the course of the river, shifting it as much as a mile south of its historic course. Prior to historic hydrological modifications, the San Jacinto River flowed perennially only in the eastern portion of the valley; during the wet season, however, the river flowed farther than today, collecting in the northern part of the valley (about 5 miles northwest of the Project) in an elongate depression forming a shallow, ephemeral lake now known as Mystic Lake (Morton 1977; Whitney 1982). Overflow from the lake drained to the southwest, eventually reaching Lake Elsinore. Because the lake existed before 1895, which predates groundwater withdrawal in the valley, Morton (1977) inferred that the depression is of tectonic origin.

Soils in the Project area, as mapped by the U.S. Department of Agriculture Natural Resources Conservation Service, include four soil series. The Chino and Grangeville soils are Mollisols, Dello soils are Entisols, and Traver soils are Alfisols. Mollisols are a taxonomic order of soils that consist mostly of minerals with a fertile surface horizon found extensively in the North American plains. Entisols are a taxonomic order of soils that consist mostly of minerals and are not in place long enough to form diagnostic horizons. Alfisols are soils that typically retain water

DRAFT

well for 3 months of the year during warm seasons, which fosters sufficient plant growth (Soil Survey Staff 1999b).

Chino soils are poorly drained silt loams and silty clay loams that formed in alluvium derived from granitic rocks (Soil Survey Staff 2020). Dello soils are very deep and poorly drained soils that formed in alluvium from granitic rock (Soil Survey Staff 1990). Grangeville soils are very deep and poorly drained soils that formed in moderately coarse-textured alluvium from granitic rock (Soil Survey Staff 1999a). Traver soils are moderately well to poorly drained soils that formed in alluvium derived from granitic bedrock (Soil Survey Staff 2003).

Considering the presence of each soil series and the disturbed nature of the Project area, the archaeological sensitivity is low. While the Chino soil contains well-defined A and C horizons, the integrity of the deposits is questionable because of agricultural disturbances. The Dello, Grangeville, and Traver soils are less defined. Furthermore, none of the soil series contains buried A (Ab) horizons that typically indicate the potential for buried archaeological deposits.

2.2 PREHISTORIC SETTING

The prehistory of inland Southern California is less thoroughly understood than in the adjacent desert and coastal regions. This is partially a result of historic circumstances, such as ease of access, the location of universities, and public versus private land ownership, and partly due to the nature of archaeological research in these interior valleys and mountains of Southern California (Goldberg and Arnold 1988). In the absence of absolute chronological indicators for inland sites, researchers generally employ typological cross-dating from either coastal or desert sequences, often as the sole means for assigning age to archaeological sites within the interior valleys, including the Project area.

Two large reservoir projects, Perris Reservoir (O'Connell et al. 1974) and Eastside Reservoir Project (ESRP) (Goldberg et al. 2001), generated large data sets to provide a basis for resolving some of these regional problems. It is difficult to extrapolate the geographic extent of the prehistoric cultural patterns discerned from excavations at these two reservoirs, which are 12 miles apart in central western Riverside County. The ESRP is approximately 7 miles south of the Project, and it is almost certain that prehistoric patterns are like those discerned for the ESRP studies.

This discussion of the Project's prehistoric cultural setting is drawn from the cultural sequence developed for the ESRP. This chronology was based first on artifact cross-dating, and then refined with radiocarbon and obsidian hydration dates (Onken and Horne 2001; Robinson 1998, 2001); however, the ESRP chronology draws heavily on a cultural sequence defined by Warren (1984) for Southern California, which is based largely on archaeological work conducted in the Colorado and Mojave deserts. Because Warren's chronology used period names that suggest links to the Mojave, these were replaced in the ESRP chronology by value-neutral terms. Because no sites dating to the Paleoindian Period (circa 12,000–9500 before present [B.P.]) have been documented within the region, the discussion below begins with the Early Archaic Period.

DRAFT

2.2.1 Early Archaic Period (circa 9500–7000 B.P.)

During this period, the environment of the interior deserts was more favorable for human occupation than the cismontane valleys of Southern California, where the Project is located. Populations in the interior valleys would have been tethered to the few reliable, drought-resistant water sources such as Lake Elsinore, Mystic Lake, and possibly the Cajalco Basin. In general, small, highly mobile groups traveled widely, using highly portable tool kits to procure and process critical resources, with brief and anticipated intervals of seasonal sedentism near predictable water locations. Due to isolated locations where the conditions for occupation were met, Early Archaic Period sites are rare compared to later periods of prehistory (Goldberg et al. 2001; Grenda 1997; Horne and McDougall 2008; McDougall 1995).

2.2.2 Middle Archaic Period (circa 7000–4000 B.P.)

A gradual transition from wet pluvial conditions to arid desert conditions during the Early Holocene marks the transition to the Middle Archaic Period. Middle Archaic Period sites in Southern California include two in the ESRP, one at Lake Elsinore, the Stahl Site in Owens Valley, desert sites in Death Valley, Salt Springs, and at Pinto Basin in Joshua Tree National Park. Middle Archaic Period sites are associated with the margins of pluvial lakes and with now-extinct springs. Pinto-series projectile points, a type of basally notched or bifurcate base dart point, are the most distinctive artifact type of this period (Justice 2002). Other artifacts found at Middle Archaic Period sites include leaf-shaped bifacial knives, split cobble choppers and scrapers, scraper-planes, and small milling slabs and manos. With a few exceptions in the ESRP area and the Stahl Site, most sites of this age are small surface deposits of lithic artifacts, suggestive of temporary and perhaps seasonal occupation by small groups of people.

2.2.3 Late Archaic Period (circa 4000–1500 B.P.)

The Late Archaic Period was one of cultural intensification coinciding with the Little Pluvial, a period when increased moisture allowed for more extensive occupation of the region. Sedentism likely increased during this period, with large occupation sites located adjacent to permanent water sources such as perennial springs and streams. Projectile points diagnostic of this period include Humboldt, Gypsum, and Elko-series dart points (Warren 1984), although Rose Spring arrow points appeared late within this period in the deserts. The mortar and pestle, used for processing acorns and hard seeds, also first appeared. A warming and drying trend began around 2100 B.P., leading to intensification of use of certain resources (Goldberg et al. 2001).

2.2.4 Saratoga Springs Period (circa 1500–750 B.P.)

Occupants of the region continued to adapt to the arid environment in the deserts (Warren 1984). Lake Cahuilla likely refilled the Coachella Valley around 1450 B.P. and was the focus of exploitation of fish and wetland resources. Occupation around large local water sources declined as these dried, however, and people became tethered to springs (Goldberg et al. 2001). Cultural trends continued from the Late Archaic Period, as Saratoga Springs projectile points, also associated with early use of the bow and arrow, appeared. The sparse assemblages found within the region obscure the timing of local adoption of the bow and arrow (Goldberg et al. 2001). Shoshonean language speakers likely moved into Southern California at this time. Brown and Buff Ware pottery first appeared on the lower Colorado River at about 1200 B.P. and started to

DRAFT

diffuse across the California deserts by about 1100 B.P. (Moratto 1984). The warmer and drier Medieval Warm Period set in throughout the Southwest by about 1060 B.P. (Stine 1994; Warren 1984) and led to the withdrawal of Native American populations from marginal desert areas.

2.2.5 Late Prehistoric Period (circa 750–410 B.P.)

A period of lower temperatures and increased precipitation known as the Little Ice Age resulted in increased resource productivity in the region and subsequent population increase. Cottonwood Triangular points appear in inland assemblages and Obsidian Butte glass became much more common (Goldberg et al. 2001). Lake Cahuilla began to recede (Waters 1983), and the large Patayan populations occupying its shores moved westward to areas such as Anza Borrego, Coyote Canyon, the Upper Coachella Valley, the Little San Bernardino Mountains, and the San Jacinto Plain (Wilke 1976). The final recession of Lake Cahuilla, which had occurred by approximately 400 B.P., resulted in a population shift away from the lakebed into the Peninsular Ranges to the west and the Colorado River regions to the east.

2.2.6 Protohistoric Period (circa 410–180 B.P.)

Sedentism intensified during the Protohistoric Period. Increased hunting with bow and arrow and widespread exploitation of acorns, other hard nuts, and berries (indicated by the abundance of mortars and pestles) provided reliable and storable food resources. Reliable food sources likely prompted the establishment of small, completely sedentary villages with resource catchment areas around them (True 1966, 1970). Ceramic technology first appeared in the region around 350 B.P. Cottonwood Triangular points were supplemented by Desert Side-notched points. This period ended in 1769 A.D. when Spanish settlement began in Upper California.

2.3 ETHNOGRAPHIC SETTING

This description of the ethnographic setting is based on information passed down from tribal elders; found in published academic works in the areas of anthropology, history, and ethnohistory; and provided in recorded ethnographic and linguistic accounts (cf., Kroeber 1925; Smith and Freers 1994; Strong 1929; Vane 2000). The Project lies within the ancestral cultural territory of the Luiseño Native American cultural group, and more specifically, within the traditional territory of the Soboba Band of Luiseño Indians. However, the area also may have been occupied by the Cahuilla Native American cultural group due to population shifts in the historic era (Bean 1978). Both tribes speak a language of the Takic branch of the Shoshonean family, part of the larger Uto-Aztecan language stock.

Luiseño territory in ethnographic times encompassed a stretch of the California coast and included most of the drainage of the San Luis Rey and Santa Margarita rivers. Inland, Luiseño territory extended south from Santiago Peak, including the Elsinore and Temecula valleys, and extended farther south to Mount Palomar and the San Jose Valley, then west to the coast at Agua Hedionda Creek. The coastal territory of the Luiseño extended north to near San Mateo Creek in Orange County (Bean 1978). Elders of the Pechanga Band of Luiseño Indians add that the Temecula/Pechanga people had usage/gathering rights to an area extending from Rawson Canyon on the east to Lake Mathews (modern) on the northwest, down Temescal Canyon to Temecula, eastward to Aguanga, and then along the crest of the Cahuilla Range back to Rawson Canyon.

DRAFT

Ethnographically, Cahuilla territory spanned from the summit of the San Bernardino Mountains in the north to Borrego Springs and the Chocolate Mountains in the south, a portion of the Colorado Desert west of Orocopia Mountain to the east, the San Jacinto Plain as far as Riverside, and the eastern slopes of Palomar Mountain to the west (Bean 1978).

2.3.1 Ethnographic Lifeways of the Soboba Band of Luiseño Native Americans and the Cahuilla Native Americans

Prior to the Mission Period (before circa 1769), each Luiseño village was organized as a clan tribelet: a group of people patrilineally related who owned an area in common and who were politically and economically autonomous from neighboring groups. The entire social structure is obscure. It does not appear that they were organized into exogamous moieties such as were the Cahuilla (Strong 1929:291).

The Cahuilla had nonpolitical, nonterritorial moieties that governed marriage patterns as well as patrilineal clans and lineages. The words for these moieties mean "Coyote" and "Wildcat." In turn, the political-ritual-corporate units (clans) were composed of 3–10 lineages, distinctly different, named, and claiming a common genitor, with one lineage recognized as the founding lineage (Bean 1978; Bean and Vane 2001). Clans owned a large territory in which each lineage owned a village site and specific resource areas. Clan lineages cooperated in large communal subsistence activities (including animal drives, hunts, controlled burns) and in performing rituals.

The Luiseño and Cahuilla were, for the most part, hunters, collectors, and harvesters. Clans were apt to own land in valleys, foothill, and mountain areas, providing them with the resources of many different ecological niches. Individual lineages or families owned specific resource areas within the clan territory. Although any given village had access to only some of the necessary resources, briskly flourishing systems of trade and exchange gave them access to neighboring and distant resources. Rules that forbade marriage to anyone related within five generations or belonging to the same moiety ensured that everyone had relatives living in many ecozones; this was an important arrangement because relatives were invited to ceremonies. The ceremonial exchange of gifts at such events provided a way for drought-stricken groups to get food in return for treasure goods.

The Luiseño and Cahuilla, like other California Indians, understand the universe in terms of power, which they believed to be sentient and willful. In their view, power is the principal causative agent for all phenomena. Unusual natural phenomena are viewed as especially sacred, serving as the repositories of concentrations of power. Mountain tops are held sacred, as are unusual rock formations, springs, and streams. Rock art sites are sacred, having been the sites of ceremonies. Burial and cremation sites are also sacred, as are many other places of residual power. In addition, various birds, but especially eagles, condors, hawks, and other birds of prey and their symbolic representations, are revered as sacred beings of great power and were sometimes killed ritually and mourned in mortuary ceremonies similar to those for human elites. For this reason, bird cremation sites are also sacred.

Because of these strong beliefs, rituals were (and continue to be) a constant factor in the life of Native American individuals. Some rituals were scheduled and routine (e.g., birth, puberty, death, mourning, and the eagle ritual and first rites), while others, such as the deer ceremony,

DRAFT

bird dance, enemy songs, and rain ritual, were sporadic and situationally performed (Bean 1978; Bean and Vane 2001:VII.A-3-10).

2.4 HISTORIC SETTING

The Spanish occupation of Alta California and the founding of the San Diego de Alcalá mission in San Diego occurred in 1769, resulting in compilation of written records. The following historic context of California was taken primarily from Clark and Smallwood (2015). Exploration of the California coast in the sixteenth and seventeenth centuries was the basis for the Spanish claim to the region. In the eighteenth century, Spain recognized that to strengthen its claim, it would have to settle Alta California to preclude encroachment by the Russians and British traders from the north. Therefore, in the latter half of the eighteenth century, Spain and the Franciscan Order founded a series of 3 presidios, or military camps, and 21 missions along the California coast, beginning at San Diego in 1769. The Spanish also carried out exploratory expeditions into the interior regions, including the Mojave Desert, to identify travel routes to the coast and to establish interior settlements.

With the signing of the Treaty of Guadalupe-Hidalgo on February 2, 1848, California had formally become an American territory, and 2 years later, on September 9, 1850, California became the thirty-first state in the Union. Between those 2 years came a large influx of eastern immigrants seeking their fortunes. The catalyst for this influx was James Marshall's 1848 discovery of gold at Sutter's Mill (Starr 2005), and the population and wealth in the early statehood years were concentrated in the northern part of the state. Ranching was the main occupation in the southern counties, providing meat and supplies to the north. The floods and drought of the 1860s brought that era to a close, and the completion of the transcontinental railroad in 1869 opened California to agricultural settlement.

Southern California was promoted as an ideal agricultural area, with fertile soil and a mild climate. Reports on California painted beautiful pictures that appealed to both Americans and Europeans alike. There were three land booms tied to railroad expansion: (1) after the transcontinental railroad was completed, enabling easy travel to California; (2) in the late 1870s after the Southern Pacific Railroad was completed; and (3) in 1886–1888, when the Santa Fe Railway transcontinental line was completed. Competition between these lines incited a rate war, and both tourists and potential settlers took advantage of the low fares to come to California (Lech 2004:222).

2.4.1 Local History

As the railroads spurred land development, local population increased, and a successful movement to form a new county followed. In 1893, Riverside County was formed from parts of San Diego and San Bernardino counties, with the city of Riverside as the county seat. San Jacinto was originally part of San Diego County.

As early as 1867, the Estudillo family began to sell off some of their land grant in the San Jacinto Valley to new arrivals (Brigandi 2001). By 1868, a school district was needed to educate numerous children. Around the same time, Procco Akimo (a Russian immigrant) opened the first local store, around which grew the first settlement named San Jacinto. In May 1870, a new mail

DRAFT

route established between San Bernardino and San Diego passed through the valley (Brigandi 2001).

In 1883, San Jacinto was laid out on 160 acres owned by the San Jacinto Land Association. By 1886, San Jacinto had a population of 250 and the town boasted a two-story schoolhouse, a large hotel, and a downtown commercial block. Bacon & Ashenfelter (the largest construction firm) advertised the services of architects, contractors, and builders, with plans and specifications furnished, as well as brick contractors. There were four masons and plasterers in town, two brickyards, and a planing mill. No saloons were allowed in the town (Lech 2004). The leading families built fashionable houses, the most prominent of which was that of Francisco Estudillo. H. C. Ashenfelter ("Harry") went into real estate, among other concerns; he was also a mine owner, with interests in the community of Strawberry (now Idyllwild). Lech (2004) provided the following information from an article in the *San Jacinto Weekly Register* published on March 17, 1889:

> We all know Harry, as he has been identified with the business interests of San Jacinto ever since it started and from time to time has been connected with a number of very important business transactions which have been stepping stones toward the present and prospective future of our thriving little town.

The railroad arrived in town on the same day San Jacinto became incorporated as a city: April 9, 1888. To take advantage of the railroad for agricultural shipping, Francisco Estudillo built a large brick warehouse northeast of the depot, where space was available to local farmers (Brigandi 2001). He also built a livery stable in town, and on February 9, 1893, the *San Jacinto Register* acknowledged that he had done "his full share in aiding the growth of the town" (Brigandi 2001:12). The town grew and prospered from its role as a railroad terminus, as the station was used to transport agricultural products from the valley and lumber from the San Jacinto Mountains.

All sorts of agricultural endeavors were encouraged in the 1880s. As wells were drilled on ranches west of town, more land was put into alfalfa. Notices of new arrivals and land transfers were published in the newspaper, as was every new house and business built.

The San Jacinto Valley has been important in the production of agricultural products in Southern California for more than the last 100 years. As reliable sources of water became available during this period, farms were founded, and settlers raised a variety of crops and tended domestic animals. In this rural landscape, traditional farm buildings were constructed, occupied, and used to store agricultural products and to house livestock. As some of the farming enterprises declined, the buildings were torn down or allowed to deteriorate, leaving only traces of their physical remains. Landscape features, such as apricot orchards that once dominated the countryside, have been removed. Further loss has resulted from increasing suburban construction in the last 25 years, and this trend continued to accelerate. Nonetheless, the valley is still largely rural, with remnant farms intermixed with modern housing developments. Although some farms and rural homesteads still flourish, others have been converted to business enterprises or have disappeared completely.

DRAFT

3
CULTURAL LITERATURE AND RECORDS SEARCH

On March 8, 2023, prior to the field survey of the Project area, Æ engaged the Eastern Information Center (EIC), the branch of the California Historical Resource Information System housed at the University of California, Riverside, to complete a literature and records search. The objective of this records search was to determine whether any prehistoric or historic cultural resources had been recorded previously within the Project area and a 0.5-mile search radius of the proposed Project.

3.1 RECORDS SEARCH RESULTS

Results of the records search indicated 43 cultural resource studies have been conducted previously within the 0.5-mile search radius (Table 3-1). Eighteen of the previous studies involved a portion of the Project area. As a result, approximately 40 percent of the Project area has been studied previously.

a - Study overlaps the Project area.

The records search resulted in the identification of a total of eight previously recorded cultural resources within the 0.5-mile search radius. Six of the resources are archaeological: three prehistoric isolated artifacts, one historic refuse scatter, and two irrigation wells. In addition, two built-environment resources were identified within the 0.5-mile search radius (Table 3-2). One of the cultural resources, the Colorado River Aqueduct, is documented within the Project area. This resource is described in further detail below.

a - Resource within the Project area.

3.1.1 CA-RIV-6726H/33-011265—Colorado River Aqueduct

Originally recorded by Goodman and Neves (2000), CA-RIV-6726H consists of the Colorado River Aqueduct and its various segments, constructed in the early 1930s. The aqueduct begins at the Whitsett Intake Pumping Plant in Lake Havasu California and extends approximately

DRAFT

242 miles to its terminus at Lake Mathews. The Colorado River Aqueduct has been recommended as eligible for listing in the National Register of Historic Places (NRHP) under Criteria A, C, and D (Beedle 2008:5). Furthermore, a portion of the aqueduct was determined eligible for the NRHP with concurrence from the State Historic Preservation Officer.

3.2 HISTORIC MAP REVIEW

A series of historic maps were consulted to assess land use and development in the study area. Several USGS topographic quadrangle maps were consulted: 1901 Elsinore 1:125,000, 1901 Southern California 1:125,000, 1942 Perris 1:62,500, 1953 and 1967 Lakeview 1:24,000.

Two historic roads that appear to be aligned with modern-day Ramona Expressway and Warren Road are visible on the 1901 Elsinore map north of the Project and continue to be displayed on the latest examined maps. The 1953 Lakeview map shows a segment of the Colorado River Aqueduct in the northwestern portion of the Project, along with a component of the Colorado River Aqueduct and three structures within the agricultural fields in the southeastern Project area. The structures also appear in aerial photographs from 1966 to 1978, available online (historicaerials.com/viewer). The three structures on the southeastern corner of the Project area are no longer visible in imagery from 1985 and were likely demolished. All the maps exhibit the Colorado River Aqueduct tunnel north and south of the Project area. No other buildings, structures, or features of interest are shown in the Project area on any of the historic maps or photographs examined.

DRAFT

4
NATIVE AMERICAN COMMUNICATION

Æ contacted the Native American Heritage Commission (NAHC) on March 8, 2023, for a review of their Sacred Lands File to determine if any known Native American cultural properties (e.g., traditional use or gathering areas, or places of religious or sacred activity) are present within or adjacent to the Project area. The NAHC responded on March 15, 2023, stating the Sacred Lands File search was completed with negative results. The NAHC requested that Æ contact Native American individuals and organizations to elicit information regarding cultural resource issues related to the proposed Project, if any.

Upon review of the Native American contact list, Æ narrowed the list to 15 individuals and organizations traditionally and culturally affiliated with the geographic area of the Project. Æ sent out Project scoping letters via email and U.S. Postal Service on December 8, 2023, describing the Project and asking these individuals and organizations for their input. Copies of the letters, the list of contacts, and received responses are included in Appendix A. Æ sent follow-up email correspondence on December 22, 2023, to the organizations who had not responded to the initial request on December 8, 2023.

Individuals/organizations contacted include:

- Reid Milanovich, Chairperson for the Agua Caliente Band of Cahuilla Indians
- Amanda Vance, Chairperson of the Augustine Band of Cahuilla Indians
- Doug Welmas, Chairperson of the Cabazon Band of Mission Indians
- Daniel Salgado, Chairperson of the Cahuilla Band of Indians
- Ray Chapparosa, Chairman of the Los Coyotes Band of Cahuilla and Cupeño Indians
- Robert Martin, Chairperson for the Morongo Band of Mission Indians
- Shasta Gaughen, Tribal Historic Preservation Officer for the Pala Band of Mission Indians
- Mark Macarro, Chairperson for the Pechanga Band of Indians
- Manfred Scott, Acting Chairperson for the Quechan Tribe of the Fort Yuma Reservation
- Joseph Hamilton, Chairperson of the Ramona Band of Cahuilla
- Bo Mazzetti, Chairperson for the Rincon Band of Luiseño Indians

DRAFT

- Jessica Mauck, Director of Cultural Resources for the San Manuel Band of Mission Indians
- Lovina Redner, Tribal Chair of the Santa Rosa Band of Cahuilla Indians
- Isaiah Vivanco, Chairperson for the Soboba Band of Luiseño Indians
- Cultural Committee of the Torres-Martinez Desert Cahuilla Indians

As of January 12, 2024, Æ has received seven responses.

- Because the Project falls within the Agua Caliente Band of Cahuilla Indians' Traditional Use Area, the Tribe requested a copy of the records search, survey reports, and site records from the EIC, copies of any cultural resource documentation generated from the current Project, and shapefiles of the Project area.
- The Augustine Band of Cahuilla Indians are unaware of any cultural resources that would be affected by the Project but wish to be contacted immediately if any resources are discovered during development.
- The Cahuilla Band of Indians are unaware of any cultural resources that would be affected by the Project but wish to be contacted immediately if any resources are discovered during development. However, since this Project is within the Cahuilla Band's traditional land use area, they request to participate in monitoring once construction starts.
- The Pechanga Band of Indians requested consultation on the Project because part of the Project area is within a Traditional Cultural Property and nearly adjacent to a second Traditional Cultural Property. Therefore, the Tribe requests notification of Project start, copies of all applicable reports, government-to-government consultation with the lead agency, and monitoring by a Riverside County qualified archaeologist and Pechanga Tribal Monitor.
- The Rincon Band of Luiseño Indians has no additional information to provide, but they recommend that Æ directly contact the Soboba of Luiseño Indians as they are closer to the Project and may have pertinent information.
- The San Manuel Band of Mission Indians stated that the Project is located outside of Serrano's ancestral territory and, therefore, San Manuel will not be requesting to receive consulting party status with the lead agency or to participate in the scoping, development, or review of documents created under legal and regulatory mandates.
- The Soboba Band of Luiseño Indians stated that Project Line E is located within an area of high concern for Tribal Cultural Resources. Substantial information will be provided to the lead agency during consultation.

Complete responses from each contact are attached in Appendix A.

DRAFT

5
METHODS AND RESULTS

This chapter details the methods and results of the intensive pedestrian survey of the Project area. Portions of the Project were previously surveyed during initial phases of the Project. Approximately 20 percent of the Project area was inaccessible during the current survey due mainly to dense tree and weed growth in various areas (Figure 5-1). The intensive survey was completed by Æ archaeologist Andrew DeLeon on November 29, 2023.

5.1 SURVEY METHODS

DeLeon began surveying on the northwestern portion of the Project area and proceeded south. The survey was conducted in 15-meter transects oriented east–west, moving westward through the Project area. While surveying, DeLeon photographed the Project area at various locations to document its current condition. Any newly identified resources were to be photographed and mapped with an Arrow 100 global navigation satellite system receiving unit and iPad. DeLeon also visited the locations of the previously recorded cultural resource mapped within the Project area.

5.2 SURVEY RESULTS

The entire Project area is heavily disturbed, with the northwestern and southeastern portions being the most affected. In the northwestern portion, DeLeon encountered challenges due to heavy weed growth and loose dogs near the greenhouses on the western side, which prevented survey of the open field areas south of the Colorado River Aqueduct (CRA, 33-011265/ CA-RIV-6726H). However, DeLeon was able to conduct transects with 15-meter spacing north of the CRA. The northwestern portion of the Project area appeared to be disturbed entirely, primarily due to active facilities and agriculture. The ground visibility was poor, with only two percent visibility due to extensive grass coverage (Figure 5-2). The surface soil was a soft gray silt loam.

DRAFT

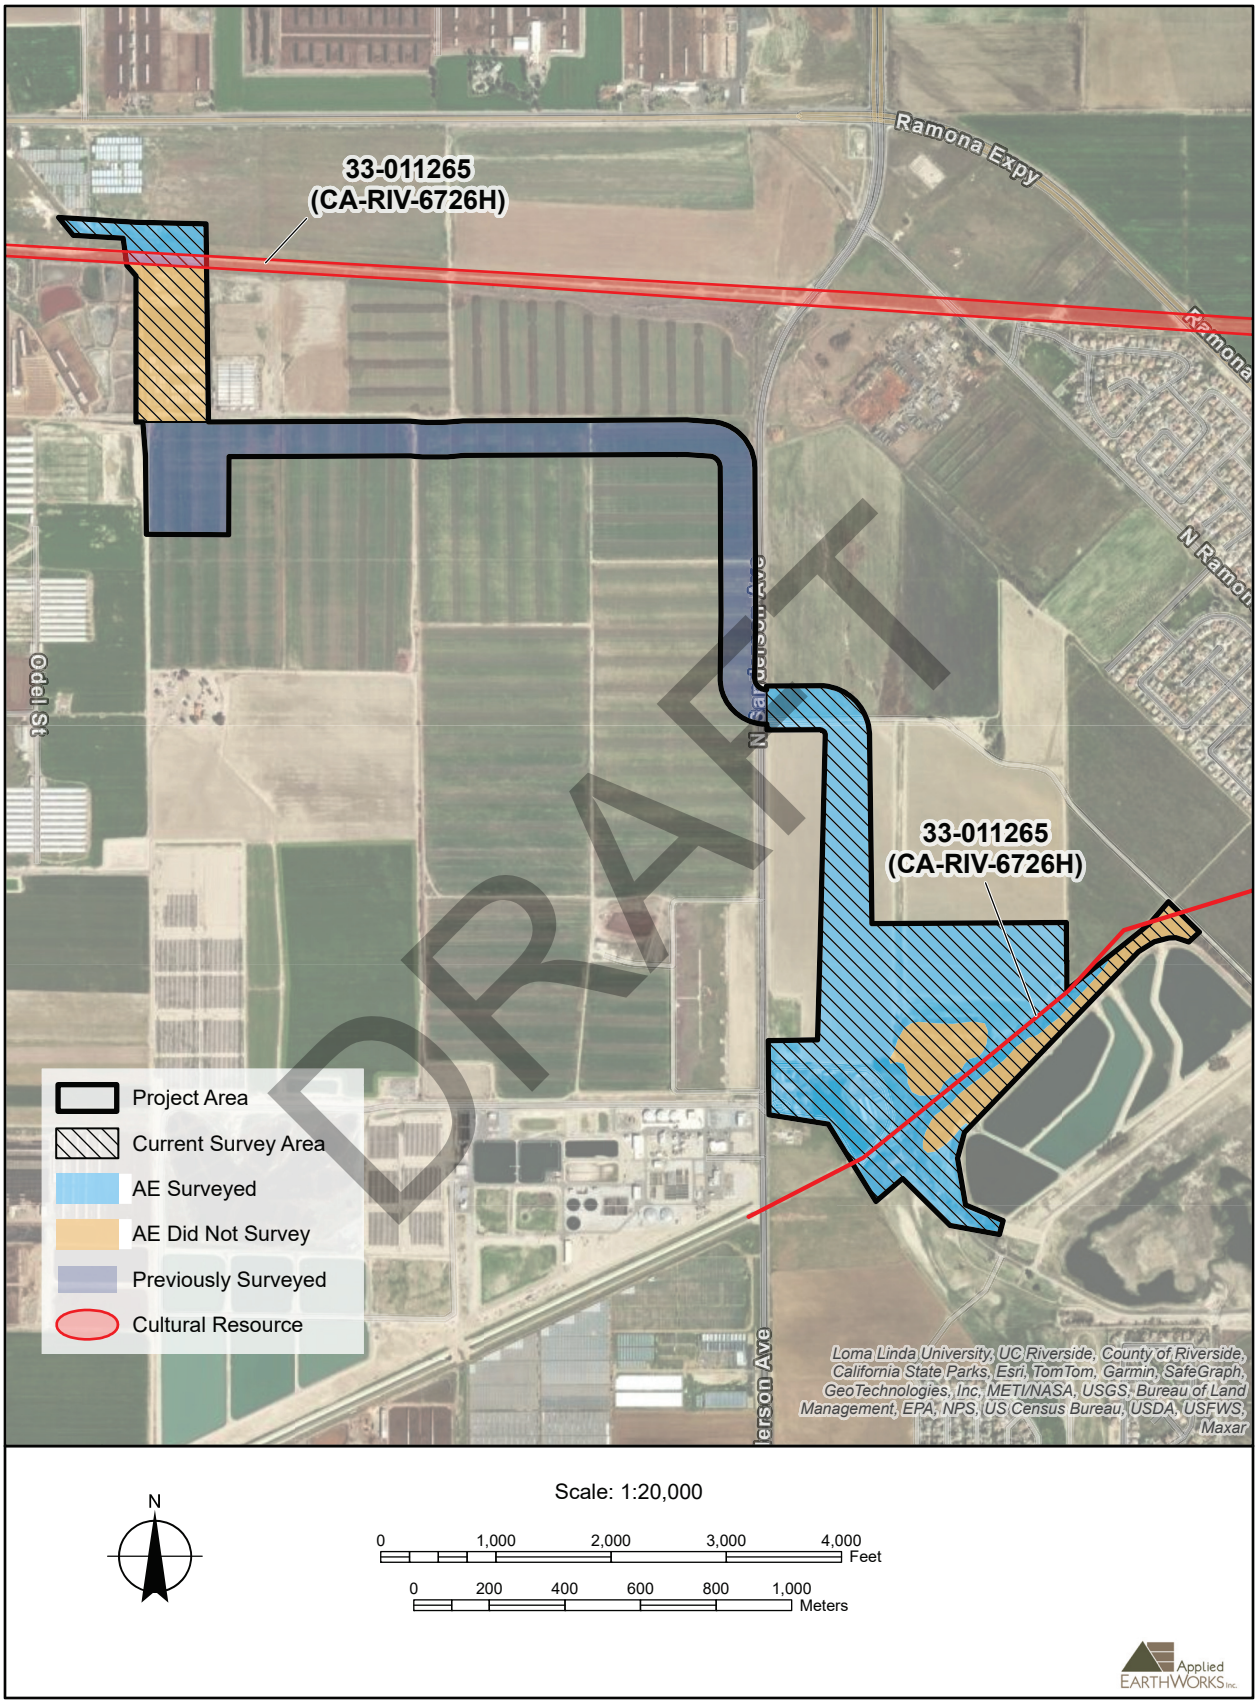

Figure 5-1 Cultural resources and survey coverage within the Project area.

Figure 5-2 Northwestern corner, facing south.

Almost all the area was disturbed in the southeastern portion of the Project, mainly due to active agriculture and occupied homestead property (Figure 5-3). The agricultural fields were visible on satellite imagery, indicating the extent of the disturbance. However, the southern half of the southeastern Project area contained densely forested areas of mainly eucalyptus, cottonwood, willow, palo verde trees, and Russian thistle, which made surveying on foot difficult. Considering the inconsistent terrain, DeLeon focused on surveying open areas clear of dense vegetation. Only the southernmost extension of the southeastern Project area was accessible for on-foot surveying.

5.2.1 Previously Documented Resources

Upon completion of the survey, Æ confirmed the Colorado River Aqueduct (CA-RIV-6726H/ 33-011265) crosses through the Project area underground at two locations. This resource is outside the Project area's vertical limits and, therefore, will not be impacted by construction of the Project.

DRAFT

Figure 5-3 Overview from southwestern corner of homestead, facing northeast.

DRAFT

6
MANAGEMENT RECOMMENDATIONS

Æ did not encounter any previously unrecorded cultural resources within the Project area during the intensive pedestrian survey. However, the previously recorded cultural resource within the Project area was revisited—segments of the Colorado River Aqueduct (33-011265/ CA-RIV-6726H). The Colorado River Aqueduct crosses the Project area underground. This resource is outside the Project's vertical limits and, therefore, will not be impacted by the construction of the Project.

The entire Project area is highly disturbed on the surface by agricultural activity, road development, and addition of modern structures. Geological data indicate no Ab (buried) horizons for soil series mapped within the Project area. Although the Chino soil series contains well developed A and C horizons, the integrity of those deposits is questionable due to modern agricultural activities. Although the Project area is disturbed from agricultural activity and soil sensitivity appears low, previous prehistoric isolated finds and historic archaeological sites identified by the records search in the buffer for the current Project indicate a potential for subsurface deposits. In addition, it is Æ's experience in this region that buried deposits can be found near the San Jacinto River. Therefore, Æ recommends archaeological monitoring during surface grubbing or clearing and initial grading within the Project area.

It should be noted that the Project falls within the traditional land use area of the Agua Caliente Band of Cahuilla Indians. The Augustine Band of Cahuilla Indians and the Cahuilla Band of Indians are unaware of any cultural resources that would be affected by the Project but request to be notified immediately if any resources are discovered during development. However, since this Project is within the Cahuilla Band's traditional land use, they requested to participate in monitoring once construction begins. The Pechanga Band of Indians requested consultation on the Project, as part of the Project area is within a Traditional Cultural Property. The Rincon Band of Luiseño Indians has no additional information to provide, but they recommend that Æ directly contact Soboba of Luiseño Indians as they are closer to the Project and may have pertinent information. The San Manuel Band of Mission Indians will not participate as the Project is located outside of Serrano ancestral territory. The Soboba Band of Luiseño Indians stated that Project Line E is within an area of high concern for Tribal Cultural Resources. No further comments were received from the tribes after follow-up communication.

Finally, if the Project area is expanded to include areas not covered by this survey or other recent cultural resource studies, additional cultural resource studies may be required.

APPENDIX A

Native American Communication

DRAFT

LIST OF NATIVE AMERICAN CONTACTS AND RECORD OF RESPONSES

Name	Date & Time of Calls	Responses
Reid Milanovich Chairperson Agua Caliente Band of Cahuilla Indians	December 8, 2023 December 14, 2023	Scoping letter sent via email. Response received from Cultural Resource Analyst Xitlaly Madrigal. The Project is located within the Tribe's Traditional Use Area and therefore the Tribe requests copies of any cultural resource documentation (report, site records) generated from the current Project, a copy of the records search, with associated survey reports and site records from the information center. The Tribe also requests the presence of a cultural resource monitor(s) during any ground disturbing activities, including any archaeological testing or surveys.
Amanda Vance Chairperson Augustine Band of Cahuilla Indians	December 8, 2023 December 11, 2023	Scoping letter sent via email. Response received from Jacobia Kirksey, Tribal Operations Specialist, on 12/11/2023. The Tribe is not aware of any cultural resources that may be affected by the Project but wishes to be contacted immediately if any cultural resources are discovered during construction.
Doug Welmas Chairperson Cabazon Band of Mission Indians	December 8, 2023 December 22, 2023	Scoping letter sent via email. Follow-up sent via email. No response received.
Daniel Salgado Chairperson Cahuilla Band of Indians	December 8, 2023 December 11, 2023	Scoping letter sent via email. Response received from Anthony Madrigal, THPO, and Lorrie Gregory, the Cultural Resource Coordinator, on 12/11/2023. The Tribe is not aware of any cultural resources that may be affected by the Project. However, since this Project is within Cahuilla's traditional land use, they request to participate in monitoring once construction is completed. And that we send over any associated cultural materials for review and to be contacted immediately.
Ray Chapparosa Chairperson Los Coyotes Band of Cahuilla and Cupeno Indians	December 8, 2023 December 22, 2023	Scoping letter sent via post. Follow-up phone call made to the contact number listed for Ray Chapparosa on the NAHC contact list. A voicemail was left briefly describing the Project and contact number, should the Tribe have any comments.

DRAFT

Name	Date & Time of Calls	Responses
Robert Martin Chairperson Morongo Band of Mission Indians	December 8, 2023 December 22, 2023	Scoping letter sent via email. Follow-up sent via email. No response received.
Shasta Gaughen Tribal Historic Preservation Office Pala Band of Mission Indians	December 8, 2023 December 22, 2023	Scoping letter sent via email. Follow-up sent via email. No response received.
Mark Macarro Chairperson Pechanga Band of Indians	December 8, 2023 December 11, 2023	Scoping letter sent via email. Response received from Paul Macarro, the Cultural Coordinator on 12/11/2023. The Tribe wishes to consult on the Project since part of the Project area is situated within a Traditional Cultural Property and closely adjacent to a second Traditional Cultural Property. Therefore, the Tribe requests notification of Project start, copies of all applicable reports, government to government consultation with the Lead Agency, and monitoring by a Riverside County qualified archaeologist and Pechanga Tribal Monitor.
Manfred Scott Acting Chairperson Quechan Tribe of the Fort Yuma Reservation	December 8, 2023 December 22, 2023	Scoping letter sent via email. Follow-up sent via email. No response received.
Joseph Hamilton Chairperson Ramona Band of Cahuilla	December 8, 2023 December 22, 2023	Scoping letter sent via email. Follow-up sent via email. No response received.
Bo Mazzetti Chairperson Rincon Band of Luiseno Indians	December 8, 2023 December 22, 2023 January 4, 2024	Scoping letter sent via email. Response received from Shuuluk Linton on 01/04/2024. At this time, the tribe has no additional information to provide. They recommend that Æ directly contact Soboba of Luiseño Indians as they are closer to the project and may have pertinent information.
Jessica Mauck Director of Cultural Resources San Manuel Band of Mission Indians	December 8, 2023 December 11, 2023	Scoping letter sent via email. Response received from Alexandra Mc Cleary on 12/11/2023. The Project is located outside of Serrano's ancestral territory and, as such, San Manuel will not be requested to receive consulting party status with the lead agency or to participate in the scoping, development, or review of documents created under legal and regulatory mandates.
Lovina Redner Tribal Chair Santa Rosa Band of Cahuilla Indians	December 8, 2023 December 22, 2023	Scoping letter sent via email. Follow-up sent via email. No response received

Re: San Jacinto Master Drainage Plan Project, Riverside County

Dear Mr. DeLeon:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

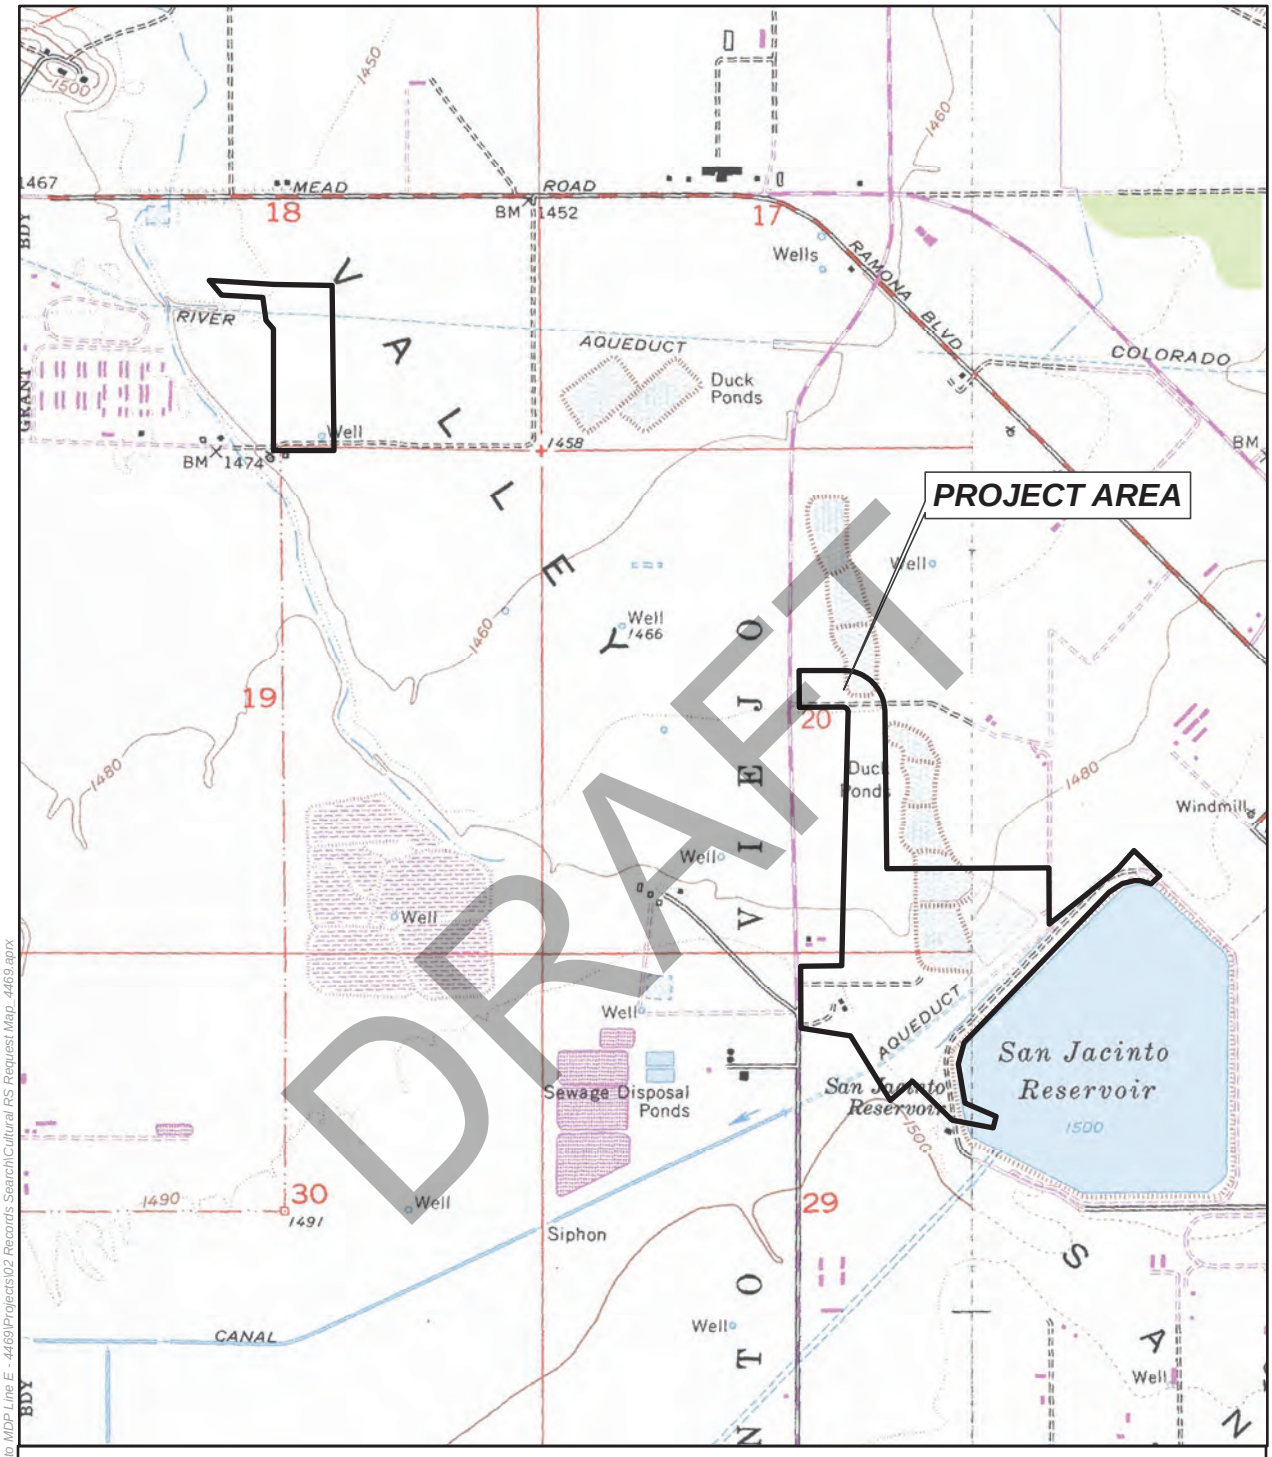
Re: Cultural Resource Assessment for the San Jacinto Master Drainage Plan Line E Project, City of San Jacinto, Riverside County, California

Dear Chairperson Amanda Vance:

On behalf of Albert A. Webb Associates, Applied EarthWorks, Inc. (Æ) is conducting a cultural resource study for the San Jacinto Master Drainage Plan Line E Project, City of San Jacinto, Riverside County, California (Project). The Project involves construction of a 3-mile-long storm drain channel (Line E) which is an implement of the overall San Jacinto Master Drainage Plan. The Project is subject to the California Environmental Quality Act (CEQA) with the City of San Jacinto as the lead CEQA agency. The Project is located within Sections 18, 20, and 29 of Township 4 South, Range 1 West as indicated on the attached map. Specifically, the Project area is located south of Ramona Expressway and east of Sanderson Avenue.

Æ conducted a literature and records search review, which indicated 8 cultural resources within a 0.5-mile radius of the Project area. One of those resources (The Colorado River Aqueduct) is documented within the project area. Æ was contracted to perform an archaeological survey of the Project area, which was completed on November 29, 2023. The project area consists primarily of active agricultural facilities, land, and a modern homestead. AE was able to reidentify the single subterranean cultural resource mapped within the Project area during the survey. No other cultural resources were identified within the Project area.



As part of the cultural resource assessment of the Project area, Æ requested a search of the *Sacred Lands File* by the Native American Heritage Commission (NAHC) on March 8, 2023. The NAHC responded on March 15, 2023, noting that *Sacred Lands File* search was completed with negative results. Should your records show that cultural properties exist within or near the Project area shown on the enclosed map, or if you have any concerns regarding Native American issues related to the overall Project, please contact me at (951) 766-2000 or via letter expressing your concerns. You may also e-mail me at adeleon@appliedearthworks.com. If I do not hear from you within the next two weeks, I will contact you with a follow-up email or phone call.

Please be aware that your comments and concerns are very important to us, as well as to the successful completion of this Project. I look forward to hearing from you in the near future. Thank you, in advance, for taking the time to review this request.

Respectfully yours,

Andrew DeLeon

Re: Cultural Resource Assessment for the San Jacinto Master Drainage Plan Line E Project, City of San Jacinto, Riverside County, California

Dear Chairperson Ray Chapparosa:

On behalf of Albert A. Webb Associates, Applied EarthWorks, Inc. (Æ) is conducting a cultural resource study for the San Jacinto Master Drainage Plan Line E Project, City of San Jacinto, Riverside County, California (Project). The Project involves construction of a 3-mile-long storm drain channel (Line E) which is an implement of the overall San Jacinto Master Drainage Plan. The Project is subject to the California Environmental Quality Act (CEQA) with the City of San Jacinto as the lead CEQA agency. The Project is located within Sections 18, 20, and 29 of Township 4 South, Range 1 West as indicated on the attached map. Specifically, the Project area is located south of Ramona Expressway and east of Sanderson Avenue.

Æ conducted a literature and records search review, which indicated 8 cultural resources within a 0.5-mile radius of the Project area. One of those resources (The Colorado River Aqueduct) is documented within the project area. Æ was contracted to perform an archaeological survey of the Project area, which was completed on November 29, 2023. The project area consists primarily of active agricultural facilities, land, and a modern homestead. AE was able to reidentify the single subterranean cultural resource mapped within the Project area during the survey. No other cultural resources were identified within the Project area.

As part of the cultural resource assessment of the Project area, Æ requested a search of the *Sacred Lands File* by the Native American Heritage Commission (NAHC) on March 8, 2023. The NAHC responded on March 15, 2023, noting that *Sacred Lands File* search was completed with negative results. Should your records show that cultural properties exist within or near the Project area shown on the enclosed map, or if you have any concerns regarding Native American issues related to the overall Project, please contact me at (951) 766-2000 or via letter expressing your concerns. Re: San Jacinto Master Drainage Plan - Line E

Dear Mr. Andrew DeLeon,

The Agua Caliente Band of Cahuilla Indians (ACBCI) appreciates your efforts to include the Tribal Historic Preservation Office (THPO) in the San Jacinto Master Drainage Plan Line E project. The project area is not located within the boundaries of the ACBCI Reservation. However, it is within the Tribe's Traditional Use Area. For this reason, the ACBCI THPO requests the following:

*Copies of any cultural resource documentation (report and site records) generated in connection with this project.

*A copy of the records search with associated survey reports and site records from the information center.

*The presence of an approved Cultural Resource Monitor(s) during any ground disturbing activities (including archaeological testing and surveys). Should buried cultural deposits be encountered, the Monitor may request that destructive construction halt and the Monitor shall notify a Qualified Archaeologist (Secretary of the Interior's Standards and Guidelines) to investigate and, if necessary, prepare a mitigation plan for submission to the State Historic Preservation Officer.

DRAFT

Again, the Agua Caliente appreciates your interest in our cultural heritage. If you have questions or require additional information, please call me at (760) 423-3485. You may also email me at ACBCI-THPO@aguacaliente.net.

SUBJECT: Cultural Resource Assessment for the San Jacinto Master Drainage Plan Line E Project, City of San Jacinto, Riverside County, California

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources have resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time, we are unaware of specific cultural resources that may be affected by the proposed project, however, in the event, you should discover any cultural resources during the development of this project please contact our office immediately for further evaluation.

Very truly yours,
Jacobia Kirksey

RE: Request for Information for the San Jacinto Master Drainage Plan-Line E Project, City of San Jacinto, Riverside County, California

Dear Mr. DeLeon,

The Pechanga Band of Indians ("the Tribe") appreciates your request for information regarding the above referenced Project. After reviewing the provided maps and our internal documents we have determined that the Project area is not within Reservation land's, although it is located in the heart of Our Ancestral Territory. At this time, we are interested in participating in this Project based upon Our 'Ayélkwish/Traditional Knowledge of the area and because of its placement entirely within 2 distinct Ancestral Placenames (in the northern/southern APE's). Additionally, we have 2 Sacred Lands Filing's for Traditional Cultural Properties located 1.28 miles west-northwest and at 1.43 miles due west from this proposed-Project. There are in upwards of 60 Ancestral/historical archaeological sites and over 40, GPS-recorded Ancestral-features located 62 yards-to-1mile away from this Projects'-APE's. 1966-to-present day historic aerial records depict properties that have retained their farming, ranch, or water-project activities. The Tribe maintains—a majority of this Project's native soils remain intact below the plow-zone. The San Jacinto River once connected a dozen villages along its span in our Ancestral Territory. A National Hydrography Dataset (NHD)-blueline feeder for the San Jacinto courses between 115 yards-to-.67 of a mile from the Projects' APE's. As evidenced by the upwards of 40 Ancestral features nearby, this region's waterways provided perennial water-sources for nearby Ancestral Clans. The nearness of this long-term blueline and the San Jacinto River to the Project, is *very concerning* to the Tribe. Given a combination of Our Culture's burial practices and a close proximity to long-term water sources often, increases potential impacts to our Ancestor's sacred sites. Because of this Project's nearness to known Ancestral human-remains and ceremonial sites, in view of this Project's placement *directly within* a Placename and nearby to 2 Traditional Cultural Properties, bearing in mind the adjacent NHD-waterway, considering the close proximity of 60 previously recorded sites and numerous features, and because of longstanding project experience within this Project's vicinity the Tribe therefore, is interested in participating in this Project. Pechanga believes that the possibility of recovering sensitive subsurface resources during ground-disturbing activities for this Project is extremely high.

DRAFT

The Tribe is dedicated to providing comprehensive cultural information to you and your firm for inclusion in the archaeological study as well as to the Lead Agency for CEQA review. At this time, the Tribe requests the following so we may continue the consultation process and to provide adequate and appropriate recommendations for the Project:

1) Notification once the Project begins the entitlement process, if it has not already;
2) Copies of all applicable archaeological reports, site records, proposed grading plans and environmental documents (EA/IS/MND/EIR, etc);
3) Government-to-government consultation with the Lead Agency; and
4) The Tribe believes that monitoring by a Riverside County qualified archaeologist and a professional Pechanga Tribal Monitor may be required during earthmoving activities. Therefore, the Tribe reserves its right to make additional comments and recommendations once the environmental documents have been received and fully reviewed.
5) In the event that subsurface cultural resources are identified, the Tribe requests consultation with the Project proponent and Lead Agency regarding the treatment and disposition of all artifacts.

As a Sovereign governmental entity, the Tribe is entitled to appropriate and adequate government-to-government consultation regarding the proposed Project. We would like you and your client to know that the Tribe does not consider initial inquiry letters from project consultants to constitute appropriate government-to-government consultation, but rather tools to obtain further information about the Project area. Therefore, the Tribe reserves its rights to participate in the formal environmental review process, including government-to-government consultation with the Lead Agency, and requests to be included in all correspondence regarding this Project.

Please note that we are interested in participating in surveys within 'Atáaxum/Payómkawichum Ancestral Territory. Prior to conducting any surveys, please contact the Cultural Department to schedule specifics. If you have any additional questions or comments, please contact me at pmacarro@pechanga-nsn.gov or 951-770-6306.

MANAGEMENT SUMMARY

Applied EarthWorks, Inc. (Æ), at the request of Albert A. Webb Associates, assessed the potential for impacts to significant paleontological resources for the San Jacinto Master Drainage Plan (MDP) Line E Project (Project) in the city of San Jacinto, Riverside County, California. The Project involves the construction of a 3-mile-long storm-drain channel as part of the MDP on approximately 1,920 acres of land in northern San Jacinto, which will provide flood protection to the San Jacinto Commerce Center Specific Plan. Æ prepared this Paleontological Resource Assessment (PRA) in partial satisfaction of California Environmental Quality Act (CEQA) requirements. The City of San Jacinto is the lead agency for CEQA compliance.

This PRA was completed from a combination of desktop studies and fieldwork. The desktop studies included a review of published and unpublished literature and maps, as well as museum records searches. The purpose of these studies was to identify the geologic units in the Project area and to determine whether previously recorded paleontological localities occur either within the Project area, or within the same geologic units nearby but outside the Project area. As a result of the desktop studies and fieldwork, Æ has determined that the Project area has High B Sensitivity based on Riverside County's sensitivity rankings.

Æ recommends preparation of a Paleontological Resource Impact Mitigation Program (PRIMP) by a qualified professional paleontologist (Paleontological Principal Investigator, Project Paleontologist) as defined by mitigation paleontology industry standards and/or the Society of Vertebrate Paleontology. The PRIMP will specify the steps to be taken to mitigate impacts to paleontological resources. For instance, Worker's Environmental Awareness Program training should be prepared prior to the start of Project-related ground disturbance and presented in person to all field personnel to describe the types of paleontological resources that may be found and the procedures to follow if any are encountered. The PRIMP also will include a monitoring plan that indicates where construction monitoring will be required and the frequency of required monitoring (i.e., full-time, spot-checks, etc.). to ensure adverse impacts to paleontological resources will be reduced to a less-than-significant level in accordance with CEQA.

1
INTRODUCTION

Applied EarthWorks, Inc. (Æ), at the request of Albert A. Webb Associates, assessed the potential for impacts to significant paleontological resources for the San Jacinto Master Drainage Plan (MDP) Line E Project (Project) in the city of San Jacinto, Riverside County, California. Æ prepared this Paleontological Resource Assessment (PRA) in partial satisfaction of California Environmental Quality Act (CEQA) requirements. The City of San Jacinto (City) is the lead agency for CEQA compliance.

1.1 PROJECT DESCRIPTION

The Project is within the western portion of the city of San Jacinto in Riverside County (Figure 1-1). Specifically, the approximately 1,920-acre Project area is south-southwest of the intersection of Ramona Expressway and North Sanderson Avenue. The northwestern corner of the Project area is approximately 1 mile west of the intersection, and the southeastern corner borders and partially overlaps the east-northeastern side of the San Jacinto Reservoir approximately 1.7 miles south of the intersection. The Project area is mapped in Sections 18, 19, 20, and 29, and unsectioned areas of Township 4 South, Range 1 West, San Bernardino Baseline and Meridian, as shown on the U.S. Geological Survey (USGS) Lakeview and San Jacinto, CA, 7.5-minute topographic quadrangle maps (Figure 1-2).

The Project is a component of the MDP that involves development of a 3-mile-long storm-drain channel that will provide flood protection to the San Jacinto Commerce Center Specific Plan. Storm water will flow from south to north, beginning from an outlet channel of a large joint flood-control and confluence basin at the southeastern terminus and ending at the existing Metropolitan Water District of Southern California aqueduct right-of-way at the northwestern terminus. The Project will involve construction of an earthen channel measuring 65 feet wide and up to 10 feet high, with side slopes inclined at 4:1 (horizontal:vertical), as well as several sloped rip-rap drops along the alignment. The Project also will include 20-foot-wide access roads on both sides of the channel along with seven 6- to 8-cell reinforced concrete box culverts. One of the culverts will intersect Sanderson Avenue, and the remaining culverts will intersect future roadways. The maximum anticipated depth of excavation for the Project is approximately 20 feet below ground surface (bgs).

DRAFT

1.2 PURPOSE OF INVESTIGATION

This PRA is designed to accomplish several goals: (1) identify the geologic units within the Project area and assess their paleontological resource potential; (2) determine whether the Project has the potential to adversely impact scientifically significant paleontological resources; (3) provide Project-specific management recommendations for paleontological resources, as necessary; and (4) demonstrate compliance with state laws and local regulations. Section 1.4 describes the ways in which this PRA meets the stated goals.

DRAFT

1.3 KEY PERSONNEL

Qualifications for Æ's key paleontology personnel can be found in Appendix A. Æ Paleontology Program Manager Amy Ollendorf served as the Principal Investigator for the paleontological investigation. She oversaw each task required for this PRA, including quality control. Ollendorf qualifies as a principal investigator for paleontology per industry standards (Murphey et al., 2019). She has interdisciplinary doctor of philosophy and master of science degrees involving geology and a bachelor of science degree in geology and anthropology (double major), all of which focused on paleontological subject matter. Ollendorf is the principal investigator for paleontology on Æ's 2021–2024 California Statewide Paleontological Resource Use Permit (CA-21-06P) from the U.S. Bureau of Land Management (BLM). She also is a Registered Professional Archaeologist (RPA 12588) with over 40 years of experience.

Æ Senior Paleontologist Chris Shi completed the desktop research and wrote the PRA. Shi has the necessary qualifications to meet the Society of Vertebrate Paleontology (SVP; 2010) and industry standards (Murphey et al., 2019) for a qualified professional paleontologist and is an additional principal investigator for paleontology on Æ's BLM permit. He has a master's degree in geology with a focus on paleobotany, and additional graduate studies in invertebrate paleontology. Furthermore, he has over 14 years of experience in geology and paleontology, including the past 7 years in paleontological monitoring, recovery, and preparation of fossil remains, laboratory analysis, and report preparation. Æ Senior Paleontologist/Geographic Information System Analyst Melissa Macias prepared the figures for the report in coordination with Shi. Æ Paleontological Technician Victor Jiménez-González completed the paleontological field survey.

1.4 REPORT ORGANIZATION

Chapter 1 has described the Project, defined the purpose of the investigation, and provided a description of Æ's key personnel for this PRA. Chapter 2 discusses the regulatory framework governing the Project. Chapter 3 presents the paleontological sensitivity criteria and resource guidelines used for this assessment. Chapter 4 provides the methods employed, and Chapter 5 describes the geology and paleontology of the Project area. The results of the desktop studies, and paleontological sensitivity assessment are presented in Chapter 6. Management recommendations can be found in Chapter 7, and references cited are listed in Chapter 8. Appendix A provides qualifications of key personnel.

DRAFT

2
REGULATORY ENVIRONMENT

Paleontological resources (i.e., fossils) are considered nonrenewable because when they are destroyed, they cannot be replaced. As such, paleontological resources are afforded protection under various federal, state, and local laws. This Project is not subject to federal laws. Consequently, all resources are protected under state and local laws, as described in the following sections.

2.1 STATE

California is among the states that protect significant paleontological resources. CEQA is the legal framework through which this protection is accomplished. Enacted in 1970, CEQA does not directly regulate land uses but instead requires state and local agencies within California to follow a protocol of analysis and public disclosure of unavoidable environmental impacts of proposed projects and to adopt all feasible measures to mitigate those impacts.

2.1.1 California Environmental Quality Act

This Project is subject to Section 15002(a)(3) of the Guidelines for Implementation of CEQA (California Code of Regulations, Title 14, Chapter 3), which states one of the basic purposes of CEQA is the intention to "prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible." Therefore, CEQA requires detailed studies that analyze the environmental effects of a proposed project.

If a project is determined to have a potential significant environmental effect, the act requires that alternative plans and mitigation measures be considered. Specifically, Section VII(f) of Appendix G of the CEQA Guidelines, the Environmental Checklist Form, poses the question, "Will the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" If paleontological resources are identified as being within the proposed project area, the sponsoring agency must take those resources into consideration when evaluating project effects. The level of consideration may vary with the importance of the resource.

2.1.2 CEQA Implementation

Guidelines for implementation of CEQA are codified in 14 CCR 15000 et seq., which requires state and local public agencies to identify the environmental impacts of proposed discretionary activities or projects, determine if the impacts will be significant, and identify alternatives and mitigation measures that will substantially reduce or eliminate significant impacts to the environment. The various agencies within state government all have their own guidance documents to assist with CEQA compliance. The City is the government agency responsible for CEQA compliance for the Project.

DRAFT

2.2 LOCAL

In addition to state-level implementing regulations, policies, and guidance, various counties and municipalities throughout California also have developed environmental goals, policies, and guidance that pertain to paleontological resources. The following sections list all relevant goals, objectives, and policies.

2.2.1 County of Riverside

There are several policies covering paleontological resources within the County of Riverside (County) *General Plan, Multipurpose Open Space (OS) Element* (Riverside County Planning Department, 2015:OS-51):

> **OS 19.6:** Whenever existing information indicates that a site proposed for development has high paleontological sensitivity as shown on Figure OS-8, paleontological resource impact mitigation program (PRIMP) shall be filed with the Riverside County Geologist prior to site grading. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources.
>
> **OS 19.7:** Whenever existing information indicates that a site proposed for development has low paleontological sensitivity as shown on Figure OS-8, no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the Riverside County Geologist shall be notified and a paleontologist shall be retained by the project proponent. The paleontologist shall document the extent and potential significance of the paleontological resources on the site and establish appropriate mitigation measures for further site development.
>
> **OS 19.8:** Whenever existing information indicates that a site proposed for development has undetermined paleontological sensitivity as shown on Figure OS-8, a report shall be filed with the Riverside County Geologist documenting the extent and potential significance of the paleontological resources on site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources prior to approval of that department.
>
> **OS 19.9:** Whenever paleontological resources are found, the County Geologist shall direct them to a facility within Riverside County for their curation, including the Western Science Center in the City of Hemet.

2.2.2 City of San Jacinto

The City's *General Plan, Resource Management (RM) Element* also includes goals, policies, and implementation program that pertain to paleontological resources (City of San Jacinto, 2006:RM-9 and Appendix RM-5 and RM-6). Those within the cultural resources section of the document that are relevant to paleontological resources include:

> **Resource Management (RM) Goal 4:** Promote cultural awareness through the preservation of the City's historical, archaeological, and paleontological resources. Policies 4.1 through 4.4 cover the identification, protection, and preservation of such resources within the City.

DRAFT

RM-16 California Environmental Quality Act, Cultural Resources

Continue to assess development proposals for potential impacts to sensitive historic, archaeological, and paleontological resources pursuant to the California Environmental Quality Act (CEQA). The first two policies, a and b, cover archaeological and built-environment resources, but the third policy addresses paleontological resources:

c. The City shall require an assessment of the potential for development proposals to significantly impact paleontological resources pursuant to the California Environmental Quality Act Guidelines. If the project involves earthworks, the City may require a study conducted by a professional paleontologist to determine if paleontological assets are present, and if the project will significantly impact the resources. If significant impacts are identified, the City may require the project to be modified to avoid impacting the paleontological materials, require monitoring of rock units with high potential to contain significant nonrenewable paleontologic [sic] resources, or require mitigation measures to mitigate the impacts, such as recovering the paleontological resources for preservation.

DRAFT

3
PALEONTOLOGICAL RESOURCE ASSESSMENT GUIDELINES

Protection of paleontological resources requires assessment of the potential for geologic units to yield significant paleontological resources that could be directly or indirectly impacted or destroyed during Project development. Successful protection also involves the formulation and implementation of appropriate management measures to mitigate impacts. Mitigation measures are proportional to the potential of individual areas to yield intact and significant paleontological resources.

3.1 DEFINITION OF PALEONTOLOGICAL RESOURCES AND SIGNIFICANCE CRITERIA

The SVP guidelines define paleontological resources as fossils and fossiliferous deposits (SVP, 2010). Fossils are the evidence of once-living organisms as preserved in the rock record. They include both the lithified remains of ancient plants and animals and the traces thereof (trackways, imprints, burrows, etc.). In general, the SVP considers fossils to be greater than 5,000 years old (older than middle Holocene[1]) and to typically be preserved in sedimentary rocks, although certain volcanic rocks and low-grade metamorphic rocks may be fossiliferous if formed under certain conditions.

Well-preserved and identifiable individual fossils are considered significant paleontological resources if they are a type specimen, rare, a complete specimen, or part of an important diverse fossil assemblage. Of particular importance are fossils found in situ, or in their primary geologic context. These fossils are important because they are used to examine evolutionary relationships, provide insight on the development of and interaction between biological communities, establish time scales for geologic studies, and for many other scientific purposes, including investigation into paleoenvironments and paleoclimates (Scott and Springer, 2003; SVP, 2010). Among the various types of fossils, intact and in situ vertebrate fossils are usually assigned a greater significance than other types as they are comparatively rare. Consequently, more attention tends to be placed on the recovery of vertebrate fossils than other types.

3.2 PROFESSIONAL STANDARDS AND CLASSIFICATION OF PALEONTOLOGICAL RESOURCE SENSITIVITY

Most professional paleontologists in California adhere to the guidelines set forth by the SVP (2010) and industrywide standards (Murphey et al., 2019) to determine the course of paleontological mitigation for a given project unless specific city, county, state, or federal guidelines are available. The City does not have its own paleontological sensitivity guidelines. However, the County of Riverside (County) has developed a system that establishes detailed protocols for the assessment of the paleontological sensitivity of a project area and outlines

[1] Middle Holocene: the Holocene Epoch is subdivided into early (11,700 to 8,200 years ago), middle (8,200 to 4,200 years ago), and late (4,200 years ago to present) subepochs (Cohen et al., 2023). The Quaternary Period also includes the older Pleistocene Epoch, which is also subdivided into early (2.6 million to 1.8 million years ago), middle (1.8 million to 77,400 years ago), and late (77,400 to 11,700 years ago) subepochs (Cohen et al., 2023).

DRAFT

measures to follow in order to mitigate adverse impacts to known or unknown fossil resources during project development (County of Riverside, 2015). Therefore, this PRA utilizes the County's ranking system and mitigation measures.

Following the County's established process, baseline information is used to assign the paleontological sensitivity of a geologic unit(s) (or members thereof) to one of four categories—Low, Undetermined, High A (Ha), and High B (Hb) (County of Riverside, 2015). Table 3-1 shows the criteria for the categories in comparison with those of the SVP as well as mitigation recommendations for each category.

Table 3-1
Paleontological Sensitivity Classifications

Sensitivity/Potential			
County of Riverside	**SVP**	**Criteria[a]**	**Mitigation Recommendations[b]**
High A High B	High	Rock units from which vertebrate or significant specimens of other fossil types have been recovered are considered to have a high potential. Rock units with high potential also may include rock units that are temporally or lithologically suitable for the preservation of fossils (e.g., Middle Holocene and older, argillaceous and carbonate-rich paleosols, fine-grained marine sandstones, etc.). Rock units with High B Sensitivity are considered to have high potential at depths greater than 4 feet bgs.	Retain a qualified paleontologist and typically complete a field survey, PRIMP, and on-site construction monitoring. Any significant specimens discovered during monitoring will need to be prepared, identified, and curated into a museum. A final report documenting the significance of the finds will also be required.
Undetermined	Undetermined	In some cases, available literature on a particular rock unit will be scarce and a determination of whether or not it is fossiliferous or potentially fossiliferous will be difficult to make. Under these circumstances, further study is needed to determine the unit's paleontological resource potential.	A field survey is required to further assess the unit's paleontological potential. The survey may provide data for development of a PRIMP prior to construction.
Low	Low	Rocks units from which few fossils have been recovered or generally unsuitable for preservation of fossils are considered to have a low potential. These units typically yield fossils only on rare occasions and under unusual circumstances (e.g., basalt flows, recent colluvium, etc.).	Mitigation is not typically required; however, if an unanticipated paleontological resource is encountered, a qualified professional paleontologist (Principal Investigator, Project Paleontologist) may need to evaluate the resource to consider mitigation.
N/A	No Potential	Rock units that have no potential for paleontological resources are those that are formed under or exposed to immense heat and pressure, such as high-grade metamorphic rocks and plutonic igneous rocks.	No mitigation required.

a - Criteria based on County of Riverside (2015) and SVP (2010).
b - Recommendations based on County of Riverside (2015).

DRAFT

4
METHODS

This PRA was completed through desktop studies and a field survey. The twofold purpose of the off- and on-site research was: (1) to identify the geologic units in the Project area and immediate vicinity to determine whether previously recorded paleontological localities occur either within the Project area or within the same geologic units nearby and (2) to determine the sensitivity of the geologic units in the Project area for their potential to yield paleontological resources.

4.1 LITERATURE REVIEWS AND MUSEUM RECORDS SEARCHES

In many areas, the near-surface layers of sediments and sedimentary rocks are broken down and converted to soil (pedogenesis) through chemical and physical weathering processes (Boggs, 2012). During pedogenesis, any fossils preserved within the near-surface layers often are destroyed or rendered unrecognizable. Therefore, intact and identifiable fossils are unlikely to be found in soil. Reviews of relevant geologic maps, regional geological publications, and unpublished reports are necessary to ascertain the geology and stratigraphy of a project area to determine the potential for significant subsurface paleontological resources.

To supplement the map and literature reviews, Æ requested searches of records of the invertebrate and vertebrate collections maintained by the Natural History Museum of Los Angeles County (NHMLAC) and the Western Science Center of Hemet (WSC). Æ also completed online searches of two databases readily available to the public—the Paleobiology Database (PBDB) and the database maintained by the University of California Museum of Paleontology (UCMP). All records searches were completed to identify known fossil localities within or near the Project area. In addition to the museum records searches, Æ examined the geotechnical investigation report for the Project (Marquez, 2023).

4.2 FIELD SURVEY

Prior to the field survey, Shi examined recent aerial photographs of the entire Project area in Google Earth to determine likely locations of geologic outcrops and potential survey routes. For the purpose of discussing survey locations, we have defined two subareas within the Project area. The northwestern subarea includes the northwestern terminus where the proposed channel alignment meets the existing Metropolitan Water District of Southern California aqueduct right-of-way. An array of greenhouses is located in the central portion of this subarea. The southeastern subarea includes the large joint flood-control and confluence basin at the southeastern terminus, which borders the San Jacinto Reservoir. A homestead also is in the central portion of this subarea. The east-west and north-south stretches of the alignment between these two subareas cross several agricultural fields.

Victor Jiménez-González conducted the paleontological field survey for the Project on November 29, 2023, alongside Æ Associate Archaeologist Andrew DeLeon, who conducted the cultural field survey. The purpose of the survey was to confirm the presence or absence of exposed fossils on the ground surface and to evaluate geologic exposures for their potential to yield significant subsurface paleontological resources.

DRAFT

Jiménez-González started the survey from the northwestern subarea and proceeded east parallel to Ramona Expressway, then south parallel to Sanderson Avenue before crossing the street and proceeding south to the southeastern subarea. He completed the survey with a combination of close visual inspection and spot-checking. Close visual inspection was conducted where the ground surface was visible and sediments were exposed, including (1) near the array of greenhouses in the northwestern subarea; (2) around the perimeter of the homestead; and (3) within agricultural fields along the north-south stretch of the alignment north of the homestead. Jiménez-González spot-checked the remainder of the Project area where the ground surface was obscured by vegetation, including (1) most of the northwestern subarea north of the greenhouses; (2) the east-west stretch of the alignment parallel to Ramona Expressway; and (3) most of the southeastern subarea south of the homestead. He used a cellular Global Positioning System receiver to navigate through the Project area, provided notes on his field form using the ArcGIS Survey123 application, and took photographs to document the survey. Any fossils encountered were to be field-documented and not collected.

DRAFT

5
GEOLOGY AND PALEONTOLOGY

The following sections provide the geological context of the Project area, descriptions of the geologic units mapped as surface exposures within the boundaries of the Project area, and units exposed nearby and thought to be present in the subsurface. The section also includes any paleontological information reported from the units.

5.1 REGIONAL GEOLOGY

The Project area is in the San Jacinto Valley within the northern part of the geologically complex Peninsular Ranges geomorphic province (California Geological Survey, 2002)[2]. Derived from the same massive batholith (i.e., very deep igneous intrusion) as the core of the Sierra Nevada, the Peninsular Ranges are a series of mountain ranges separated by northwest-trending valleys formed from faults branching from the San Andreas Fault (Norris and Webb, 1976; California Geological Survey, 2002). The mountain ranges are bounded to the east by the Colorado Desert and range in width from 30 to 100 miles (Norris and Webb, 1976).

The Project area is within the San Jacinto Fault Zone and is crossed by the northwest-southeast-trending Casa Loma Fault (Morton et al., 2006a, 2006b). The geologic units in the region date from the Paleozoic[3] to the present, with basement rocks represented by the Mesozoic[4] Peninsular Ranges batholith and prebatholithic metasedimentary and metavolcanic rocks (Jahns, 1954; Morton et al., 2006b). Thick sequences of Cenozoic[5] sediments, mostly Quaternary in age, have accumulated above these in the valleys of the region.

5.2 GEOLOGY AND PALEONTOLOGY OF THE PROJECT AREA

The Project area is mapped on the Lakeview and San Jacinto quadrangles at a scale of 1:24,000 by Morton and Matti (2001) and Dibblee and Minch (2003), respectively. However, more recent

DRAFT

[2] A geomorphic province is a region of unique topography and geology that is readily distinguished from other regions based on its landforms and tectonic history (American Geological Institute, 1976).

[3] Paleozoic Era: Approximately 539 to 252 million years ago, subdivided into six periods—Cambrian (539–485 million years ago), Ordovician (485–444 million years ago), Silurian (444–419 million years ago), Devonian (419–359 million years ago), Carboniferous (359–299 million years ago), and Permian (299–252 million years ago) (Cohen et al., 2023).

[4] Mesozoic Era: Approximately 252 to 66 million years ago, subdivided into three periods—Triassic (252–201 million years ago), Jurassic (201–145 million years ago), and Cretaceous (145–66 million years ago) (Cohen et al., 2023).

[5] Cenozoic Era (formerly Tertiary): 66 million years ago to present, subdivided into three periods—Paleogene (66–23 million years ago), Neogene (23–2.6 million years ago), and Quaternary (2.6 million years ago to present). The Paleogene Period is subdivided into the Paleocene, Eocene, and Oligocene epochs; the Paleocene Epoch lasted from approximately 66 to 56 million years ago, the Eocene Epoch lasted from approximately 56 to 34 million years ago, and the Oligocene Epoch lasted from approximately 34 to 23 million years ago. The Neogene Period is subdivided into the Miocene and Pliocene epochs; the Miocene Epoch lasted from approximately 23 to 5.3 million years ago and the Pliocene Epoch lasted from approximately 5.3 to 2.6 million years ago. The Quaternary Period is subdivided into the Pleistocene and Holocene epochs; the Pleistocene Epoch, or last Ice Age, lasted from approximately 2.6 million to 11,700 years ago when the Holocene Epoch began; all dates according to Cohen et al. (2023).

geologic map compilations at a scale of 1:100,000 by Morton et al. (2006a) and Lancaster et al. (2012) have refined the geology of the these quadrangles and therefore, the geologic map of the Project area (Figure 5-1) is based on these compilations. The following subsections provide additional information from Morton et al. (2006b) where relevant. The subsections also summarize the findings from 19 borings completed along the entire channel alignment as part of the geotechnical investigation (Marquez, 2023).

5.2.1 Young Alluvial-Valley Deposits (Qyv_a/Qya and Qyv_{1a})

The majority of the Project area falls within undifferentiated late Pleistocene to Holocene young alluvial-valley deposits (Qyv_a), according to the surface geology map by Morton et al. (2006a). In addition, small wedges of the oldest, late Pleistocene to early Holocene subunit of the deposits (Qyv_{1a}) occur at the ground surface of the southwestern corner of the northwestern subarea and the west-southwestern side of the southeastern subarea (Morton et al., 2006a). The geologic contact between Qyv_1 and Qyv_a is delineated by the Casa Loma Fault (Morton et al., 2006a). The surface geology of the easternmost third of the southeastern subarea is also mapped by Lancaster et al. (2012) as late Pleistocene to Holocene young alluvial-valley deposits but is instead labeled as Qya. Qyv_a and Qya sediments are fluvial deposits commonly present along valley floors in the region and consist of unconsolidated to slightly consolidated, undissected to slightly dissected sand, silt, and clay (Morton et al., 2006a, 2006b; Lancaster et al., 2012). These deposits are mostly sandy in composition (subscript "a" = arenaceous) in the vicinity of the Project area. The composition of Qyv_{1a} (Morton et al., 2006a, 2006b) does not differ markedly from that of the Qyv_a and Qya deposits, other than gravel reported by Lancaster et al. (2012) for the latter unit.

The boring logs from the geotechnical report show alluvial deposits from a depth of 0.5–2.5 feet bgs to their maximum depths of either 21.5 or 51.5 feet bgs (Marquez, 2023). In most of the borings, the deposits alternate between beds with varying proportions of sand and silt (i.e., sand, silty sand, sand with silt, sandy silt, silt with sand). Three of the borings (B-1, B-4, and B-15) also encountered beds of clayey sand. The authors of the report used Morton and Matti (2001) as their reference, and their observations are consistent with the mapping. Specifically, the geologic units mapped in the Project area in Morton and Matti (2001)are identical to those mapped in Morton et al. (2006a), as the latter incorporates data from the former.

All beds of the young alluvial-valley deposits older than middle Holocene in age are potentially fossiliferous. In particular, Pleistocene alluvial deposits are well documented to have yielded a wide variety of megafauna as well as numerous invertebrate and plant taxa throughout inland valleys of Riverside and San Bernardino counties (Reynolds and Reynolds, 1991; Scott, 2007; Springer et al., 2009).

5.2.2 Artificial Fill

Marquez (2023) reported the presence of artificial fill in all the borings to depths of 0.5–2.5 feet bgs. The fill consists of locally derived sandy silt and silty sand. Because the fill consists of local, potentially fossiliferous sediments, it may yield fossils. However, such fossils, if present, are unlikely to be significant as they would be removed from their primary geologic context and may have become damaged during excavation and transport. Despite this, the fill forms only a thin veneer over undisturbed alluvial deposits in the Project area. Therefore, significant, in situ fossils may be preserved in the shallow subsurface just beneath the fill.

DRAFT

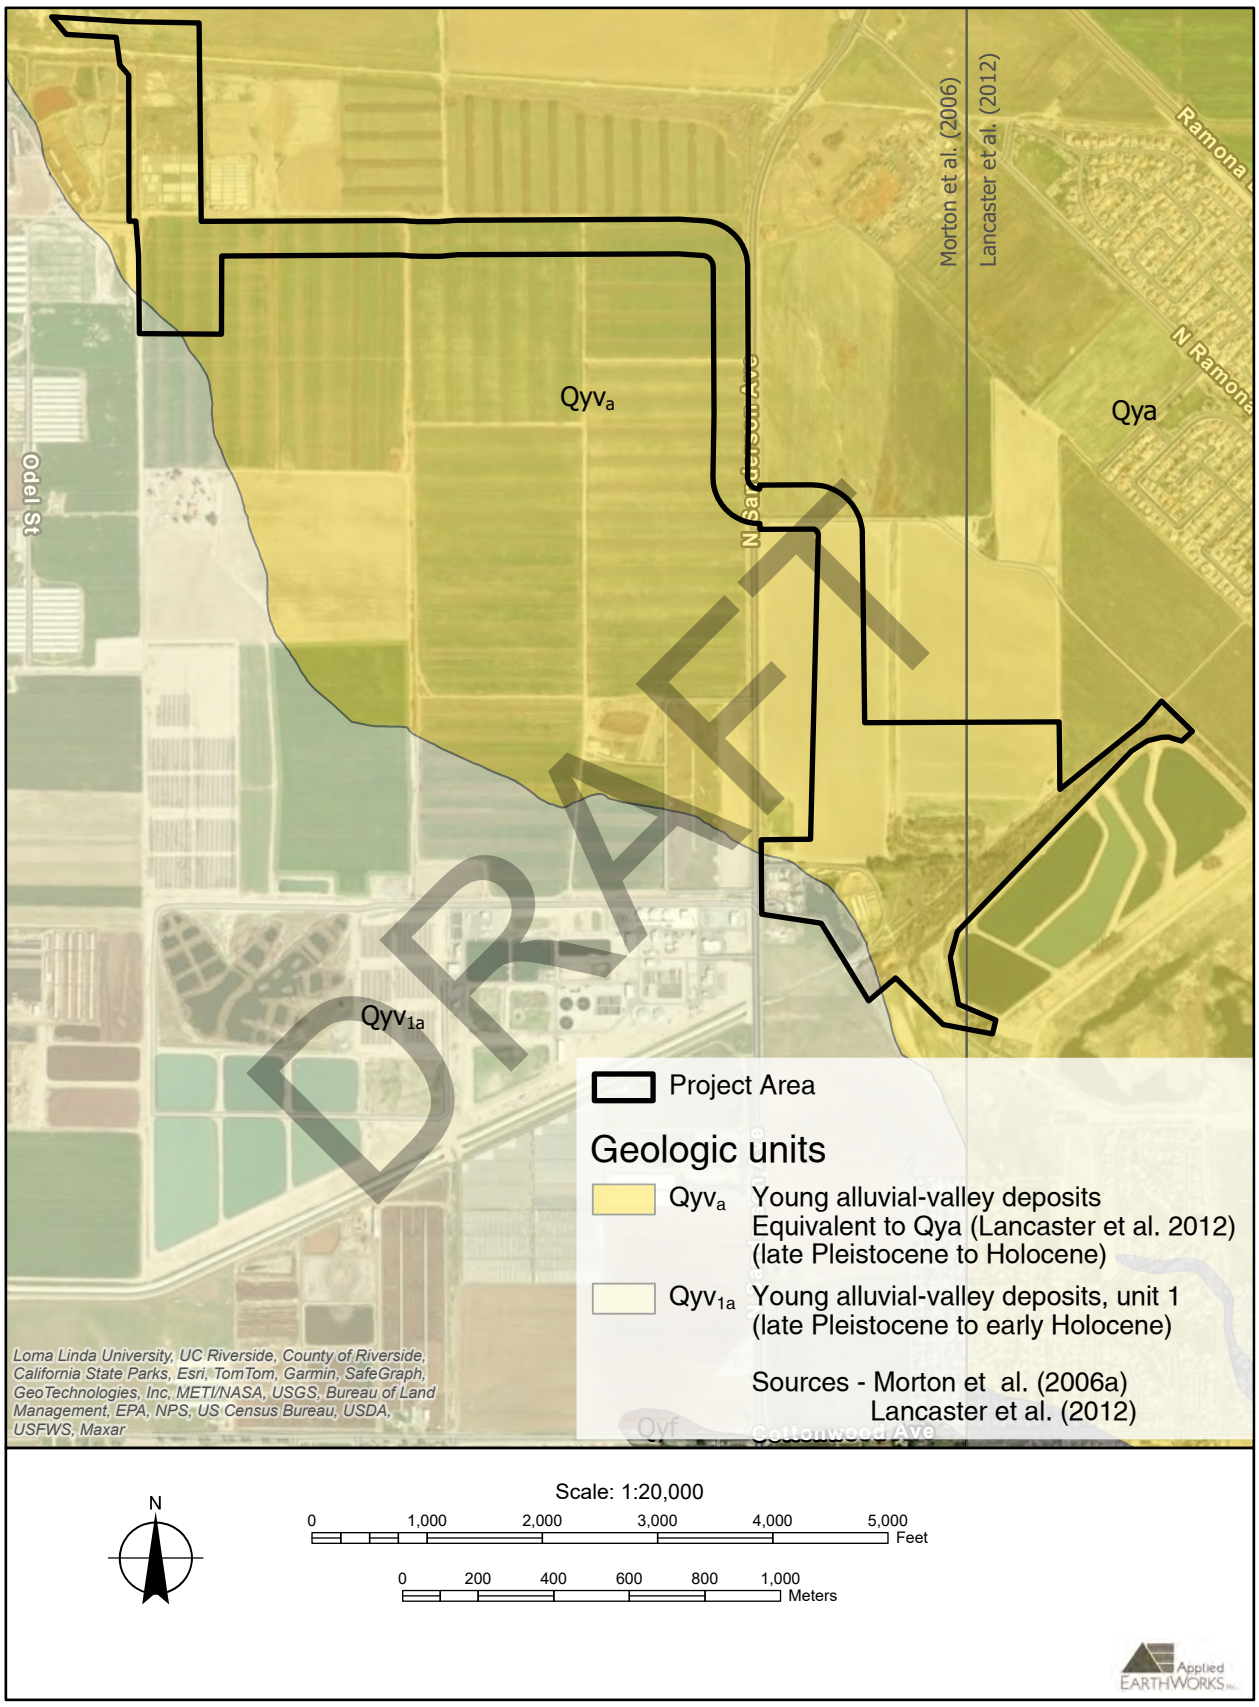

Figure 5-1 Geologic map for the Project area and vicinity.

6
RESULTS AND ANALYSIS

This chapter reports on the results of the desktop studies and fieldwork completed for this Project. Paleontological sensitivity rankings also are assigned to the geologic units mapped at the ground surface as well as those likely present at unknown depths based on the available information.

6.1 GEOTECHNICAL REPORT

The geotechnical investigation for the Project included excavation of 19 hollow-stem auger borings to depths of either 21.5 or 51.5 feet bgs along the length of the Project area, with B-1 completed in the northwestern subarea and B-19 completed in the southeastern subarea (Marquez, 2023). Specifically, borings B-1, B-2, and B-4 reached a depth of 51.5 feet bgs, whereas the rest terminated at 21.5 feet bgs. From the boring logs, a layer of artificial fill derived from local sandy silt and silty sand is at 0.5–2.5 feet bgs, followed by alternating beds of alluvial sand and silt of varying proportions, which extend to the maximum depths of the borings. Three of the borings (B-1, B-4, and B-15) also show beds of clayey sand at various depths. As discussed in the previous chapter, the authors noted the alluvial sediments were consistent with mapping by Morton and Matti (2001), whose geologic data was incorporated into Morton et al. (2006a). No paleontological resources were encountered during the geotechnical investigation.

6.2 RECORDS SEARCHES

The UCMP online database does not list any localities within a 10-mile radius of the Project area. Records search results from the PBDB, WSC, and NHMLAC are detailed below in Table 6-1, which shows all listings within a 10-mile radius of the Project area. The PBDB online database does not list any fossil localities from Pleistocene alluvial deposits within the Project area but shows numerous localities reported from Lakeview 5–6 miles to the west. The WSC search did not yield any localities within the Project area, although numerous localities are listed from Pleistocene alluvial deposits reported during construction of the Eastside Pipeline Project 1.5–2 miles to the southwest. The NHMLAC records search results do not report any localities within the Project area, although several nearby localities to the south-southwest are listed from geologic units similar to those mapped in or in the vicinity of the Project area.

6.3 FIELD SURVEY RESULTS

Low ground visibility and the absence of geologic outcrops or road cuts (Figure 6-1) limited Æ's close field examinations of the surficial geology in the Project area. The ground surface throughout the Project area was mostly obscured by vegetation, particularly in much of the northwestern and southeastern subareas and in the east-west stretch of the alignment parallel to Ramona Expressway. Jiménez-González observed exposed sediments in a few locations including the perimeter of the greenhouses in the northwestern subarea (Figure 6-2), the perimeter of the homestead in the southeastern subarea (Figure 6-3), and on dirt roads and fields between patches of vegetation along the linear, north-south stretch of the alignment in the southern half of the Project area (Figure 6-4). Most of these exposed sediments appear to have been previously disturbed from cultivation or landscaping. Jiménez-González also observed spoil

DRAFT

Table 6-1
Fossil Localities Reported near the Project Area

Locality No.	Geologic Unit (Date)	Taxa	Depth	Approximate Distance from Project Area
WSC[a]—Eastside Pipeline Project, numerous localities	Alluvial deposits (Pleistocene)	Aves (bird) Rodentia (rodent) Gastropoda (snail) Numerous other vertebrates, microvertebrates, and invertebrates	200–300 feet bgs	1.5–2 miles
PBDB[b]—Lakeview localities	Alluvial deposits (Pleistocene)	*Mammuthus* (mammoth) *Smilodon* (saber-toothed cat) *Equus* (horse) *Bison* sp. cf. *B. antiquus* (bison) Numerous other vertebrates, invertebrates, and plants	Unknown	5–6 miles
LACM[c] VP 4540	Unnamed formation, gravel pit (Pleistocene)	Equidae (horse)	Unknown	6 miles
LACM[c] VP 1653, IP 437	Unknown formation (Pleistocene)	*Squatina* (monkfish) *Gasterosteus* (stickleback) *Sobobapteron kirkbaye* (protoorthopteran insect) *Terebratalia hemphili* (terebratulid brachiopod)	Unknown	7 miles

DRAFT

piles from previous excavations east of Sanderson Avenue along the north-south stretch of the alignment, which appear identical in lithology to nearby sediments and elsewhere in the Project area. Because of the low ground visibility, lack of geologic outcrops or road cuts, and previous disturbances throughout most of the Project area, little geologic information such as stratigraphy was discernible during the survey. Of the sediments Jiménez-González did observe, he recorded poorly sorted, white (10YR 8/1) to gray (10YR 6/1) silty sand with angular gravel throughout the entire Project area. He did not observe any notable changes in lithology and did not encounter any paleontological resources during the survey.

6.4 DETERMINATION OF PALEONTOLOGICAL RESOURCE POTENTIAL WITHIN THE PROJECT AREA

Using information obtained from the desktop studies and field survey, Æ determined the paleontological resource potential of the Project area. Æ's paleontological sensitivity rankings follow the County of Riverside (2015) classification system. Based on the findings, Æ recommends the assignment of High B Sensitivity to the entire Project area (Figure 6-5).

Æ did not observe any exposures of unequivocally undisturbed alluvial deposits during the survey. Based on the presence of artificial fill in all of the boring logs and the extent of previous disturbance in the Project area, most of the sediments Æ observed during the survey may have been the locally derived artificial fill described by (Marquez, 2023). Therefore, we consider the surficial sediments in the Project area unlikely to yield significant paleontological resources. However, Æ's desktop studies indicate deposits of Qyv_a/Qya as well as Qyv_{1a} have a high potential of preserving significant paleontological resources particularly with increasing depth. (Marquez, 2023) described sediments matching the descriptions of Qyv_a/Qya at a depth of 0.5–2.5 feet bgs, just below artificial fill, throughout the Project area. Therefore, construction monitoring for paleontological resources from 4 feet bgs and downward (i.e., High B recommendation) may result in observations that can help to further refine our understanding of the geology of the Project area.

DRAFT

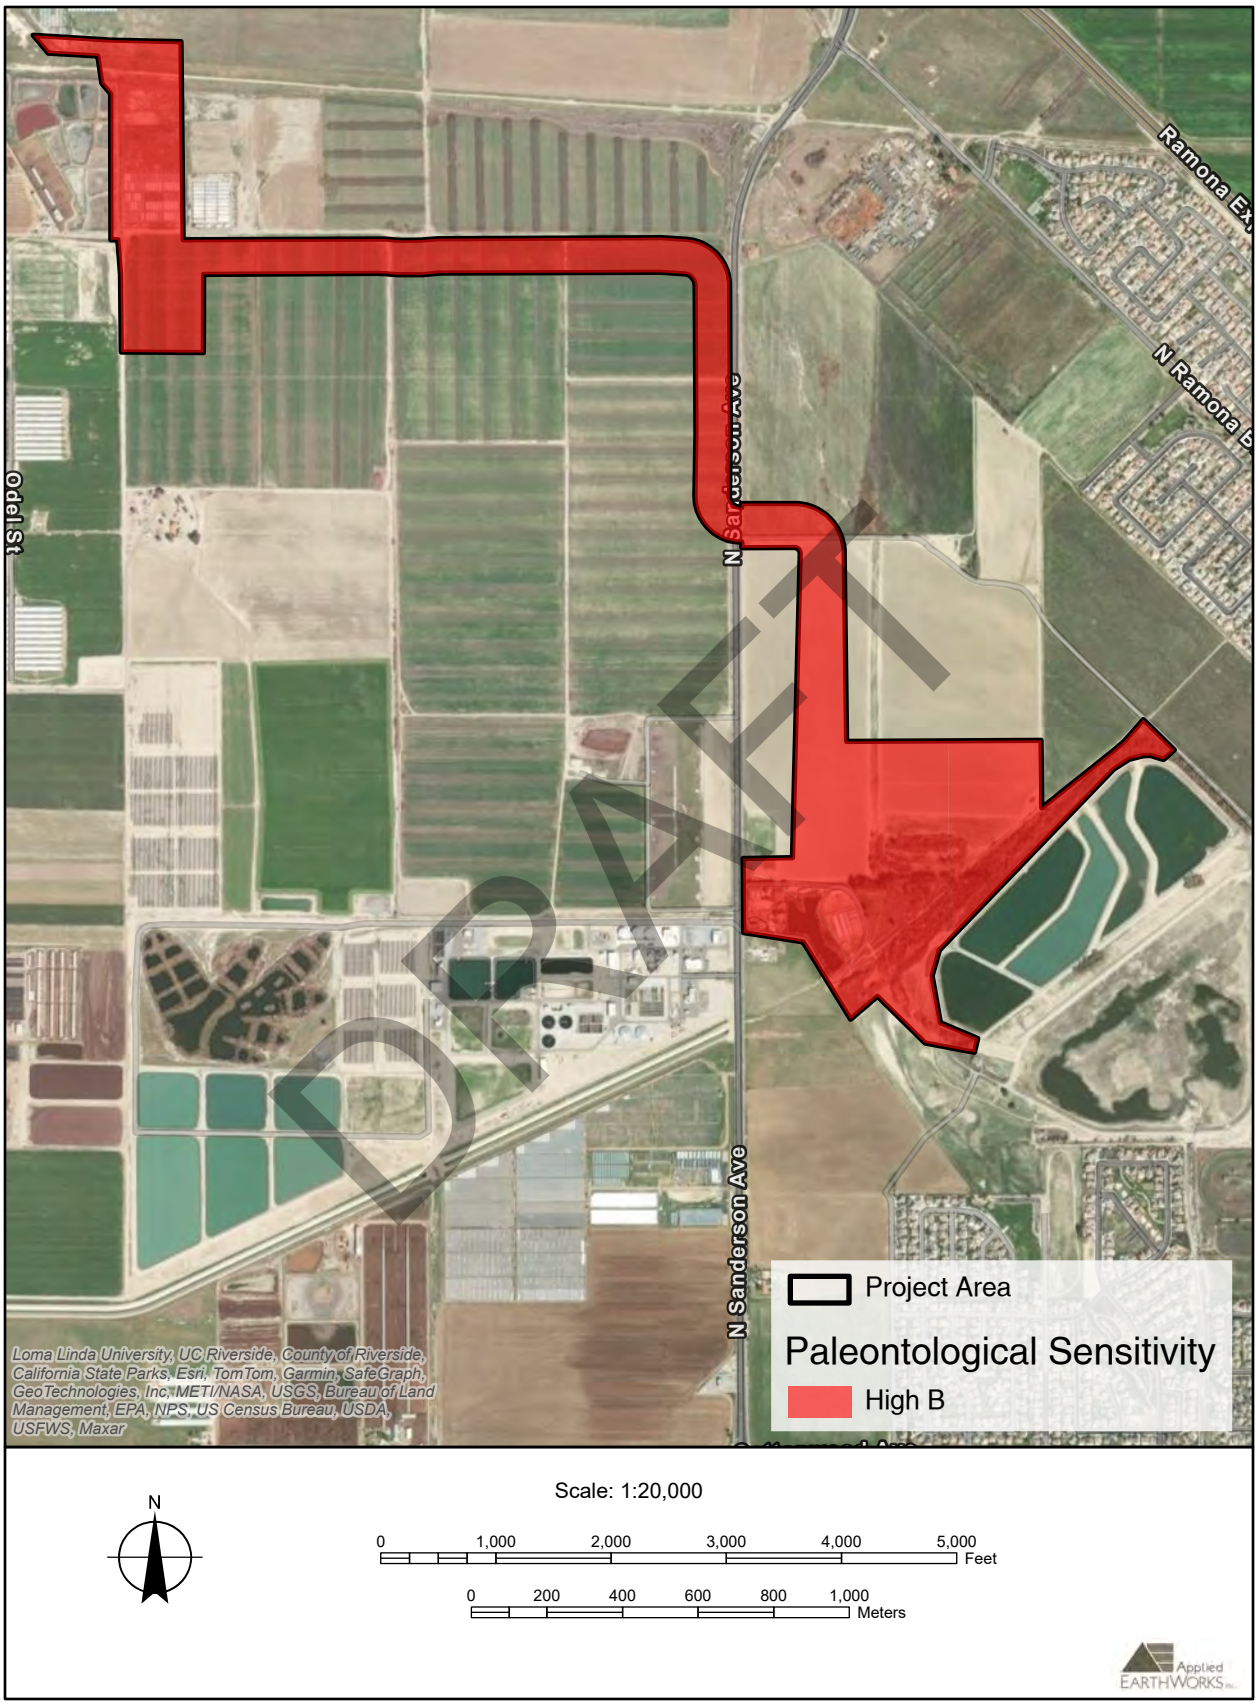

Figure 6-5 Paleontological sensitivity of the Project area.

DRAFT

7
RECOMMENDATIONS

Æ concludes that construction activities may impact significant paleontological resources in various locations throughout the Project area. Æ's desktop studies indicate the Project area has High B Sensitivity for paleontological resources.

Prior to the issuance of grading permits and consistent with applicable policies (County of Riverside, 2015), Æ recommends a PRIMP be prepared by a qualified professional paleontologist (Paleontological Principal Investigator, Project Paleontologist) as defined by mitigation paleontology industry standards (Murphey et al., 2019) and/or the SVP (2010). The PRIMP will specify the steps to be taken to mitigate impacts to paleontological resources. For instance, Worker's Environmental Awareness Program training should be prepared prior to the start of Project-related ground disturbance and presented in person to all field personnel to describe the types of paleontological resources that may be found and the procedures to follow if any are encountered.

The Project-specific PRIMP also will include a monitoring plan that will indicate where construction monitoring should occur and the frequency of required monitoring (i.e., full-time, spot-checks, etc.). In addition to construction monitoring procedures, the monitoring plan also will provide details about fossil collection, analysis, and preparation for permanent curation at an approved repository, such as the WSC. Lastly, the monitoring plan will describe the different reporting standards to be used, such as monitoring with negative findings versus monitoring resulting in fossil discoveries.

DRAFT

APPENDIX A

Qualifications of Key Personnel

DRAFT

AMY L. OLLENDORF

Vice President/Managing Principal/Paleontology Program Manager/Principal Investigator

Areas of Expertise

- Paleontology, mineralogy, and sedimentary geology
- CEQA/NEPA compliance
- Project management

Years of Experience

- 40

Education

Postdoctoral Research Associate, 2006–2007, World Heritage Studies, University of Minnesota

Ph.D., Ancient Studies,1993, University of Minnesota

M.S., Ancient Studies, 1986, University of Minnesota

B.S., Anthropology (with honors) and Geology, 1983, Beloit College

Registrations/Certifications

- Registered Professional Archaeologist #12588
- Licensed Professional Geologist, Minnesota #30084 (6/1998-6/2018, expired)
- Paleontologist Consultants List, Santa Cruz County (2022-present)
- Certified Paleontologist and Archaeologist, Orange County (2020-present)
- Paleontology and Cultural Consultant, Riverside County (2018-present)

Permits/Licenses

BLM - California Statewide Paleontological Resources Use Permit *CA-21-06P*, Principal Investigator.

BLM - Nevada Statewide Paleontological Resources Use Permit *N-090758*, Principal Investigator, Field Director.

Technical Qualifications

Dr. Ollendorf has 40 years of experience in paleontology, paleoecology, environmental compliance, and geoarchaeology at the global, national, tribal, state, and local levels. She meets industry standards for principal investigator in paleontology and she is also Æ's principal investigator on Æ's California and Nevada statewide Paleontological Resource Use Permits for paleontology from the US Bureau of Land Management (BLM).

Dr. Ollendorf has supervised and/or participated in paleontological services, tribal negotiations, and agency coordination throughout her career. She also has managed EISs and EAs. Her project experience includes work in 35 states, including California and other western states, and abroad on a wide range of client projects across many different industry sectors.

During her career, Dr. Ollendorf has written or overseen several hundreds of compliance reports in addition to having published multiple articles in peer-reviewed professional journals and presented to a wide variety of audiences, including professional peers.

Selected Project Experience

California High-Speed Rail Merced-to-Fresno Counties, California. Principal Investigator/Managing Principal, Paleontology and Cultural Resources (2023-present). Æ is providing as-needed multi-year paleontological services and occasional cultural resources services to support all environmental work within the approximately 57-mile-long corridor. Paleontologically sensitive geologic units: early to middle Pliocene-age Mehrten, Pliocene- to Pleistocene-age Laguna, Pliocene- to Holocene-age Tulare, early Pleistocene-age Turlock Lake, middle Pleistocene-age Riverbank, and late Pleistocene-age Modesto Formations; and Pleistocene-age non-marine sediment. Completing for CEQA compliance (California High-Speed Rail Authority) and NEPA compliance (Federal Railroad Administration). Working closely with paleontology staff (Chris Shi and Melissa Macias). Client: T.Y. Lin.

DRAFT

CHRISTOPHER SHI

Senior Paleontologist/Project Manager

Areas of Expertise

- Paleontological resource technical and project management
- CEQA/NEPA compliance

Years of Experience

- 14

Education

Ph.D., Geology (studies), UCLA, 2012-2016

M.S., Geology, UCLA, 2011

B.S., Biology, University of Minnesota, Minneapolis, 2006

Registrations/Certifications

- Paleontologist Consultants List, Santa Cruz County (2022-present)
- Certified Paleontologist, Orange County (2020-present)
- Qualified Paleontologist, Riverside County (2019-present)

Permits

- Field Director, California BLM Statewide Paleontological Permit CA-21-06P

Classes/Training

- OSHA Excavation Competent Person Seminar, Mar. 11, 2019
- OSHA Hazardous Waste Operations Worker (HAZWOPER) Training, 40-Hour, January 20-23, 2020 and 8-Hour Refreshers, January 21, 2021, June 10, 2022, and June 20, 2023

Professional Experience

2020–	Senior Paleontologist/Project Manager, Applied EarthWorks, Inc., Pasadena, California.
2018–2020	Associate Paleontologist/Project Manager, Applied EarthWorks, Inc., Pasadena, California.
2016–2018	Paleontological Laboratory and Field Technician, Applied EarthWorks, Inc., Pasadena, California.
2017–2018	Lead Paleontology Monitor, Rincon Consultants, Los Angeles, California.

Technical Qualifications

Mr. Shi is a paleontologist and geologist with 14 years of experience in paleontology, evolutionary biology, mineralogy, and sedimentary geology, and meets the Society of Vertebrate Paleontology's (SVP) standards for a qualified professional paleontologist/project paleontologist/principal investigator. He has a background in plant and invertebrate taphonomy, and his master's thesis focused on the characterization of fossilized Eocene ferns using a novel three-dimensional imaging technique. Additionally, Mr. Shi spent several years working toward a Ph.D. in geology with research focused on the link between the trend in changing seawater chemistry and the evolution of the first animals to develop shells from calcium carbonate during the Cambrian explosion. He has completed several professional publications and presentations throughout his career.

Mr. Shi completes various tasks within the Paleontology Program of Applied EarthWorks. He coordinates and schedules paleontological monitors throughout Æ's 5 offices. In the field, Mr. Shi's responsibilities include stratigraphic analyses, geological and paleontological data collection, bulk-sediment sampling, collection paleontological resources, and documentation of fossil localities. In the lab, Mr. Shi picks microvertebrate fossils, identifies, analyzes, and prepares collected fossils for permanent curation, including jacketing of large vertebrate specimens. Mr. Shi also regularly completes paleontological desktop literature and map reviews and coordinates with various paleontology curators for museum records searches; authors paleontology monitoring plans, inventory and evaluation reports, resource impact management plans, and worker environmental awareness training materials. In the past, Mr. Shi served as Æ's lead monitor on construction monitoring projects for utility, transportation, and residential and commercial development projects.

DRAFT

Table 1 – Total Construction-Related Fuel Consumption

MDP Line E

Fuel	Consumption	
Diesel		
On-Road Construction Trips[1]	39,016	Gallons
Off-Road Construction Equipment[2]	290,325	Gallons
Diesel Total	**329,340**	**Gallons**
Gasoline		
On-Road Construction Trips[1]	30,632	Gallons
Off-Road Construction Equipment[3]	-	Gallons
Gasoline Total	**30,632**	**Gallons**

Notes:

1. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod for construction in 2027 and fleet-average fuel consumption in gallons per mile from EMFAC2021 web based data for Riverside (South Coast). See Table 2 for calculation details.
2. Off-road mobile source fuel usage based on a fuel usage rate of 0.05 gallons of diesel per horsepower (HP)-hour, based on SCAQMD CEQA Air Quality Handbook, Table A9-3E.
3. All emissions from off-road construction equipment were assumed to be diesel.

Table 2 – On-Road Construction Trip Estimates

MDP Line E

Trip Type	Trips	Trip length	Vehicle Miles Traveled (VMT)	Fuel Efficiency	Annual Fuel Usage[1]	
	(trips)	(miles)	(miles)	(mpg)	(Fuel)	(gallon)
Worker[2,3]	45,080	18.5	833,980	27.9	Gasoline	30,632
Vendor[4]	6,272	10.2	63,974	7.7	Diesel	8,563
Hauling[5]	64,467	3	193,401	6.4	Diesel	30,453

Notes:

1. On-road mobile source fuel use based on vehicle miles traveled (VMT) from CalEEMod output for construction and fleet-average fuel consumption in gallons per mile from EMFAC2021 web based data for 2027 in Riverside (South Coast).
2. Worker trips were assumed to be 100% gasoline powered vehicles.
3. Per CalEEMod, worker Trips were assumed to be 25% LDA, 50% LDT1, and 25% LDT2.
4. Vendor trips were assumed to be 50% MHDT and 50% HHDT, split evenly between the MHDT and HHDT construction categories.
5. Per CalEEMod, hauling trips were assumed to be 100% HHDT.

Phase I Environmental Site Assessment

Executive Summary

Shea Properties (User) retained Roux Associates, Inc. (Roux) to perform a Phase I Environmental Site Assessment (ESA) of the property located along North Sanderson Avenue and Record Road in San Jacinto, Riverside County, California; the property is identified as the Line E - Orange Proposed Irrigation Channel Alignment (Subject Property; Figure 1). Roux performed this Phase I ESA in general accordance with the American Society for Testing Materials (ASTM) *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-21) in an effort to identify, to the extent feasible, the presence of recognized environmental conditions (RECs) with respect to the Subject Property as defined in ASTM E1527-21. Exceptions to, or deletions from, this practice are described in Section 9.1 of this report.

The Subject Property consists of a proposed irrigation channel alignment, referred to as the Line E - Orange Proposed Irrigation Channel Alignment, that traverses nine individual parcels (collectively identified as the Parent Property) with Riverside County Assessor's Parcel Numbers (APNs) 436-170-008, 436-170-016, 436-170-001, 436-030-004, 436-010-003, 432-030-012, 432-030-010, 432-030-006, and 430-100-018 (Parcels 1 through 9; Figure 2). The proposed irrigation channel project will include buffer and support areas (Figure 2) for construction activities (such as equipment staging), which are largely located within the Parent Property but are not included as part of the Subject Property. North Sanderson Avenue, a north-south trending road, transects the Parent Property and is located east of Parcels 6 and 7 and west of Parcels 2 through 5. Record Road, an east-west trending road, also transects the Parent Property and is located north of Parcels 6 through 8 and south of Parcel 9. A description of the use and/or operation of the Parent Property and each Subject Property area is provided below:

- Parcel 1 is developed with the western portion of the San Jacinto Reservoir. The Subject Property portion of Parcel 1 consists of berms and unpaved roadways.
- Parcel 2 is developed as a ranch for retired horses operated by the California Equine Retirement Foundation (805 North Sanderson Avenue). The Subject Property portion of Parcel 2 consists of a vacant area with no structures or notable features;
- Parcel 3, including the Subject Property portion, consists of vacant land;
- Parcel 4, including the Subject Property portion, consists of an agricultural field (watermelon);
- Parcel 5, including the Subject Property portion, consists of an agricultural field (unknown leafy crop);
- Parcel 6, including the Subject Property portion, consists of an agricultural field (watermelon);
- Parcels 7 and 8, including the Subject Property portions, consist of vacant land; and
- Parcel 9, including the Subject Property portions, consists of an enclosed agricultural field (unknown crop) with greenhouse farming structures.

Based on a review of historical sources, the following site histories were identified for the Parent Property, including Subject Property areas:

- Parcel 1 was vacant land as early as 1901 and has been developed as part of the San Jacinto Reservoir since at least 1949. The Subject Property area of Parcel 1 has consisted of berms and unpaved roadways since the parcel was developed as part of the Reservoir.

- Parcels 2, 3, and 4 were vacant land as early as 1901. By 1949, a dwelling and multiple structures (likely associated with agricultural operations of the surrounding area) were apparent on the western-most portions of Parcels 2, 3, and 4. Duck ponds were depicted within the central portions of Parcel 3 and 4 (outside the Subject Property area) between the 1960s through 2015 when the land was developed with row crops as part of agricultural operations. The current horse retirement facility and associated structures and features were present on Parcel 2 by 2006. No structures have been present in the Subject Property area of Parcel 2.

- Parcel 5 was vacant land as early as 1901 through the 1940s when the parcel was used as agricultural land. A duck pond (part of a series of duck ponds) was depicted on the eastern portion of the parcel (and within the Subject Property area) from the 1960s through 2012 when the parcel was converted to agricultural land.

- Parcels 6, 7, and 8, including the Subject Property areas, were vacant land from as early as 1901. By the 1950s, Parcels 6, 7, and 8 were agricultural land with various unpaved roads. A small structure, likely associated with the agricultural operations in the area, was located on the Subject Property portion of Parcel 8 from at least 1975 through 2002. Parcel 8 has been vacant or agricultural land since 2005.

- Parcel 9, including the Subject Property area, was vacant land from as early as 1901 through the 1970s when two small structures, likely associated with the surrounding agricultural operations, appeared within the southwestern portion of the parcel. Parcel 9, including the Subject Property area, was most recently developed with greenhouse farming structures starting in 2023.

On October 12 and 13, 2023, Roux visually assessed the Subject Property during the site reconnaissance for potential RECs, including, but not limited to, potential underground storage tanks (USTs), aboveground storage tanks (ASTs), polychlorinated biphenyl (PCB)-containing equipment, hazardous materials storage or handling areas, containerized or bulk wastes, and visual indications of impacted soil.

Roux, on behalf of User, conducted previous Phase I ESAs and subsurface investigations of Parcels 7 and 8 in 2021 and Parcel 6 in 2023. The Phase I ESAs and subsurface investigations were prepared under separate covers; previous environmental issues identified as RECs, hRECs, and/or OEFs with respect to Parcels 6, 7, and 8 were addressed in the subsurface investigations. Based on the analytical results of the 2021 and 2023 investigations, Roux did not recommend any further investigations with respect to Parcels 6, 7, and 8 (including the Subject Property areas).

Roux also performed a records review in an effort to identify RECs in connection with the Subject Property. This records review addressed the Subject Property and surrounding properties. Roux reviewed commercially available records associated with the Subject Property and nearby properties to assess potential concerns associated with the migration of hazardous substances. The records review also included reasonably ascertainable historical data, which can be helpful in identifying the past uses of the Subject Property and surrounding areas, as it may relate to the environmental condition of the Subject Property.

Roux performed interviews and/or file reviews with various government agencies and other parties with possible knowledge of the Subject Property and surrounding properties in an effort to identify current and past uses of the Subject Property and surrounding areas, as they may relate to the environmental condition of the Subject Property.

ASTM E 1527-21 defines a Recognized Environmental Condition (REC) as:

> "The presence of hazardous substances or petroleum products in, on, or at the Subject Property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum

products in, on or at the Subject Property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on or at the Subject Property under conditions that pose a material threat of a future release to the environment. A de minimis condition is not a recognized environmental condition."

A Controlled Recognized Environmental Condition (cREC) as:

> "A recognized environmental condition affecting the Subject Property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to implementation of required controls (for example, activity and use limitations and other property use limitations."

And a Historical Recognized Environmental Condition (hREC) as:

> "A previous release of hazardous substances or petroleum products affecting the Subject Property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the Subject Property to any controls (for example, activity and use limitations and other property use limitations."

The term recognized environmental condition is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

This Executive Summary provides a brief overview of the findings of this Phase I ESA. Although the Executive Summary is an integral part of a report, it does not substitute for reading the entire report or the appended or referenced documents in order to fully understand the findings and potential environmental concerns associated with the Subject Property.

Recognized Environmental Conditions (RECs)

Based on the information obtained through the performance of this Phase I ESA, Roux identified the following RECs in connection with the current and historical operations at the Subject Property or adjoining properties. To the extent possible, the locations of the RECs are shown in Figure 2. To avoid confusion, all RECs, cRECs, hRECs, and OEFs are numbered sequentially.

> **REC 1 – Former Agricultural Applied Pesticide Area**. According to aerial photographs, agricultural operations (row crops) have been conducted on Parcels 3, 4, 5, 6, 7, and 8 (including Subject Property areas) since at least 1949. Parcel 9 appeared developed for agricultural use circa 1975 and again in 2023. Based on the long-term agricultural use, it is possible that agricultural chemicals, such as organochlorine, lead-based, and arsenic-based pesticides, herbicides, and fertilizers, may have been used on-site within Parcels 3 through 8. Previous site investigations conducted within Parcels 6, 7, and 8 did not identify significant evidence of soil contamination associated with historical crop growth. The potential for impacts from agricultural chemicals to on-site soils within Parcels 3, 4, 5, and 9 is considered a REC.

Controlled Recognized Environmental Conditions (cRECs)

Roux did not identify known or suspected cRECs in connection with the current and historical operations at the Subject Property or adjoining properties.

Historical Recognized Environmental Conditions (hRECs)

Roux did not identify known or suspected hRECs in connection with the current and historical operations at the Subject Property or adjoining properties.

Other Environmental Features (OEFs)

The term recognized environmental condition is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Other environmental features (OEFs) are environmental conditions that do not meet the definition of a REC, but which may warrant mention in a comprehensive Phase I ESA. Based on the subject Phase I ESA, Roux identified the following OEFs.

> **OEF 2 – Adjoining Dairy Ponds.** The west adjoining dairy farm features several ponds, likely used to store dairy farm effluent including manure. At the time of the inspection, no water was observed in the ponds. The likely use of the adjoining dairy ponds for disposal of dairy farm effluent (including manure) is considered an OEF due to the potential generation and migration of methane gas. The Subject Property is slated to be redeveloped with an irrigation channel with no structures, minimizing the concern for gases beneath future inhabited buildings or structures.

1. Introduction

Roux Associates, Inc. (Roux) completed this Phase I Environmental Site Assessment (ESA) of the property located along North Sanderson Avenue and Record Road in San Jacinto, Riverside County, California; the property is identified as the Line E - Orange Proposed Irrigation Channel Alignment (Subject Property). The Subject Property consists of a proposed irrigation channel alignment and traverses nine individual parcels (collectively identified as the Parent Property) with Riverside County Assessor's Parcel Numbers (APNs) 436-170-008, 436-170-016, 436-170-001, 436-030-004, 436-010-003, 432-030-012, 432-030-010, 432-030-006, and 430-100-018 (Parcels 1 through 9). The Subject Property location is shown in Figure 1 and the Subject Property and vicinity is shown in Figure 2. Roux performed this Phase I ESA in compliance with the scope and limitations of American Society for Testing Materials (ASTM) E1527-21 and the terms and conditions of Roux' proposal dated July 28, 2023. Roux conducted this Phase I ESA for the benefit of Shea Properties (the User).

The following sections of this report present our Phase I ESA findings and conclusions. A glossary containing terms and definitions presented in ASTM E1527-21 is included in Appendix A – Glossary of Terms. Other appendices presented at the end of the report include historical topographic maps, historical aerial photographs, regulatory records review documentation, applicable historical records, and personnel qualifications.

1.1 Purpose

The purpose of this Phase I ESA is to identify and report, to the extent feasible, recognized environmental conditions (RECs) with respect to the Subject Property. Performing a Phase I ESA in general compliance with ASTM E 1527-21 may enable a User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) liability. That is, the practice that constitutes one of the requirements for "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in 42 USC Section 9601(35) (B).

1.2 Scope of Services

The scope of services for this Phase I ESA included, but was not limited to, the activities listed below.

- A review of reasonably ascertainable and practicably reviewable topographic maps, historical aerial photographs, and city directories, if available, to investigate current and past uses of the Subject Property and surrounding properties;
- A review of specific government lists pursuant to ASTM Standard E 1527-21 regarding environmental activities for the Subject Property and local area properties;
- A review of recorded land title records, building, assessors, and fire department records, for permits, citations, and reports connected to the Subject Property that were reasonably ascertainable, practicably reviewable, and publicly available within reasonable time and cost;
- An inspection by an environmental professional to investigate the current use of the Subject Property and to identify environmental concerns including but not limited to, the presence of hazardous substances or petroleum products, wastes, underground storage tanks (USTs), aboveground storage tanks (ASTs), or other environmental concerns;

- Interviews with available representatives of the owner of the Subject Property, occupants, and local government officials by an environmental professional; and
- Preparation of this Phase I ESA report.

Roux initiated this Phase I ESA pursuant to receipt of written authorization to proceed on September 21, 2023.

1.3 Standard of Care

Roux conducted this Phase I ESA using a defined scope of services considered appropriate and agreed upon by all parties on the date the service was authorized, unless the scope of services or the methods used were later modified, in writing, and accepted by all parties prior to performance. Roux conducted this Phase I ESA in accordance with generally accepted practices in a manner consistent with that level of care exercised by other members of our profession in the same locality and under similar conditions of time and accessibility of improvements and information. No other representations, expressed or implied, and no warranty or guarantee is included or intended to be part of this Phase I ESA.

Please note that the scope of services performed in execution of this assessment may not be appropriate to satisfy the needs of other parties. We, therefore, are not responsible for independent conclusions, opinions, or recommendations of others based on our assessment. Furthermore, this Phase I ESA relates to the environmental conditions of the Subject Property and does not address issues raised in transactions such as business risk, purchase of business entities, or interests therein, or of their assets, that may well involve environmental liabilities pertaining to properties previously owned or operated or other off-site liabilities.

Additionally, the findings of this Phase I ESA are based on Roux' observations, inquiries, and historical research using reasonably ascertainable and practically reviewable information obtained within reasonable time and cost constraints. Roux does not represent that this Phase I ESA is an exhaustive investigation that reflects the findings of all of the information available for the Subject Property, nor is it representative of future Subject Property conditions. If additional information is generated from the Subject Property, it should be provided to Roux so that we may evaluate its impact on our conclusions. As such, activities or episodes that transpire subsequent to this Phase I ESA are not considered in this assessment. It is not intended that a Phase I ESA in accordance with ASTM E1527-21 be an exhaustive assessment of a property nor can it wholly eliminate uncertainty regarding the potential for *recognized environmental conditions* in connection with a property.

1.4 Assumptions

This Phase I ESA Report, including the exhibits attached hereto, describes the results of Roux' investigation to identify the presence of *recognized environmental conditions* connected with the Subject Property in accordance with ASTM E1527-21, as allowed by and consistent with the regulatory requirements of the All Appropriate Inquiry Rule, 40 CFR Part 312, Amendment to Standards and Practices for All Appropriate Inquires Under CERCLA, Final Rule, published December 30, 2013 (AAI Rule). Specifically, the preamble to the amended AAI Rule states:

> *The Environmental Protection Agency (EPA) today is taking final action to amend the standards and practices for conducting all appropriate inquiries under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) to reference a standard practice recently made available by ASTM International, a widely recognized standards development organization. Specifically, this final*

rule amends the ''All Appropriate Inquiries Rule'' at 40 CFR Part 312 to reference ASTM International's E1527–13 ''Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process'' and make clear that persons conducting all appropriate inquiries may use the procedures included in this standard to comply with the All Appropriate Inquiries Rule[1].

As of February 13, 2023, the EPA indicated that the updated standard ASTM E1527-21 is now AAI compliant. While ASTM E1527-21 is now the current standard, the previous standard (ASTM E1527-13) is still AAI compliant until February 13, 2024.

One of the requirements that a person acquiring real property must meet in order to qualify for either the innocent landowner, contiguous owner, or bona fide prospective purchaser (collectively hereinafter "Prospective Purchaser") defense to liability under the federal Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended by the Superfund Amendments and Reauthorization Act of 1986, and the Small Business Liability Relief and Brownfields' Revitalization Act of 2002, 42 U.S.C. 9601-9675 (collectively referred to hereafter as "CERCLA") is that person must conduct all appropriate inquiries into the previous ownership and uses of the property in conformance with the AAI Rule (or the ASTM E1527-21) prior to acquisition of the property. The User has acknowledged that, under the AAI Rule, Roux' performance of this Phase I ESA in accordance with ASTM E1527-21 will not alone result in the User satisfying all requirements of the AAI Rule and will not in itself provide a defense to CERCLA liability. The User has acknowledged that the AAI Rule also requires that the Prospective Purchaser undertake certain additional inquiries and post-acquisition activities to satisfy the CERCLA AAI requirements. Accordingly, Roux makes no guarantees or warranties, expressed or implied, regarding this Phase I ESA, including without limitation, that this Phase I ESA will qualify the User for a defense to CERCLA liability.

Roux has performed this Phase I ESA in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. Professional judgments expressed herein are based on the facts currently available to Roux.

The AAI Rule requires, and the conclusions and recommendations stated herein represent, the application of a variety of engineering and technical disciplines to material facts and conditions associated with the Subject Property. As such, these conclusions and recommendations are based on subjective interpretations and the exercise of discretion based on the facts available to Roux and conditions at the time of the performance of this Phase I ESA. Many of these facts and conditions are subject to change over time. Accordingly, the conclusions and recommendations must be considered within this context.

The User has agreed that Roux shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this Phase I ESA was performed. To the extent practicable, Roux has identified data gaps, and has evaluated the potential significance of such data gaps. Recommendations to address those data gaps are presented herein and are based on the data available at the time of the performance of this Phase I ESA. Implementation of the recommendations may not fully address the data gaps, and the information obtained from execution of those recommendations may alter and/or modify the interpretation of the Subject Property conditions and conclusions, herein. This Phase I ESA does not include consideration of matters specifically excluded by ASTM E1527-21, including but not limited to, asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, and mold unless specifically identified herein.

[1] Federal Register: December 30, 2013 (Volume 78, Number 250) Page 79319

Emerging contaminants that are not defined as hazardous substances under CERCLA including, but not limited to per- and polyfluoroalkyl substances (PFAS) are outside the scope of the Phase I ESA. This Phase I ESA does not include the completion of searches for recorded environmental liens.

Roux has not collected any soil and/or groundwater samples on the Subject Property for Phase I purposes, and is relying on information presented by others, often in preliminary, draft, or verbal form. By referencing this information, Roux does not accept responsibility for the accuracy of the underlying data, sampling methods, laboratory analysis, or documentation.

This Phase I ESA Report should not be considered a legal interpretation of existing environmental laws and regulations. This Phase I ESA was conducted with a reasonable degree of inquiry to identify *recognized environmental conditions*, but uncertainty is not eliminated. No Phase I ESA can wholly eliminate uncertainty regarding the potential for *recognized environmental conditions* in connection with a property. The Phase I ESA process is intended to reduce, but not eliminate, the uncertainty involved with identifying *recognized environmental conditions*.

This Phase I ESA Report is not an appraisal or value judgment of the Subject Property. The User has agreed that Roux shall not be liable for any use of this Phase I ESA Report as an appraisal or value judgment of the Subject Property.

This Phase I ESA Report has been prepared for the exclusive use of the User for specific application to the Subject Property covered by this Phase I ESA Report. The User has agreed that any third-party use of this Phase I ESA Report, upon disclosure by the User, is the sole responsibility and at the sole liability of the User.

1.5 User Reliance

No additional parties may use the information contained in this report without obtaining the written permission of Roux or the User. Roux' duties and obligations extend to the User and to no other party. Roux' duties and obligations to the User are not transferable to persons, corporations, or organizations without the express written consent of the User and Roux. The User may rely upon the information provided in this Phase I ESA report for a period of 180 days. After 180 days, this Phase I ESA should be updated in accordance with ASTM E1527-21 guidance. Roux will not be liable for any consequential damages arising from the use of this report for other than its intended purpose, for use of this report beyond 180 days of its issue date, or from unauthorized use by third parties.

This Phase I ESA report must be read and interpreted as a whole and can only be considered representative of the conditions of the Subject Property as of the date of our site reconnaissance described herein. Roux makes no representation whatsoever concerning the condition of the Subject Property beyond the date of our site reconnaissance described herein. Individual sections and appendices of this report are dependent on the balance of this report, and on the terms, conditions, and stipulations contained in the proposal and written amendments accepted by Roux.

2. Subject Property Description

2.1 Subject Property Location and Description

Subject Property Information	
Subject Property Name	Line E - Orange Proposed Irrigation Channel Alignment
Address	No current or proposed address for irrigation channel alignment 805 North Sanderson Avenue (associated with parcel 436-170-016)
City	City of San Jacinto
County	Riverside
State	California
Location	Subject Property traverses nine contiguous parcels (Parent Property) located along North Sanderson Avenue and Record Road. The Subject Property traverses both North Sanderson Avenue and Record Road.
Assessor's Parcel Numbers (APNs) for Parent Property	Parent Property consists of the following parcels: Parcel 1: 436-170-008, owned by Eastern Municipal Water District; Parcel 2: 436-170-016, owned by California Equine Retirement Foundation; Parcel 3: 436-170-001, owned by Golden Ocean Realty LLC; Parcel 4: 436-030-004, owned by Rennsport Properties LLC and Golden Ocean Realty LLC; Parcel 5: 436-010-003, owned by Guang Fei Chen and Hongxia Zhang; Parcel 6: 432-030-012, owned by JD Pierce; Parcel 7: 432-030-010, owned by Shea Properties; Parcel 8: 432-030-006, owned by Shea Properties; and, Parcel 9: 430-100-018, owned by Senior Info Care LLC.
Subject Property Acreage (per Google Earth and Riverside County Assessor Website, respectively)	Approximately 65 acres for the irrigation channel alignment. Parent Property totals approximately 665.02 acres
Subject Property Occupants / Uses	Parcel 1: Berms and unpaved roadways part of San Jacinto Reservoir Parcel 2: Vacant area part of California Equine Retirement Foundation (805 North Sanderson Avenue) Parcel 3: Vacant land Parcel 4: Agricultural use (watermelon crops) Parcel 5: Agricultural use (unknown leafy crop) Parcel 6: Agricultural use (previously corn crops) Parcels 7 and 8: Vacant land Parcel 9: Agricultural use (unknown crops)
On-site Operations	Part of San Jacinto Reservoir (Parcel 1), ranch for retired horses (Parcel 2), and agricultural production (Parcels 4, 5, 6, and 9). Remaining Parent Property areas are vacant or inactive.
Description of On-site Structures	No permanent structures currently occupy the Subject Property areas.
Subject Property Paving	Subject Property and Parent Property generally consist of unpaved areas.

Subject Property Information	
Subject Property and Parent Property Vicinity	General agricultural (row crops and dairies), vacant, and residential

Refer to Section 5.0 for a detailed description of the current condition of the Subject Property and operations.

2.2 Vicinity General Characteristics

The facilities and improvements which are adjoining to the Parent Property are provided in the following table. Selected adjoining and nearby properties are shown in Figure 2.

Direction from Parent Property	Improvements / Use (Addresses)
North	Vacant and agricultural land, followed by Ramona Expressway and Vanderwoude Dairy (26580 Ramona Expressway)
Northeast	Vacant land, agricultural land, and residences
East	Vacant land, agricultural land, and party of San Jacinto Reservoir
Southwest	Residence (775 North Sanderson Avenue, Jacinto Valley Regional Water Reclamation Facility (770 North Sanderson Avenue), and agricultural land
Southeast	Single-family residences along the intersection of Sandalwood Street and Georgetown Street and the intersection of Caseros Drive and Georgetown Street.
West	Hettinga Dairy, including ponds (1861 North Warren Road)

2.3 Past Use of the Subject Property

Based on a review of historical sources, the following site histories were identified for the Parent Property, including Subject Property areas:

- Parcel 1 was vacant land as early as 1901 and has been developed as part of the San Jacinto Reservoir since at least 1949. The Subject Property area of Parcel 1 has consisted of berms and unpaved roadways since the parcel was developed as part of the Reservoir.

- Parcels 2, 3, and 4 were vacant land as early as 1901. By 1949, a dwelling and multiple structures (likely associated with agricultural operations of the surrounding area) were apparent on the western-most portions of Parcels 2, 3, and 4. Duck ponds were depicted within the central portions of Parcel 3 and 4 (outside the Subject Property area) between the 1960s through 2015 when the land was developed with row crops as part of agricultural operations. The current ranch for retired horses and associated structures and features were present on Parcel 2 by 2006. No structures have been present in the Subject Property area of Parcel 2.

- Parcel 5 was vacant land as early as 1901 through the 1940s when the parcel was used as agricultural land. A duck pond (part of a series of duck ponds) was depicted on the eastern portion of the parcel (and within the Subject Property area) from the 1960s through 2012 when the parcel was converted to agricultural land.

- Parcels 6, 7, and 8, including the Subject Property areas, were vacant land from as early as 1901. By the 1950s, Parcels 6, 7, and 8 were agricultural land with various unpaved roads. A small structure, likely associated with the agricultural operations in the area, was located on the Subject

Property portion of Parcel 8 from at least 1975 through 2002. Parcel 8 has been vacant or agricultural land since 2005.

- Parcel 9, including the Subject Property area, was vacant land from as early as 1901 through the 1970s when two small structures, likely associated with the surrounding agricultural operations, appeared within the southwestern portion of the parcel. Parcel 9, including the Subject Property area, was most recently developed with greenhouse farming structures starting in 2023.

2.4 Physical Setting

Roux obtained and reviewed published, reasonably ascertainable information concerning the physical setting of the Subject Property. The following is a summary of the information reviewed from those physical setting sources.

Physical Setting Summary	
United States Geological Survey (USGS) Topographic Map	Lakeview / San Jacinto, California Quadrangle
Approximate Subject Property Elevation / Source	1,465 feet above mean sea level (msl) / Lakeview / San Jacinto, California (2018) 7.5-minute quadrangle topographic map published by the USGS
Nearest Surface Water Feature(s) and Approximate Distance(s)	A pond associated with the California Equine Retirement Foundation and a portion of the San Jacinto Reservoir are located in the southeastern portion of the Parent Property. Reclamation ponds associated with the San Jacinto Valley Regional Reclamation Facility are located approximately 350 feet to the south, and the San Jacinto River is located approximately 1.2 miles to the northeast of the Subject Property.
Regional Geology / Source	Quaternary deposits: alluvium, lake, playa and terrace, consolidated and semi-consolidated / California Department of Conservation, 2010 Geologic Map of California
Subject Property Topography / Source	Generally flat with a gradual slope to the north / Site observation and USGS topographic map
Hydrogeological Region / Source	Located along the eastern portion of the San Jacinto Groundwater Basin / *California Department of Water Resources Bulletin 118, Update 2003 and Interim Update 2016*
Depth to Groundwater / Source	Perched groundwater zones in the site vicinity were reported to be approximately 11 to 13 feet below ground surface (bgs) / Monitoring well installation report for a facility approximately 0.5 mile northeast of the Subject Property (Leighton, 2009)
Groundwater Gradient Direction / Source	Groundwater in the site vicinity is reported to flow to the southwest with a hydraulic gradient of approximately 0.004 feet per foot / Monitoring well installation report for a facility approximately 0.5 mile northeast of the Subject Property (Leighton, 2009)
Nearby Soils / Source	Soils in the site vicinity are reported to be silt and silty sands to a depth of approximately 15 feet bgs / Subsurface investigation for south adjoining property (Roux, 2021B)

3. Sources of Information

Sources of information utilized in preparing this Phase I ESA report included historical topographic maps; historical aerial photographs; a walkover survey of the Subject Property, Parent Property, and adjoining properties; in-person discussions with User and tenant personnel; a review of records available at selected local and state regulatory agencies; a review of databases maintained by local, state, and federal government agencies; and other records available from commercial and online sources.

3.1 Historical Sources

To help understand the history of the Subject Property and adjoining properties, historical sources were obtained from Environmental Data Resources, Inc. (EDR), of Shelton, Connecticut. The sources and locations within the Appendices are provided in the table below.

EDR Historical Sources		
Historical Range	**Source**	**Appendix**
1901 – 2018	U.S. Geological Survey Topographic Maps	B
1938 – 2020	EDR Aerial Photographs "Decade Package"	C
No Available Coverage	EDR "Certified Sanborn® Map Report"	D
1976 – 2020	EDR "City Directory Image Report"	E

3.2 Government Databases

To document potential sources of contamination at or near the Subject Property, a government records search was conducted by EDR. The search included local, state, and federal records for the Subject Property and for other properties within ASTM-standard distances of the Subject Property. The records search is summarized in Section 8.0 and copies of "The EDR Radius Map™ Reports with GeoCheck®" are included in its entirety as Appendix F. As recommended by ASTM, all but a few of the databases searched were "current," i.e., had been updated within 90 days prior to the search date.

3.3 Site Reconnaissance

Roux personnel conducted a reconnaissance of the Subject Property, Parent Property, and surrounding areas on October 12 and 13, 2023. During the site reconnaissance, Roux representatives Ms. Ashley Whitaker and Ms. Francine Cason were able to access all areas of the Subject Property and representative areas of the Parent Property. The observations made during the site reconnaissance are discussed in Section 5.0 and throughout the report. A photographic log of the site reconnaissance is included as Appendix G.

3.4 Interviews

On October 12 and 13, 2023, Roux personnel contacted representatives of the Parent Property parcels via telephone and email regarding access to the Subject Property. No on-site items of features of significant environmental concern were noted during the site reconnaissance. No previous Subject Property owners/operators were available for an interview. This data gap is not considered significant due to sufficient

information regarding Subject Property history available from previous reports, EDR historical documents, and public records requests.

3.5 User Provided Information

ASTM E1527-21 provides an optional User Questionnaire to present select User-provided information that can assist in identifying possible RECs in connection with the Subject Property. According to ASTM E1527-21, these tasks do not require the technical expertise of an environmental professional and the environmental professional generally does not perform these tasks. Roux administered the optional questionnaire to the User at the beginning of this Phase I ESA to assist them with these tasks; however, the completed questionnaire has not been returned to Roux as of this report date.

3.6 Regulatory Agencies

Roux contacted governmental agencies for reasonably ascertainable information concerning environmental conditions at the Parent Property and Subject Property. Roux contacted or reviewed information from the agencies provided in the following table. Refer to Appendix H – Pertinent Historical Documentation for copies of the records reviewed. A summary of the information gathered from the regulatory agencies is provided in the table and details regarding the records were incorporated into applicable sections as noted.

Agency	Date Requested / Accessed	Response Date	Description of Records	Section Discussed
Federal				
U.S. Environmental Protection Agency (EPA) – FOIAonline	9/25/2023 11/22/2023	10/3/2023 12/6/2023	No records were associated with the Subject Property or Parent Property.	N/A
National Pipeline Mapping System (NPMS) Online Database	9/26/2023 11/22/2023	N/A	No pipelines were found within 1,000 feet of the Subject Property or Parent Property.	N/A
State				
State Water Resources Control Board (SWRCB): GeoTracker Online Database	9/26/2023 11/22/2023	N/A	Westra Dairy Farm, located adjoining to the south at 870 Sanderson Avenue, was identified in the GeoTracker database as having a closed Leaking Underground Storage Tank (LUST) file and is discussed in detail in Section 7.1.2.	7.1.2
SWRCB: Storm Water Multiple Application and Report Tracking System (SMARTS) Online Database	9/26/2023 11/22/2023	N/A	Stormwater construction permits associated with the San Jacinto Reservoir were identified for Parcel 1. The permits were issued in June 2021 (terminated) and September 2021 (active).	N/A

RCDEH Wells Program Online Database	11/22/2023	N/A	No well records were associated with the Subject Property. Wells were identified within the Parent Property areas of Parcel 4 and Parcel 9 (see Figure 2). Historical topographic maps have identified at least one former well within Parcel 7. No wells were identified within the Subject Property areas.	N/A

4. Subject Property History

This section documents the history of the Subject Property, Parent Property, and adjoining properties and describes current conditions and existing or former environmental features.

4.1 Subject Property History

The history of the Subject Property, Parent Property, and, to a lesser extent, the surrounding area, including previous land use, has been compiled based on information from the exhaustive list of sources provided in Section 3.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
Predevelopment History				
1900s	1901	Historical Topographic Map: Elsinore / San Jacinto (30-minute)	The Subject Property and Parent Property are depicted as undeveloped or vacant land.	Adjoining properties are generally depicted as vacant land. Arterial roads are depicted to the north (currently Ramona Expressway) and east (currently Ramona Boulevard). Small structures (likely homesteads or residential dwellings) are depicted during this period.
1910s	No sources available.			
1920s	No sources available.			
Early Agricultural Use				
1930s	1938	EDR Aerial Photograph	A dwelling and multiple structures (likely associated with agricultural operations of the surrounding area) are apparent within Parcel 2. A north-south trending stream runs through the Parent Property area east of Sanderson Avenue. The remaining Parent Property areas appear to be undeveloped vacant land.	Adjoining properties are shown to be vacant and agricultural land. A road appears to the north of the Subject Property (currently Ramona Expressway). Minor homesteads or residential dwellings appear during this period.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
1940s	1942	Historical Topographic Map: Perris (15-minute)	An unimproved road and residential dwelling are depicted in the area of Parcel 2. Coverage for the eastern portions of Parcels 1 through 4 was not available.	The land to the east of the Parent Property is unmapped. No other significant changes noted to the remaining vicinity.
	1943	Historical Topographic Map: Perris / Banning (15-minute)	Parcel 2 continues to be developed with a small structure and road. The remaining Parent Property areas consist of vacant or unimproved land.	No significant changes from prior history except for some additional residential dwellings to the north and east and the appearance of a road to the west (currently North Warren Road).
	1948	Historical Topographic Map: Banning (15-minute)	The eastern portions of Parcels 1 through 4 appear vacant and undeveloped. The western portion of Parcels 1 through 4 are in unmapped areas. The entirety of Parcels 5 through 9 are in unmapped areas.	No significant changes from prior topographic maps.
	1949	EDR Aerial Photograph	Several Parent Property areas appear developed with row crops (Parcels 3, 4, 5, and 6). Residential structures appear on Parcel 2 and animal enclosures appear on Parcels 3 and 4. A north-south trending road (currently North Sanderson Avenue) is apparent. The San Jacinto Reservoir and associated structures are present within Parcel 1.	Adjoining properties to the north and east generally appear developed for agricultural use (row crops). The adjoining site to the east appears to be occupied by the San Jacinto Reservoir and a portion of the San Diego Aqueduct.
1950s	1953	Historical Topographic Map: Lakeview / San Jacinto (7.5-minute)	The earliest topographic map depiction of San Jacinto Reservoir appears in Parcel 1. Three small structures (likely residences) appear in Parcels 2 and 3. One well is depicted in Parcel 7 and one small structure is depicted in the northwest corner of Parcel 8. An unpaved road appears between Parcels 8 and 9. Early configuration of the current Sanderson Avenue is depicted.	Adjoining land use generally remains unchanged. Additions of windmills and wells are depicted in the general vicinity.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
		EDR Aerial Photograph	Increased agricultural use throughout the Parent Property (Parcels 3, 4, 5, 6, and 8). No other significant changes from prior aerial photographs.	No significant changes from prior aerial photographs.
	1956	Historical Topographic Map: Banning (7.5-minute)	Coverage for the western portions of Parcels 1 through 4 was not available. No coverage was available for 5 through 9. No significant changes noted for eastern portions of Parcels 1 through 4.	No significant changes from prior topographic maps.
1960s	1961	EDR Aerial Photograph	Additional unpaved roads likely associated with agricultural operations, appear to traverse the Parent Property. Increased agricultural use is noted throughout Parcel 7. Features resembling ponds appear on Parcels 4 and 5.	Features resembling ponds appear on an adjoining site to the north. An early configuration of the current dairy farm to the east is apparent. No other significant configurational changes were noted.
	1967	EDR Aerial Photograph	No aerial coverage was provided for portions of Parcels 7 and 8. No other significant changes noted to for the remaining Parent Property areas.	Early configuration of the wastewater treatment facility to the south and dairy farm to the north are apparent.
	1967	Historical Topographic Map: Lakeview / San Jacinto (15-minute)	Duck ponds were depicted on Parcels 3, 4, and 5. A total of three water wells were now depicted in the western portion of the Parent Property (Parcels 7, 8, and 9). A section of an intermittent stream was depicted in the southwest portion of the Parcel 8.	Duck ponds were depicted on the adjoining site to the north of Parcel 5 and Parcel 7. Three structures and two sewage disposal ponds were depicted in the vicinity to the south of Parcel 7 as part of the San Jacinto Valley Regional Water Reclamation Facility.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
1970s	1975	EDR Aerial Photograph	A new pond appears within Parcel 3. Features resembling structures likely associated with the agricultural operations are within Subject Property areas of Parcel 8. Structures likely associated with agricultural operations are depicted within Parcel 9.	No significant changes from prior aerial photographs.
	1978	EDR Aerial Photograph	No significant changes from prior aerial photographs.	The early stage of current residential development is apparent to the east. No other significant changes from prior aerial photographs.
	1979	Historical Topographic Map: Lakeview / San Jacinto (7.5-minute)	North Sanderson Avenue is depicted in its current configuration. No other significant changed noted from prior topographic maps.	The operations of the San Jacinto Valley Regional Water Reclamation Facility appear expanded with additional sewage disposal ponds.
1980s	1985	EDR Aerial Photograph	Parcel 2 appears to be developed with an oval-shaped feature resembling a track or pond. Western-most portions of Parcels 3 and 4 appear to be developed with ranching or agricultural features such as animal enclosures. The features noted above are located outside the Subject Property areas. No other significant changes from prior aerial photographs.	Increased agricultural use in the general vicinity and increase residential development to the east.
	1989	EDR Aerial Photograph	A small rectangular structure appears on the northwest corner of Parcel 8. Western-most portions of Parcels 3 and 4 appear to be developed with ranching or agricultural features including two structures and animal enclosures. The features noted above are located outside the Subject Property areas. No other significant changes from prior aerial photographs.	Duck ponds previously shown on the adjoining land to the north, were no longer present.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
1990s	1995	Cole Information	Wind Machine Sales & Service listed as occupant at 805 North Sanderson Avenue (Parcel 2).	N/A
	1996	EDR Aerial Photograph	Most of the previous ponds on Parcels 3, 4, and 5 are no longer present and areas are replaced with agricultural land (row crops). No other significant changes from prior aerial photographs.	No significant changes from prior aerial photographs.
		Historical Topographic Map: San Jacinto (7.5-minute)	Eastern portions of Parcels 1 through 4 appear unchanged. Remaining Parent Property areas are in unmapped areas.	No significant changes from prior topographic maps.
2000s	2002	EDR Aerial Photograph	The previous small structure on Parcel 8 is no longer present. Parcel 2 appears to be under construction with the current horse retirement facility. A structure, resembling a residence, appears on the northwest portion of Parcel 4 (outside of Subject Property area). No other significant changes from prior aerial photographs.	No significant changes from prior aerial photographs.
	2005	Cole Information	Residential tenants listed as occupants at 981, 1225, and 1315 North Sanderson Avenue (potentially associated with Parcel 4).	N/A
	2006	EDR Aerial Photograph	A pond and several stables (currently the California Equine Retirement Foundation) appears in Parcel 2. The structure previously shown on Parcel 4 is no longer present. No other significant changes from prior aerial photographs.	Single-family residences were developed on the land to the south of the Parent Property.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
	2009	EDR Aerial Photograph	Decreased agricultural activity is apparent on Parcels 4, 5, 6, 7, 8, and 9. Agricultural continues in later aerial photographs. No other significant changes from prior aerial photographs.	No significant changes from prior aerial photographs.
2010s	2010	Cole Information	Residential tenants listed as occupants at 981, 1225, and 1315 North Sanderson Avenue (potentially associated with Parcel 4).	N/A
	2012	Historical Topographic Map: Lakeview / Sab Jacinto (7.5-minute)	No significant changes from prior topographic maps.	No significant changes from prior topographic maps.
		EDR Aerial Photograph	No significant changes from prior aerial photographs.	Increased residential development is noted to the west of Parcel 4 and south of Parcel 1. No other significant changes from prior aerial photographs.
	2014	Cole Information	Residential tenant listed as occupant at 1315 North Sanderson Avenue (potentially associated with Parcel 4). Residential tenant listed as occupant at 805 North Sanderson Avenue (Parcel 2).	Residential tenants to the north.
	2015	Historical Topographic Map: Lakeview / San Jacinto (7.5-minute)	Former duck ponds present in Parcels 3, 4, and 5 are no longer depicted. One intermittent pond is depicted in the area of Parcel 3 and/or 4. No other significant changes from prior topographic maps.	No significant changes from prior topographic maps.
	2016	EDR Aerial Photograph	Previous features on Parcels 3 and 4 are no longer present; the area now appears developed with row crops. No other significant changes from prior aerial photographs.	No significant changes from prior aerial photographs.

Summary of Historical Sources				
Decade	**Year**	**Source**	**Subject Property and Parent Property Description**	**Vicinity Description**
	2017	Cole Information	Residential tenant and California Equine Retirement Foundation listed as occupants at 805 North Sanderson Avenue (Parcel 2).	Residential tenants to the north.
	2018	Historical Topographic Map: Lakeview / San Jacinto (7.5-minute)	Former duck pond areas in Parcels 2 and 4 are depicted as a marsh or swamp area.	No significant changes from prior topographic maps.
2020s	2020	EDR Aerial Photograph	No significant changes from prior aerial photographs.	No significant changes from prior aerial photographs.
		EDR Digital Archive	California Equine Retirement Foundation listed as occupant at 805 North Sanderson Avenue (Parcel 2).	Residential tenants to the north.
	2021	Historical Topographic Map: Lakeview / San Jacinto (7.5-minute)	No significant changes from prior topographic maps.	No significant changes from prior topographic maps.

Several portions of the Parent Property (and Subject Property) continue to be used for agricultural purposes (row crops). Environmental concerns associated with historical and current agricultural operations are discussed below in Section 5.2.

Aerial photographs and topographic maps indicate Parcels 3, 4, and 5 were developed with duck ponds between at least 1961 and 1989. Hunting and shooting range, such as those potentially associated with duck ponds, may impact shallow site soils with deposited lead from bullets and other metals. However, evidence indicating local hunting, shooting, or gun club activities was not identified at or near the Subject Property throughout the course of this Phase I ESA.

According to aerial photographs and city directory listings, the California Equine Retirement Foundation has occupied Parcel 2 since at least 2006. On-site operations do not include the use of significant quantities of hazardous substances or petroleum products. The Subject Property area of Parcel 2 is vacant with no structures or notable features. No environmental issues were identified in association with current and historical horse ranch operations on Parcel 2.

5. Current Subject Property Conditions

A Roux representative conducted a reconnaissance of the Subject Property and surrounding areas on October 12 and 13, 2023. During the Subject Property visit, Roux representatives, Ms. Ashley Whitaker and Ms. Francine Cason, observed the Subject Property and adjoining properties from reasonably accessible locations on the Subject Property and public thoroughfares. During the site reconnaissance, the weather was clear, and the temperature was approximately 90° Fahrenheit. The following sections summarize observations during the inspection. Roux documented the site reconnaissance with photographs which are provided in Appendix G.

5.1 Site Reconnaissance

The Subject Property consists of a proposed irrigation channel alignment which traverses nine contiguous parcels along North Sanderson Avenue and Record Road (Figure 2). North Sanderson Avenue, a north-south trending road, transects the Parent Property and is located east of Parcels 6 and 7 and west of Parcels 2 through 5. Record Road, an east-west trending road also transects the Paret Property and is located north of Parcels 6 through 8 and south of Parcel 9. A description of the use and/or operation of the Parent Property and each Subject Property area is provided below:

- Parcel 1 is developed with the western portion of the San Jacinto Reservoir. The Subject Property portion of Parcel 1 consists of berms and unpaved roadways.
- Parcel 2 is developed as a retired horse ranch occupied by California Equine Retirement Foundation (805 North Sanderson Avenue). The Subject Property portion of Parcel 2 consists of a vacant area with no structures or notable features;
- Parcel 3, including the Subject Property portion, consists of vacant land;
- Parcel 4, including the Subject Property portion, consists of an agricultural field (watermelon);
- Parcel 5, including the Subject Property portion, consists of an agricultural field (unknown leafy crop);
- Parcel 6, including the Subject Property portion, consists of an agricultural field (watermelon);
- Parcels 7 and 8, including the Subject Property portions, consist of vacant land; and
- Parcel 9, including the Subject Property portions, consists of an enclosed agricultural field (unknown crop) with greenhouse farming structures.

The adjoining properties are developed with agricultural land (row crops and dairy farm), residences, and the Jacinto Valley Regional Water Reclamation Plant.

5.2 Phase I ESA Observations

During the site reconnaissance, Roux personnel attempted to identify any environmental features that may be relevant in the context of the Phase I ESA. The features identified are summarized in the table below. Any such features are discussed in the following subsections.

Feature	Observed on the Subject Property	Observed on an Adjoining Property
Areas of stressed vegetation		
Areas which receive flood or storm water from potentially contaminated areas		
Air Compressor Vent Discharges		
Chemical Storage and/or Use		
Drainage Swales and Culverts		
Discharge Areas		
Discolored or Spill Areas		
Drums (55 Gallons or Larger)		
Electrical Transformers		
Former Agricultural Applied Pesticide Area	X	X
Hydraulic Lifts		
Incinerators		
Landfills or Landfarms		
Loading and Unloading Areas		
Non-Contact Cooling Water Discharge		
Oil-Water Separator(s)		
Open Areas Away from Production Areas		
Ponds		X
Process Area Sinks and Piping		
Rail Cars/Railroad Spurs		
Septic Systems Leach Fields or Seepage Pits		
Silos		
Sprayfields		
Storm Sewer and Spill Containment Collection System		
Surface Impoundments and Lagoons		
Underground / Aboveground Storage Tanks and Associated Piping		
Waste Piles		

5.2.1 Former Agricultural Applied Pesticide Area

According to aerial photographs, agricultural operations (row crops) have been conducted on Parcels 3, 4, 5, 6, 7, and 8 (including Subject Property areas) since at least 1949. Parcel 9 appeared developed for agricultural use circa 1975 and again in 2023. At the time of Roux's site reconnaissance, Parcel 4 was developed as a watermelon field, Parcel 5 was developed with a field (unknown leafy crops), and Parcel 6 was developed with a corn field. Parcels 3, 7, and 8 were vacant. Based on the long-term agricultural use, it is possible that agricultural chemicals, such as organochlorine, lead-based, and arsenic-based pesticides, herbicides, and fertilizers, may have been used on-site within Parcels 3 through 8. Previous site investigations conducted within Parcels 6, 7, and 8 did not identify significant evidence of soil contamination associated with historical crop growth. The potential for impacts from agricultural chemicals to on-site soils within Parcels 3, 4, 5, and 9 is considered a REC.

5.2.2 Pond(s)

The west adjoining dairy farm features several ponds, likely used to store dairy farm effluent including manure. At the time of the inspection, no water was observed in the ponds. The likely use of the adjoining dairy ponds for disposal of dairy farm effluent (including manure) is considered an other environmental feature (OEF) due to the potential for vapor migration of methane gas in soil vapor. The Subject Property is slated to be redeveloped with an irrigation channel with no structures, minimizing the concern for vapor intrusion to future occupants.

Concentrated animal feeding lots such as dairy farms can be a source of local groundwater degradation due to nitrates and total dissolved solids (TDS). The Subject Property and surrounding areas are not located within any known groundwater degradation areas affected by elevated nitrates and TDS.

6. Vapor Migration and Intrusion

As recommended by ASTM E 1527-21 and ASTM E 2600-15 (Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions), Roux performed a vapor migration/intrusion pathway assessment in order to identify the presence or likely presence of chemicals of concern vapors from contaminated soil and/or groundwater either on or near the Subject Property.

The operation of the west adjoining property as a dairy farm constitutes a source for potential vapor intrusion due to possible methane buildup in shallow soils. The dairy farm operations have been identified elsewhere in this report as an OEF.

No other sources for potential vapor intrusion were identified for the Subject Property, Parent Property, or any other adjoining or nearby properties.

7. Summary of Key Previous Investigations

The following sections provide a summary of previous environmental investigations at select Parent Property parcels, including portions of the Subject Property. Previous environmental investigation reports are included in Appendix H.

Roux, on behalf of User, conducted previous Phase I ESAs and subsurface investigations of Parcels 7 and 8 in 2021 and Parcel 6 in 2023. The Phase I ESAs and subsurface investigations were prepared under separate covers; and previous environmental issues identified as RECs, hRECs, and/or OEFs with respect to Parcels 6, 7, and 8 were addressed in the subsurface investigations and are discussed in more detail in the following sections.

7.1 Draft Environmental Impact Report (Dudek, 2009)

Dudek prepared an Environmental Impact Report (EIR) for the City of San Jacinto for the proposed Villages of San Jacinto redevelopment project (the Site). The Site, as defined by Dudek in the 2009 EIR, included Parcels 7 and 8 as well the south adjoining parcel at 870 Sanderson Avenue). The Villages of San Jacinto project consisted of mixed-use redevelopment of the Site including parks, residences, and a high school. Included in the EIR is a reference to a previous Phase I ESA prepared by Gradient Engineers, dated October 10, 2002 (2002 Phase I ESA). A copy of this report was not included in the appendices provided to Roux. The following on-Site environmental hazards were identified in the EIR, particularly regarding the former agricultural operations and petroleum storage.

- **Former Heifer Farm**. A southeastern portion of the Site, totaling approximately 20 acres in size, was formerly developed as a heifer raising farm from at least 1978 through 2002. The former heifer farm operations represented a REC due to the possible presence of methane from manure. According to the EIR, the Riverside County's Methane Investigation Protocol would be followed in order to ensure that methane hazards did not exist on the 20-acre portion of the Site formerly used for heifer raising. Methane gas sampling and associated mitigation activities were reportedly planned after grading, in accordance with RCDEH protocols.

  Roux note: The former heifer farm was located on the south adjoining parcel and is not considered a REC in the context of this Phase I ESA.

- **Petroleum-Stained Soil.** During the 2002 Phase I ESA, petroleum-stained soil was observed beneath a diesel aboveground storage tank (AST) located northwest of the reservoir (pond), near the irrigation groundwater well located southwest of the reservoir, and on the floor of the equipment shed, beneath three oil-containing 55-gallon drums. Based on the storage of hazardous substances and petroleum products in uncovered ground areas and evidence of a release, the former chemical storage identified above represented a REC. In order to evaluate and possibly mitigate environmental hazards associated with petroleum releases, the EIR recommended sampling and proper disposal of stained soils.

  Roux note: The petroleum-stained soil area was located on the south adjoining parcel and is not considered a REC in the context of this Phase I ESA.

- **Septic Systems.** According to the EIR, the Site was equipped with two septic systems that historical sources suggest may have been in operation for many decades. The EIR stated the septic systems would be removed along with any residue material in accordance with RCDEH protocols. Based on the likely use of these systems for domestic waste only, the existing septic systems represent an OEF.

Roux note: The locations of the septic systems were not identified or and are unlikely to be associated with disposal of hazardous substances or petroleum products. Any potentially on-site septic systems are not considered a REC in the context of this Phase I ESA.

- **Debris.** Debris, including old equipment, water heaters, tires, and trash were observed in several piles throughout the site both in the 2002 Phase I ESA and during Site reconnaissance associated with the EIR. Several mounds of soil also were observed across the Site. According to the EIR, the soil piles were generated from on-Site activities and were piled for storage and eventual removal. The EIR recommended a qualified environmental professional be present on-Site during removal of debris piles to assess debris and stockpiled soils and direct disposal accordingly. All debris would be disposed of in accordance with state and local laws. Based on observations made during the Site reconnaissance, on-Site debris represent an OEF.

  Roux note: The location of the debris was not identified or and is unlikely to be associated with disposal of hazardous substances or petroleum products. Any potentially on-site debris is not considered a REC in the context of this Phase I ESA.

7.2 Phase I ESA (South Shore, 2021)

South Shore Testing and Environmental (South Shore) conducted a Phase I ESA of Parcel 6 in 2021 on behalf of the current property owner, Mr. J.D. Pierce. At the time of the assessment, the property was vacant agricultural land and proposed to be redeveloped for residential use. South Shore identified the potential presence of pesticides in soil from historical agricultural use as a REC and recommended further investigation.

Subsequent soil sampling conducted in Parcel 6 is discussed below.

7.3 Phase I ESA (Roux, 2021A)

Roux prepared a Phase I ESA of Parcels 7 and 8, and the south adjoining property at 870 Sanderson Avenue (Site). A review of historical sources indicated that Parcels 7 and 8 were developed for agricultural use, possibly row crops, by 1949 and remained until approximately 2012. By 1978, 20 acres on the southeastern portion of the site (south adjoining property) were developed with a heifer raising farm including corrals, water cisterns, and covered structures. No heifer or dairy farm operations were identified within Parcel 7 or 8.

Westra Dairy Farm, formerly located at 870 Sanderson Avenue, was identified as having a closed Leaking Underground Storage Tank (LUST) file. The closed LUST case is discussed in Section 7.1.2. Roux identified the remaining petroleum hydrocarbon-impacted soil in the former LUST area as a hREC in the 2021 Phase I ESA.

Other notable items of environmental concern identified for the south adjoining parcel at 870 North Sanderson Avenue include petroleum-stained soil was observed beneath a diesel aboveground storage tank (AST) located northwest of a reservoir (pond), near the irrigation groundwater well located southwest of the reservoir, and on the floor of the equipment shed, beneath three oil-containing 55-gallon drums.

Roux also noted an EnviroStor case, identified as the Proposed High School at the Villages of San Jacinto (Proposed High School), associated with Parcels 7 and 8 of the Parent Property. DTSC records for the Proposed High School indicate soil samples, composite surface soil samples, and discrete soil samples were collected and analyzed for metals and organochlorine pesticides in order to determine potential threat to public health and/or the environment related to former agricultural use. A letter of “No Further Action” was

given on September 24, 2008. Based on the "No Further Action" letter and the lack of additional investigation, the Proposed High School property was not considered an environmental concern in the context of the Phase I ESA. Based on the available information, Roux identified the former Heifer Farm, petroleum-stained soil, unlined pond, and former agricultural use as RECs.

Roux note: For the purposes of this Phase I ESA, the former agricultural use of the Site was the only REC appliable to Parcels 7 and 8. The remaining RECs apply to the south adjoining property at 870 North Sanderson Avenue and are not considered RECs in the context of this Phase I ESA.

7.4 Phase II Subsurface Investigation Letter Report (Roux, 2021B)

Roux conducted Phase II a subsurface investigation on Parcels 7 and 8, and the south adjoining property at 870 Sanderson Avenue) to address environmental concerns identified by Roux in the 2021 Phase I ESA.

The scope of work attempted to address the following:

- Residual petroleum-impacted soil in the former UST area;
- Potential petroleum impacts from former on-Site ASTs;
- Potential volatile organic compounds, metals, pesticides, and total petroleum hydrocarbon (TPH), methane impacts from former on-Site heifer raising farm uses, including multiple livestock corrals and an unlined pond; and
- Potential pesticide impacts to shallow soils from former agricultural (row crop) uses.

Roux note: Potential pesticide impacts to shallow soils were the only environmental concerns located within the Subject Property. The remaining environmental concerns were located on the south adjoining property. Investigation of the off-site environmental concerns is not discussed in detail as part of this Phase I ESA.

On September 1 and 2, 2021, a total of 184 soil samples were collected from 46 quadrants (SS-1 through SS-46) across the Site, including Subject Property areas, at a depth of 0.5 feet bgs. Soil sampling locations were evenly distributed in a grid pattern across each quadrant. Soil samples were composited into 46 samples (SS-COMP-1 through SS-COMP-46) and analyzed for lead and arsenic and organochlorine pesticides (OCPs).

In general, individual OCP constituents were detected in several quadrants including dichlorodiphenyldichloroethane (4,4'-DDD), dichlorodiphenyldichloroethylene (4,4'-DDE), dichlorodiphenyl-trichloroethane (4,4'-DDT), and eldrin aldehyde. No OCPs were detected above applicable commercial/industrial screening levels.

Arsenic was detected at concentrations exceeding applicable regulatory screening levels; however, arsenic concentrations were below the upper range of regional background concentrations. Lead was not detected above regional background concentrations or applicable commercial/industrial screening levels.

Based on the results of this Phase II Subsurface Investigation, Roux determined that it had addressed the RECs identified in the Phase I ESA and did not recommend further investigation.

7.5 Phase I ESA (Roux, 2023A)

Roux conducted a Phase I ESA of the Parcel 6 in 2023. The property was vacant agricultural land at the time of the time of the assessment. Roux considered the potential presence of impacted on-site soils based on the long-term use of agricultural chemicals, such as pesticides, herbicides, and fertilizers as a REC.

7.6 Phase II Subsurface Investigation Letter Report (Roux, 2023B)

Roux conducted a Phase II investigation of a Parcel 6 in 2023 following the Phase I ESA which identified potential pesticide impacts to shallow soils from agricultural use as a REC. To address the identified environmental concern, Roux collected composite and discrete soil samples from 12 locations (quadrants) across the site to identify potential impacts in the shallow soil associated with historical agricultural use.

A total of 28 soil samples were collected from 12 quadrants, composited into 14 samples, and were analyzed for lead, arsenic, and OCPs.

No OCP constituents were reported at concentrations above their respective laboratory method reporting limits (MRLs). All MRLs were below applicable USEPA RSLs and/or DTSC HERO HHRA Note 3 for commercial/industrial soil.

Arsenic was detected at concentrations exceeding applicable regulatory screening levels; however, arsenic concentrations were below the upper range of regional background concentrations. Lead was not detected above regional background concentrations or applicable commercial/industrial screening levels.

The results of the Phase II subsurface investigation indicated that shallow soil OCP and select metals concentrations were below conservative regulatory thresholds for commercial/industrial land use and/or regional background concentrations. Roux concluded that the REC identified in the Phase I ESA was addressed and no further investigation was recommended.

8. Database Records Review

8.1 Standard Environmental Record Sources

According to ASTM Standard E1527-21, the purpose of reviewing regulatory records is to obtain and review records that will help identify *recognized environmental conditions* in connection with the Subject Property. In addition, some records to be reviewed pertain not only to the Subject Property, but also to properties within an additional "approximate minimum search distance" in order to help assess the likelihood of problems from migrating hazardous substances or petroleum products. The basis of the "approximate minimum search distance" is the Subject Property boundary.

Roux retained EDR of Shelton, Connecticut to provide ASTM Radius Map Reports (EDR Reports) for the Subject Property. Each report is a computerized search of select state and federal environmental databases that identify various properties with a record of environmental activity. Roux reviewed the reports and summarized the relevant findings in the following sections. Copies of the compiled EDR Reports have been included as Appendix F. The EDR reports include a detailed description of each of the databases searched, providing a summary of the type of information provided by each. A summary of Roux' review of the EDR Report listings is provided in Table 1.

The following section describes the findings of the database search. Roux used professional judgement in determining which EDR-listed sites to include in the narrative of this report. Facilities adjoining the Subject Property were included due to their proximity to the Subject Property and the potential for surface water discharges (e.g., storm water runoff, surface water effluent discharges) to enter the Subject Property or through the migration of groundwater. Sites with listings indicative of a release (e.g., SHWS, LUST, RELEASE) are likewise discussed below. Non-adjoining facilities with database listings not necessarily indicative of a release (hazardous waste generator, FINDS, ECHO, NPDES, HAZNET, AST, or UST) will not be discussed unless considered potentially relevant in context of the Phase I ESA.

8.1.1 Subject Property (Target Property)

Address	Owner/Operator	Database
Ramona Boulevard/CAW	Proposed High School at the Villages of San Jacinto	ENVIROSTOR, SCH, and CERS
N/A	Metropolitan Water District of Southern California	HWTS
N/A	San Jacinto Deteriorated Pole 2178000E Replacement	CERS
N/A	San Jacinto Reservoir Pump Station Pipeline	CERS

The Proposed High School at the Villages of San Jacinto (Proposed High School) was located in the northern portion of the Subject Property (Parcels 7 and 8) and is listed on the ENVIROSTOR, SCH, and CERS databases. Information associated with the Proposed High School case is discussed in Section 6.5.

The HWTS listing for Metropolitan Water District of Southern California is likely associated with the San Jacinto Reservoir facility (Parcel 1). The database listing was created in May 2018 and became inactive by August 2018. No additional information regarding the listing was available at the time of this assessment.

No violations were noted on the database listing. Based on the lack of documented releases or violations, this listing is not considered an environmental concern in the context of this Phase I ESA.

The CERS database listings under the name of "San Jacinto Deteriorated Pole 2178000E Replacement" and "San Jacinto Reservoir Pump Station Pipeline" are associated with the operations conducted at the San Jacinto Reservoir facility (Parcel 1). No additional information regarding this listing was available in the EDR report. Based on the lack of documented releases or violations, these listings are not considered an environmental concern in the context of this Phase I ESA.

8.1.2 Adjoining and Nearby Properties

Discussions of adjoining and nearby properties of potential environmental concern as noted in Table 1 are provided below.

- **Westra Dairy Farm (870 Sanderson Avenue).** The former Westra Dairy Farm is located on a south adjoining property (south of Parcel 7) and is listed on the LUST, CORTESE, and CERS database. The LUST database indicates there is a cleanup case for gasoline in soil. Under the direction of the County of Riverside, two 1,000-gallon USTs and one 10,000-gallon USTs were removed from the site in December 1999. Subsequent soil sampling was conducted and determined extent of the contamination was "very limited", and the vertical extent reached below the former tanks to a depth of 35 feet. A mobile soil vapor extraction system was used to extract and treat soil vapor contamination in mid-2001. A "No Further Action" letter was issued by the SA-RWQCB to the Westra Family Trust on December 26, 2001. According to the "No Further Action" letter, data from this investigation indicated that the residual petroleum hydrocarbons in soil were limited to an area with a 15-foot radius between 15 and 20 feet bgs and did not indicate a significant presence or source of petroleum hydrocarbons in the soil. Roux performed additional soil and soil vapor sampling in the vicinity of the former USTs and did not identify significant impacts (Roux, 2021B).

- **San Jacinto Mobil (2070 North Sanderson Avenue).** The San Jacinto Mobil facility is located approximately 0.5 mile northeast of the Subject Property and is listed on the LUST (Leaking Underground Storage Tank), CORTESE, and CERS databases. The LUST database indicates there is a cleanup case for diesel, gasoline, waste oil, motor oil, hydraulic oil, and lubricating oil in groundwater. According to groundwater monitoring reports, samples collected towards the direction of the Subject Property were non-detectable or had low detections of chemicals of concern (Leighton, 2009). On May 27, 2010, the facility was granted case closure by RCDEH. Due to the closure status and low detections, the San Jacinto Mobil facility is not considered an environmental concern in the context of the Phase I ESA.

- **Betty Goedhart (2004 North Ramona Boulevard).** The Betty Goedhart listing is associated with a property (approximately 0.20 mile west-northwest from the Subject Property) that appears to be an area utilized as a parking location for semi-trucks and trailers. According to the database listing, this facility is not a generator of hazardous waste of hazardous waste. The database listings notes that no violations were found for the facility. Based on the available information, this facility is not expected to be an environmental concern in the context of this Phase I ESA.

8.1.3 Orphan Sites

The EDR Report includes a section addressing "Orphan" sites. Orphan listings are sites, which, due to incomplete geographic location data, incomplete address information or incorrect address information, cannot be plotted correctly. The database reports identified one unmapped facility. Based on the relative distance to this facility, it is not considered a REC in the context of this Phase I ESA.

9. Findings

Roux has performed this Phase I ESA in general compliance with the scope and limitations of ASTM Standard Practice E1527-21. Roux separated the findings of this assessment into the following four categories: *recognized environmental conditions*, *controlled recognized environmental conditions*, *historical recognized environmental conditions* and *other environmental features*.

9.1 Data Gaps

During conduct of this ESA, the following data gaps, as defined in ASTM Standard E1527-21 were identified:

- Previous Subject Property owners/operators were not available for an interview. This data gap is not considered significant due to sufficient information regarding Subject Property history available from EDR historical documents and FOIA requests.

9.2 Recognized Environmental Conditions

Based on the information obtained through the performance of this ESA, Roux identified the following RECs in connection with the current and historical operations at the Subject Property or adjoining properties. To the extent possible, the locations of the RECs are shown in Figure 2. To avoid confusion, all RECs, cRECs, hRECs, and OEFs are numbered sequentially.

REC 1 – Former Agricultural Applied Pesticide Area. According to aerial photographs, agricultural operations (row crops) have been conducted on Parcels 3, 4, 5, 6, 7, and 8 (including Subject Property areas) since at least 1949. Parcel 9 appeared developed for agricultural use circa 1975 and again in 2023. Based on the long-term agricultural use, it is possible that agricultural chemicals, such as organochlorine, lead-based, and arsenic-based pesticides, herbicides, and fertilizers, may have been used on-site within Parcels 3 through 8. Previous site investigations conducted within Parcels 6, 7, and 8 did not identify significant evidence of soil contamination associated with historical crop growth. The potential for impacts from agricultural chemicals to on-site soils within Parcels 3, 4, 5, and 9 is considered a REC.

9.3 Controlled Recognized Environmental Conditions

Roux did not identify known or suspected cRECs in connection with the current and historical operations at the Subject Property or adjoining properties.

9.4 Historical Recognized Environmental Conditions

Roux did not identify known or suspected hRECs in connection with the current and historical operations at the Subject Property or adjoining properties.

9.5 Other Environmental Features

Based on the information obtained through the performance of this ESA, Roux identified the following OEFs in connection with the current and historical operations at the Subject Property or adjoining properties.

OEF 2 – Adjoining Dairy Ponds. The west adjoining dairy farm features several ponds, likely used to store dairy farm effluent including manure. At the time of the inspection, no water was observed

in the ponds. The likely use of the adjoining dairy ponds for disposal of dairy farm effluent (including manure) is considered an OEF due to the potential generation and migration of methane gas. The Subject Property is slated to be redeveloped with an irrigation channel with no structures, minimizing the concern for gases beneath future inhabited buildings or structure.

11. Signature of Environmental Professional

Roux performed this assessment in accordance with the generally accepted practices for environmental assessments at the time of implementation. Roux made a reasonable effort to ensure that the information presented in this report is materially complete and accurate.

Roux completed a Phase I ESA in general compliance with the scope and limitations of ASTM Practice E1527-21 of the Line E - Orange Proposed Irrigation Channel Alignment property located along North Sanderson Avenue and Record Road in San Jacinto, Riverside County, California (the Subject Property).

"We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental professional as defined in §312.10 of 40 CFR 312" and,

"We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312."

Roux performed this Phase I ESA by, or under direct supervision of, the undersigned environmental professionals. Copies of professional profiles for the undersigned environmental professionals and report preparers are included in Appendix I.

Respectfully Submitted,

ROUX ASSOCIATES, INC.

APPENDIX A

Glossary of Terms

GLOSSARY OF KEY TERMS

This appendix provides definitions, description of terms, and a list of acronyms for many of the words used in ASTM E 1527-21. These terms are an integral part of ASTM E 1527-21 and are critical to understanding ASTM E 1527-21 and its use.

DEFINITIONS:

Abandoned Property – *property* that can be presumed to be deserted, or an intent to relinquish possession or control can be inferred from the general disrepair or lack of activity thereon such that a reasonable person could believe that there was an intent on the part of the current *owner* to surrender rights to the *property*.

Activity and Use Limitations – Legal or physical restrictions or limitations on the use of, or access to, a site or facility: *(1)* to reduce or eliminate potential exposure to *hazardous substances* or *petroleum products* in the soil, soil vapor, groundwater, and/or surface water on the *property*, or *(2)* to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or *engineering controls*, are intended to prevent adverse impacts to individuals or populations that may be exposed to *hazardous substances* and *petroleum products* in the soil, soil vapor, groundwater, and/or surface water on a *property*.

Construction debris, n – Concrete, brick, asphalt, and other such building materials discarded in the construction of a building or other improvement to property.

Contaminated public wells, n – Public wells used for drinking water that have been designated by a government entity as contaminated by toxic substances (for example, chlorinated solvents,) or petroleum products, or as having water unsafe to drink without treatment.

Contiguous Property Owner [42 U.S.C. Section 9607 (q)], n– a person may qualify for the *contiguous property owner liability protection* if, among other requirements, such person owns real *property* that is contiguous to, and that is or may be contaminated by *hazardous substances* from other real *property* that is not owned by that person. Furthermore, such person conducted *all appropriate inquiries* at the time of acquisition of the *subject property* and did not know or have reason to know that the *subject property* was or could be contaminated by a *release* or threatened *release* from the contiguous *property*. The *all appropriate inquiries* must not result in knowledge of contamination. If it does, then such person did “know” or “had reason to know” of contamination and would not be eligible for the *contiguous property owner liability protection*. See appendix C1 for the other necessary requirements that are beyond the scope of this practice.

Controlled Recognized Environmental Condition, n – a *recognized environmental condition* affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with *hazardous substances* or *petroleum products* allowed to remain in place subject to implementation of required controls (for example, *activity and use limitations* or *other property use limitations*). For examples of *controlled recognized environmental conditions,* see Appendix X4.

Data failure, n – failure to achieve the historical research objective in 8.3.1 even after reviewing the *standard historical resources* in 8.3.4.1 through 8.3.4.8 that are *reasonably ascertainable* and likely to be useful. *Data failure* is on type of *data gap*.

Data gap, n – a lack of or inability to obtain information required by this practice despite *good faith* efforts by the *environmental professional* to gather such information. *Data gaps* may result from incompleteness in

any of the activities required by this practice, including, but not limited to, *site reconnaissance* (for example, an inability to conduct the *site visit*), and *interviews* (for example. An inability to interview the *key site manager*, regulatory officials, etc.). See 12.6.

de minimis condition, n – a condition related to a *release* that generally does not present a threat to human health or the *environment* and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. A condition determined to be a *de minimis condition* is not a *recognized environmental condition* nor a *controlled recognized environmental condition*.

Demolition debris, n – Concrete, brick, asphalt, and other such building materials discarded in the demolition of a building or other improvement to a property.

Drum, n – A container (typically, but not necessarily, holding 55 gal (208 L) of liquid) that may be used to store *hazardous substances* or *petroleum products.*

Dry wells, n – Underground areas where soil have been removed and replaced with pea gravel, coarse sand, or large rocks. Dry wells are used for drainage, to control storm runoff, for the collection of spilled liquids (intentional and non-intentional), and wastewater disposal (often illegal).***Dwelling, n*** – Structure of portion thereof used for residential habitation.

Engineering controls, n – Physical modifications to a site or facility (for example, capping, slurry walls, or point of use water treatment) to reduce or eliminate the potential for exposure to hazardous substances or petroleum products contaminants in the soil or groundwater on the property.

Environment, n – *environment* shall have the same meaning as the definition of *environment* in CERCLA 42 U.S.C. Section 9601(8), For additional background information, see Legal Appendix (Appendix X1) to X1.1.1 “Releases.”

Environmental Compliance audit, n – the investigative process to determine if the operations of an existing facility are in compliance with applicable environmental laws and regulations. This term should not be used to describe this practice, although an *environmental compliance audit* may include an *environmental site assessment* or, if prior to audit are available, may be part of an *environmental site assessment*.

Environmental lien, n – A charge, security, or encumbrance upon title to a *property* to secure the payment of a cost, damage, debt, obligation, or duty arising out of response actions, cleanup, or other remediation of *hazardous substances* or *petroleum products* upon a *property*, including (but not limited to) liens imposed pursuant to CERCLA 42 USC § 9607(1) & 9607(r) and similar state or local laws.

Environmental professional, n – a person meeting the education, training, and experience requirements as set forth in 40 C.F.R. § 312.10(b). For the convenience of the reader, this section is reprinted in Appendix X2. The person may be an independent contractor or an employee of the *user*.***ERNS list, n*** – EPA’s emergency response notification system list of reported CERCLA hazardous substance releases or spills in quantities greater than the reportable quantity, as maintained at the National Response Center. Notification requirements for such releases or spills are codified in 40 C.F.R. parts 302 and 355.

Fire insurance maps, n – Maps originally produced for fire insurance purposes that indicate uses of properties at specified dates.

Good faith, n – absence of any intention to seek an unfair advantage or to defraud another property; an honest and sincere intention to fulfill one's obligations in the conduct or transaction concerned.

Hazardous substance, n – A substance defined as hazardous pursuant to CERCLA 42 USC § 9601(14), as interpreted by EPA regulations and the courts: "(A) any substance designated pursuant to section 1321(b)(2)(A) of Title 33, (B) any element, compound, mixture, solution, or substance designated pursuant to section 9602 of this title, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Soil Waste Disposal Act (42 USC § 6921) (but not including any waste the regulation of which under the Solid Waste Disposal Act (42 USC § 6901 *et seq.*) has been suspended by Act of Congress), (D) any toxic pollutant listed under section 1317(a) of Title 33, (E) any hazardous air pollutant listed under section 112 of the Clean Air Act (42 USC § 7412), and (F) any imminently hazardous chemical substance or mixture with respect to which the Administrator (of EPA) has taken action pursuant to section 2606 of Title 15. The term does not include petroleum, including crude oil or any fraction thereof, which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph; the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas)." (See Appendix X1.)

Hazardous waste – Any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Cat (42 USC § 6921) (but not including any waste the regulation of which under the Solid Waste Disposal Act (42 USC § 6901 *et seq.*) has been suspended by Act of Congress). The Solid Waste Disposal Act of 1980 amended RCRA. RCRA defines hazardous waste, in 42 USC § 6903, as: "a solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may: (A) cause, or significantly contribute to an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness, or (B) pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed."

Hazardous waste/contaminated sites, n – sites on which a *release* has occurred, or is suspected to have occurred, of any *hazardous substance, hazardous waste,* or *petroleum products*, and that *release* has been reported to a government agency.***Innocent landowner [42 U.S.C. § 9601(35) & 9607(b)(3), n –*** a person may qualify as one of three types of innocent landowners: (1) a person who "did not know and had no reason to know" that contamination existed on the subject property at the time the purchaser acquired the subject property; (2) a government entity which acquired the subject property by escheat, or through any other involuntary transfer or acquisition, or through the exercise of eminent domain authority by purchase or condemnation; (3) a person who "acquired the facility by inheritance or bequest." To qualify for the *innocent landowner* defense, such person must have made *all appropriate inquiries* on or before the date or purchase. Furthermore, the *all appropriate inquiries* must not have resulted in knowledge of the contamination. If it does, then such person did "known" or "had reason to know" of contamination and would not be eligible for the *innocent landowner defense*. See Appendix X1 for the other necessary requirements that are beyond the scope of this practice.

Institutional controls (IC), n – A legal or administrative mechanism (e.g., deed restriction, restrictive zoning) on the use of, or access to, a site or facility to (1) reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil or groundwater on the property, Of (2) to prevent activities that could interfere with the effectiveness of a response actions, in order to ensure maintenance of a condition of no significant risk to public health of the environment. An *institutional control* is a type of activity and use limitation (AUL).

Land title records, n - records that affect the title of real estate, which may include, among other things, deeds, mortgages, leases, land contracts, court orders, easements, liens, and AULs recorded within the

recording systems or land registration systems created by state statute in every state and ordinarily administered in the local jurisdiction (usually the county) in which the subject property is located, and available by performing a title search. Such records are publicly accessible, through the process of performing a title search to find *land title records* often requires specialized expertise or knowledge of the local system. Information bout the title to the subject property that is filed or stored in any place other than where land title records are, by law or custom, recorded for the local jurisdiction in which the subject property is located, are not considered land title records.

Landfill, n – A place, location, tract of land, area, or premises used for the disposal of solid wastes as defined by state solid waste regulations. The term is synonymous with the term *solid waste disposal site* and is also known as a garbage dump, trash dump, or similar term.

Landowner liability protections (LLPs), n – A defense to CERCLA available to bona fide prospective purchasers, contiguous property owners, and innocent landowners. See 42 U.S.C. § 9601(35)(A), 9601(40), 9607(q), and 9607(r).

Local government agencies, n – Those agencies of municipal or county governments having jurisdiction over the subject property. Municipal and county government agencies include but are not limited to cities, parishes, townships, and similar entities.

Local street directories, n – Directories published by private or government entities that list the occupant(s) of a specific address at the time the occupant data were collected, typically within a year of the publication date of the directory.

Material safety data sheet (MSDS), n – See safety data sheet.

Migrate/migration, v/n – For the purposes of this practice, “migrate” and “migration” refers to the movement of *hazardous substances* or *petroleum products* in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface.

National Priorities List (NPL), n – List compiled by the EPA, pursuant to CERCLA 42 USC § 9605(a)(8)(B), of sites with the highest priority for cleanup pursuant to EPA’s Hazard Ranking System. See 40 CFR Part 300.

Occupants, n – Those tenants, subtenants, or other persons or entities using a *property* or a portion of a *property.*

Operator, n – Person responsible for the overall operation of a facility.

Other historical resources, n – Any resource other than those designated that are credible to a reasonable person and that identify past uses of the properties.

Owner, n – Generally the fee owner of record for a *property*.

Petroleum exclusion, n – The exclusion from CERCLA liability provided in 42 USC § 9601(14), as interpreted by the courts and EPA: “The term (hazardous substance) does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).”

Petroleum products, n – Those substances included within the meaning of the *petroleum exclusion* to CERCLA, 42 USC § 9601(14), as interpreted by the courts and EPA, that is: petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under Subparagraphs (A) through (F) of 42 USC § 9601(14), natural gas, natural gas liquids, liquefied natural gas, and synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas). (The word fraction refers to certain distillates of crude oil, including gasoline, kerosene, diesel oil, jet fuels, and fuel oil, pursuant to *Standard Definitions of Petroleum Statistics*[1]*.)*

Phase I Environmental Site Assessment, n – The process described in this practice.

Pits, ponds, or lagoons, n – Manmade or natural depressions in the ground surface that are likely to hold liquids or sludge containing *hazardous substances* or *petroleum products*. The likelihood of such liquids or sludge being present is determined by evidence of factors associated with the pit, pond, or lagoon, including, but not limited to, discolored water, distressed vegetation, or the presence of an obvious wastewater discharge.

Property, n – Real property including buildings and other fixtures and improvement located on and affixed to the land.

Property use limitation, n – Limitation or restriction on current or future use of a *property* in connection with a response to a *release*, in accordance with the applicable regulatory authority or authorities that allows *hazardous substances* or *petroleum products* to remain in place at concentrations exceeding unrestricted use criteria.

Property tax files, n – Files kept for property tax purposes by the local jurisdiction which may include records of past ownership, appraisals, maps, sketches, phtographs, or other information.

RCRA generators, n – Those persons or entities that generate hazardous waste, as defined and regulated by RCRA.

RCRA TSD facilities, n – Those facilities at which treatment, storage, and/or disposal of hazardous wastes takes place, as defined and regulated by RCRA.

Release, n/v – A *release* of any *hazardous substance* or *petroleum product* shall have the same meaning as the definition of “release” in CERCLA 42 U.S.C § 9601(22). There are a number of statutory exclusions from the definition of *release* that may impact the *environmental professional’s* opinion and conclusions, such as the normal application of fertilizer. For additional background information, see Legal Appendix (Appendix X1) to X1.1.1 “*Releases* and Threatened *Releases*.”

Report, n – Written report prepared by the environmental professional and constituting part of a “Phase I Environmental Site Assessment,” as required by this practice.

Safety data sheets, n – Written or printed material that is prepared by chemical manufacturers and importers for distributors’ and employers’ use that provides comprehensive information regarding a hazardous chemical pursuant to OSHA’s Hazard Communication Standard (HCS), 29 C.F.R. § 1910.1200.

Significant data gap, n – A *data gap* that affects the ability of the *environmental professional* to identify a *recognized environmental condition*.

Solid waste disposal site, n – A place, location, tract of land, area, or premises used for the disposal of solid wastes as defined by state solid waste regulations. The term is synonymous with the term *landfill* and is also known as a garbage dump, trash dump, or similar term.

Solvent, n – A chemical compound that is capable of dissolving another substance and may itself be a *hazardous substance,* used in a number of manufacturing/industrial processes including, but not limited to, the manufacture of paints and coatings for industrial and household purposes, equipment clean-up, and surface degreasing in metal fabricating industries.

Subject property, n – The property that is the subject of the *environmental site assessment* described in this practice.

Sump, n – Pit, cistern, cesspool, or similar receptacle where liquids drain, collect, or are stored.

Topographic map, n – Graphic representation delineating natural and man-made features of an area or region in a way that shows their relative positions and elevations.

TSD facility, n – Treatment, storage, or disposal facility (*see RCRA TSD facilities*).

Underground injection, n – The emplacement or discharge of fluids into the subsurface by means of a well, improved sinkhole, sewage drain hole, subsurface fluid distribution system or other system, or groundwater point source.

Underground storage tank (UST), n - Any tank, including underground piping connected to the tank, that is or has been used to contain *hazardous substances* or *petroleum products* and the volume of which is 10% or more beneath the surface of the ground.

USGS 7.5 Minute Topographic Map, n – USGS Topographic Map, including the current US Topo 7.5-Minute Series or the historical 7.5-Minute Topographic Series, which is available from the United States Geologic Survey and showing the subject property.

Wastewater, n – Water that (1) is or has been used in an industrial or manufacturing process, (2) conveys or has conveyed sewage, or (3) is directly related to manufacturing, processing, or raw materials storage areas at an industrial plant. Wastewater does not include water originating on or passing through or adjacent to a site, such as storm water flows, that has not been used in industrial or manufacturing processes, has not been combined with sewage, or is not directly related to manufacturing, processing, or raw materials storage areas at an industrial plant.

Zoning/land use records, n – Those records of the local government in which the *property* is located, indicating the uses permitted by the local government in particular zones within its jurisdiction. The records may consist of maps or written records.

DEFINITIONS SPECIFIC TO ASTM E 1527-21:

Actual knowledge, n – The knowledge actually possessed by an individual who is a real person, rather than an entity. Actual knowledge is to be distinguished from constructive knowledge that is knowledge imputed to an individual or entity.

Adjoining properties – Any real property or properties the border of which is contiguous or partially contiguous with that of the property, or that would be contiguous or partially contiguous with that of the property but for a street, road, or other public thoroughfare separating them.

Aerial photographs, n – Photographs taken from an airplane or helicopter (from a low enough altitude to allow identification of development and activities) of areas encompassing the property. Aerial photographs are often available from government agencies or private collections unique to a local area.

Appropriate inquiry, n – That inquiry constituting "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in CERCLA, 42 USC § 9601(35)(B), that will give a party to a *commercial real estate* transaction the *innocent landowner defense* to the CERCLA liability (42 USC § 9601(A) and (B) and § 9607(b)(3)), assuming compliance with other elements of the defense. See Appendix X1.

Approximate minimum search distance, n – The area for which records must be obtained and reviewed pursuant to Section 7 subject to the limitations provided in that section. This may include areas outside the *property* and shall be measured from the nearest *property* boundary. This term is used in lieu of radius to include irregularly-shaped properties.

Building department records, n – Those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property. Often, building department records are located in the building department of a municipality or county.

Business environmental risk, n – A risk which can have a material environmental or environmentally-driven financial impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice. Consideration of *business environmental risk* issues may necessitate that an *environmental professional* address one or more non-scope considerations, some of which are identified in Section 12.

Commercial real estate, n – Any real property except a dwelling or property with no more than four dwelling units exclusively for residential use (except that a dwelling or property with no more than four dwelling units exclusively for residential use is included in this term when it has a commercial function, as in the building of such dwellings for profit). This term includes, but is not limited to, undeveloped real property and real property used for industrial, retail, office, agricultural, other commercial, medical, or educational purposes; property used for residential purposes that has more than four residential dwelling units; and any property with no more than four dwelling units for residential use when it has a commercial function, as in the building of such dwellings for profit.

Commercial real estate transaction, n – A transfer of title to or possession of real property or receipt of a security interest in real property, except that it does not include transfer of title to or possession of real property or the receipt of a security interest in real property with respect to an individual dwelling or building containing fewer than five dwelling units, nor does it include the purchase of a lot or lots to construct a dwelling for occupancy by a purchaser, but a commercial real estate transaction does include real property purchased or leased by persons or entities in the business of building or developing dwelling units.

Controlled Recognized Environmental Condition, n – a *recognized environmental condition* affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with *hazardous substances* or *petroleum products* allowed to remain in place subject to implementation of required controls (for example, *activity and use limitations* or *other property use limitations*). For examples of *controlled recognized environmental conditions,* see Appendix X4.

Due diligence, n – the process of inquiring into the environmental characteristics of a *commercial real estate* or other conditions, usually in connection with a *commercial real estate* transaction. The degree and kind of *due diligence* vary for different *properties*, and differing purposes. See Appendix X1.

Environmental audit, n – The investigative process to determine if the operations of an existing facility are in compliance with applicable environmental laws and regulations. This term should not be used to describe Practice E 1528 or this practice, although an environmental audit may include an *environmental site assessment* or, if prior audits are available, may be part of an environmental site assessment.

Environmental professional, n – A person processing sufficient training and experience necessary to conduct a *site reconnaissance, interviews,* and other activities in accordance with this practice, and from the information generated by such activities, having the ability to develop opinions and conclusions regarding *recognized environmental conditions* in connection with the *property* in question. An individual's status as an environmental professional may be limited to the type of assessment to be performed or to specific segments of the assessment for which the professional is responsible. The person may be an independent contractor or an employee of the *user.*

Environmental site assessment (ESA), n – the process by which a person or entity seeks to determine is a subject property is subject to *recognized environmental conditions*. At the option of the *user*, an *environmental site assessment* may include more inquiry than that constituting *all appropriate inquiries* or, if the *user* is not concerned about qualifying for the *LLPs*, less inquiry than that constituting *all appropriate inquiries*. An *environmental site assessment* is both different from and often less rigorous than an *environmental compliance audit*.

Fill dirt, n – dirt, soil, sand, or other earth, that is obtained off-site, that is used to fill holes or depressions, create mounds, or otherwise artificially change the grade or elevation of real *property*. It does not include material that is used in limited quantities for normal landscaping activities.

Hazardous waste/contaminated sites, n – Sites on which a release has occurred, or is suspected to have occurred, of any *hazardous substance, hazardous waste,* or *petroleum products,* and that release or suspected release has been reported to a government entity.

Historical Recognized Environmental Condition, n – a previous *release* of any *hazardous substances* or *petroleum products* affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations, or other property use limitations). A *historical recognized environmental condition* is not a *recognized environmental condition*. For examples of *historical recognized environmental conditions*, see Appendix X4.

Innocent landowner defense – That defense to CERCLA liability provided in 42 USC § 9601(35) and § 9607(b)(3). One of the requirements to qualify for this defense is that the party make "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice." There are additional requirements to qualify for this defense.

Interviews, n – those portions of this practice that are conducted to gather information from an individual or individuals in person, by telephone, in writing, or via other electronic media to meet the objectives of this practice.

Key site manager, n – The person identified by the *owner* of a *property* as having good knowledge of the uses and physical characteristics of the property.

Local government agencies, n – Those agencies of municipal or county government having jurisdiction over the *property.* Municipal and county government agencies include, but are not limited to, cities, parishes, townships, and similar entities.

LUST sites, n – State lists of leaking underground storage tank sites. Section 9003 (h) of Subtitle I of RCRA gives EPA and states, under cooperative agreements with EPA, authority to clean up releases from UST systems or require owners and operators to do so.

Major occupants, n – Those tenants, subtenants, or other persons or entities each of which uses at least 40% of the leasable area of the *property* or any anchor tenant when the *property* is a shopping center.

Material threat, n – Obvious threat which is likely to lead to a release and that, in the opinion of the environmental professional, would likely result in impact to public health or the environment. An example might include an aboveground storage tank system that contains s *hazardous substance* and which shows evidence of damage. The damage would represent a *material threat* if it is deemed serious enough that it may cause or contribute to tank integrity failure with a release of contents to the environment.

Obvious, adj – That which is plain or evident; a condition or fact that could not be ignored or overlooked by a reasonable observer while *visually* or *physically observing the property.*

Other historical sources, n – Any source or sources other than those designated in 7.3.4.1-7.3.4.8 that are credible to a reasonable person and that identify past uses of the property. The term includes, but is not limited to, miscellaneous maps, newspaper archives, and records in the files and/or personal knowledge of the *property owner* and/or *occupants.*

Physical setting sources, n – Resources that provide information about the geologic, hydrogeologic, hydrologic, or topographic characteristics of the area that includes the subject property.

Practically reviewable, adj – Information that is *practically reviewable* means that the information is provided by the source in a manner and in a form that, upon examination, yield information relevant to the subject property without the need for extraordinary analysis of irrelevant data. The form of the information shall be such that the *user* can review the records for a limited geographic area. Records that cannot be feasibly retrieved by reference to the location of the subject property or a geographic area in which the subject property is located are not generally *practically reviewable*. Most databases of public records are practically reviewable if they can be obtained from the source agency by the county city, zip code, or other geographic area of the facilities listed in the record system. Records that are sorted, filed, organized, or maintained by the source agency only chronologically are not generally *practically reviewable*. Listings in *publicly available* records which do not have adequate address information to be located geographically are not generally considered *practically reviewable*. For large databases with numerous records (such as RCRA hazardous waste generator and registered *underground storage tanks*), the records are not *practically reviewable* unless they can be obtained from the source agency in the smaller geographic area of zip codes. Even when information is provided by zip code for some large databases, it is common for an unmanageable number of sites to be identified within a given zip code. In these cases, it is not necessary to review the impact of all if the site that are likely to be listed in any given zip code because that information cannot be feasibly reviewed regarding its impact on the subject property, it is not *practically reviewable.*

Preparer, n – The person preparing the *transaction screen questionnaire* pursuant to Practice E 1528, who may be either the user or the person to whom the user has delegated the preparation of the *transaction screen questionnaire.*

Publicly available, adj – Information that is publicly available means that the source of the information allows access to the information by anyone upon request.

Reasonably ascertainable, adj – Information that is (1) *publicly available*, (2) obtainable from its source within reasonable time and cost constraints, and (3) *practically reviewable*.

Recognized Environmental Conditions, n – (1) the presence of *hazardous substances* or *petroleum products* in, on, or at the *subject property* due to a *release* to the *environment*; (2) the likely presence of *hazardous substances* or *petroleum products* in, on, or at the *subject property* due to a *release* or likely *release* to the *environment*; or (3) the presence of *hazardous substances* or *petroleum products* in, on, or at the *subject property* under conditions that pose a *material threat* of a future *release* to the *environment*.

Records review, n – That part that is contained in Section 8 of this practice addresses which records shall or may be reviewed.

Site reconnaissance, n – That part that is contained in Section 9 of this practice and addresses what should be done in connection with the *site visit*. The *site reconnaissance* includes, but is not limited to, the *site visit* done in connection with such a *Phase I Environmental Site Assessment*

Site visit, n – The visit to the subject property during which observations are made constituting the *site reconnaissance* section of this practice.

Standard environmental record sources, n – Those records specified in 8.2.2.

Standard historical sources, n – Those sources of information about the history of uses of the property specified in 8.3.4.

Standard physical setting source, n – A current USGS 7.5-minute topographic map (if any) showing the area on which the property is located.

Standard practice(s), n – The activities set forth in either and both this practice and Practice E 1528.

Standard sources, n – Sources of environmental, physical setting, or historical records specified in Section 7 of this practice.

Transaction screen process, n – The process described in Practice E 1528.

Transaction screen questionnaire, n – The questionnaire provided in Section 6 of Practice E 1528.

User, n – The party seeking to use Practice E1527 to complete an *environmental site assessment* of the *subject property*.

Visually and/or physically observed, v – During a *site visit* pursuant to this practice, this term means observations made by visual, auditory, or olfactory means while performing *site reconnaissance*.

ACRONYMS:

AULs – Activity and Use Limitations

CERCLA – Comprehensive Environmental Response, Compensation and Liability Act of 1980 (as amended, 42 USC § 9601 *et seq.*)

C.F.R. – Code of Federal Regulations

CREC – Controlled Recognized Environmental Condition

EC – Engineering Control

EPA – United States Environmental Protection Agency

EPCRA – Emergency Planning and Community Right to Know Act (also known as SARA Title III), 42 USC § 11001 *et seq.*)

ERNS – Emergency response notification system

ESA – Environmental site assessment (different than an *environmental audit*)

FR – Federal Register

HREC – Historical Recognized Environmental Condition

IC – Institutional Control

LLP – Landowner Liability Protections under the *Brownfields Amendments*

LUST – Leaking underground storage tank

NCP – National Contingency Plan

NFRAP – Sites were no further remedial action is planned under CERCLA

NPDES – National Pollutant Discharge Elimination System

NPL – National Priorities List

PCBs – Polychlorinated biphenyls

RCRA – Resource Conservation and Recovery Act (as amended, 42 U.S.C. § 9601 *et seq.*.)

REC – Recognized Environmental Condition

SARA – Superfund Amendments and Reauthorization Act of 1986 (amendment to CERCLA).

TSDF – Hazardous waster treatment, storage, or disposal facility

U.S.C. – United States Code

USGS – United States Geological Survey

UST – Underground Storage Tank

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Roux Associates were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Limited Permission To Make Copies

Roux Associates (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/24/2023 has revealed that there is 1 ENVIROSTOR site within approximately 1 mile of the target property.

PROPOSED HIGH SCHOOL	***RAMONA BOULEVARD/CAW***	***0 - 1/8 (0.000 mi.)***	***A1***	***9***
Status: No Further Action Facility Id: 60000906				

Lists of state and tribal leaking storage tanks

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 2 LUST sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

SCH: This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category. depending on the level of threat to public health and safety or the. environment they pose.

A review of the SCH list, as provided by EDR, and dated 04/24/2023 has revealed that there is 1 SCH

site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
PROPOSED HIGH SCHOOL	***RAMONA BOULEVARD/CAW***	***0 - 1/8 (0.000 mi.)***	***A1***	***9***

Status: No Further Action				

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 07/24/2023 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EPA ID:: CAL000257542				

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 05/04/2023 has revealed that there is 1 FINDS site within approximately 0.001 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
EASTERN MUN WATER DI	***22251 SANDERSON***	***0 - 1/8 (0.000 mi.)***	***B3***	***12***
Registry ID:: 110000517664				

ECHO: ECHO provides integrated compliance and enforcement information for about 800,000 regulated facilities nationwide.

A review of the ECHO list, as provided by EDR, and dated 06/24/2023 has revealed that there is 1 ECHO site within approximately 0.001 miles of the target property.

EXECUTIVE SUMMARY

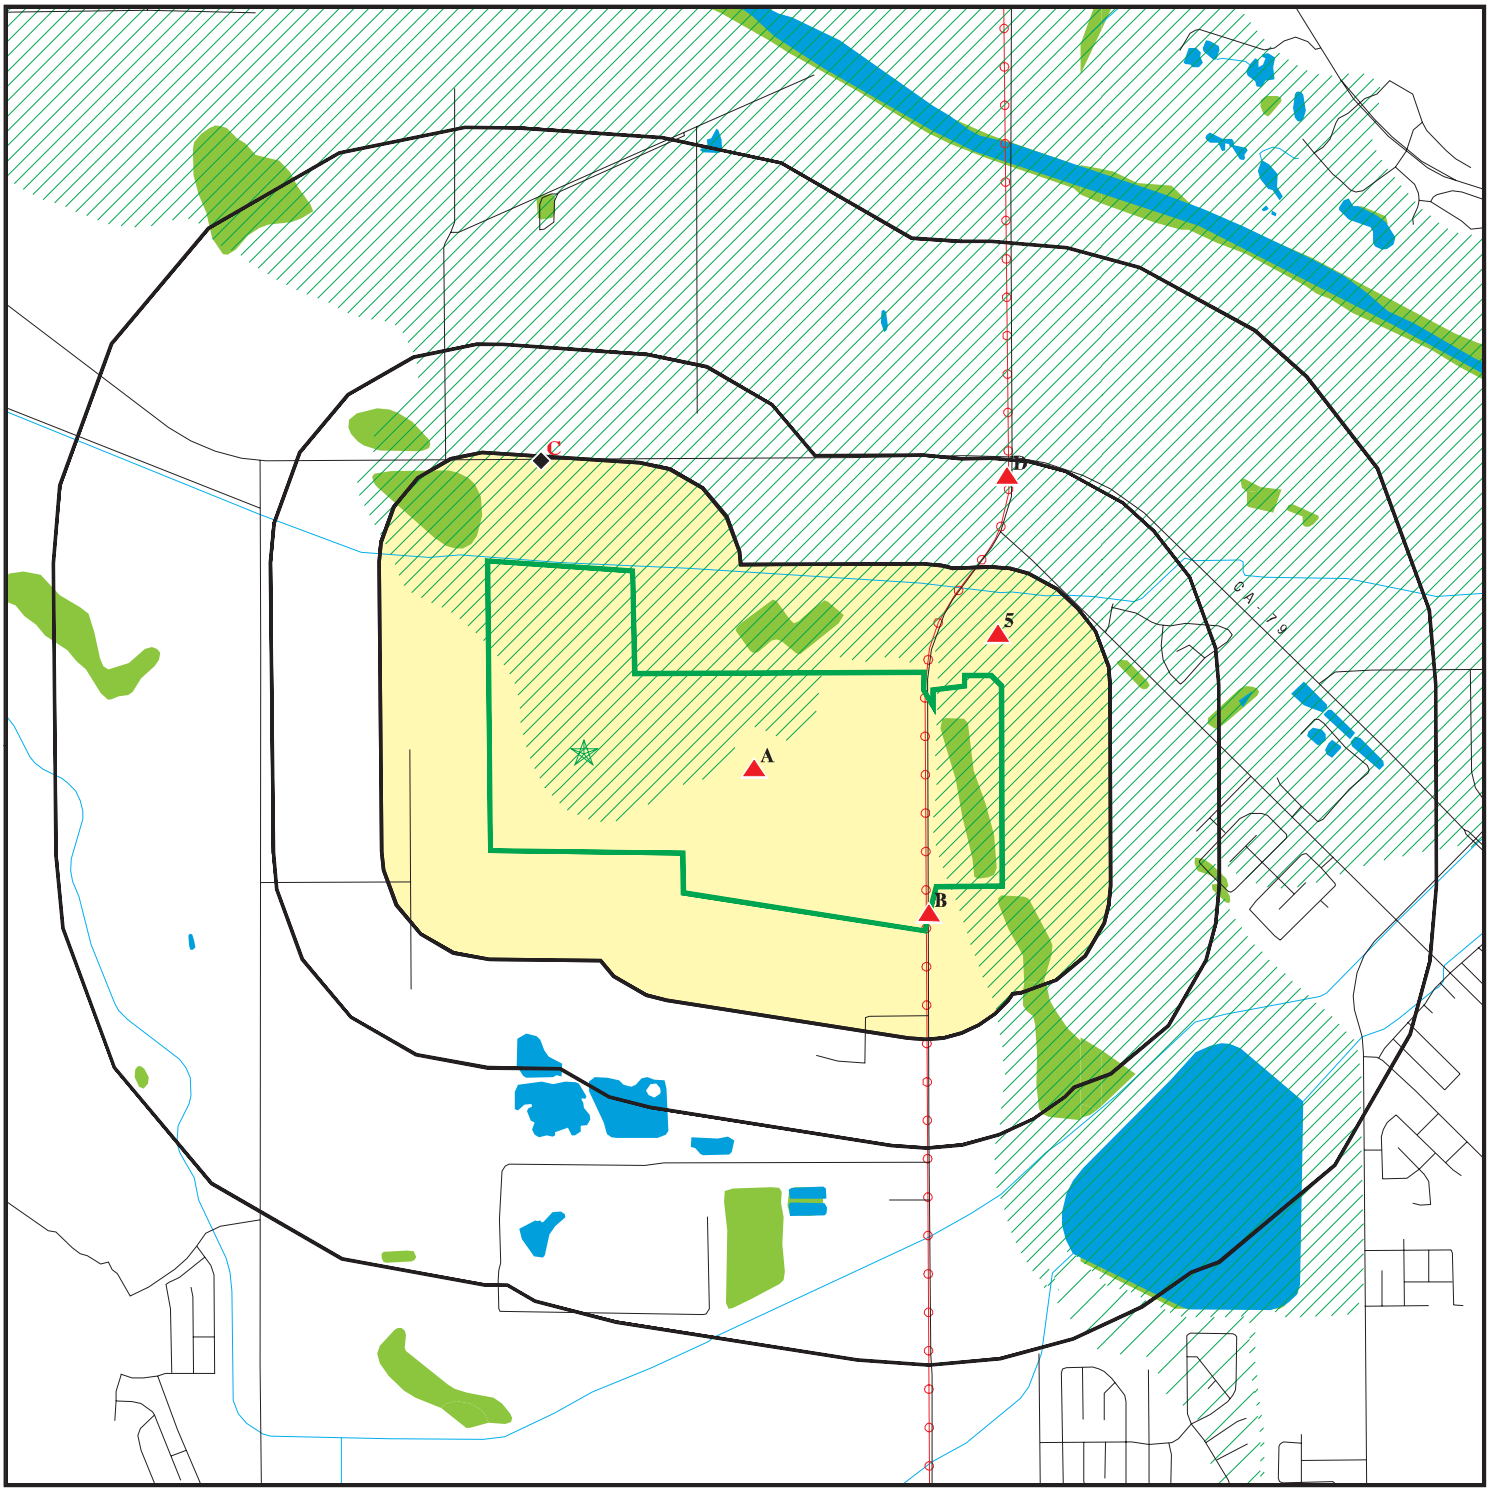
Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
EASTERN MUN WATER DI	***22251 SANDERSON***	***0 - 1/8 (0.000 mi.)***	***B3***	***12***
Registry ID: 110000517664				

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the Cortese list, as provided by EDR, and dated 06/14/2023 has revealed that there is 1 Cortese site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN JACINTO MOBIL	***2070 N SANDERSON AVE***	***ENE 1/4 - 1/2 (0.462 mi.)***	***D9***	***18***
Cleanup Status: COMPLETED - CASE CLOSED				

CERS: The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials



A review of the CERS list, as provided by EDR, and dated 07/17/2023 has revealed that there are 2 CERS sites within approximately 0.001 miles of the target property.

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

RWQCB Region:	SANTA ANA RWQCB (REGION 8)
Site History:	A phase II environmental assessment was completed September 20-21, 2007, for the sale of the property to the County Dept. of Transportation in order to widen the road. 11 borings were geoprobed to 20 . Groundwater was encountered at 13 . 2 grab samples were taken from B-4 near the UST s and B-11 near the dispenser islands. TPHg was detected in 4 borings. B1 at 5 had 203 ppm TPH in the C11-C22 range and 74 ppm in the C-23 to C35 range. B4 at 5 had 47.3J ppm TPH in the C23-C35 range. B6 at 5 had 33.4J ppm TPH in the C23-C35 range. B8 at 5 had 77.3 ppm TPH in the C23-C35 range. No TPH or BTEX was detected in the grab water samples. 2 gasoline and 1 diesel tank were removed January 25, 2008. MTBE was detected under 4 of the dispensers and piping at 2 and 4 at 6.5, 5.5, 8.6 and 7.2 ppb and at 6 under the tank at 6.5 ppb. On July 31, 2008, 7 boreholes were advanced using geoprobes. Soil samples were taken at 10, 13 and 15 . Groundwater was encountered at 13 . Groundwater samples were taken. 3 additional borings were advanced with no soil sampling; only groundwater samples were taken. No TPHg or TPHd was detected in any of the soil samples. One sample showed 0.9 ppm MTBE. TPHg was detected in 3 of the 11 g.w. samples at 42.2J, 259, and 19.0 ppb. No benzene or TPHd was detected in the g.w. Toluene was detected in 2 g.w. samples at 0.82 and 2.12 ppb. Ethylbenzene was detected in 3 samples at 0.64, 4.88, and 0.43J ppb. Xylenes were detected at 3,93, 20.48 and 2.04 ppb. MTBE was detected in 4 samples from 0.57J to 1.99 ppb. Naphthalene was

SAN JACINTO MOBIL (Continued) **S108754562**

detected a6t 7.93 ppb, 124-TMB was detected at 32.6 and 135-TMB was detected at 8.39 ppb. The only chemical which exceeded the MCL were naphthalene with a MCL of 0.14 ppb and 1,2,4-TMB with a MCL of 15 ppb. The RCDEH and SARWQCB both required permanent wells be installed. Ken Williams of the SARWQCB agree to two groundwater sampling events before closure could be considered. Three wells were installed June 30, 2009 to 20 . Groundwater was encountered at ~10 . The wells were screened from 5-20 . No TPHg, VOC s or oxygenates were detected in the soils. The wells were sampled July 13, 2009 and again on September 16, 2009. No TPHg, VOC s or oxygenates were detected in either sampling event. The case was closed on 5/6/2010. No further action required.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 06/22/2023
Date Data Arrived at EDR: 07/06/2023

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

CHROME PLATING: Chrome Plating Facilities Listing

This listing represents chrome plating facilities the California State Water Resources Control Board staff identified as possibly being a source of Per- and polyfluoroalkyl substance (PFAS) contamination. Sites and locations were identified by staff with the Division of Water Quality in the California State Water Board. Data was collected from the CA Air Resources Board 2013 and 2018 - Cr VI emission survey, CA Emission Inventory, CA HAZ Waste discharge database and by reviewing storm water permits. Former chrome plating sites are also included that are open site investigation or remediation cases with the Regional Water Quality Control Boards and the Department of Toxic Substances Control.

Next Scheduled EDR Contact: 01/15/2024
Data Release Frequency: Varies

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/16/2022

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

East Map:	12002892 SAN JACINTO, CA
Version Date:	2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

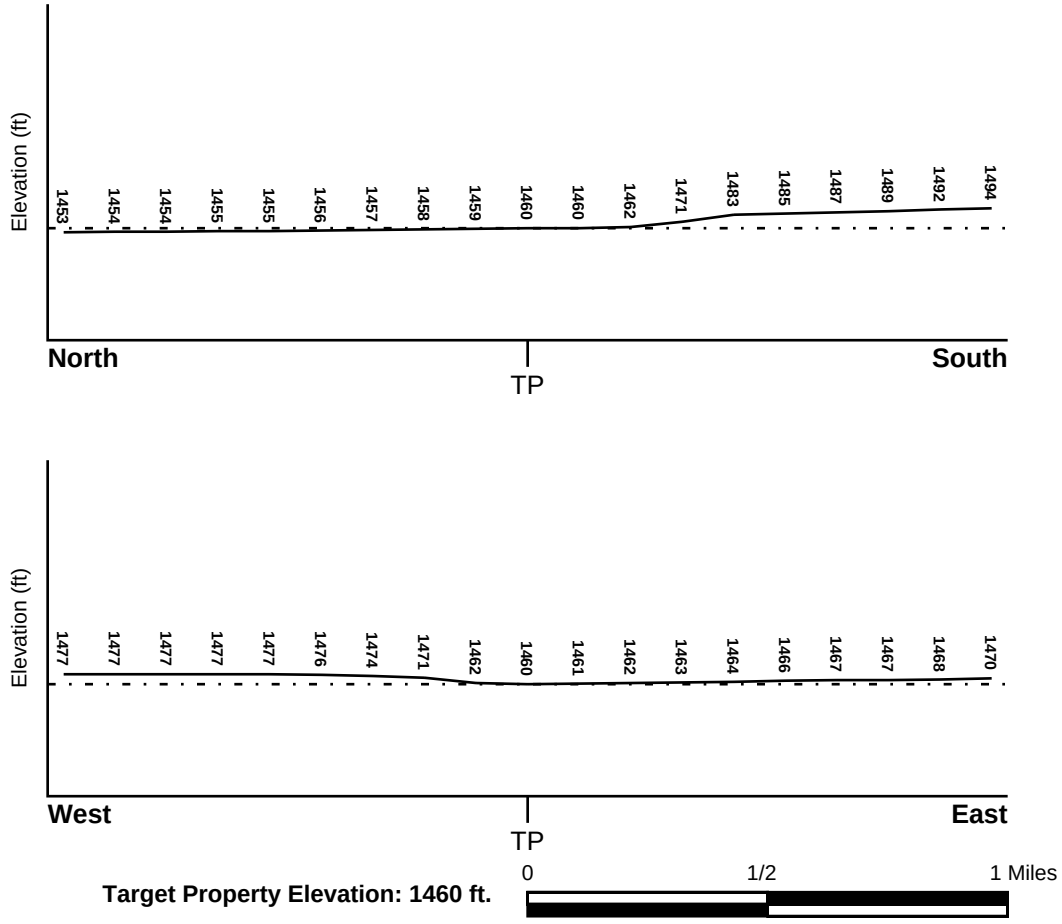
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ENE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06065C1460H	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06065C1470G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LAKEVIEW	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: CHINO

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
2	14 inches	27 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
3	27 inches	59 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9

Soil Map ID: 2

Soil Component Name: GRANGEVILLE

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9 Min: 7.4
2	16 inches	59 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9 Min: 7.4

Soil Map ID: 3

Soil Component Name: GRANGEVILLE

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9 Min: 7.4
2	16 inches	59 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9 Min: 7.4

Soil Map ID: 4

Soil Component Name: DELLO

Soil Surface Texture: loamy fine sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4
2	7 inches	61 inches	sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4

Soil Map ID: 5

Soil Component Name: TRAVER

Soil Surface Texture: loamy fine sand

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)

1	0 inches	20 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9.6 Min: 8.4
2	20 inches	59 inches	stratified fine sandy loam to silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9.6 Min: 8.4

Soil Map ID: 8

Soil Component Name: TRAVER

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

PHYSICAL SETTING SOURCE RECORDS SEARCHED

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 07/24/2023 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN JACINTO HOUSE EPA ID:: CAP000284778	2025 LA CLARITA AVEN	S 0 - 1/8 (0.087 mi.)	6	16

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 07/24/2023 has revealed that there is 1 RCRA-VSQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SAN JACINTO VALLEY R EPA ID:: CAL000344571	700 N SANDERSON AVE	SW 0 - 1/8 (0.014 mi.)	4	10

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/24/2023 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
LYON AVE. NEW ELEMEN Status: Certified Facility Id: 60001838	***425 NORTH LYON AVENU***	***SE 1/2 - 1 (0.525 mi.)***	***8***	***22***

Lists of state and tribal leaking storage tanks

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there is 1 LUST site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
WESTRA DAIRY FARM	***870 SANDERSON***	***SSW 0 - 1/8 (0.084 mi.)***	***5***	***13***

Database: LUST REG 8, Date of Government Version: 02/14/2005

Status: Completed - Case Closed
Facility Status: Case Closed
Global Id: T0606599136
Global ID: T0606599136

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the Cortese list, as provided by EDR, and dated 06/14/2023 has revealed that there is 1 Cortese site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
WESTRA DAIRY FARM	***870 SANDERSON***	***SSW 0 - 1/8 (0.084 mi.)***	***5***	***13***

Cleanup Status: COMPLETED - CASE CLOSED

HWTS: DTSC maintains the Hazardous Waste Tracking System that stores ID number information since the early 1980s and manifest data since 1993. The system collects both manifest copies from the generator and destination facility.

A review of the HWTS list, as provided by EDR, and dated 04/13/2023 has revealed that there is 1 HWTS site within approximately 0.001 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
METROPOLITAN WATER D	LAT/LONG_USED	0 - 1/8 (0.000 mi.)	1	9

CERS: The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

A review of the CERS list, as provided by EDR, and dated 07/17/2023 has revealed that there are 2 CERS sites within approximately 0.001 miles of the target property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

CHROME PLATING: Chrome Plating Facilities Listing

This listing represents chrome plating facilities the California State Water Resources Control Board staff identified as possibly being a source of Per- and polyfluoroalkyl substance (PFAS) contamination. Sites and locations were identified by staff with the Division of Water Quality in the California State Water Board. Data was collected from the CA Air Resources Board 2013 and 2018 - Cr VI emission survey, CA Emission Inventory, CA HAZ Waste discharge database and by reviewing storm water permits. Former chrome plating sites are also included that are open site investigation or remediation cases with the Regional Water Quality Control Boards and the Department of Toxic Substances Control.

HWTS: Hazardous Waste Tracking System

DTSC maintains the Hazardous Waste Tracking System that stores ID number information since the early 1980s and manifest data since 1993. The system collects both manifest copies from the generator and destination facility.

Date of Government Version: 04/13/2023
Date Data Arrived at EDR: 04/18/2023
Date Made Active in Reports: 07/10/2023
Number of Days to Update: 83

Last EDR Contact: 09/27/2023
Next Scheduled EDR Contact: 01/15/2024
Data Release Frequency: Varies

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/16/2022

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991

East Map:	12002892 SAN JACINTO, CA
Version Date:	2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

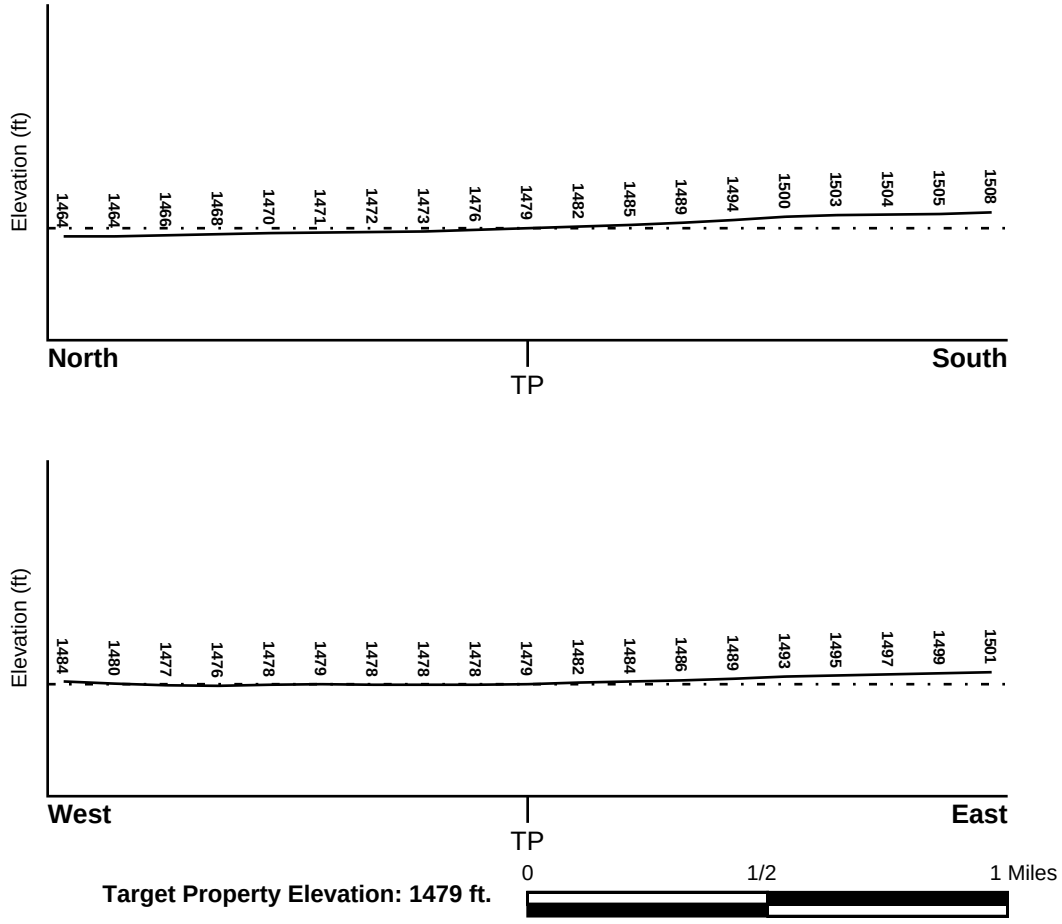
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 1479 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06065C1470G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06065C1460H	FEMA FIRM Flood data

06065C1490G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LAKEVIEW	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: GRANGEVILLE

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9 Min: 7.4
2	16 inches	59 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 9 Min: 7.4

Soil Map ID: 2

Soil Component Name: GRANGEVILLE

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	35 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 9 Min: 7.4
2	35 inches	59 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 9 Min: 7.4

Soil Map ID: 3

Soil Component Name: GRANGEVILLE

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations

RE: **SITE INVESTIGATION**
WESTRA DAIRY
870 SANDERSON AVENUE
SAN JACINTO, CALIFORNIA
ATC PROJECT NUMBER 12077.5203

Dear McGlothlin:

This report presents the results of a Phase II Subsurface Investigation performed at 870 Sanderson Avenue in San Jacinto, California, by ATC Associates Inc. (ATC). This investigation was performed in accordance with the *Workplan of Environmental Sampling* dated August 4, 2000 prepared by ATC and approved within a California Regional Water Quality Control Board-Santa Ana Region letter dated September 26, 2000. ATC previously prepared a report of tank removal operations "Underground Storage Tank Closure Summary Report" dated February 21, 2000 (ATC Job No. 12077.5202).

BACKGROUND

The project location is the Westra Dairy (the Site) located at 870 Sanderson Avenue in the City of San Jacinto. The Site is situated in Riverside County (See Drawing 1).

ATC was retained by Consolidated Waste Industries, Inc. (CWI) to assist in the closure of three underground storage tanks at the Westra Dairy. ATC's initial scope of work included the collection of soil samples from the floor and walls of a former UST System tank pit (see Drawing 2). CWI over-excavated obvious petroleum hydrocarbon stained soil, prior to ATC's collection of soil samples. Ms. Brenda MacGregor, a representative for the County of Riverside Environmental Health Department, monitored ATC sample collection activities. ATC submitted the collected soil samples for analysis by EPA Methods 8015M for gasoline and diesel, 8020 for BTEX/MTBE and 8260 for MTBE confirmation to a state-certified laboratory.

ATC's evaluation of the analytical results indicated that a release had occurred at the site. ATC recommended a subsurface characterization beneath the former tanks. ATC prepared a Workplan for a Phase II Subsurface Investigation in which was submitted to the State Regional Water Resources Control Board – Santa Ana Regional for approval.

PURPOSE AND SCOPE

The purpose of the work was to define the approximate vertical and lateral extent of contamination in the subsurface soil. The scope of work included:

- Drilling three borings to a maximum depth of 60 feet below ground surface.
- Monitor and log the soil;
- Collect soil samples for analysis by EPA Methods 8015, 8021B, 8260B, and 8270C.
- Evaluate the analytical results
- Provide a report of exploration activity.

ATC's *Workplan of Environmental Sampling* dated August 4, 2000 was approved by the California Regional Water Quality Control Board-Santa Ana Region (RWQCB) dated September 26, 2000 (see attached letter).

HYDROGEOLOGICAL CONDITIONS

The Site and surrounding area are included within the U.S. Geological Survey, San Jacinto, California, 7.5-minute quadrangle map. The elevation of the Subject Property is shown as approximately 1,530 feet above mean sea level (MSL).

Quaternary age alluvial fan deposits consisting of unconsolidated sand and gravel underlie the Site. Ground water in this area is reportedly at 120 feet below the ground surface. The regional ground water gradient is southward in the vicinity.

FIELD WORK

ATC advanced 3 soil borings with the use of a CME-85 drilling rig on October 10, 2000 at RWQCB pre-approved locations in association with the former UST field. Soil sample collection was performed at 5 foot intervals beginning at 15 feet to a depth of 70 feet within boring S-1 and S-2, and to a maximum depth of 60 feet within boring S-3. Soil lithology within the borings were characteristic of alluvial deposits consisting of unconsolidated sands and gravel from the surface to the total depth of each boring.

Soil samples were collected using a Modified California Split Spoon Sampler. Upon reaching designated sampling depths, the sampler was driven 18 inches ahead into undisturbed soil. The collected soil samples were retained in stainless steel sleeves, capped with Teflon sheeting and plastic end caps. The samples designated for analysis were labeled, placed on Chain of Custody forms, placed in an iced cooler and delivered to a certified laboratory for analysis.

LABORATORY ANALYSES

All collected soil samples were tested for total (gas and diesel) fuel and aromatic hydrocarbons by Environmental Protection Agency (EPA) methods 8015 and 8021B. Selected samples from boring S-1 at 15 feet and S-3 at 15 feet were analyzed for oxygenates, alcohol's and semi-volatiles as requested by Ms. Rose Scott of the RWQCB by EPA Methods 8260B and 8270C. Analyses were performed by Enviro Chem Laboratories of Pomona, California.

FINDINGS

Soil encountered during this investigation consisted of alluvium, which was brown to a mottled blue/gray color, moist and firm to very dense. Groundwater was not encountered in the borings drilled. Groundwater is estimated to be at a depth of approximately 120 feet beneath the site. Petroleum odors and obvious staining was encountered in all the borings to a depth of 15 feet.

The laboratory analyses indicated that gasoline compounds were present at 15 feet in boring S-1, but concentrations diminished quickly with depth. The highest concentration (2,710-ppm) was at 15 feet, diminishing to 0.497 ppm at 35 feet, and non-detect below 35 feet. Only one sample contained gasoline hydrocarbons in either of borings S-2 or S-3. The sample from boring S-3 at 15 feet contained 0.147 ppm gasoline hydrocarbons Diesel concentrations were not detected in any soil samples.

Two soil samples from 15 feet which contained gasoline compounds were further analyzed for oxygenates and semi volatile compounds by EPA Methods 8260B and 8270C. As expected, several gasoline related compounds were present in sample S-1 at 15 feet which had the highest concentration of gasoline. MTBE was present at 200 mg/kg. Aromatic hydrocarbons including benzene, toluene, ethylbenzene, xylene and trimethylbenzene were present ranging from 22.4 to 578 mg/kg. The laboratory results are summarized on Tables 1, 2, and 3. The laboratory results and chain-of-custody are attached to this report.

CONCLUSIONS

Based on ATC's field observations and the analytical results of the collected soil samples, it is ATC's opinion that the contamination at the site is very limited in vertical and lateral extent. The vertical extent of contamination extends below the former tanks to a depth of 35 feet.

ATC suggests that recent cleanup criteria allow fuel hydrocarbons to be left in soil if the risk of impacting groundwater resources is low. As reported to ATC, the depth to groundwater in this local vicinity is below 120 feet bgs. It appears therefore, that the site conditions are low-risk. The type of hydrocarbons (gasoline) and the relatively low concentrations of hydrocarbon constituents (benzene) and the lack of MTBE, TAME, DIPE and TBA coupled with the great depth to groundwater suggest that no cleanup action would be required. Additionally, a "clean" zone has been established beneath the deepest zone of contamination and the potential for migration to any groundwater resources is low. ATC recommends that the regulatory agency close the site.

LIMITATIONS

This project was performed employing the same degree and skill expected of other similar firms practicing in similar situations or localities. The statements and conclusions provided herein are based on field observations and the analytical results described herein and considered professional opinions.

If there are any questions regarding this report or any of its attachments, please contact the undersigned at (626) 447-5216.

Sincerely,

Timothy J. Lane
Project Geologist

Keith G. Farrell, CEG #1314

Mr. Cal Westra
Westra Family Trust
870 North Sanderson Avenue
San Jacinto, California 92582

SUBJECT: WESTRA DAIRY FARM TANKS
870 NORTH SANDERSON AVENUE
SAN JACINTO, CALIFORNIA 92582
UST CASE NO. 083303601T

Dear Mr. Westra:

We have reviewed the *Site Investigation Workplan* dated August 4, 2000. Your consultant, ATC Associates Inc. (ATC), prepared this plan. The objectives of the proposed investigation are to delineate the lateral and vertical extent of soil contamination.

In the workplan, ATC proposes to drill three borings to a minimum depth of 60 feet and collect soil samples for analysis. Based on our review, we approve the workplan for site investigation with the following conditions:

- The worst-case soil sample based on the EPA Method 8015 sample results must be analyzed using EPA Method 8260, full scan including all fuel oxygenates and alcohols, in addition to the semi-volatile analysis proposed.
- To consider the site fully assessed, a minimum of 30 feet of clean soil must be delineated beneath the deepest contamination.

Please submit the results of the assessment to this office by November 15, 2000. Please submit copies of all correspondence to Ms. Sharon Boltinghouse at the County of Riverside. If you have any questions, please call me at (909) 320-6375.

Sincerely,

Rose Scott
Associate Engineering Geologist
Pollutant Investigation Section

RE: SITE INVESTIGATION WORKPLAN
WESTRA DAIRY FARMS
870 NORTH SANDERSON
SAN JACINTO, CALIFORNIA
ATC PROJECT NUMBER 12077.5203

Dear Mr. Williams:

ATC Associates Inc (ATC) has been requested to submit this Workplan on behalf of our client, Consolidated Waste Industries (CWI) to comply with a fax memo dated July 6, 2000 by Rose Scott of the California Regional Water Quality Control Board, Santa Ana Region.

This Site Investigation Workplan describes the work to be performed to determine the approximate extent of soil contamination at the above referenced Site (Drawing 1). On December 14, 1999 ATC Associates Inc. (ATC) observed the removal of three underground storage tanks (1-10,000 gallon diesel, 2-1,000 gallon gasoline). Eight soil samples taken directly below the tanks indicated elevated analytical concentration of gasoline as high as 5,290 milligrams per kilogram (mg/Kg) and diesel as high as 2,360 mg/Kg. Laboratory results also indicated Methyl-tertiary butyl ether (MTBE) in six of the eight soil samples from the tank field in concentrations ranging from non-detect (ND) to 519 mg/Kg.

ATC recommends that three soil borings be advanced to a maximum depth of 60 feet to determine the approximate vertical and lateral extent of contamination at the site (Drawing 2).

SCOPE OF WORK

Soil Borings and Analysis

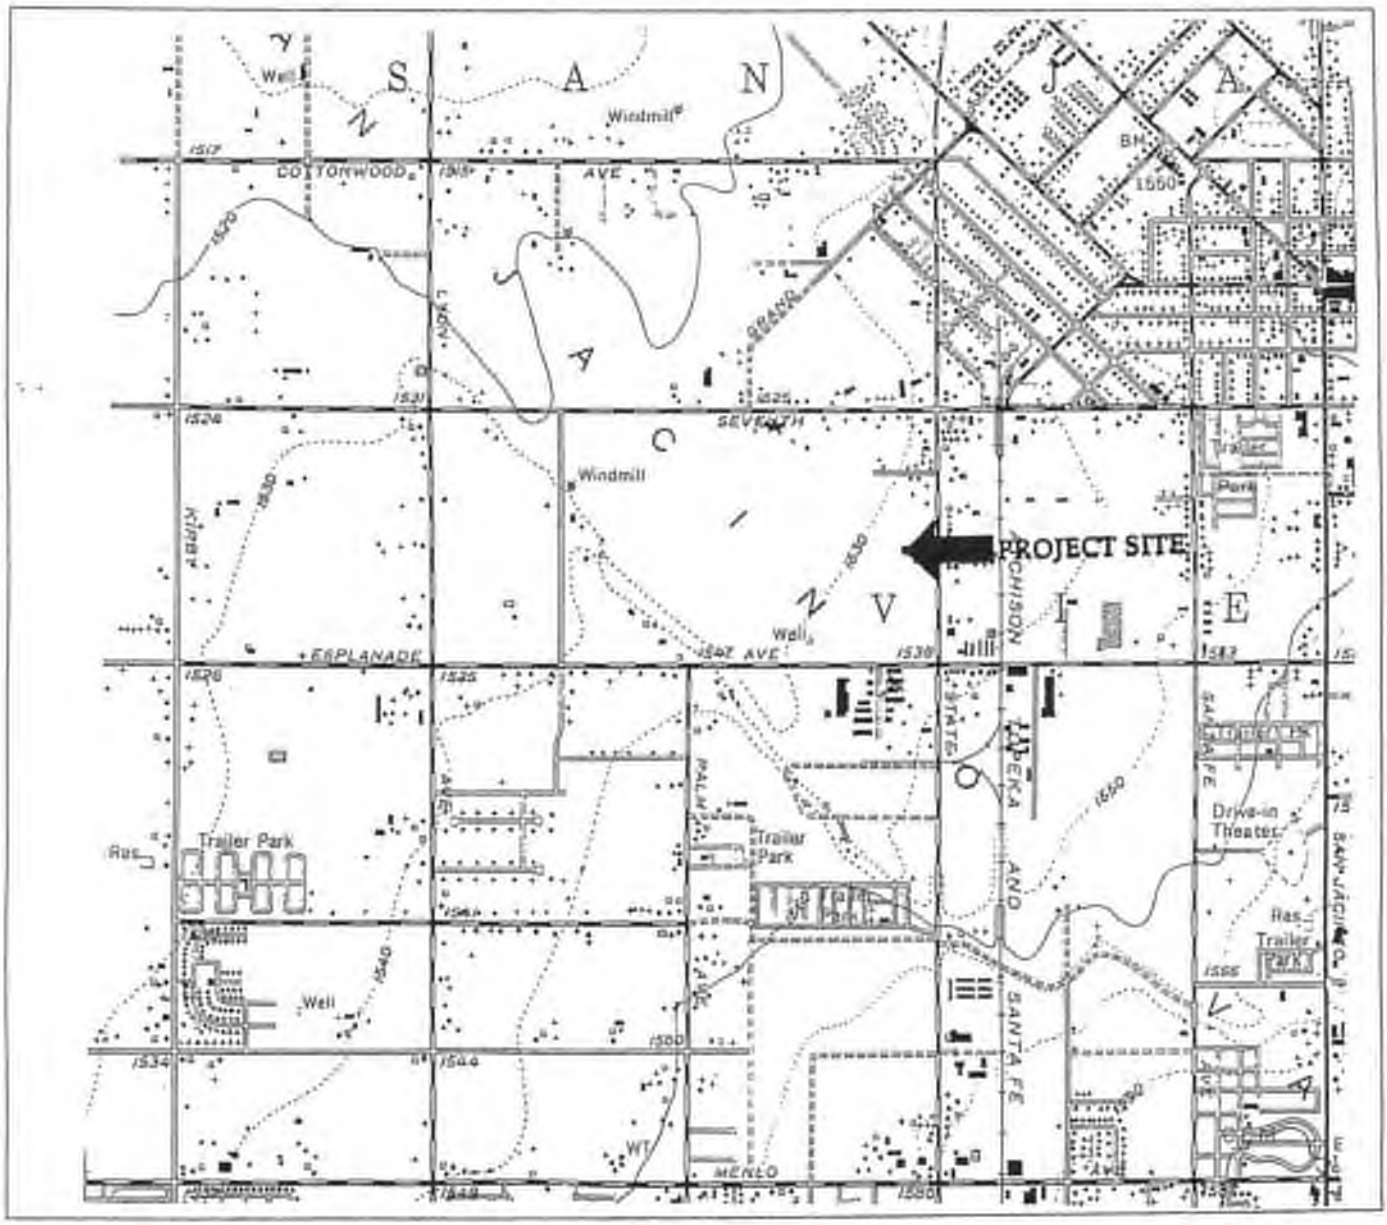
ATC proposes to drill and sample three soil borings on the subject property to a maximum depth of sixty feet. A hollow stem auger-drilling rig (CME 75 or equivalent) will perform the drilling. Soil samples will be collected at five-foot intervals beginning at 15 feet. All soil samples will be collected in brass tubes and as required by state and local agencies. Chain of custody protocol will be followed. Monitoring for volatile organic compounds (VOCs) will be conducted throughout field drilling and sampling operations.

Laboratory Analysis

All soil samples will be analyzed for Carbon Chain Analysis by EPA Method 8015 (Mod) and for aromatic hydrocarbons (BTEX) by EPA Method 8021B. Methyl tertiary butyl ether (MTBE) and additional oxygenates will be analyzed by EPA Method 8260B. Semi-volatiles including polynuclear aromatics (PNA), will be analyzed by EPA Method 8270 will be run only on the sample with the highest laboratory result from each borehole.

SCHEDULE

Upon written notification of the Workplan approval, ATC intends to initiate field operations within five working days. ATC anticipates a 15-day completion time for this project.



Should you have any questions regarding this Workplan, please contact the undersigned at (626) 447-5216.

Sincerely,

Ed McGlothlin
Project Manager

Timothy J. Lane
Project Geologist

SECTION 1.0
EXECUTIVE SUMMARY

PROJECT SETTING

The Villages of San Jacinto project site is approximately 475.1 acres in size and is located in the City of San Jacinto in northwestern Riverside County, California (see *Figure 1-1, Regional Map*). The project site is located in the northwestern portion of the City (see *Figure 1-2, Vicinity Map*). The project is located along Sanderson Avenue which is one of the City's main north-south transportation routes (see *Figure 1-3, Site Location Map*). The project site is bordered by undeveloped agricultural land to the north (and future westward extension of Ramona Boulevard), Sanderson Avenue to the east, Odel Avenue to the west, and undeveloped agricultural land and a municipal wastewater treatment plant to the south. The project site has been used as pasture land and/or a farming operation, similar to surrounding properties, for over one hundred years. The San Jacinto Valley has traditionally supported agriculture and rural residential land uses, but has been experiencing increased urbanization in the past several years.

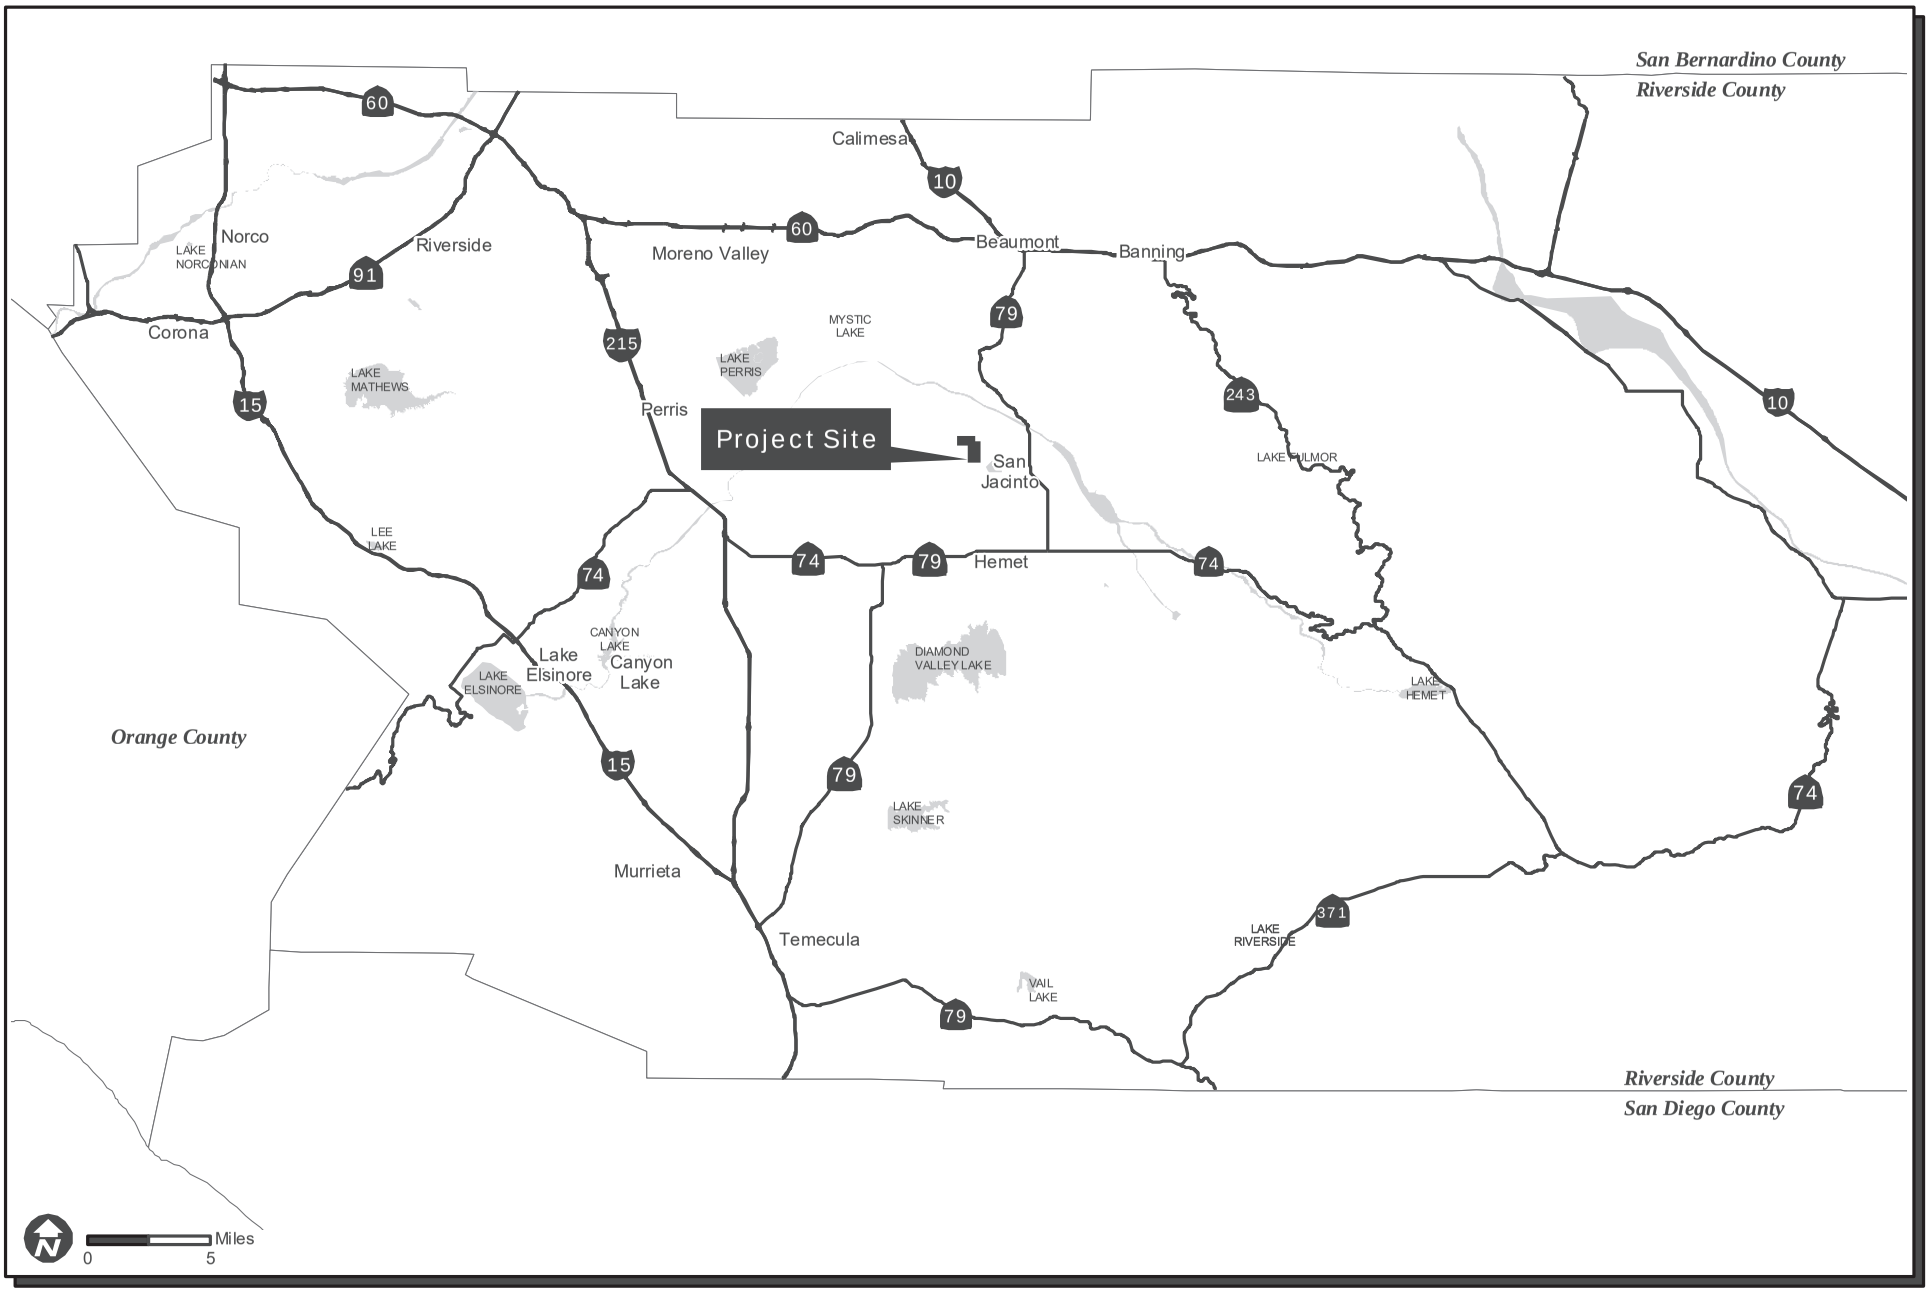
The site is generally flat and is located on the alluvial plain of the San Jacinto River. The site elevation above sea level ranges from 1,455 feet along the northern edge to 1,490 feet in the southeastern corner. The southeastern corner of the site is a former cattle feed lot with several remaining animal shade structures. The remainder of the land consists primarily of vacant former agricultural land. Vegetation on site consists of weedy invasive species that have accumulated since the majority of agricultural production was discontinued. There are scattered sod fields in the northern portions of the property which is the only remaining agricultural operation. Several unnamed, unimproved dirt roadways traverse the site and are associated with former and current agricultural operations. Irrigation canals run along the edges of fields in support of sod farming activities. A detention basin is located along the north-central edge of the project site.

PROJECT DESCRIPTION

The project would consist of development of mostly vacant former agricultural lands into a suburban development including residential, commercial, mixed-use, public facility and open space/recreational uses. The 475.1-acre site would be divided into 18 "Planning Areas" (PA). Each planning area would consist of a specific land use type with some having subareas of the particular land use. The following presents a summary of the proposed development while a detailed description is contained in Chapter 3 of this document.

Residential

Residential land uses would consist of 80.6 acres of low density and detached residential with 6,000-square-foot minimum lots and 117.9 acres of medium density residential having lot sizes

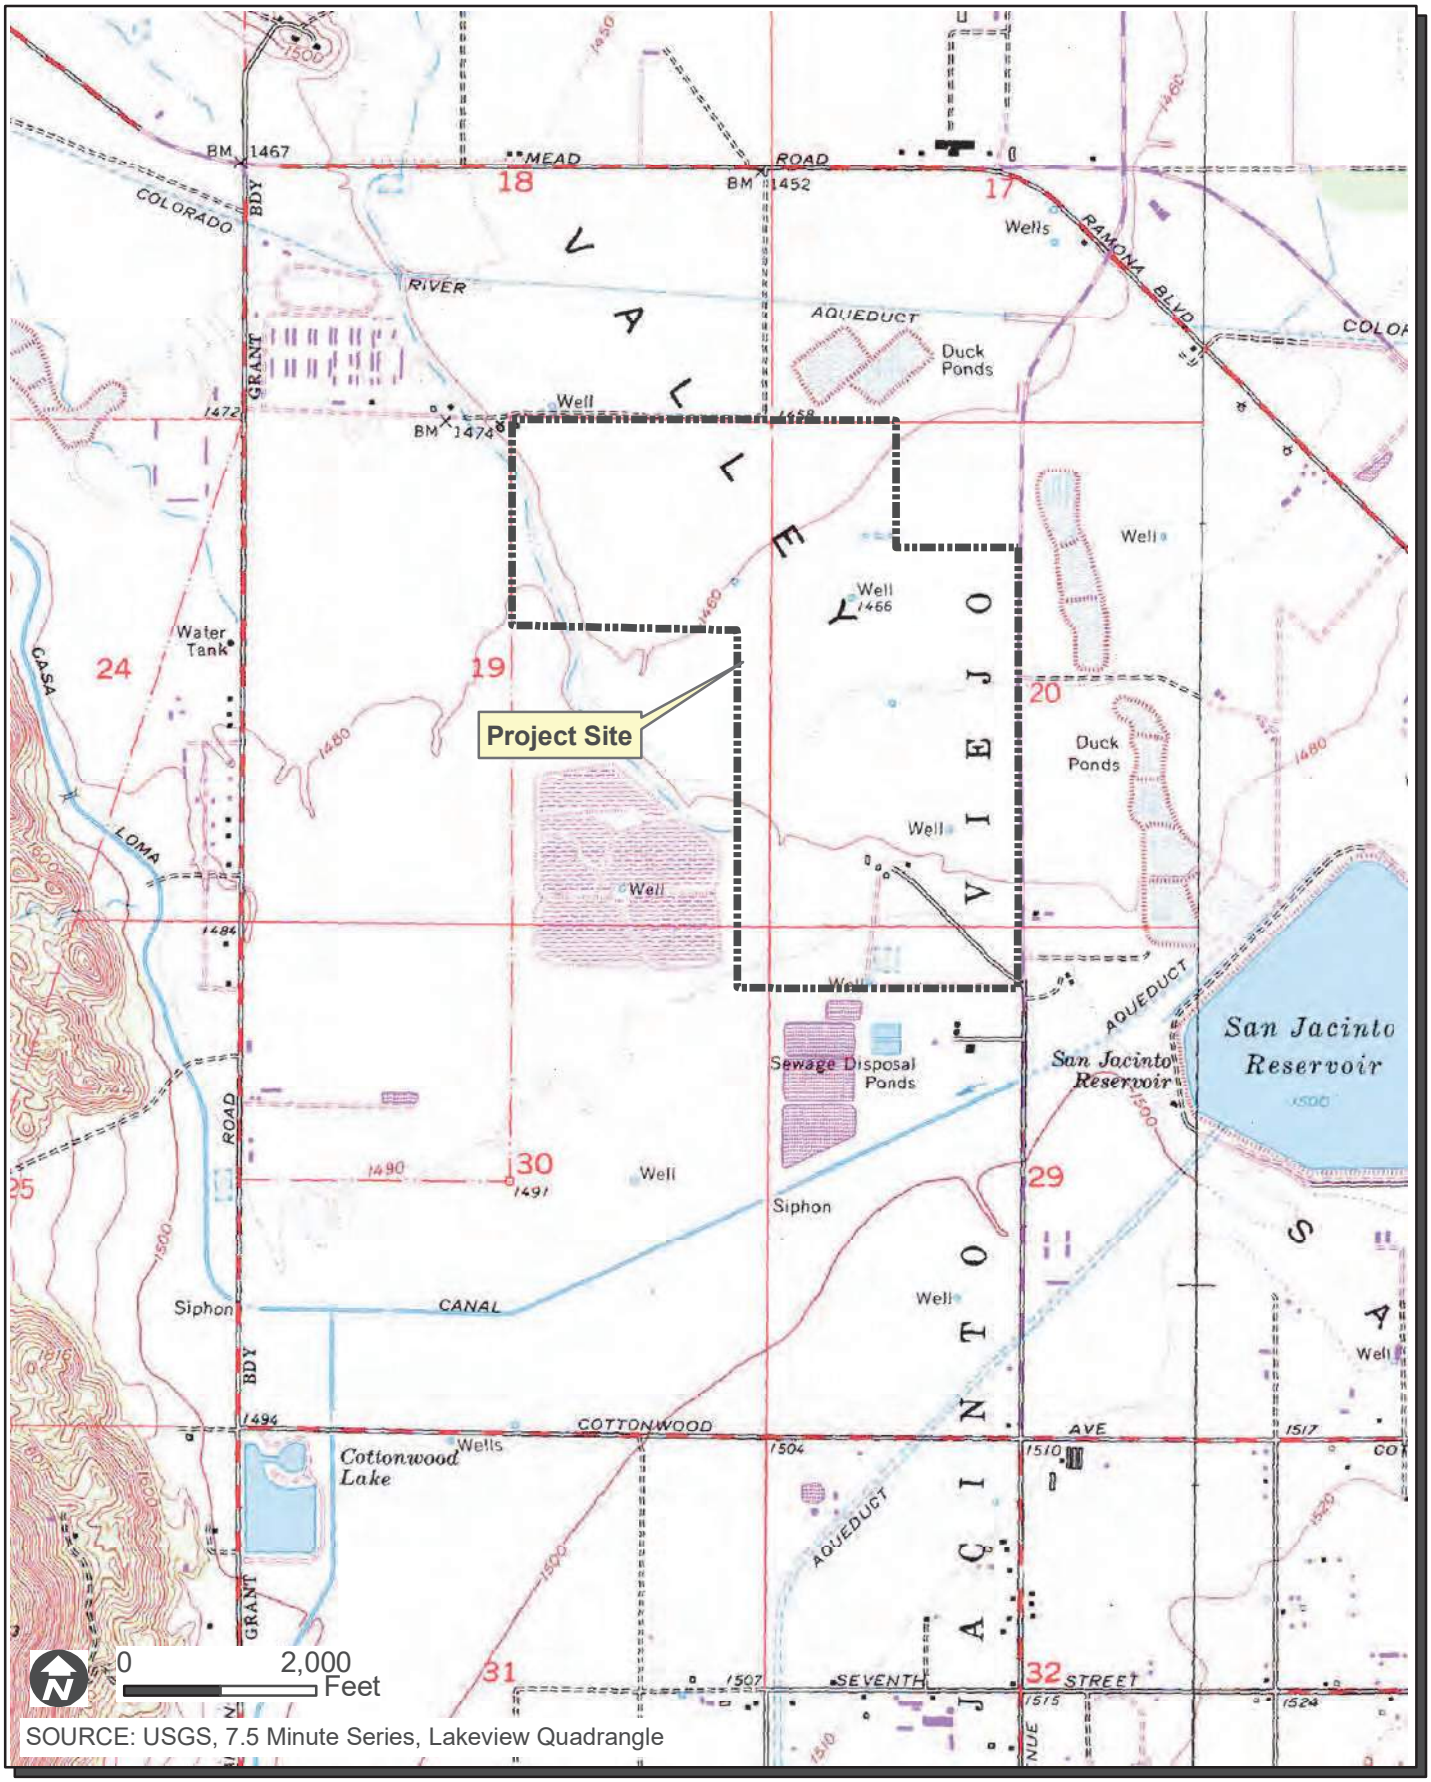


of 4,000 square feet and 5,000 square feet. The medium density residential development will have densities between 5.1 to 6.2 units per acre and a total of 657 dwelling units. Medium density residential is intermixed throughout the site and includes Planning Areas 1, 2, 4, 7, 8, 9, and 10. Low density uses would consist of single family residential lots with a density of approximately 4.5 dwelling units per acre, and a total of 359 dwelling units. The low-density development would be located in Planning Areas 3, 5, 6, 13, and 19. A total of 1,016 dwelling units are proposed with an allowance of up to 1,329 units if the proposed school site is not developed as discussed below.

Commercial

Commercial development would be focused in the southeast corner of the project site within PA 11. This development is intended to result in approximately 247,000 square feet of neighborhood retail commercial uses on 22.7 acres. This designation is intended to meet the provision for retail commercial land uses as set forth in the San Jacinto General Plan Land Use Element and to provide an accessible local shopping center for the proposed project and nearby communities. This would allow for a wide range of businesses including grocery store, drug store, cleaners, restaurants, fast food, and specialty stores. The Specific Plan for the project includes Conceptual Design Guidelines and Development Standards for commercial development of this Planning Area. Comprehensive Design Guidelines will need to be reviewed and approved by the City prior to development of the Planning Area.

Mixed-Use



Mixed-use development will be provided within the 26.3-acre Planning Area 12. This designation is intended to provide for a broad range of land uses, with the primary focus on municipal uses such as library, police and fire facilities and other development such as business and professional park uses including dental and medical offices, real estate offices, banks, etc. This area could also provide accessory uses to the primary facilities such as coffee shop, printers, postal/shipping outlets etc. This designation provides for a maximum of 343,000 square feet of building area and will have a maximum height limit of 45 feet. Conceptual Design Guidelines for commercial uses are provided in the project Specific Plan, but Comprehensive Design Guidelines will need to be reviewed and approved by the City prior to development of the Planning Area.

Site Location Map

FIGURE 1-3

INTENTIONALLY LEFT BLANK

School

As noted in *Table 3-2*, Planning Area 14 is designated for a proposed high school by San Jacinto Unified School District (District). The 69.1 acre high school site would be located southwest of the future intersection of Cawston Avenue and Ramona Boulevard. Preliminary plans for the school include baseball and softball fields, a track/football stadium, gymnasium, performing arts facility and classroom space for up to 2,000 students. Final plans for the school would be processed separately from the Villages of San Jacinto Specific Plan through the District Board of Trustees and the California Division of the State Architect. If the District does not choose to construct a high school on this site, it will instead be used for residential uses. Under this scenario, Planning Area 14 would be developed with 200 low-density residences (minimum 6,000-square-foot lots) and 113 medium-density residences (5,000-square-foot lots). Because final planning for the school would be undertaken by the District, as its own lead agency under CEQA, this EIR's impact analysis of the school is limited to a programmatic level.

Parks and Recreational Amenities

Following is a summary of the recreational amenities and park facilities planned for the proposed project. Further discussion of parks and recreation, including the requirement for provision of adequate parkland is contained in Section 5.12.4.

Public Parks

The proposed project includes three public parks totaling approximately 41 acres. The largest of the public parks is the 33.4-acre Community Park in Planning Area 15C north of Bridge Street in the southern portion of the proposed development. This park will provide soccer and baseball fields, concession area, as well as barbeque and picnic areas overlooking the proposed lake. Public parks in Planning Areas 15B and 15D provide just over seven acres of various active and passive recreational opportunities.

Private Parks

The two private parks in Planning Areas 15A and 15E will provide passive recreation for nearby residents such as tot lots, shade structures, pathways and picnic areas.

Lake House and Swim Lagoon

Other recreational amenities include a 5.1-acre Lake House Beach Club and Swim Lagoon within Planning Area 16. This will be a private facility for residents and will feature a Swim Lagoon with sandy beach, play island, lap pool, play pool, fire pits, open turf area and shade

structures. The clubhouse will provide an exercise room, activity room, restroom/changing rooms and office space.

Lake

The 11-acre private lake will be located primarily between Planning Areas 7 and 8 and adjacent to the Swim Lagoon. It will feature a concrete trail surrounding the lake and connecting to the community park in PA 15C. No swimming or boating will be allowed on the lake, but it will provide recycled water for irrigation of common landscaping within the community.

Paseos

A total of 9.6 acres of landscaped paseos will serve as pedestrian linkages between land uses and will create landscaped buffer areas between Planning Areas. These paseos will be a minimum of 50 feet wide and have 10-foot-wide concrete trails.

Open Space

In addition to the above parks and recreational amenities, approximately 15.2 acres of open grass-lined drainage channels/basins would be constructed along the western perimeter of the project site. A vegetated open detention basin will be located in the northwest corner of the project site. A total of 2.4 acres of landscape easements are provided in various locations throughout the project site. The proposed system of open spaces would provide both on-site and off-site visual benefits to compensate for the loss of existing open space character of the site.

Access

Roadway right-of-way would be located throughout the development and would provide access to and from as well as within the project. Sanderson Avenue and Odell Avenue would serve as primary access points for the project. Ramona Boulevard will be constructed to provide access along the north edge of the project site. Cawston Avenue would serve as the major north-south arterial through the project while De Anza Drive would serve as the major east–west arterial within the development taking access from Sanderson Avenue and connecting to Cawston Avenue. Modifications to Sanderson Avenue, Odell Avenue and Cawston Avenue would be required with project development. Improvements may include traffic light installation and additional turn lanes into the development from perimeter streets, where necessary. Secondary access to Planning Area 19 would be provided by the planned extension of Odell Avenue north to Ramona Expressway. The northern extent of Cawston Avenue would be terminated at the location of the proposed future alignment of Ramona Boulevard until this roadway is complete, at which time the dead ended Cawston Avenue would be retrofitted to form a functional intersection with Ramona Boulevard.

Improvements to SR 79 within western Riverside County is currently being planned by Riverside County Transportation Commission (RCTC)/Caltrans within the general vicinity of the project. Due to the conceptual nature of the ultimate alignment of the future SR 79 corridor, an on/off ramp into or near the proposed development is not contemplated as a project feature. Should roadway improvements be necessary to accommodate an ultimate SR 79 alignment, modifications to the project and preparation of a supplemental environmental document may be necessary. As of April 2004, the City has adopted a locally-preferred alignment for SR 79 which directs the roadway to the east of the proposed project. The Draft EIR/EIS for this project is expected to be circulated for public review in late 2009 with construction to begin in 2011. In late 2006, the City also selected a locally-preferred alignment for Mid-County Parkway, a future regional east-west roadway approximately 1,000 feet north of the project site which is a joint Caltrans/RCTC and Federal Highway Administration (FHWA) project. The 32- mile route will connect the San Jacinto area with the Corona area. Final environmental approvals are expected to be obtained by late 2010 to 2011 with construction set to begin sometime in 2013 (www.midcountyparkway.org).

Sewer and Water Service

The project would involve installation of an on-site sewer and water distribution system. Water and sewer service would be provided by Eastern Municipal Water District and be extended into the project via new conveyance facilities consistent with the District's approved master plan expansion program. The project, along with other future development planning in the western portion of the City of San Jacinto, would contribute to the need for expansion of the Eastern Municipal Water District's Hemet/San Jacinto Regional Water Reclamation Facility located to the south. The expansion of this facility is being analyzed by Eastern Municipal Water District (CEQA Lead Agency) in a separate environmental document.

Recycled Water Service. The project would utilize reclaimed water from the adjacent Eastern Municipal Water District Hemet/San Jacinto Regional Water Reclamation Facility. Recycled water would be utilized for lake/water features as well as common area irrigation needs throughout the proposed community. Recycled water would not be used for private landscaping such as front or back yards.

Storm Drain System

The project incorporates a drainage plan that will not impact upstream and downstream property owners but will provide flood protection for the overall project site. The Drainage Plan will incorporate a vegetative channel and a detention/water quality basin, which are designated as Line V and Detention Basin V. These two facilities are the major backbone infrastructure that will collect the runoff that emanates from off-site and on-site areas. Line V and Detention Basin

V have been designed to convey and control the interim flow rate and ultimate flow rate. The interim flow rate results in a runoff rate that exceeds the ultimate condition flow rate. The interim condition will require the construction of two interim culvert facilities and the reconstruction of an earthen roadway to eliminate ponding east of DeAnza Drive and Sanderson Avenue intersection. These interim drainage facilities are required to control and convey the interim flow rates originating from the off-site area. Several storm drain laterals will provide flood protection for the on-site Planning Areas. Further details of the Drainage Plan are contained in *Section 5.8, Water Quality and Hydrology*.

Tentative Map

A draft tentative map (TM 36188) has also been prepared for the project. *Figure 3-5, Tentative Tract Map*, shows individual residential lots, mixed use and commercial areas and accessory uses including open space, lakes and roadways. In summary, the Tentative Tract Map, which further defines the Specific Plan Land Use Plan (described above), would allow the following housing units and other land uses to be developed on the project site:

Unit Type Summary

- 6,000-square-foot lots – 359 units
- 5,000-square-foot lots – 349 units
- 4,000-square-foot lots – 308 units

  TOTAL 1,016 units

- 69.1-acre high school site
- 22.7 acres of commercial uses
- 26.3 acres of mixed-use
- 5.1-acre lake house and Swim Lagoon
- 43.0 acres for parks
- 11.0 acres for lake surfaces
- 24.2 acres for water quality/detention basin facilities
- 15.2 acres for drainage channels
- 9.6 acres for paseos
- 48.0 acres for roadways

Alternatives Summary

The following is a summary of the three (3) alternatives carried forward for analysis in this EIR. The complete alternatives analysis is contained in Section 10.0 of this document. In addition to the CEQA-mandated consideration of a No Project scenario, two (2) alternatives were selected based on their ability to fulfill the basic objectives of the proposed project, as well as their capability to reduce any potentially significant adverse impacts of the project. A comparison summary of the alternatives is provided below, and impacts have been quantified wherever possible.

- Alternative 1: No Project/No Development Alternative
- Alternative 2: Existing General Plan Designation Alternative
- Alternative 3: Reduced Density Alternative

No Project/No Development Alternative assumes that the project site would not be developed and the former agricultural operations (sod farm and cattle feeding area) would continue.

Existing General Plan Designation Alternative The existing General Plan designations establish 136.5 acres of low density residential and 239.5 acres of medium density residential. This would allow for a maximum of 2,390 medium density dwellings (10 du/ac maximum) and up to 682 low density dwellings (5 du/ac maximum) for a total of 3,072 dwelling units under the existing General Plan.

Reduced Density Alternative would involve the development of a low density housing tract with approximately 1-acre lots. Due to drainage and infrastructure needs, this alternative would consist of approximately 350 single-family homes (on approximately 350 acres), 41 acres of parks, 27 acres of greenbelts, 14 acres of drainage basin, 18 acres of lake surfaces, 18 acres of roadways and a 3-acre clubhouse. Due to the existing nature of the site topography, this project alternative would be prepared, graded and designed in a similar fashion as the proposed project.

Table 1-1, Alternatives Summary, provides a summary of alternatives as they compare to the proposed project. Each alternative was analyzed for its potential impact on environmental issues that were determined to be either significant and mitigable or significant and unmitigable in the proposed project condition. Issues such as land use and planning were not found to be significant, therefore analysis was not provided for each alternative.

Table 1-1
Alternatives Summary

Environmental Issue	Proposed Project	No Project/No Development	Existing General Plan Designation	Reduced Density
Landform Alteration/ Aesthetics	Mitigable Impacts	Reduced impacts due to lack of changed aesthetic nature	Similar, but does not provide as many transitions between land uses	Similar
Agricultural Resources	Unmitigable Impacts	No Impact	Similar	Similar
Biological Resources	Mitigable Impacts	No Impact	Similar	Similar
Geology and Soils	Mitigable Impacts	No Impact	Similar	Similar
Cultural Resources	Mitigable Impacts	No Impact	Similar	Similar
Paleontological Resources	Mitigable Impacts	No Impact	Similar	Similar
Water Quality/ Hydrology	Mitigable Impacts	No Impact	Similar	Similar but less impervious surface due to less intensity of land use.
Transportation/ Circulation/Access	Mitigable Project Impacts Unmitigable Cumulative Impacts	No traffic impacts, but would not facilitate City's goal of installing infrastructure in western San Jacinto	Similar, but would result in higher traffic volumes that may not be completely mitigated.	Less impacts due to less overall trips
Air Quality	Unmitigable Impacts	No Impact	Greater Impacts	Less impacts but likely still significant and unmitigable due to non-attainment status of basin
Noise	Mitigable Impacts	No Impact	Greater Impacts	Similar
Public Services/Utilities	Mitigable Impacts	No Impact	Similar, but water use and other utility use would be much higher under this alternative	Less impacts due to less demand for services
Hazards/Risk of Upset	Mitigable Impacts	No Impact	Similar	Similar
Meets Most Project Objectives?	Yes	No	No	No

Summary of Environmental Impacts

Table 1-2, Summary of Environmental Impacts, provides a comprehensive list of all project impacts and associated mitigation measures. A statement as to whether residual impacts would occur after mitigation is applied is also provided.

Table 1-2
Summary of Environmental Impacts

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
Landform Alteration and Aesthetics		
1. The project would introduce additional night lighting within the project vicinity as well as potential new sources of glare (i.e., glass and reflective exterior surfaces). Particularly the commercial components of the site have the potential to produce significant night lighting impacts upon rural agriculture uses in the vicinity as well as proposed residential land uses within the project itself. Metal or other reflective exterior surfaces and finishes within the commercial components of the site could create new sources of light or glare resulting in significant glare impacts for adjacent residential, park, and agricultural uses.	5.2-a To avoid light and glare impacts, future submittals for commercial portions of the project development shall include a photometric lighting plan. The lighting plan shall demonstrate that project lighting is shielded from surrounding properties and that only the minimum amount of lighting required for safety purposes is provided to avoid adverse effects on surrounding areas. In general, lighting fixtures shall be shielded downward and away from the adjacent residential areas and public roadways. Commercial development plans shall also be reviewed to ensure the avoidance of substantial areas of reflective surfaces for building exteriors.	1. Incorporation of mitigation will reduce impacts to below a level of significance.
2. Should Planning Area 14 be purchased by the San Jacinto Unified School District for development as a high school, any potential light or glare impacts would need to be addressed by the School District in the course of their environmental compliance for that project. However, potential homebuyers in the vicinity should be made aware that potential outdoor lighting impacts may occur.	5.2-b A Notice-to-Property Owner shall be recorded on a separate buyer information sheet with the final map providing notice to potential future property owners in the vicinity of the school site (i.e., Planning Areas 1, 3 and 19) that there may be lighted ball fields in the future should the school district proceed with plans for the proposed high school.	2. Incorporation of mitigation will reduce impacts to below a level of significance.
Agricultural Resources		
1. Development of the proposed project would potentially result in significant urban/rural land use conflicts between the planned residential development and existing agricultural uses surrounding the project site. Conflicts would potentially include fertilizer and pesticide application drift into the proposed residential area, residential	5.3-a A Notice-to-Property Owner shall be recorded on a separate buyer information sheet with the final map providing notice to potential future property owners of the proposed development that the property is located in an area of active agricultural land uses which may potentially result in inconvenience and/or discomfort associated with adjacent agricultural operations including noise, odors and dust generation, and chemical drift.	1. The proposed mitigation would serve to alleviate land use conflicts associated with new residential development and existing agricultural land uses. However, this impact would remain significant and unavoidable until surrounding land converts to the ultimate planned uses prescribed under the City's General Plan.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
complaints about noise and dust resulting from site preparation activities associated with adjacent agricultural uses, and increased trespassing onto agricultural lands.		
2. The proposed project would irreversibly convert land currently under agricultural production and identified as containing significant agricultural resources to urban uses and would contribute to incremental urbanization of a predominantly rural area sustaining existing agricultural land uses.	None.	2. The City's General Plan EIR (January 2006) discusses a number of reasons mitigation for loss of agriculture is infeasible. Rising land costs to replace agricultural lands, rising water costs, labor costs, urbanization and environmental regulations all contribute to ongoing conversion of farmland. Without property owner cooperation and substantial financial incentives, it is infeasible to provide permanent on or offsite mitigation to replace converted farmland. Therefore, no feasible mitigation measures are available to reduce this impact below a level of significance.
Biological Resources		
1. Sensitive vegetation communities on the Villages of San Jacinto Project site include 4.22 acres of open water, 0.23 acre of freshwater marsh, 0.07 acre of southern willow woodland, 0.21 acre of herbaceous wetlands, 0.01 acre of cismontane alkali marsh, and 0.01 acre of intermittent unvegetated stream channel. These areas are under the jurisdiction of RWQCB and/or CDFG. All impacts to RWQCB/CDFG jurisdictional areas are considered significant.	5.4-a Mitigation for impacts to jurisdictional wetlands and non-wetlands waters will consist of: (1) off-site creation, (2) a combination of off-site creation and enhancement of wetlands of equal or higher habitat quality, or (3) purchase of wetlands mitigation credits in an approved mitigation bank. Because wetlands/waters on the Villages of San Jacinto project site are isolated, of low overall quality (contain large quantities of non-native species), and are surrounded by agricultural lands, they do not provide high quality habitat for riparian-dependent wildlife species, therefore mitigation onsite would not result in equal or greater wetland habitat value. Mitigation for on-site wetlands/waters impacts would be a biologically equivalent or superior alternative to avoidance of these impacts. The above not withstanding, wetlands areas created, enhanced, or preserved through the project's wetlands mitigation plan would	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	be connected to other wetlands/riparian/riverine areas and would provide overall biological value to the peregrine falcon and other sensitive wildlife and plant species. Wetland mitigation ratios are based on past experience developing appropriate mitigation for impacts to similar wetland and/or Waters of the US. **Herbaceous Wetlands, Open Water, Freshwater Marsh and Intermittent Stream Channel** Mitigation for impacts to 4.22 acres of open water, 0.23 acre of freshwater marsh, 0.21 acre of herbaceous wetlands, and 0.01 acre of intermittent unvegetated stream channel would be accomplished through creation or purchase of wetlands mitigation credits from an approved mitigation bank at a 1:1 ratio (i.e., 4.67 acres total). (see Section 5.4 in the EIR), **Cismontane Alkali Marsh** Mitigation for impacts to 0.01 acre of cismontane alkali marsh would be accomplished through the creation, or a combination of creation and enhancement, of wetlands of equal or higher habitat quality at a 3:1 ratio (i.e., 0.03 acre). Mitigation can also be accomplished through the purchase of wetlands mitigation credits in an approved mitigation bank. **Southern Willow Woodland** Mitigation for impacts to 0.07 acre of southern willow woodland would be required at a ratio of 4:1 (i.e., 0.28 acre) (see *Section 5.4 in the EIR)*. Mitigation can be accomplished through the creation, or a combination of creation and enhancement of wetlands of equal or higher habitat quality. Mitigation can also be accomplished through the purchase of wetland mitigation credits in an approved mitigation bank.	

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
2. Impacts to the burrowing owl are covered in accordance with the Species Conservation Objectives for the burrowing owl listed in the MSHCP. That said, in order to comply with the specific Burrowing Owl Survey Area provisions of the MSHCP, mitigation for direct impacts to known individuals will require mitigation.	5.4-b Per MSHCP, because of the site does not support long term conservation value for burrowing owls , mitigation for impacts to this pair of owls can include passive or active relocation of owls following accepted protocols per the burrowing owl Species Account in Volume II-B of the MSHCP. In addition, MSHCP requires that: *"Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present will be conducted for all Covered Activities through the life of the permit. Surveys will be conducted within 30 days prior to disturbance. Take of active nests will be avoided. Passive relocation (use of one way doors and collapse of burrows) will occur when owls are present outside the nesting season."* Because impacts to other sensitive wildlife species are covered under the MSHCP, no additional mitigation is proposed for impacts to these species. However, if construction activity is to take place during the breeding season (*i.e.,* January through October), a one-time biological survey for nesting bird species would be conducted within the proposed impact area no earlier than 72 hours prior to construction. This survey is necessary to assure avoidance of impacts to nesting native birds (per the federal Migratory Bird Treaty Act). If nesting birds are detected within vegetation which is to be impacted, the nest location(s) will be protected. A buffer of 25 to 300 feet (specific width to be determined by the project biologist according to species of bird) around the nest will be avoided until fledging. 5.4-c MSHCP requires that night lighting shall be directed away from the MSHCP conservation area. Shielding will be incorporated by the project to ensure that ambient lighting in the MSHCP conservation area is not increased; therefore impacts on potential adjacent MSHCP conservation area lands due to increased lighting would be avoided.	2. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features		Level of Significance after Mitigation
3. Due to the project's location adjacent to land that could potentially be conserved through the MSHCP Plan, potential indirect impacts related to invasive species may occur.	5.4-d	Table 6.2 of the MSHCP lists landscape plant species that shall be avoided for all portions of developments that are located adjacent to (within 1,000 feet) the MSHCP conservation areas. These plant species will be avoided on the areas of the Villages of San Jacinto project site adjacent to Criteria Cells 2775 and 2878 to the west of the project site. This would be achieved by including language in the residential sale documents to ensure that future property owners understand the types of plants that are restricted. Sample language for inclusion in sale documents would be submitted to the Planning Department for approval prior to approval of a certificate of occupancy. Therefore no indirect effects due to invasive species are anticipated.	3. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
Cultural Resources			
1. Due to the presence of five previously recorded sites located within one mile of the project and the fact that the project is located within an alluvial setting, potentially significant archeological resources could be unearthed during site grading.	5.5-a	In order to reduce the potential for disturbance or damage to unknown archaeological resources, monitoring of mass grading activities of the site during . by a qualified archaeologist is required. Should the monitor observe disturbance of resources that could be important archaeological artifacts, the monitor shall have the power to stop grading in the immediate area of discovery in order to allow for a resource study and recovery/curation effort (if necessary) to occur.	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
Geology and Soils			
1. Many portions of the site are characterized as having unsuitable compressible soils not suitable for structural support. Location of a structure on an unstable geological unit or soil would be a significant impact.	5.6-a	The on-site soils are suitable for reuse as compacted fill, provided they are relatively free of organic materials, debris and oversize materials. The optimum lift thickness to produce a uniformly compacted fill will depend on the type and size of compaction equipment used. In general, fill will be placed in uniform lifts not exceeding 8 inches in thickness. Fill soils will be placed and compacted to a minimum 92% relative compaction at a minimum of 2% above the optimum moisture content.	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	Fill slopes shall be overbuilt a minimum of 2 feet and trimmed back to the compacted core or rolled with a weighted sheepsfoot compaction roller as the fill slope height increases in maximum 4-foot increments. Placement and compaction of fill shall be performed in accordance with City grading ordinances and minimum compacted standard under the observation and testing of a qualified geotechnical engineer. All loosely packed exploration trench backfill shall be removed and recompacted in accordance with project geotechnical guidelines. An engineering geologist shall be present to observe all excavations to confirm limits of faulting. If exposures differ from anticipated conditions, further investigations and/or additional structural setbacks can be required.	
2. The perched groundwater table may be located between 5 and 22 feet. A shallow groundwater table can present hazards during site development.	5.6-b. To facilitate the grading operations, on-site irrigation water shall be reduced or ceased for a period of 3 to 6 months prior to the start of grading. Further, the contractor will pothole the upper 12 to 14 feet of soil prior to the start of grading operations to determine if shallow groundwater will affect the planned grading. In localized areas where shallow groundwater conditions exist such that removals cannot be performed to the required depths or where deeper excavations (such as in the proposed "lake" areas) are proposed at or below the existing perched groundwater, methods of localized dewatering will be required including the use of well points and/or interceptor ditch methods. Alternative ground stabilization methods such as deep dynamic compaction shall be required. Deep dynamic compaction is a means of physically compacting the subsurface soils by repeatedly dropping a heavy weight (typically a large concrete block) to densify the underlying soils to a predetermined density. After proposed grading plans are developed, these areas shall be further reviewed by a qualified geotechnical engineer.	2. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
3. Potential site ground rupture, as determined by the Leighton and Associates Fault Investigation, is considered moderate to high. Ground rupture due to on-site faults could potentially affect existing and future facilities (such as gas, electrical, water mains, etc.) that traverse fault zones on the site. Secondary seismic effects due to strong ground shaking, ground rupture, liquefaction and seismically induced settlement are considered significant.	5.6-c. A structural setback zone of 50 feet on either side of the encountered fault zone, and as much as 75 feet on the "down-block" side shall be observed for structures intended for human occupancy (2,000 hours/year). This preliminary setback zone will be refined as the grading concept is developed and possible additional site studies are performed. The Fault Location Map (Plate 2) within the Fault Investigation shows required preliminary structural setbacks. However, the final setback limits shall be determined during grading or future studies as the fault trace is exposed, identified and surveyed for lateral and vertical location. The setbacks shall be shown on all project plans. To reduce the effects and magnitude of the earthquake-induced settlements, remedial grading shall occur. Following remedial grading, differential dynamic settlements are anticipated to be approximately 2 inches in a horizontal distance of 40 feet. Additional analysis will be performed by a qualified geotechnical specialist to further refine earthquake-induced settlement. Based on a review of the rough grading plans by a qualified geotechnical specialist, remedial grading requirements will be revised. To reduce the potential adverse secondary seismic effects, mitigation of compressible alluvial soils to support the planned development at areas such as free-face slopes ("green belt" detention basins, channels etc.), the project perimeter (where removals may be limited by property restraints) and planned lake areas will require additional geotechnical stability design by a qualified geotechnical engineer after project plans are developed.	3. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
4. The volume change of excavated on-site materials upon recompaction is expected to vary with materials, density, insitu moisture content, location and intended compaction effort. Therefore, it is likely that on-site ground rupture could potentially affect future	5.6-d. While it is difficult to determine the level of subsidence and shrinkage risk, site grading must include a balance area or ability to adjust import quantities to accommodate some variation. Relative compaction rates must be followed as they appear in the February 28, 2005, Leighton and Associates Technical Report. As stated in the February 28, 2005,	4. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
site improvements. Based on the site specific fault investigation, the potential for site ground rupture during a seismic event is considered moderate to high.	Leighton Report, due to the agricultural discing of the surface soils, a subsidence value of 0.2 feet must be applied when evaluating earthwork volumes.	
5. The relatively loose saturated alluvial deposits on site are considered susceptible to liquefaction hazards.	5.6-e. To reduce the potential for liquefaction and earthquake-induced settlements at the site, the following guidelines will be implemented. For preliminary design purposes, a minimum removal and recompaction of 10 feet (as measured from finish grade) will be used in cut areas on that portion of the site designated as having a high potential for liquefaction (roughly the northern one third to one half of the site). In cut areas outside the area designated as high potential for liquefaction, a minimum overexcavation of 5 feet below finish grade must be used. For areas designated as "fill" a minimum removal of 5 feet will be used, provided a minimum total thickness of 10 feet of properly compacted fill is maintained below the lowest adjacent finish grade (including lowest adjacent street elevation). The removal depths for the infrastructure roadways shall be a minimum 5 feet below pavement subgrade. These estimates are for preliminary design planning only and will be revised based on our review of rough grading plans. These preliminary estimates will be revised upon review of the proposed grading concept plan. These alluvial soils must be removed down to medium dense to dense, relatively non-porous alluvium material as determined by the geotechnical consultant. Undercuts will be made 1:1 next to existing roadways that will remain after grading. Cut slopes shall be replaced as properly compacted fill. The excavated materials will be moisture conditioned or dried back, as appropriate, to achieve the required minimum relative compaction. Saturated soils may need to be dried back or mixed with drier on-site materials and shall be thoroughly mixed prior to fill placement. The resultant excavation will be filled and compacted in this lifts to a minimum 92% relative	5. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	compaction at a minimum of 2% above the optimum moisture content. A minimum 90% relative compaction may be acceptable in the southern portion of the site. This will be determined during review of rough grading plans. After completion of the required removal of unsuitable soils, the approved surface will be scarified, moisture conditioned as needed and compacted prior to placing fill. If subgrade conditions at the approved bottoms are wet and "pumping" near the required removal depth, the scarification and moisture conditioning will not be necessary. Stabilization measures where shallow groundwater conditions are expected at or near the required removal depth may include the use of a stabilization fabric and/or coarse gravel/graded rock and gravel. Where shallow groundwater conditions are present, alternative ground improvement guidelines shall be followed (see Mitigation Measure 5.5-b). Further evaluation of these specific areas will be necessary after draft grading plans are prepared.	
6. Manufactured slopes that are planned for construction on the site would be susceptible to slope stability hazards. Slopes adjacent to severe flow direction changes may be susceptible to increases scour erosion and slope stability.	5.6-f. All slopes will be provided with appropriate surface drainage features and landscaped with drought-tolerant, slope-stabilizing vegetation as soon as possible after grading to reduce the potential for erosion. Berms will be provided at the top of fill slopes to direct water away from slope faces. Lot drainage shall be directed such that runoff on slope faces is minimized. Oversteepening of slopes must be avoided during fine grading and building construction. Although not anticipated, if seepage is encountered in slopes, special drainage features may be necessary. 5.6-g. For slopes that are will be adjacent to ditches or other water conveyance features, proper protection including rip rap or other slope protection devices as designed by the project civil engineer would be required. Slope stability and the potential for scour shall be required in the design drainage alignment.	6. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
Paleontological Resources		
1. Since the proposed project lies within a geologic formation with high resource bearing potential and the project would necessitate recompaction of potential fossil bearing alluvium, impacts to paleontological resources are considered to be significant. Impacts to paleontological resources could occur during excavation and site development when geologic formations that have resource bearing potential are disturbed. Impacts would occur when fossils are physically destroyed by such activities.	5.7-a. Prior to beginning any excavation work, the developer or its contractor shall demonstrate that a qualified paleontologist has been retained to carry out a paleontological resources mitigation program. A paleontological monitor shall be on site at all times during grading activities that disturb non-undocumented fill soils or formations. If fossils are discovered, the paleontologist or paleontological monitor shall have the authority to halt construction in the immediate area of discovery until such a time that a complete assessment of the resources can be conducted. If resources are found that are determined to be significant, the paleontological monitor shall direct activities to recover the resources. Prepared fossils, along with copies of all pertinent field notes, photos and maps shall be deposited in a scientific institution with paleontological collections, such as the San Bernardino County Museum.	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
Water Quality and Hydrology		
1. Implementation of the project would increase the amount of impervious surfaces within the local area which would result in increased runoff and reduced on-site water percolation. Increasing an area's impervious surface may result in drainage problems and flooding.	5.8-a. The project is located within the San Jacinto – Area Drainage Plan (SJ-ADP), which is a financing mechanism used to offset costs for construction of proposed Master Drainage Plan (MDP) facilities. The project will be charged a per-acre fee in order to pay a fair share of the price of area-wide drainage facilities.	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
2. All lake and drainage features on site would be constructed so they are above the groundwater table so as to prevent intermixing of ground and surface waters. That said, it is possible that during project construction, groundwater may be encountered.	5.8-b. If dewatering becomes necessary during construction, all discharges shall be in accordance with Santa Ana Regional Water Quality Control Board requirements which mandate that dewatered groundwater be tanked and hauled to a legal disposal site for treatment. Dewatering shall not occur in on-site drainages or water features. In addition, if dewatering becomes necessary during construction, a National Pollution Discharge Elimination System dewatering permit shall be obtained from the Santa Ana Regional Water Quality Control Board.	2. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
3. The northern portion of the project site is located within the 100-year floodplain of the San Jacinto River. Development within the floodplain would result in an impedence to flow and an increase in the base flood elevation. Because a portion of the proposed development is proposed to be constructed within the limits of the 100-year floodplain, development of the proposed project will result in potentially significant impacts relating to flood hazards.	5.8-c. All buildings shall be located outside of the 100-year floodplain. The applicant shall process a Flood Insurance Rate Map (FIRM) map revision. Further, the applicant shall obtain a Conditional Letter of Map Revision (CLOMR) prior to issuance of building permits. The project applicant, or subsequent property owners, shall obtain flood insurance, to the extent required by law, to protect against any damage that might occur during a flood event. It must be noted that at the time of EIR publication, the applicant and City had initiated the CLOMR process with the Riverside County Flood Control and Water Conservation District.	3. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
4. Development of the proposed project may result in an increase in pollutant load due to sedimentation. Sediments are soils or other surficial materials eroded and then transported or deposited by the action of wind, water or gravity. Sediment from erosion, primarily during construction, is quite often a major project pollutant of concern. A potentially significant impact could occur during construction related to sedimentation.	5.8-d. During construction, the project will incorporate all City of San Jacinto construction Best Management Practices (BMPs). These BMPs include the following: • Erosion control BMPs including temporary seeding, permanent seeding, etc. • Soil stabilization BMPs • Sediment control BMPs including silt fence perimeter controls, surface roughening, tree or natural vegetation preservation and protection, temporary gravel construction entrance/exit, temporary diversions, permanent diversions, outlet stabilization, inlet protection, temporary sediment basins and gravel bay barriers. • Wind erosion BMPs • Minimize contact with Stormwater BMPs including BMPs for construction vehicles and equipment maintenance, fueling and washing, materials maintenance and construction material loading, unloading and access area controls. • Non-storm water BMPs • Post-construction BMPs	4. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	5.8-e. The project applicant will need to develop a Stormwater Pollution Prevention Plan (SWPPP) pursuant to NPDES Storm Water Discharge Associated with Construction Activity Guidelines (Water Quality Order 99-08-DWQ). The SWPPP will identify all BMPs that will prevent construction pollutants from contacting storm water. Measures shall also be designed so as to prevent all products of erosion from moving off site into receiving waters. Provisions will also be included to ensure that BMPs are monitored and success recorded.	
5. Development of the proposed project may result in an increase in pollutant load due to sedimentation. Sediments are soils or other surficial materials eroded and then transported or deposited by the action of wind, water or gravity. Sediment from erosion, primarily during construction, is quite often a major project pollutant of concern. A potentially significant impact could occur during construction related to sedimentation.	5.8-f. Structural Best Management Practices (BMPs) are required for new development to improve water quality of stormwater runoff. In order to meet NPDES regulations, the design volume or design flow to be treated must reduce pollutants to the Maximum Extend Practicable (MEP). This project will incorporate a water quality extended detention basin to provide water quality treatment for the runoff emanating from the project site, a volume-based BMP, and a flow-based BMP. Once the project is complete, maintenance will be the responsibility of the Villages of San Jacinto homeowners association. In addition to sizing techniques, several quantity-control Best Management Practices (BMPs) shall be implemented to control runoff: • Rainfall shutoff devices shall be used to prevent irrigation during and after precipitation; • Irrigation systems shall utilize a dripping system to eliminate nuisance run-off; and • Backflow preventer/pressure regulators shall be installed. • The project applicant will need to develop a Water Quality Management Plan pursuant to NPDES Permit #CAS 618033, order # R8-2002-001. The Water Quality Management Plan will identify all final site BMP requirements.	5. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	The following BMPs may be incorporated into final site designs: • Construct community streets, sidewalks and parking lot aisles to the minimum widths necessary; • Incorporate landscape treatment for parking lot runoff; • Use unit pavers or other equivalent porous material to construct walkways, alleys and other low-traffic areas; • Utilize trees in landscaping plans to maximize canopy interception and water conservation; • Plant native trees and maximize canopy interception and water conservation; • Drain rooftops into adjacent landscaping prior to discharging to the storm drain; • Vegetate slopes with native or drought tolerant vegetation; and • Install energy dissipaters at the outlets of new storm drains that enter the regional storm drain system that eventually feeds into the San Jacinto River. • Utilize and install "high to medium efficiency" Post Construction BMP filtration system within the proposed water quality basin that would help reduce as many bacteria and viruses as possible from entering the downstream local stormwater collection system. This system must follow the specifications of the California Stormwater Handbook to ensure that the system provides maximum bacteria/viral capture.	
6. Transportation, Circulation, and Access		
1. The project may result in significant impacts to local circulation systems if site specific improvements are not implemented in conjunction with each phase of the project (refer to *Figures 5.9-5 thru 5.9-8*).	**Phase I** 5.9-a The following measures shall implemented prior to issuance of the first residential and commercial building permits and as depicted on *Figure 5.9-5*: • Construct Sanderson Avenue at its ultimate half-section width as an Urban Arterial roadway from the project's northerly boundary to the project's southerly boundary in	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	conjunction with development. • Construct De Anza Drive at its ultimate full-section width as a secondary roadway from Cawston Avenue to Sanderson Avenue in conjunction with development. • Construct Bridge Street at its ultimate half-section width as a secondary roadway from Street "A" to Sanderson Avenue. • Construct Cawston Avenue at its ultimate half-section width as a secondary roadway from the Phase II southerly boundary to De Anza Drive. • Participate in fair share fees to construct a traffic signal at the following intersection in conjunction with Phase I of the development: o Sanderson Avenue (NS) at: De Anza Drive (EW) • Construct a traffic signal at the following intersection in conjunction with Phase I of the development: o Sanderson Avenue (NS) at: Bridge Street (EW) • Provide stop sign, stop bar, and stop legend at all project driveways that intersect with public roadways and do not meet traffic signal warrants. • Driveway 15 shall be restricted to right in/right out only access. • Sight distance at each project access shall be reviewed with respect to standard Caltrans and City of San Jacinto sight distance standards at the time of preparation of final grading landscape and street improvement plans. • On site traffic signing and striping shall be implemented in conjunction with detailed construction plans for the project site.	

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	Phase II 5.9-b The following measures shall be implemented prior to issuance of the 432nd residential permit, any additional commercial building permits and as depicted on *Figure 5.9-6*: • Construct Cawston Avenue at its ultimate full-section width as a secondary roadway along the Phase II Cawston Avenue boundaries in conjunction with Phase II of the development. • Driveway 14 shall be restricted to right in/right out only access. • Provide stop sign, stop bar, and stop legend at all project driveways that intersect with public roadways and do not meet traffic signal warrants. • Sight distance at each project access shall be reviewed with respect to standard Caltrans and City of San Jacinto sight distance standards at the time of preparation of final grading landscape and street improvement plans. • On site traffic signing and striping shall be implemented in conjunction with detailed construction plans for the project site. **Phase III** 5.9-c The following measures shall be implemented prior to issuance of the 754th residential permit, the high school, any additional commercial building permits and as depicted on *Figure 5.9-7*: • Construct Odell Avenue at its ultimate half-section width as a secondary roadway from Ramona Boulevard to the project's southerly boundary in conjunction with Phase III development. • Construct Cawston Avenue at its ultimate full-section	

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	width as a secondary roadway from Ramona Boulevard to the Phase II northerly boundary in conjunction with Phase III development. • Construct Ramona Boulevard at its ultimate half-section width as a secondary roadway from Odell Avenue to Sanderson Avenue in conjunction with Phase III development. • Driveway 5 at Ramona Boulevard shall be restricted to right in/right out only access. • Participate in fair share fees to construct a traffic signal at the following intersection in conjunction with Phase III of the development: o Cawston Avenue (NS) at: Ramona Boulevard (EW) • Provide stop sign, stop bar, and stop legend at all project driveways that intersect with public roadways and do not meet traffic signal warrants. • Sight distance at each project access shall be reviewed with respect to standard Caltrans and City of San Jacinto sight distance standards at the time of preparation of final grading landscape and street improvement plans. • On site traffic signing and striping shall be implemented in conjunction with detailed construction plans for the project site. • Construct secondary access for PA 19 as approved by the City Engineer. **Phase IV** 5.9-d The following measures shall be implemented prior to issuance of the final remaining commercial building permits and as depicted on *Figure 5.9-8*: • Construct Cawston Avenue at its ultimate half-section width as a secondary roadway from Bridge Street to De	

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	Anza Drive in conjunction with Phase IV development. • Construct Bridge Street at its ultimate full-section width as a secondary roadway from Cawston Avenue to Street "A" in conjunction with Phase IV development. • Construct the remaining half of Bridge Street as a secondary roadway from Street "A" to Sanderson Avenue in conjunction with Phase IV development. • Driveway 10 at Bridge Street shall be restricted to right in/right out only access. • Driveway 12 at Bridge Street shall be restricted to right in/right out only access. • Driveway 16 at Sanderson Avenue shall be restricted to right in/right out only access. • Construct traffic signals at the following intersections in conjunction with Phase IV of the development: o Driveway 3 (NS) at: Ramona Boulevard (EW) (Only if High School is constructed) • Street "A"/Driveway 11 (NS) at: Bridge Street (EW) • Street "B"/Driveway 13 (NS) at: Bridge Street (EW) • Participate in fair share fees to construct a traffic signal at the following intersection in conjunction with Phase IV of the development: o Cawston Avenue (NS) at: Bridge Street (EW) • Provide stop sign, stop bar, and stop legend at all project driveways that intersect with public roadways and do not meet traffic signal warrants. • Sight distance at each project access shall be reviewed with respect to standard Caltrans and City of San Jacinto sight distance standards at the time of preparation of final grading landscape and street improvement plans.	

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features		Level of Significance after Mitigation
		On site traffic signing and striping shall be implemented in conjunction with detailed construction plans for the project site.	
2. Intersections are projected to operate at unacceptable LOS E or F during the peak hours without improvements. Some required improvements would exceed the General Plan typical roadway cross sections and are therefore not feasible. Improvements in excess of the ultimate planned roadway cross-sections at the study intersections would not be required to achieve acceptable LOS for cumulative conditions with completion of the MCP and SR 79 projects. However, it should be noted that completion of these regional improvements can't be determined by the City.	5.9-e	Because the project, along with many others in the area, is contributing to the city-wide need for street improvements, the project will need to contribute to the Riverside County TUMF and City of San Jacinto DIF programs. As discussed in Section 5.9.2, these fees are collected as part of a funding mechanism aimed at ensuring that local and regional highway capacity keeps pace with projected growth throughout the area. Eligible facilities for funding by the City's DIF program are identified on the City's Facility Needs List, which currently extends through the year 2020. *Table 5.9-17, Estimated TUMF and DIF Fee Calculations,* includes estimated fee calculations for the proposed project based on current fee rates. Many off-site circulation improvements required as a result of project impacts would be mitigated through participation in the TUMF fee program. Many of the off-site improvements that are needed will be planned, designed and constructed by the City, Riverside County Transportation Department, Riverside County Transportation Commission, other cities or a combination of the above. In order to ensure that all off-site traffic improvements are constructed by the City (or the County/RCTC), prior to construction of specific project phases, the City shall ensure that the improvements are made to compensate for the project's contribution to off-site circulation issues. The project applicant's payment of TUMF and DIF fees will allow the financing mechanism to conduct such improvements.	2. The project would contribute to a significant unavoidable impact for cumulative traffic conditions if the MCP and SR 79 projects are not in place upon completion of the first phase of project development. Because the City can not guarantee that these regional facilities would be in place prior to project build-out, a significant, cumulative impact to regional traffic may occur in the absence of these facilities.
3. The additional worker and construction-related truck trips to and from the project site would potentially affect traffic operations at project area intersections during peak hours.	5.9-f	The contractor for each phase of the project shall be required to prepare and implement a traffic control plan (TCP) in order to monitor construction equipment, deliveries and construction worker traffic to eliminate any potential hazards to surrounding roadways due to abnormally high traffic into or out of the site	3. Incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	for a concentrated period of time. Each traffic control plan shall outline when flagging operations may be necessary (during large construction equipment arrival or deportation, etc.).	
Air Quality		
1. The maximum construction-generated PM_{10} emissions of 36.58 pounds per day would be below the SCAQMD's quantitative significance threshold of 150 pounds per day. Although such fugitive dust would be short term and would only last during the duration of grading activity, such emissions could cause a public nuisance or further exacerbate the existing PM_{10} nonattainment situation in the SCAB.	5.10-a Consistent with SCAQMD Rule 403, it is required that fugitive dust generated by grading and construction activities be kept to a minimum with a goal of retaining dust on the site, by following the dust control measures listed below: a) During clearing, grading, earth moving, excavation, or transportation of cut or fill materials, water trucks or sprinkler systems shall be used to prevent dust from leaving the site and to create a crust after each day's activities cease. b) During construction, water truck or sprinkler systems shall be used to keep all areas of vehicle movement damp enough to prevent dust from leaving the site. At a minimum, this would include wetting down such areas later in the morning and after work is completed for the day and whenever winds exceed 15 miles per hour. c) Soil stockpiled for more than two days shall be covered, kept moist, or treated with soil binders to prevent dust generation. d) Reduce speeds on unpaved roads to less than 15 miles per hours. e) Halt all grading and excavation operations when wind speeds exceed 25 miles per hour. f) Dirt and debris spilled onto paved surfaces at the project site and on the adjacent roadways shall be swept, vacuumed, and/ or washed at the end of each workday. g) Should minor import/ export of soil materials be required, all trucks hauling dirt, sand, soil, or other loose material to and from the construction site shall be tarped and maintain a minimum two feet of freeboard.	1. Incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
	h) At a minimum, at each vehicle egress from the project site to a paved public road, install a pad consisting of washed gravel (minimum-size: one inch) maintained in a clean condition to a depth of at least six inches and extending at least 30 feet wide and at least 50 feet long (or as otherwise directed by SCAQMD). i) Review and comply with any additional requirements of SCAQMD Rule 403.	
2. Vehicle exhaust results from internal combustion engines used by construction equipment and vehicle which results in emissions of NO_x, VOCs, and CO. Such emissions will be below SCAQMD thresholds, but should be further reduced through the use of project design features and mitigation.	5.10-b The following shall be adhered to during project grading and construction to reduce VOC, NOx, and CO from construction equipment: a) Heavy-duty diesel-powered construction equipment manufactured after 1996 (with federally mandated "clean" diesel engines) shall be utilized. b) The engine size of construction equipment shall be the minimum size. c) The number of construction equipment operating simultaneously shall be minimized through efficient management practices to ensure that the smallest number is operating at any on time. d) Construction equipment shall be maintained in tune per the manufacturer's specifications. e) Catalytic converters shall be installed on gasoline-powered equipment.. f) Diesel catalytic converters shall be installed. g) Diesel powered equipment shall be utilized in lieu of electric equipment.	2. Less than significant impact. Incorporation of mitigation will further reduce emission levels.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
3. The application of architectural coatings (exterior/interior paint and other finishings) would produce VOC emissions that would exceed the SCAQMD's quantitative significance threshold of 75 pounds per day. This impact is considered significant.	5.10-c The project developer shall use zero-Volatile Organic Compounds (VOC)-content architectural coatings during project construction/ application of paints and other architectural coatings to reduce ozone precursors. If zero-VOC paint cannot be utilized, developer shall avoid application of architectural coatings during the peak smog season: July, August, and September. Developer shall procure architectural coatings from a supplier in compliance with the requirements of SCAQMD's Rule 1113 (Architectural Coatings). The following websites provide information/ lists of manufacturers related to zero-VOC content coatings: a) http://www.aqmd.gov/prdas/brochures/ paintguide.html b) http://www.delta-institute.org/publications/ paints.pdf c) http://www.cleanaircounts.org/factsheets/ FS%20PDF/Low%20VOC%20Paint.pdf	3. Although mitigation is proposed, impacts would remain significant and unmitigable.
4. The projected operational emissions from both area source and vehicular emissions are substantially above the SCAQMD significance criteria for all pollutants except SOx.	5.10-d The applicant shall incorporate the following energy conservation measures into project building plans: • Install low NOx water heaters and space heaters • Install heat transfer modules in furnaces • Use light colored, water-based paint and light-colored roofing materials to the satisfaction of the City. • Install solar panels for water heating systems and other facilities and/ or use water heaters that heat water only on demand. • Use passive solar cooling/ heating. • Maximize the use of natural lighting. • Install energy efficient appliances and lighting. • Use landscaping to shade buildings and parking lots. In addition to the above area source mitigations/ required site design features, the following mitigation measures are required in order to minimize long term vehicular impacts:	4. Although mitigation is proposed, impacts would remain significant and unmitigable.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features		Level of Significance after Mitigation
		• Provide preferential parking spaces for employee carpools and vanpools in the commercial and business park land uses. • Install covered bus stops to encourage use of mass transportation. • Coordinate with the local transit agency to provide public transit to the project site. • Develop, in coordination with the City of San Jacinto, public outreach programs to promote alternative methods of transportation.	
5. Due to the unknown nature of RCTC-planned transportation improvements, CO hot spots must be assumed. This would result in significant impacts.	5.10-e	To mitigate the traffic conditions that could result in potential CO "hotspots," the project applicant shall participate in funding off-site traffic improvements which are needed to serve cumulative future traffic conditions through payment of appropriate traffic mitigation fees (Riverside County TUMF and City of San Jacinto DIF fees). TUMF provides a key funding source for General Plan improvements within the project area, including the required improvements related to the Ramona Expressway. It should be noted that this mitigation measure also appears as Mitigation Measure 5.9-e.	5. Although mitigation is proposed, impacts would remain significant and unmitigable.
Noise			
1. Significant noise impacts may occur from exterior noise exposure above 65 dB CNEL for residential, commercial, and park uses located adjacent to the planned ROW for roadway facilities.	5.11-a	Residential lots located adjacent to Sanderson Avenue shall include an 11 foot high noise barrier; residential lots adjacent to Ramona Boulevard and Cawston Avenue (between Ramona Boulevard and De Anza Street) shall require noise barriers a minimum of 6 feet in height. The project noise barriers must have a surface density of at least four pounds per square foot, and have no openings or cracks. The noise barriers may be constructed of acrylic glass, any masonry material, earthern berm or a combination of these materials	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features		Level of Significance after Mitigation
2. Noise levels associated with the commercial activities would vary depending on the number of delivery trucks, loading dock areas and customer traffic generated by the commercial site. Similarly, HVAC equipment noise would vary depending on the number and types of equipment selected. Typical roof-top HVAC packaged units generate noise levels of approximately 70 dB at ten feet from the source. These noise sources may result in significant impacts depending on their make, model, location, proximity to adjacent receptors, etc.	5.11-b	Individual acoustical analyses shall be prepared as part of site plan/development plan review for future commercial development applications submitted to the City, to ensure noise levels would comply with the City's Draft General Plan noise standards (maximum exterior noise levels of 65 dB CNEL; maximum interior noise levels of 45 dB CNEL) and not result in significant noise impacts at adjacent park land or residences. The applicant for each commercial development proposal would have the responsibility to commission or fund the required acoustical analysis. Although the future building-specific noise study will determine exact specifications, it is likely that interior noise mitigation would consist of sound-rated windows and mechanical ventilation systems for the commercial buildings. All required noise control measures identified in the acoustical analysis shall be made conditions of ultimate development approval to ensure that all measures are implemented to fully mitigate anticipated noise impacts.	2. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
3. Traffic-related noise exposure levels within exterior use areas for the schools (i.e., playground, sports fields, athletic courts, etc.) could exceed acceptable noise standards, thereby resulting in potentially significant noise impacts. Future school buildings that are located in areas exposed to a noise level greater than 60 dB CNEL could exceed an interior noise level of 45 dB CNEL. This would result in a potentially significant impact. There are also residential areas proposed immediately adjacent to the north and east of the elementary school site. Specific residential setback information and the location of the schools facilities are not available. Therefore, until more specific	5.11-c	For the high school site, the specified noise barriers along Ramona Boulevard and Cawston Avenue shall be installed to protect exterior use areas of the site from traffic-related noise; OR if the School District desires to forego the construction of the specified noise barriers in favor of selective location of exterior use space, a site specific acoustical analysis shall be prepared to determine adequate noise control for traffic-related noise (i.e., use of buildings to shield exterior use areas, etc.), to ensure that noise levels do not exceed 65 dB CNEL at exterior use areas. The School District would have the responsibility to commission or fund the acoustical analysis to evaluate traffic noise control if the sound walls specified herein are not incorporated into the high school development design. All required noise control measures identified in the acoustical analysis shall be made conditions of development approval.	3. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
setback and school design information is available the elementary school noise impact upon residential land uses to the north and east are considered potentially significant.	5.11-d A Notice-to-Property Owner shall be recorded on a separate buyer information sheet with the final map providing notice to potential future property owners in the vicinity of the school site (i.e., Planning Areas 1, 3 and 19), stating that they could be exposed to noise associated with outdoor activities at the high school. The disclosure will function to make potential buyers aware of the anticipated noise levels/impacts, such that particularly noise-sensitive individuals would have the opportunity to decide against purchase of a home which is subject to these periodic noise conditions.	
4. Two new freeways, State Route 79 (SR 79) and Mid County Parkway (MCP) are currently in various planning stages. Detailed design drawings are not available for these two freeways. However, it is anticipated that the alignments of both freeways would be located at least 1,000 or more feet from the project site. As the area develops, there would be buildings and other structures that would most likely provide shielding between the freeways and the project site that would substantially attenuate the traffic noise. However, for the purposes of the project noise analysis it was conservatively assumed that the potential noise contribution from future SR 79 and MCP freeways would be 60 dB CNEL at the north and east boundaries of the project site.	5.11-e For residences proposed within the future 60 dB CNEL contour, an interior acoustical analysis shall be required prior to the issuance of building permits to ensure that the interior CNEL would not exceed 45 dB. Interior noise mitigation would most likely consist of sound-rated windows and mechanical ventilation systems for the homes. All required noise control measures identified in the acoustical analysis shall be made conditions of building permit issuance.	4. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
5. The generation of construction activities during sensitive time periods for adjacent land uses is considered a significant nuisance. As such, project generated construction noise would pose a potentially significant effect on noise-sensitive	5.11-f Future project-related site preparation and construction activities shall be limited to the hours between 7:00 am and 6:00 pm, Monday through Saturday. No construction shall occur on Federal holidays (e.g., Thanksgiving, July 4th, Labor Day, etc.). Construction equipment maintenance shall be limited to the same hours. Non-noise-generating	5. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
receptors.	construction activities such as interior painting are not subject to these restrictions.	
Public Services and Utilities		
1. The proposed development would result in a minor incremental increase in demand for fire protection services and, with consideration of future cumulative increases in demand for fire protection services associated with other development proposals and area-wide growth, could potentially result in decreased levels of service within the project area and city-wide. This would constitute a significant impact.	5.12-a The Developer shall be required to pay the Development Impact Mitigation Fees, as determined to be necessary by the development agreement, City Community Development Department and Public Works Department to offset impacts on City fire services. The current estimated fee amount is outlined in *Table 5.12-1, Fire Facilities Fee Derivation Summary*.	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
2. The proposed development would result in a minor incremental increase in demand for police services and, with consideration of future cumulative increases in demand for police services associated with other development proposals and area-wide growth, could potentially result in decreased levels of service within the project area and city-wide. This would constitute a significant impact.	5.12-b The Developer shall be required to pay the Development Impact Mitigation Fees, as determined to be necessary by the development agreement, City Community Development Department and Public Works Department to offset impacts on police services. Current fee amounts are summarized in *Table 5.12-2, Police Facilities Fee Derivation Summary.*	2. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
3. Should potential school site in the Specific Plan area not be developed by the District in a timely manner, new student generation of the proposed development may substantially exceed the capacity levels of existing school facilities. As such, impacts to school facilities resulting from the development of the Villages of San Jacinto, as well as potential cumulative impacts of the development in combination with other anticipated projects in the area, are considered potentially	5.12-c The Developer shall be required to pay the Development Impact Mitigation Fees, as determined to be necessary by the development agreement, City Community Development Department, Public Works Department and San Jacinto School District, to offset impacts on school facilities. Requiring payment of the school facility mitigation fees would aid in acquiring the additional resources to provide adequate school facilities necessary to accommodate existing and future residents. Therefore, contribution of the mitigation fees by the	3. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
significant.	developer would ensure that adequate mitigation is provided to reduce potential direct and cumulative school impacts to less than significant levels. Should the developer assist the City in facilitating the construction of the school site identified in the Specific Plan, the City may decide to waive or reduce some portion of the school mitigation fees typically required to an appropriate lesser amount in consideration of the partial mitigation provided by developer-assisted, on-site school facility construction.	
4. Due to the influx of population, the project could result in inconsistencies with AB 393 which governs the quantities jurisdictions, such as the City of San Jacinto, can contribute to local landfill facilities. This would result in a potentially significant impact.	5.12-d Demolition and/or excess construction materials shall be separated on site for reuse/recycling or proper disposal (e.g., concrete asphalt). During grading and construction, separate bins for recycling of construction materials and brush shall be provided on site. 5.12-e Landscaping shall be designed and located to utilize drought tolerant species, minimize irrigation, and to reduce green waste generation. 5.12-f The developer shall develop and submit a Solid Waste Management Plan to be reviewed and approved by the City Public Works Solid Waste Division and Planning and Development, and shall include: • Provision of space and/or bins for the storage of recyclable materials within the project site, • Methods of waste collection • Information programs to future residents regarding disposal of hazardous wastes.	4. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
Hazards/Risk of Upset		
1. Due to the historic use of approximately 20 acres of the property as a heifer raising farm, the presence of manure may result in significant environmental impacts related to methane gas exposure.	5.13a In order to ensure that methane hazards do not exist on the 20 acre portion of the site formerly used for heifer raising activities, the Riverside County's Methane Investigation Protocol shall be followed during and after site preparation. After grading of the 20 acres, methane gas sampling and any associated mitigation mechanism installation shall occur in accordance with the most recent Riverside County Department of Environmental Health protocols.	1. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
2. The issuance of the Regional Water Quality Control Board's "no further action" letter indicates that hazardous materials previously present on the site have been removed to a level that no longer poses a threat to the environment. Therefore, while the project site contains historic environmental hazards, these hazards have been removed and would no longer pose significant health risks to the public or environment. That said, regulatory procedures may be required to officially determine the site safe for reuse.	5.13b The Regional Water Quality Control Board and Department of Health Services shall be notified of potential site reuse in accordance with the December 26, 2001, "no further action" letter provided for the remediated leaking underground storage tanks. These agencies may require additional processing or testing depending on the ultimate reuse of the specific area contaminated. In order to ensure that regulatory compliance has been met, on-site soils shall be tested prior to grading to determine the presence of contaminants. Testing results will help determine if permissible levels of contaminants have been exceeded. If levels have been exceeded, impacted soils shall be remediated in accordance with Riverside County Department of Health Service protocol.	2. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
3. Historic windmills were often powered by diesel fuel. The diesel fuel source was often stored in underground storage tanks. During the Phase I Site Assessment, diesel storage tanks were not noted nor did they appear on federal or state databases within the vicinity of the old windmill. That said, often underground storage tanks are unreported and therefore could be discovered during grading. If an underground storage tank or stained soil or soil with a petroleum hydrocarbon odor is uncovered, a potentially significant impact could occur.	5.13c The former windmill site shall be flagged prior to site grading. During site grading near the former windmill site, a qualified hazardous materials specialist shall monitor grading activities. If an underground storage tank or petroleum hydrocarbon odor-laden soil is uncovered near the old windmill site, grading and site work shall cease and the Regional Water Quality Control Board and Riverside County Department of Health Services notified. A remediation plan shall be developed to ensure that all contaminated soil and structures are removed, handled and disposed of in accordance with existing state and local regulations. Sampling in the area of impacted soils shall continue until contaminant levels reach an acceptable risk.	3. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features		Level of Significance after Mitigation
4. Petroleum stained soil was observed beneath the diesel above ground storage tank located northwest of the reservoir, near the irrigation groundwater well located southwest of the reservoir and on the floor of the equipment shed, beneath three oil containing 55-gallon drums.	5.13d	In order to mitigate for potential hazards associated with petroleum stained soil beneath diesel storage tanks and on the floor of the equipment shed beneath 55-gallon oil storing drums, collection of surface and near surface samples by a qualified hazardous materials specialist must occur. Following removal of the equipment shed, observations will be made for any stained soil beneath the shed. If stained areas are observed, surface and near surface samples shall be collected. Testing for contaminant levels must occur and an assessment of significance under state and local hazardous material regulations must follow. Once contaminant levels are determined, the Regional Water Quality Control Board and Riverside County Department of Environmental Health must be contacted to determine the proper mitigation method prior to site redevelopment. Any soil and other materials contaminated with hazardous materials may be considered hazardous waste and therefore must be disposed of in accordance with federal, state and local regulations.	4. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
5. Debris, including old equipment, water heaters, trash, etc. were observed in several piles throughout the site. In order to avoid potential significant impacts related to improper disposal of debris piles.	5.13e	During removal of debris piles, a qualified hazardous materials specialist shall be on site. The hazardous materials specialist will conduct a site assessment of debris pile content and direct disposal accordingly. All waste products will be disposed of in accordance with state and local laws.	5. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
6. Two septic systems are located on site.	5.13f	In order to mitigate for potential hazards associated with existing septic tanks on site, the construction contractor shall remove the tanks and residue material in accordance with Riverside County Department of Environmental Health protocol. The project applicant will then be required to provide proof of septic tank removal to the City prior to issuance of building permits.	6. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.
7. Once the project is developed, domestic water will come from imported water sources from Eastern Municipal Water District rather than on-site groundwater supplies. Three on-site groundwater wells and any additional	5.13g	In order to prevent groundwater contamination, the three on-site groundwater wells and vapor monitoring well, and any additional wells uncovered during site development, shall be abandoned and decommissioned in accordance with Regional Water Quality Control Board and Riverside County	7. Potential impacts would be significant but incorporation of mitigation will reduce impacts to below a level of significance.

Table 1-2 (Continued)

Topic / Impacts	Mitigation Measures / Design Features	Level of Significance after Mitigation
wells that are discovered during site development will need to be closed as part of the project and may have environmental impacts.	Department of Health protocols. The project applicant will be required to provide proof of well decommissioning to the City prior to issuance of building permits.	
8. Due to the age of many on-site buildings, the potential for asbestos-laden and lead-based paint materials exist on site.	5.13h Prior to demolition of onsite buildings, an asbestos survey shall be performed by a certified asbestos abatement contractor. Findings in the survey shall be used to determine what precautions shall be taken during demolition activities. If asbestos is present, removal shall occur in accordance with Riverside County Department of Environmental Health protocol. 5.13i All building material suspected to contain lead-based paint shall be tested prior to demolition. If lead-based paints are present, removal shall occur in accordance with Riverside County Department of Environmental Health protocol.	8. Potential impacts would be less than significant.

INTENTIONALLY LEFT BLANK

SECTION 2.0
INTRODUCTION

2.1 PURPOSE AND SCOPE OF THE RECIRCULATED DEIR

A Draft Environmental Impact Report (DEIR) for the Villages of San Jacinto Specific Plan was originally circulated for a 45-day public comment period in April 2006 (State Clearinghouse No. 2004122132). After the close of public review, the project applicant proposed several project description changes, including a revised drainage scenario, an extension of the project build-out, and inclusion of a development agreement as an additional discretionary action. As Lead Agency, the City of San Jacinto determined that these changes necessitated a Recirculated Draft EIR (RDEIR). Consequently, the City prepared an RDEIR to address the project description changes, which was circulated for a 45-day public review period in January 2007. Although the entire EIR was recirculated, only the environmental topics that were revised were subject to an additional review and comment period by the public: Those topics included geology and soils, water quality and hydrology, air quality, noise, and public services and utilities. During March 2007, a Final EIR was prepared to address comments received during the two public review periods. The City Planning Commission recommended approval of the project and certification of the Final EIR in April 2007. Minor changes in the project description delayed consideration of the project before the City Council until June 2008, and subsequently the project was continued in order to respond to questions, comments, and concerns raised at the June 2008 City Council meeting. Partially in response to City Council comments and current market demand, the applicant chose to update the Villages of San Jacinto Specific Plan and the Land Use Plan and to recirculate the EIR a second time to adequately notify the public of the revised project's potential environmental impacts.

Section 15088.5 of the State California Environmental Quality Act (CEQA) Guidelines requires lead agencies to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the DEIR for review but before certification. New information can include changes in the project or environmental setting as well as additional data or other information. Since new information that was not previously described in the April 2006 DEIR or the January 2007 RDEIR has become available, the City has determined that it is appropriate to prepare this RDEIR No. 2 for public review.

As required by State CEQA Guidelines Section 15088, the City will evaluate comments received on the RDEIR No. 2. The comments and responses will be included in the Final EIR as a separate section along with revised EIR text necessitated by the response to comments (if necessary). Comments on the RDEIR No. 2 should be limited to the EIR sections/environmental issues that were modified. The following section describes the new information analyzed in this

RDEIR No. 2. The RDEIR No. 2 will retain the same SCH number (noted above) in order to establish a reference to the prior documents prepared for this project.

2.2 BACKGROUND AND CONTENT OF THE RECIRCULATED DEIR

Consistent with the requirements of Section 15088.5(c) of the State CEQA Guidelines, this RDEIR contains all sections of the DEIR. However, in accordance with CEQA requirements, comments on the RDEIR shall be limited to the EIR sections that have changed. The following sections have been modified. All section numbering is consistent with the section numbering of the April 2006 DEIR.

Section 1.0, Executive Summary: The Executive Summary has been updated to reflect the revised project description, all new mitigation measures, and any additional significant impacts that have occurred due to project changes.

Section 2.0, Introduction: This section includes a summary of all sections that have changed since preparation of the April 2006 DEIR and January 2007 RDEIR, and a brief description of the history of the project's EIR process to date.

Section 3.0, Project Description: Project features that have been revised include the project site plan, mixture of land uses, drainage and other infrastructure components of the Specific Plan, the tentative map, and construction phasing. Graphics in this section have been revised to show those changes.

Section 4.0, Environmental Setting: This section has been updated to describe changes in existing land use on the site since preparation of the April 2006 DEIR and January 2007 RDEIR.

Section 5.1, Land Use, Planning, and Zoning: This section has been revised to reflect the newly proposed land use plan and its relationship with the existing City General Plan. Since the City's General Plan was being updated during preparation of the original DEIR, the revised RDEIR section has been updated to reflect the final, adopted General Plan Update (May 2006). The land use graphics have also been updated to reflect the revised land use plan and tentative map. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.2, Landform Alteration and Aesthetics: This section has been revised to reflect revised visual resource General Plan policies included in the 2006 General Plan Update, newly proposed land uses, and revised open space corridors that may impact the ultimate visual appearance of the site once developed. The discussion of existing visual quality has been updated to reflect the changed site appearance including absence of the cattle feed lot and removal of

most of the agriculture. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance and the potential visual impact of a proposed 11-foot sound wall. Updated photos of the project site are also included.

Section 5.3, Agricultural Resources: This section has been amended to reflect the fact that cattle are no longer being raised on the site and the majority of agricultural operations have ceased. The impact analysis has been revised to provide a discussion of each CEQA threshold of significance. There is also a discussion which explains the reasons there are no feasible mitigation measures to replace converted farmland.

Section 5.4, Biological Resources: This section has been revised to clarify that mitigation for project impacts to jurisdictional wetlands would be provided off-site since the on-site wetlands were found to be of low overall quality (containing large quantities of non-native species), and do not provide high quality habitat for wildlife species due to the surrounding agricultural lands. The impact analysis has been revised to provide a discussion of each CEQA threshold of significance and to clarify minor technical specifics regarding the status of species found or expected to be encountered onsite.

Section 5.5, Cultural Resources: This section was revised to clarify the lack of historical integrity of the onsite structure and to explain the existing Soboba Consulting Services Contract which helps avoid potential impacts to unmarked Native American burial sites or other impacts to lands considered sacred by local Native American peoples. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.6, Geology and Soils: This section has been amended to reflect the modified site plan and to show the structural setback zones on the updated land use plan. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.7, Paleontological Resources: The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.8, Water Quality and Hydrology: This section has been revised to reflect impacts associated with changes in the updated drainage study provided in *Appendix G* and includes the updated Drainage Plan depicted in the Specific Plan. It also contains a summary of updated water quality issues discussed in the revised Specific Plan and in the *Lake Preliminary Design Report* (Pacific Aquascape, Inc. 2009). The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.9, Transportation, Circulation, and Access: A modified traffic study has been prepared to reflect the revised project and changed surrounding circulation system conditions, and is summarized in this section. The entire updated traffic report is contained in Appendix H.

The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.10, Air Quality: This section has been updated to reflect (1) revised and new ambient air quality standards, (2) changes in attainment status with federal and state ambient air quality standards in the South Coast Air Basin, (3) ambient air quality data for the San Jacinto River Valley, and (4) other regulatory changes since January 2007. This analysis also includes a comparison of the project to the South Coast Air Quality Management District's Local Significance Thresholds. Construction and operational emissions have been revised using the current air quality model as well as the land uses and trip generation rates associated with the revised project. This section also includes a discussion of greenhouse gases and global climate change, in order to comply with legislative and CEQA mandates that have been established subsequent to the preparation of the DEIR and first RDEIR. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance. Revised and new air quality models are contained in Appendix I.

Section 5.11, Noise: The acoustical analysis has been updated to reflect changes in the new traffic report as well as the revised land use plan. Revised noise analysis models are contained in Appendix J. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.12, Public Services and Utilities: The revised drainage plan has been incorporated into the Public Services and Utilities section to assess the potential impacts to stormwater runoff from development of the proposed project. This section includes figures that update the water and sewage systems to reflect changes in the Specific Plan. In addition, development impact fees, consumption, and other project impacts have been updated to reflect the revised unit number, commercial square footage, and related impact discussions. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 5.13, Hazards/Risk of Upset: This section reflects changes in existing site conditions including removal of cattle and some of the buildings. The impact analysis has been revised to provide a discussion of each individual CEQA threshold of significance.

Section 6.0, Cumulative Impacts: This section has been updated to include new projects that have been proposed since 2005 and to confirm the status/project descriptions of all projects that were listed in the 2006 Draft EIR. Projects that were included in the original cumulative impact analysis that are no longer active/being contemplated have been removed. The cumulative impact analysis has been revised based on the City's updated list of active projects.

Section *7*.0, Effects Found Not to be Significant: The population and housing discussion has been updated to reflect the correct number of housing units.

Section 9.0, Significant Irreversible Environmental Changes: A discussion has been added to this section to identify significant environmental effects that cannot be avoided if the proposed project is implemented. The population and housing discussion has been updated to reflect the correct number of housing units.

Section 10.0, Project Alternatives: This section was revised to update reference to the recently revised City of San Jacinto General Plan. It also reflects changes to the project description and project impacts, clarification of the reasons an alternate site location is infeasible, and further clarification as to the reasons each alternative would or would not meet project objectives.

Section 11.0, References: This section includes a comprehensive listing of all new sources of information used in the preparation of the RDEIR No. 2.

Section 12.0, List of Preparers: This section was revised to include the project team members who participated in preparation of the RDEIR No. 2.

2.3 RELATION TO DEIR

Consistent with the requirements of CEQA Guidelines Section 15087, this RDEIR No. 2 is being made available on August 27, 2009, for public review for a period of 45 days. The public review period ends on October 12, 2009. During this period, the general public, agencies, and organizations may submit written comments on the RDEIR to the lead agency. Pursuant to procedures set forth in CEQA Guidelines Section 15088.5(f)(2), reviewers are requested to limit their comments to the materials contained in this RDEIR.

As required under CEQA Guidelines Section 15087 and 15088.5(d), the City has sent a Notice of Availability to all organizations and members of the public who were on the City's distribution list for the DEIR and to any additional persons or organizations that have requested copies of the DEIR and any individuals/organizations who commented on the April 2006 DEIR or the January 2007 RDEIR. It should be noted that all comment letters previously submitted for the April 2006 Draft EIR and the January 2007 Recirculated Draft EIR are still part of the project record.

2.4 PURPOSE AND SCOPE OF THE EIR

EIRs are informational documents "which will inform public agency decision-makers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project" (Section 15121 of the CEQA Guidelines). The purpose of this RDEIR No. 2 is to evaluate changes in potential environmental effects of the proposed Villages of San Jacinto Specific Plan development from previous drafts. This RDEIR No. 2 is intended for use by both decision makers and the public. It provides relevant information concerning the potential environmental effects and mitigation

associated with the development and function of a residential, commercial, and mixed-use type development on the site. The Lead Agency for the project is the City of San Jacinto.

2.5 CEQA REQUIREMENTS

CEQA Compliance

This EIR has been prepared in accordance with CEQA (Public Resources Code Section 21000 et seq.); the CEQA Guidelines published by the Resources Agency of the State of California (California Code of Regulations Sections 15000 et. seq, as amended); and the City of San Jacinto Environmental Review Procedures.

Notice of Preparation

In compliance with Section 15082 of the CEQA Guidelines, the City of San Jacinto Planning and Building Department circulated a Notice of Preparation (NOP), dated December 27, 2004, to interested agencies, groups, and individuals. All comments received during the NOP public notice period were considered during the preparation of the April 2006 DEIR. The NOP and comments are included in *Appendix A* of this RDEIR No. 2. Based on the scope of analysis for the April 2006 DEIR, the following issues were determined to be potentially significant and are therefore included in *Sections 5.0* through *9.0* of this RDEIR No. 2 (revised sections are listed in *Section 2.2* above):

- Land Use, Planning, and Zoning
- Landform Alteration/Aesthetics
- Agricultural Resources
- Biological Resources
- Cultural Resources
- Geology and Soils
- Paleontological Resources
- Water Resources and Water Quality
- Transportation, Circulation, and Access
- Air Quality
- Noise
- Public Services and Utilities
- Hazards/Risk of Upset.

2.6 USES OF EIR/TYPE OF EIR

As the designated Lead Agency, the City of San Jacinto has assumed responsibility for preparing this document. The RDEIR No. 2 has been made available for review to the public and public agencies for 45 days to provide comments on the "sufficiency of the document in identifying and analyzing the possible impacts on the environment and ways in which the significant effects of the project might be avoided or mitigated" (Section 15204 of the CEQA Guidelines).

The proposed Villages of San Jacinto RDEIR No. 2 is intended to be a "project" EIR. As stated in CEQA Guidelines Section 15161, a Project EIR "should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project including planning, construction and operation." Specific project details, including overall planning, construction, and operation, are known at this time; therefore, a project-specific level of analysis is appropriate for this RDEIR.

2.7 AREAS OF CONTROVERSY

Per CEQA Guidelines Section 15123, an EIR shall contain a summary that identifies each significant effect of the project and mitigation measures (See *Table 1-2, Summary of Environmental Impacts*) as well as “areas of controversy” and “issues to be resolved.” The project assumes that the locally preferred alignment of a future State Route 79 corridor is chosen. Some property owners in the vicinity have raised objections at prior public hearings for this project regarding the locally preferred alignment.

Eastern Municipal Water District (EMWD) requested in its May 16, 2006 letter responding to the April 2006 Draft EIR that they would like between a 1,320 to 2,000 foot buffer between its water reclamation facility and the nearest residential areas within the proposed project. As discussed in Section 5.1.4, the nearest residential lots to the treatment plant would be located over 1,000 feet from the plant boundary and would be separated by mixed use, commercial, recreation and internal roadways.

2.8 ISSUES TO BE RESOLVED

Section 5.9, Transportation, Circulation and Access, indicates that in the absence of planned regional transportation facilities (i.e., the Mid-County Parkway or MCP and SR-79 improvements), the project would contribute to a significant unavoidable impact for cumulative traffic conditions if the MCP and SR-79 projects are not in place upon completion of the first phase of project development. Because the City can not guarantee that these regional facilities would be in place prior to project build-out, a significant, cumulative impact to regional traffic may occur in the absence of these facilities.

2.9 RELATIONSHIP TO OTHER DOCUMENTS

This document utilizes a number of planning documents as detailed in *Section 5.1, Land Use*. These documents include the City of San Jacinto General Plan (adopted on May 4, 2006); the Zoning Ordinance of the City of San Jacinto (updated April 22, 2008); the City of San Jacinto Redevelopment Plan; the Transportation Uniform Mitigation Fee (TUMF) 10-Year Strategic Plan (adopted by the Western Riverside Council of Governments (WRCOG) in June 2004); the Western Riverside County Multiple Species Habitat Conservation Plan (adopted June 17, 2003); the Southern California Association of Governments (SCAG) Growth Management Plan ; and the South Coast Air Quality Management District Air Quality Management Plan (adopted August 1, 2003); These documents are incorporated by reference in this document per the provisions of Section 15150 of the State CEQA Guidelines.

SECTION 3.0
PROJECT DESCRIPTION

3.1 PROJECT LOCATION

The proposed project is located in the City of San Jacinto (the City) in northwestern Riverside County, California (*Figure 3.0-1, Regional Map*). The project site is located in the northwestern portion of the City (*Figure 3.0-2, Vicinity Map*). The project is located along Sanderson Avenue, which is one of the City's main north–south transportation routes. The project site is bordered by undeveloped agricultural land to the north (and future westward extension of Ramona Boulevard), Sanderson Avenue to the east, Odell Avenue to the west, and undeveloped agricultural land and a municipal wastewater treatment plant to the south (*Figure 3.0-3, Site Location Map*). The proposed project is scheduled to be constructed in several phases (see *Phasing and Construction Planning*, page 3-18).

Land uses in the project area consist mainly of agricultural operations, including sod farms, dry farming, animal grazing pastures, and dairies. Several parcels within this portion of San Jacinto are in the process of being developed with residential subdivisions or commercial centers. Two drainage features, associated with the nearby San Jacinto River, are located within the vicinity of the project: Casa Loma Canal and San Jacinto Reservoir. The Colorado River Aqueduct is located north of the project. The Eastern Municipal Water District (EMWD) Hemet/San Jacinto Regional Water Reclamation Facility is located directly south of the project site.

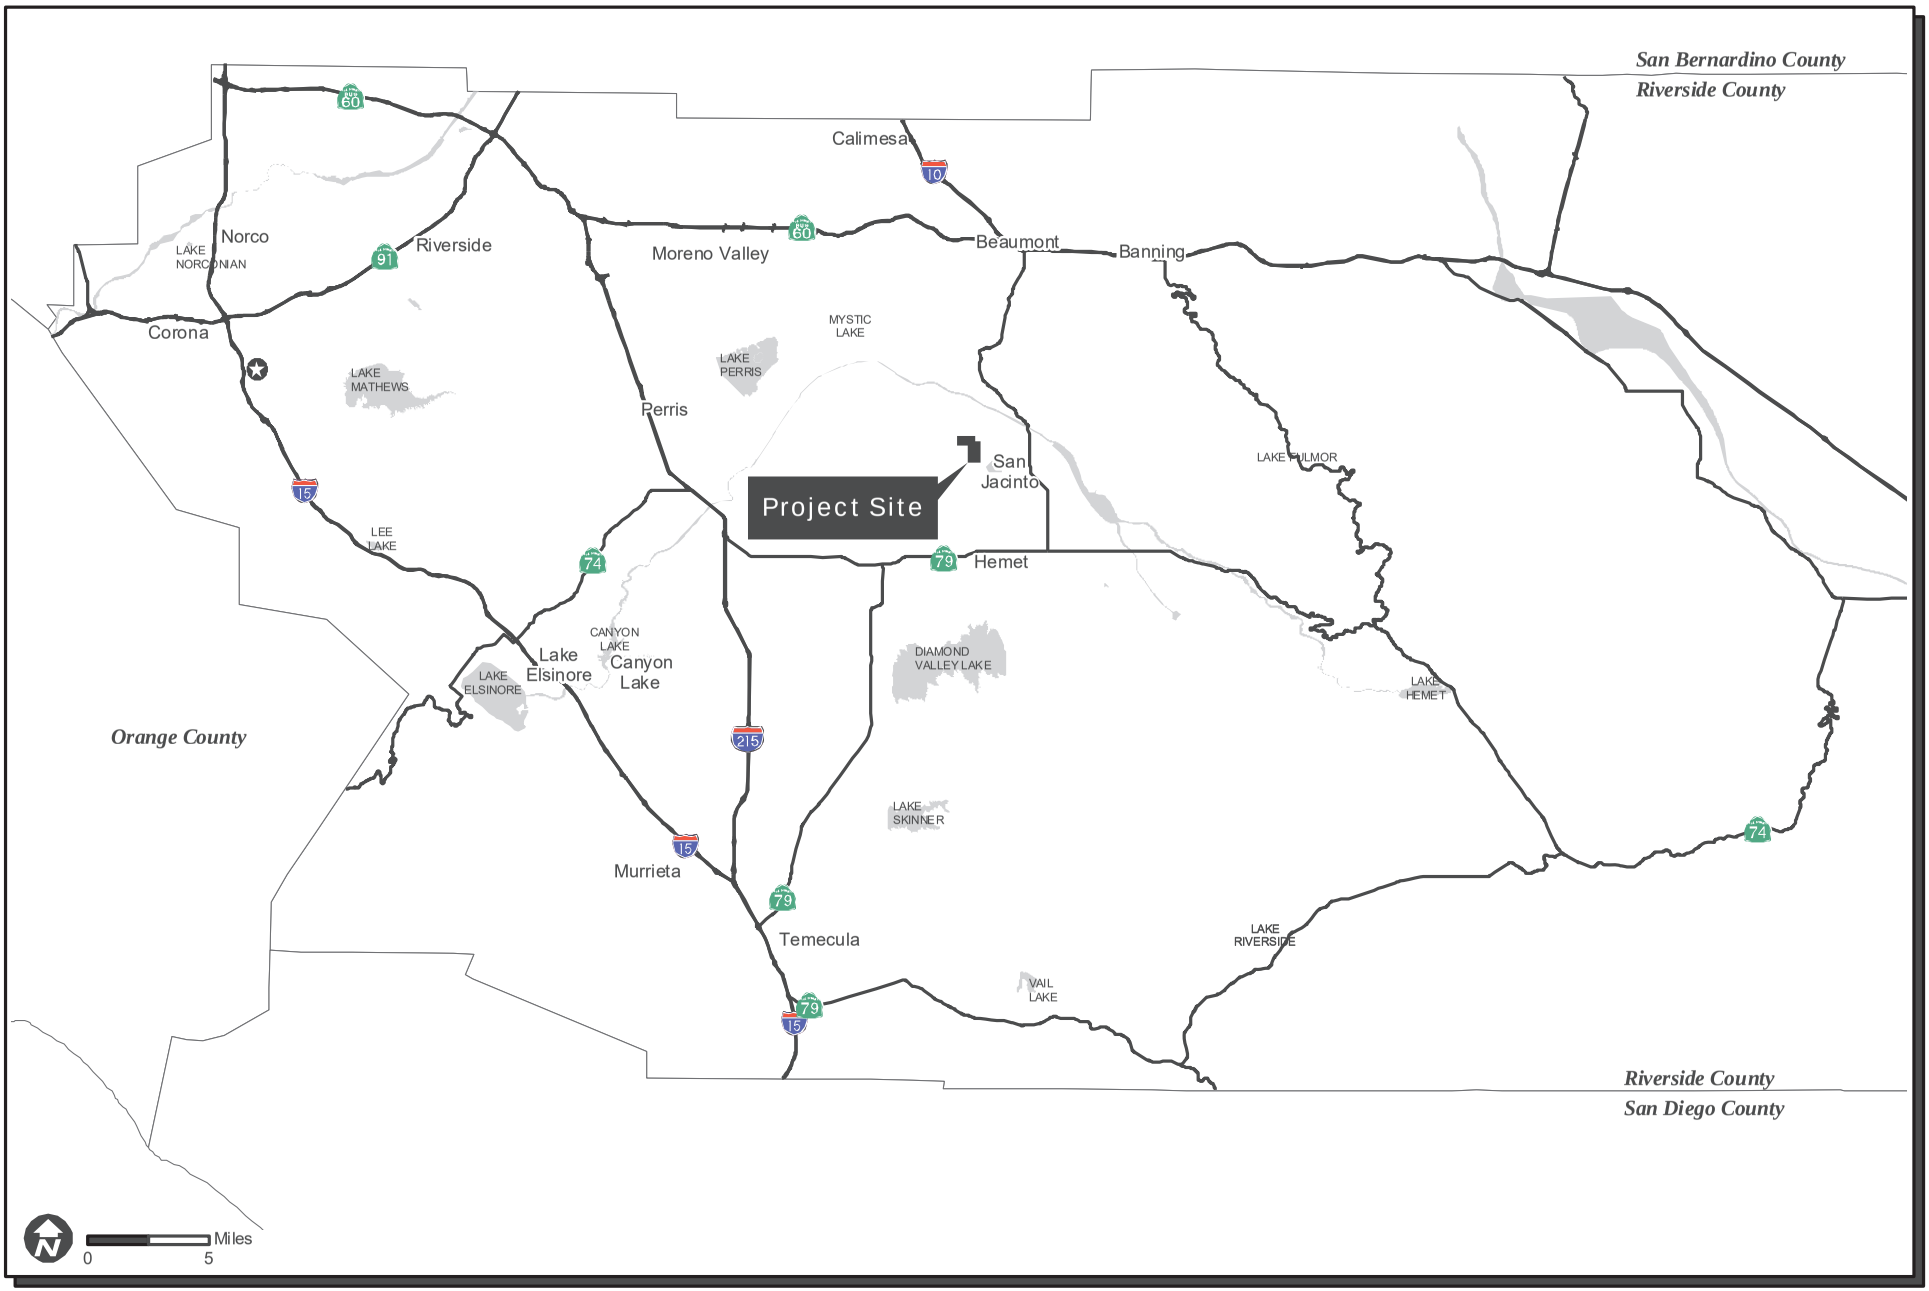
State Route 79 (SR-79) and Sanderson Avenue serve as major north–south transportation corridors through this portion of the City. Ramona Expressway, located north of the project site, serves as the main east–west arterial through the City. Enhanced access to the western portion of San Jacinto will occur through the future widening and realignment of SR-79 and Ramona Expressway.

3.2 PROJECT SITE BACKGROUND

The project site is approximately 475.1 acres in size. The project site has been used as pasture land and/or a farming operation, similar to surrounding properties, for over one hundred years. In 1978, a 20-acre area of the project site was converted to a cattle raising facility. In 1997, a majority of the remaining property was leased to the Quality Turf Company. The San Jacinto Valley has traditionally supported agriculture and rural residential land uses, but has recently been experiencing increased urbanization.

One residence and one small outbuilding are located on the project site (see *Figure 5.13-1*). The residence and the outbuilding (likely a former equipment storage shed) are both abandoned. A

portion of the project site is currently used for sod farming generally in the northwestern portion of the site.

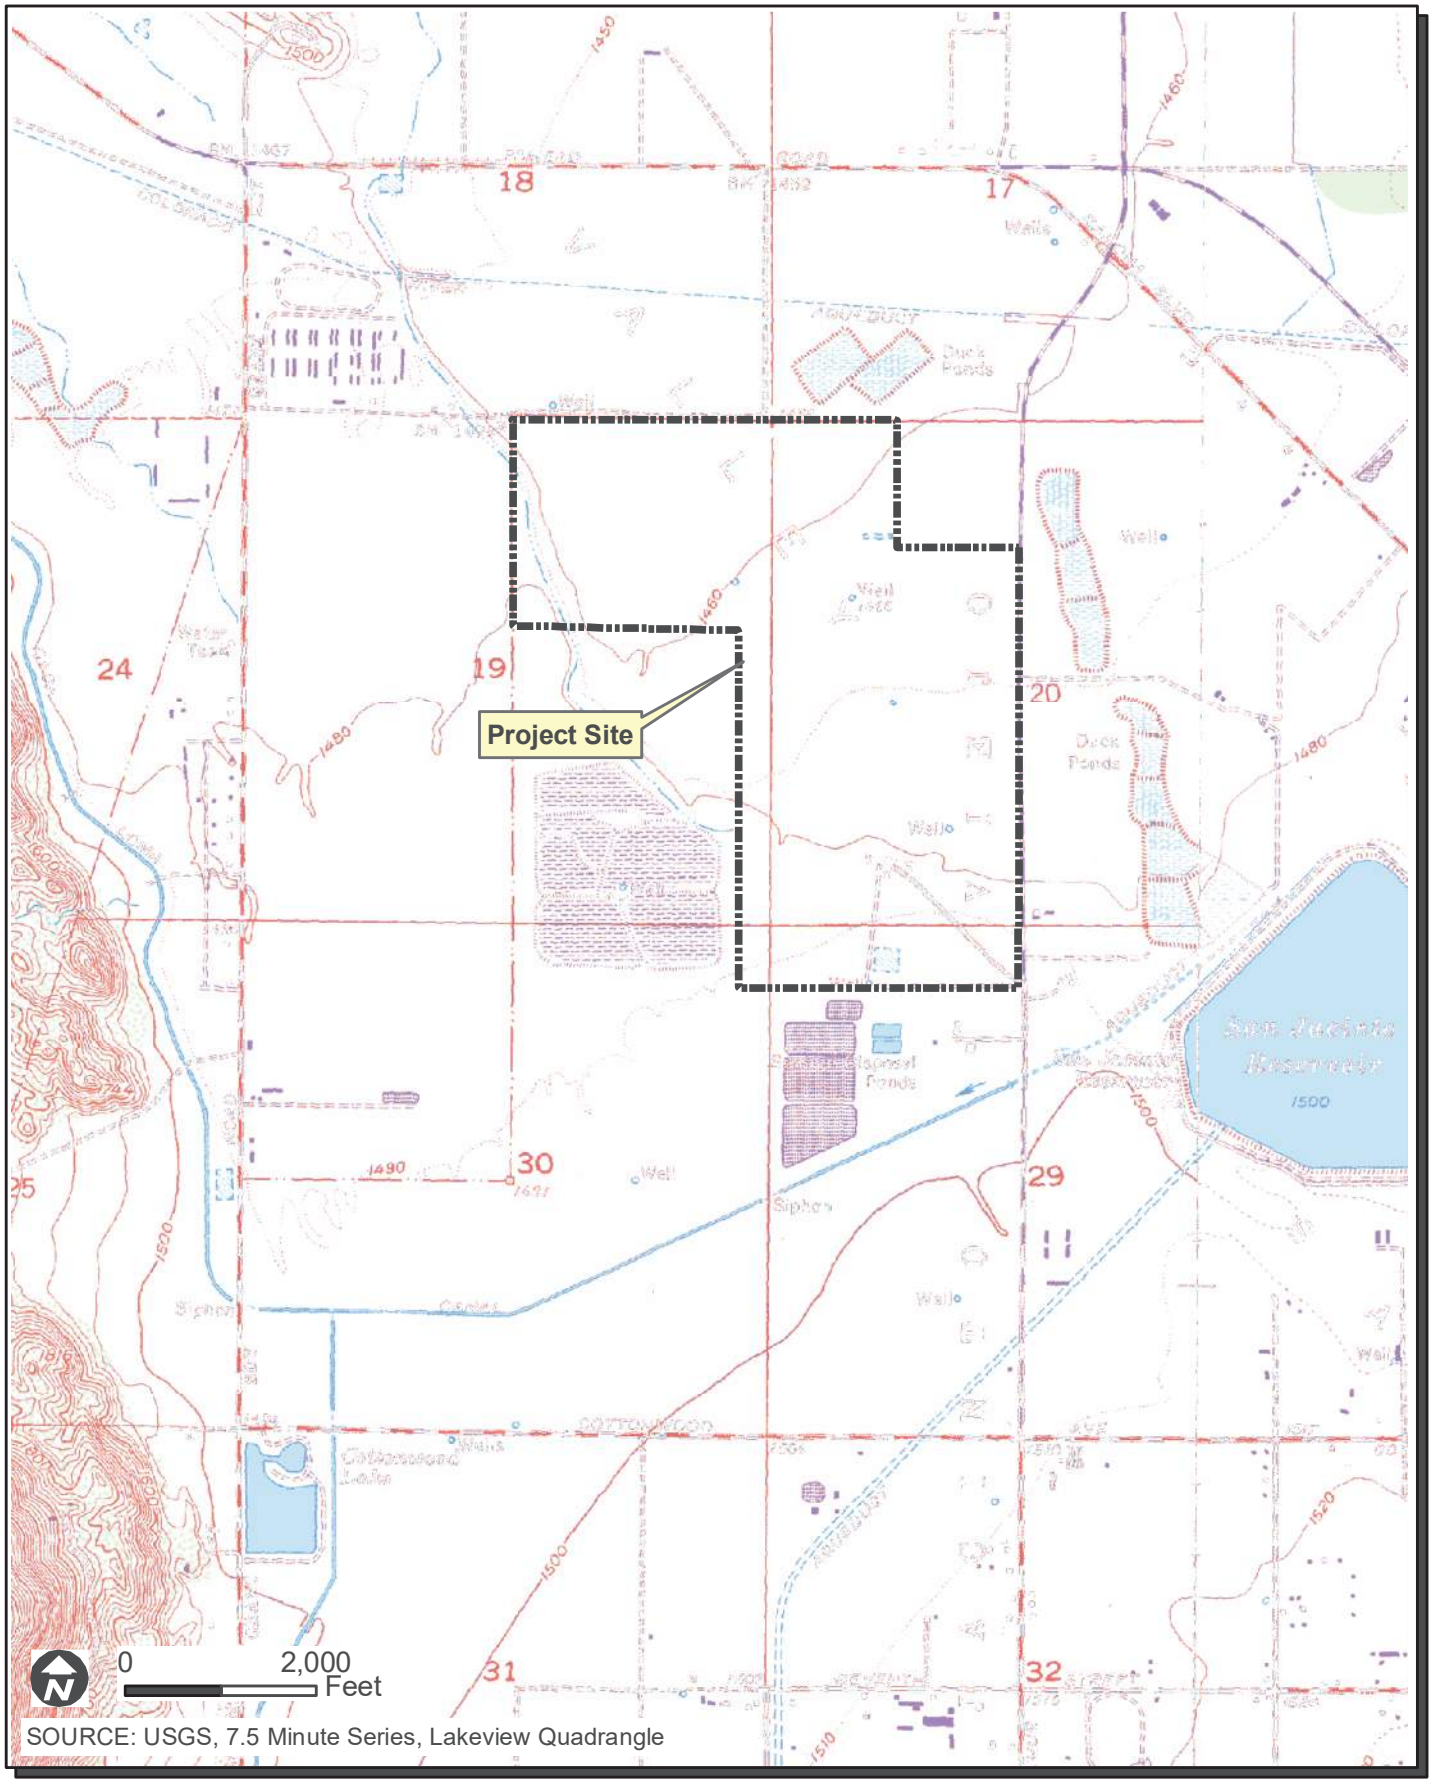


3.3 SITE DESCRIPTION

The site is generally flat and is located on the alluvial plain of the San Jacinto River. The site elevation above sea level ranges from 1,455 feet along the northern edge to 1,490 feet in the southeastern corner. The southeastern corner of the site is a former cattle feed lot with several remaining shade structures associated with that operation. The remainder of the land consists primarily of vacant former agricultural land. Vegetation on site consists of weedy invasive species that have accumulated since the majority of agricultural production was discontinued. There are scattered sod fields in the northern portions of the property, which is the only remaining agricultural operation. Several unnamed, unimproved dirt roadways traverse the site and are associated with former and current agricultural operations. Irrigation canals run along the edges of fields in support of sod farming activities. A detention basin is located along the north-central edge of the project site.

3.4 PROJECT OBJECTIVES

Specific objectives for the proposed project include the following:



- Provide for the establishment of a master-planned community through implementation of a Specific Plan, consisting of a maximum of 1,329 dwelling units, which is consistent with the scale and character of planned uses in surrounding areas.
- Provide a variety of detached single-family lot sizes in traditional subdivision layouts that are marketable within the evolving economic and demographic profile of the City of San Jacinto.
- Provide public and private recreational amenities for the benefit of residents of this community and of the City of San Jacinto.
- Provide drought-tolerant and water-efficient landscaping for the community.
- Incorporate recycled water from EMWD to supply the lake and irrigate landscaping to minimize the use of potable water.
- Provide development opportunities for municipal, office, professional, and neighborhood retail commercial land uses within the community to support the economic growth of the City and to reduce the reliance of automobile use within the surrounding community.
- Consider topographic, geologic, hydrologic, and environmental opportunities and constraints to create a design that safely accommodates seismic and hydrologic hazards.

INTENTIONALLY LEFT BLANK

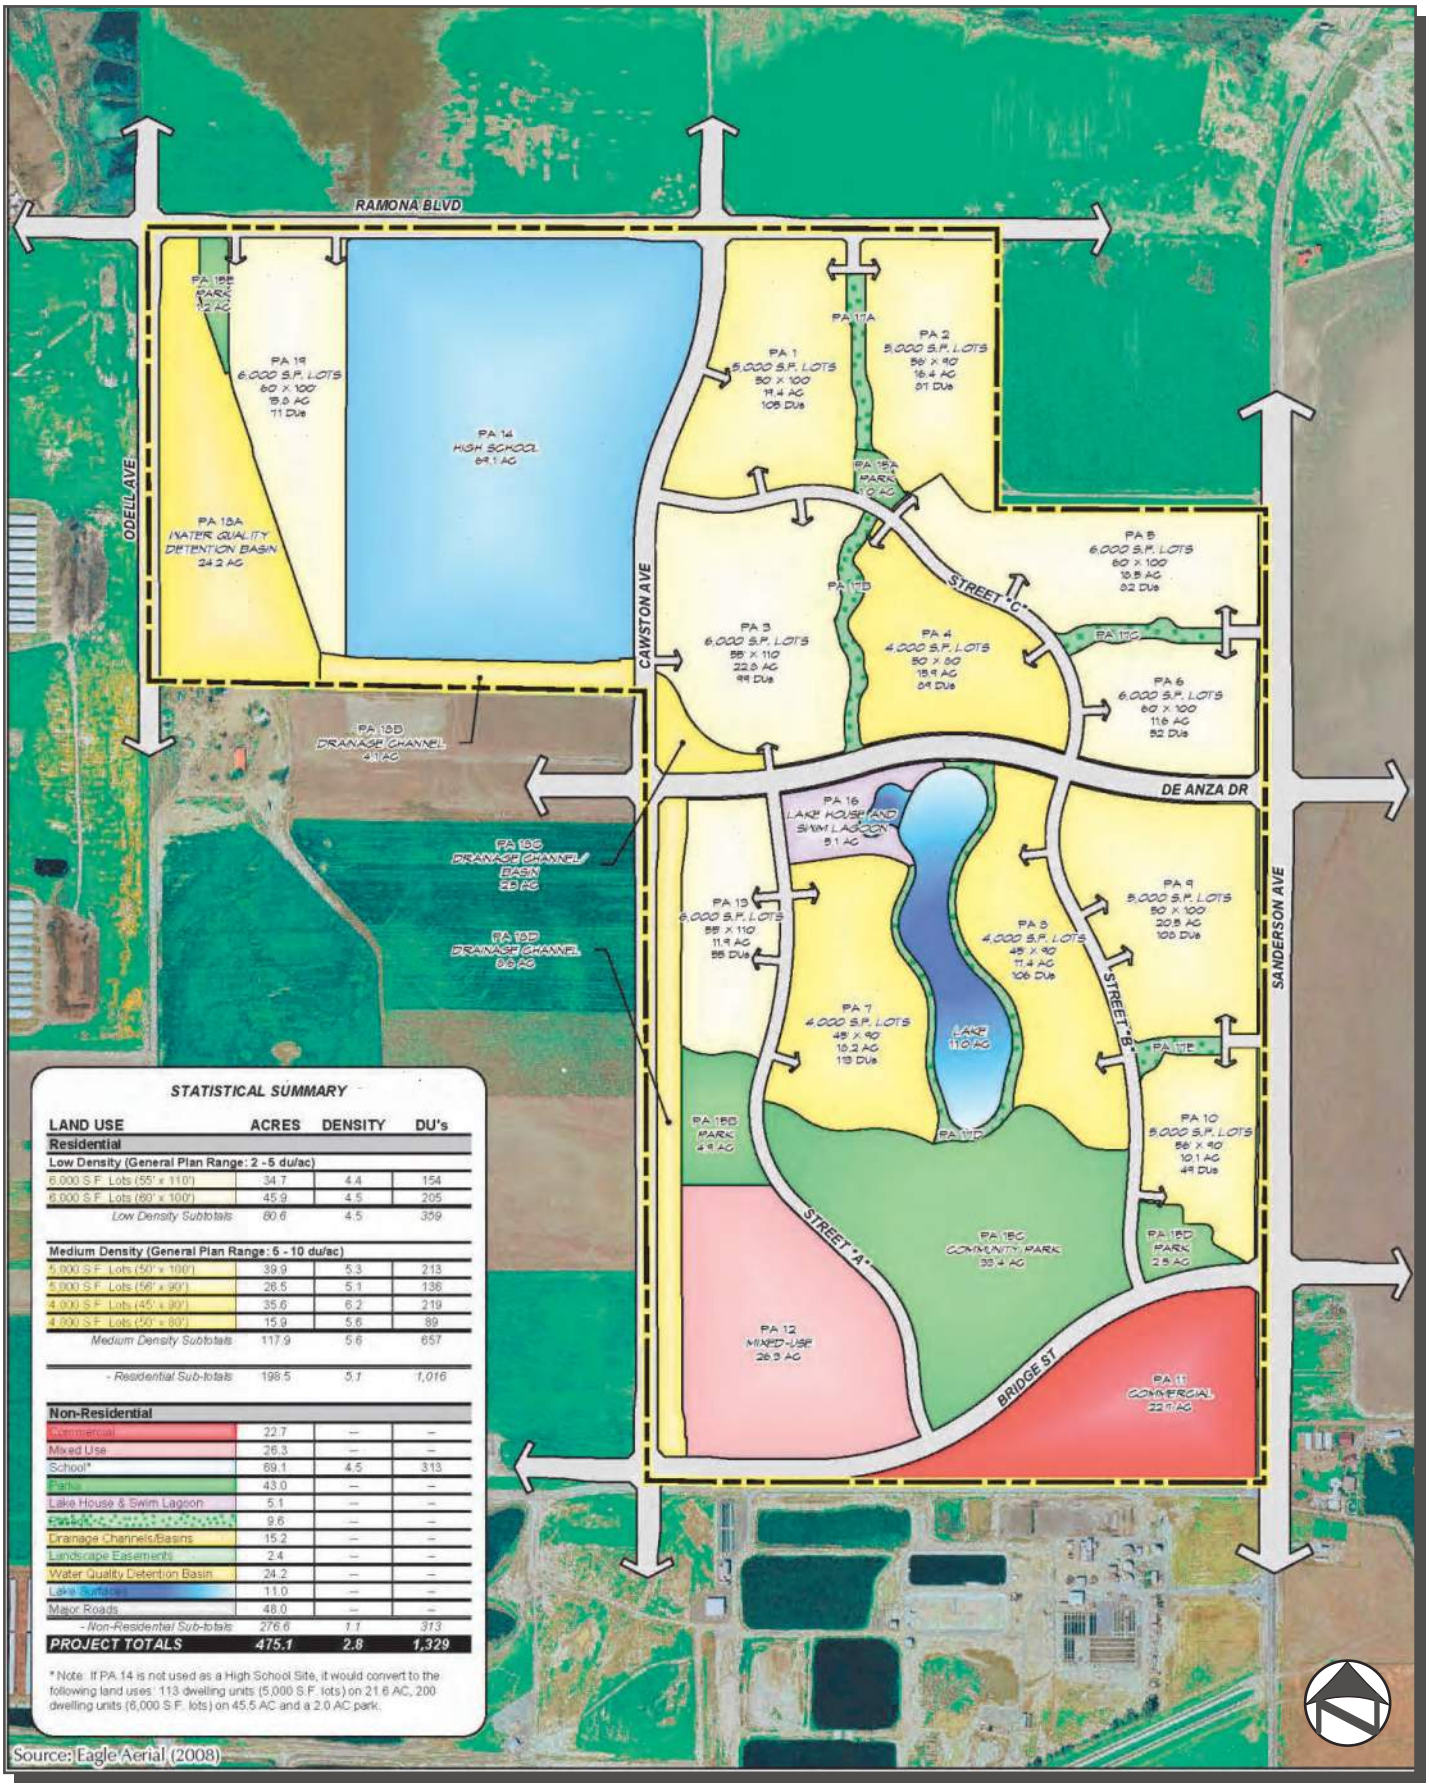
- Provide a system of public and community facilities within residential neighborhoods to support development in an efficient and timely manner.
- Provide a development with unified design elements, such as architecture, landscaping, color palette, paving, walls, fencing, signage, and entry treatments.
- Develop an environment that is visually attractive, efficient, and effectively organized, which includes a pleasing landscape palette.
- Integrate the project with the character of the surrounding community and establish development that results in logical, coordinated growth.
- Establish a circulation system that meets projected traffic volumes and accommodates a variety of transportation modes and encourages alternatives to automobile use within the community.

3.5 PROJECT FEATURES

The project would consist of development of an existing agricultural operation into a suburban development, including residential, commercial, public facility, and open space uses. The 475.1-acre site would be divided into several "Planning Areas" (PAs). Each PA would consist of a distinct land use type. Land use statistics are summarized in *Table 3.0-1, Planned Land Uses*, and land uses and densities anticipated in each PA are listed in *Table 3.0-2, Planned Land Uses by Planning Area*. *Figure 3.0-4, Specific Plan Land Use Plan,* provides a generalized site development plan depicting each PA and associated land use. *Table 3.0-2* provides a summary of the intensity of use planned within each PA.

The following is a detailed description of each of the proposed land uses within the proposed project, which is illustrated on *Figure 3.0-4, Specific Plan Land Use Plan,* and delineated in *Table 3.0-1, Planned Land Uses*.

Residential



Residential land uses would consist of two General Plan density categories: Low Density Residential, LDR (2.1 to 5.0 dwelling units/acre (DU/AC)), and Medium Density Residential, MDR (5.1 to 10.0 DU/AC) (San Jacinto General Plan 2006). The LDR category will be built within PAs 3, 5, 6, 13, and 19 and will result in a maximum of 359 dwelling units on 80.6 acres. Each residential lot will be a minimum of 6,000 square feet, and overall density will be 4.5 dwelling units per acre. The MDR category will be built within PAs 1, 2, 4, 7, 8, 9, and 10 with a total of 349 residences having 5,000-square-foot minimum lot sizes and 308 residences having 4,000-square-foot minimum lot sizes. In the event that PA 14 is not used by the San Jacinto Unified School District for a proposed new high school, a portion of this area (45.5 acres) would be developed with 200 residential lots under the LDR designation, and the remaining portion

(23.6 acres) would be developed with 113 single-family lots under the MDR designation, including a 2 acre park site.

Table 3.0-1 Planned Land Uses

Land Use Type	Acres	Density (Dwelling Units/Acre)	Maximum Dwelling Units
Residential (overall)	**198.5**	**5.1**	**1,016**
Low Density			
6,000-square-foot lots	80.6	4.5	359
Medium Density			
5,000-square-foot lots	66.4	5.3	349
4,000-square-foot lots	51.5	6.0	308
Non Residential (overall)	**276.6**	**1.1**	**313**
Commercial	22.7	—	—
School	69.1	4.5	313*
Mixed-Use	26.3	—	—
Open Space			
Parks	43.0	—	—
Lake House/Swim Lagoon	5.1	—	—
Paseos	9.6	—	—
Drainage Channels/Basins	15.2	—	—
Landscape Easements	2.4	—	—
Water Quality Detention Basin	24.2	—	—
Lake Surface	11.0	—	—
Major Roads	48.0	—	—
Total	**475.1**	**2.8**	**1,329**

* If PA 14 is not used as a High School Site, it would convert to the following land uses: 113 dwelling units (5,000-square-foot lots) on 21.6 acres, 200 dwelling units (6,000-square-foot lots) on 45.5 acres and a 2.0 acre park.

STATISTICAL SUMMARY

LAND USE	ACRES	DENSITY	DU's
Residential			
Low Density (General Plan Range: 2 - 5 du/ac)			
6,000 S.F. Lots (55' x 110')	34.7	4.4	154
6,000 S.F. Lots (60' x 100')	45.9	4.5	205
Low Density Subtotals	*80.6*	*4.5*	*359*
Medium Density (General Plan Range: 5 - 10 du/ac)			
5,000 S.F. Lots (50' x 100')	39.9	5.3	213
5,000 S.F. Lots (56' x 90')	26.5	5.1	136
4,000 S.F. Lots (45' x 90')	35.6	6.2	219
4,000 S.F. Lots (50' x 80')	15.9	5.6	89
Medium Density Subtotals	*117.9*	*5.6*	*657*
- Residential Sub-totals	*198.5*	*5.1*	*1,016*
Non-Residential			
Commercial	22.7	–	–
Mixed Use	26.3	–	–
School*	69.1	4.5	313
Parks	43.0	–	–
Lake House & Swim Lagoon	5.1	–	–
Lake	9.6	–	–
Drainage Channels/Basins	15.2	–	–
Landscape Easements	2.4	–	–
Water Quality Detention Basin	24.2	–	–
Lake Surfaces	11.0	–	–
Major Roads	48.0	–	–
- Non-Residential Sub-totals	*276.6*	*1.1*	*313*
PROJECT TOTALS	***475.1***	***2.8***	***1,329***

* Note: If PA 14 is not used as a High School Site, it would convert to the following land uses: 113 dwelling units (5,000 S.F. lots) on 21.6 AC, 200 dwelling units (6,000 S.F. lots) on 45.5 AC and a 2.0 AC park.

Specific Plan Land Use Plan

FIGURE 3.0-4

INTENTIONALLY LEFT BLANK

Table 3.0-2 Planned Land Uses by Planning Area

Land Use	Acres	Density (DU/AC)	Dwelling Units
Residential			
PA 1 – 5,000-square-foot lots (50' x 100') (Medium Density)	19.4	5.4	105
PA 2 – 5,000-square-foot lots (56' x 90') (Medium Density)	16.4	5.3	87
PA 3 – 6,000-square-foot lots (55' x 110') (Low Density)	22.8	4.3	99
PA 4 – 4,000-square-foot lots (50' x 80') (Medium Density)	15.9	5.6	89
PA 5 – 6,000-square-foot lots (60' x 100') (Low Density)	18.5	4.4	82
PA 6 – 6,000-square-foot lots (60' x 100') (Low Density)	11.6	4.5	52
PA 7 – 4,000-square-foot lots (45' x 90') (Medium Density)	18.2	6.2	113
PA 8 – 4,000-square-foot lots (45' x 90') (Medium Density)	17.4	6.1	106
PA 9 – 5,000-square-foot lots (50' x 100') (Medium Density)	20.5	5.3	108
PA 10 – 5,000-square-foot lots (56' x 90') (Medium Density)	10.1	4.9	49
PA 13 – 6,000-square-foot lots (55' x 110') (Low Density)	11.9	4.6	55
PA 19 – 6,000-square-foot lots (60' x 100') (Low Density)	15.8	4.5	71
Residential Subtotal	*198.5*	*5.1*	*1,016*
Non Residential			
PA 11 – Commercial	22.7	—	—
PA 12 – Mixed-Use	26.3	—	—
PA 14 – High School*	69.1	4.5	313*
PA 15A and 15E – Private Neighborhood Parks	2.2	—	—
PA 15B, 15C and 15D – Public Neighborhood and Community Parks	40.8	—	—
PA 16 – Beach Club & Swim Lagoon	5.1	—	—
PA 17A–17E – Paseos	9.6	—	—
PA 18A – Water Quality Detention Basin	24.2	—	—
PA 18B, 18C and 18D – Drainage Channels/Basin	15.2	—	—
Landscape Easements	2.4	—	—
Lake Surface	11.0	—	—
Major Roads	48.0	—	—
Non-Residential Subtotal	*276.6*	—	*313**
Total	**475.1**	**2.8**	**1,329**

* If PA 14 is not used as a High School Site, it would convert to the following land uses: 113 dwelling units (5,000-square-foot lots) on 21.6 acres, 200 dwelling units (6,000-square-foot lots) on 45.5 acres and a 2.0-acre park.

Commercial

Commercial development would be focused in the southeast corner of the project site within PA 11. This development is intended to result in approximately 247,000 square feet of neighborhood retail commercial uses on 22.7 acres. This designation is intended to meet the provision for retail commercial land uses as set forth in the San Jacinto General Plan Land Use Element and to provide an accessible local shopping center for the proposed project and nearby communities

that allows for a wide range of businesses, including grocery store, drug store, cleaners, restaurants, fast food, and specialty stores. The Specific Plan for the project (T&B Planning Consultants 2009) includes Conceptual Design Guidelines and Development Standards for commercial development of this PA. Comprehensive Design Guidelines will need to be reviewed and approved by the City prior to development of the PA.

Mixed-Use

Mixed-use development will be provided within the 26.3-acre PA 12. This designation is intended to provide for a broad range of land uses, with the primary focus on municipal uses and other development, such as business and professional park uses, including dental and medical offices, real estate offices, and banks. This area could also provide accessory uses to the primary facilities, such as coffee shop, printers, and postal/shipping outlets. This designation provides for a maximum of 343,000 square feet of building area and will have a maximum height limit of 45 feet. Conceptual Design Guidelines for commercial uses are provided in the project Specific Plan, but Comprehensive Design Guidelines will need to be reviewed and approved by the City prior to development of the PA.

Schools

As noted above in *Table 3.0-2,* PA 14 is designated for a proposed high school by San Jacinto Unified School District (District). The 69.1-acre high school site would be located southwest of the future intersection of Cawston Avenue and Ramona Boulevard. Preliminary plans for the school include baseball and softball fields, a track/football stadium, gymnasium, performing arts facility and classroom space for up to 2,000 students. Final plans for the school would be processed separately from the Villages of San Jacinto Specific Plan through the District Board of Trustees and the California Division of the State Architect. If the San Jacinto Unified School District does not choose to construct a high school on this site, it will instead be used for residential uses. Under this scenario, PA 14 would be developed with 200 low-density residences (minimum 6,000-square-foot lots) and 113 medium-density residences (5,000-square-foot lots) along with a 2-acre park site.

Parks and Recreational Amenities

Following is a summary of the recreational amenities and park facilities planned for the proposed project. Further discussion of parks and recreation, including the requirement for provision of adequate parkland is contained in Section 5.12.4.

Public Parks

The proposed project includes three public parks totaling approximately 41 acres. The largest of the public parks is the 33.4-acre Community Park in Planning Area 15C north of Bridge Street in the southern portion of the proposed development. This park will provide soccer and baseball fields, concession area, as well as barbeque and picnic areas overlooking the proposed lake. Public parks in Planning Areas 15B and 15D provide just over seven acres of various active and passive recreational opportunities.

Private Parks

The two private parks in Planning Areas 15A and 15E will provide passive recreation for nearby residents such as tot lots, shade structures, pathways and picnic areas.

Lake House and Swim Lagoon

Other recreational amenities include a 5.1-acre Lake House Beach Club and Swim Lagoon within Planning Area 16. This will be a private facility for residents and will feature a Swim Lagoon with sandy beach, play island, lap pool, play pool, fire pits, open turf area and shade structures. The clubhouse will provide an exercise room, activity room, restroom/changing rooms and office space.

Lake

The 11-acre private lake will be located primarily between Planning Areas 7 and 8 and adjacent to the Swim Lagoon. It will feature a concrete trail surrounding the lake and connecting to the community park in PA 15C. No swimming or boating will be allowed on the lake, but it will provide recycled water for irrigation of common landscaping within the community.

Paseos

A total of 9.6 acres of landscaped paseos will serve as pedestrian linkages between land uses and will create landscaped buffer areas between Planning Areas. These paseos will be a minimum of 50 feet wide and have 10-foot-wide concrete trails.

Infrastructure

The *Villages of San Jacinto Specific Plan* (T&B Planning Consultants 2009) details a number of infrastructure plans that will be incorporated into project development. These include a Circulation Plan, Drainage Plan, and Water and Sewer Plans. In addition, a Lake Preliminary Design Report was prepared to address lake design and water quality management systems. These plans are summarized below and discussed in more detail in the relevant sections of this EIR.

Circulation Plan

Roadways would be located throughout the development and would provide access to and from as well as within the project. Sanderson Avenue and Odell Avenue would serve as primary access points for the project. Once constructed, Ramona Boulevard would provide connection at the north edge of the project site. Cawston Avenue would serve as the major north–south arterial through the project while De Anza Drive would serve as the major east–west arterial within the development, taking access from Sanderson Avenue and connecting to Cawston Avenue. Bridge Street will also provide east–west access at the southern end of the development from either Cawston Avenue or Sanderson Avenue. The internal roadway network will include three streets designed as Modified Local Streets (Streets A, B, C) that connect the various PAs. The network will also include standard Local Streets that will connect individual neighborhoods. Roadway classifications are in compliance with City of San Jacinto and County of Riverside Road Standards.

Water Plan

Water service will be provided to the project by EMWD and be extended into the project via new conveyance facilities consistent with the EMWD's Northwest San Jacinto Area Master Plan. Domestic water will be conveyed via a proposed 16-inch pipeline in Sanderson Avenue and 12-inch pipelines within De Anza Drive; Bridge Street, Ramona Boulevard; and Streets A, B, and C.

Recycled Water Service

Recycled water pipelines will be installed concurrently with domestic lines. Recycled water would be utilized to maintain the lake water level as well as common area irrigation needs throughout the proposed community. Recycled water will not be used for private landscaping such as front or back yards. Proposed 8-inch recycled water lines will be installed within internal project roadways. Initially, the recycled water system will be provided from domestic water sources within Sanderson Avenue and Ramona Boulevard, but, ultimately, a pumping facility will use stored recycled water in the lake to supply water for irrigation. A Water Supply Assessment was completed by EMWD. The developer will be required to prepare a Plan of Service in accordance with EMWD standards prior to final engineering and construction of all domestic and recycled water lines. This will ensure that pipe sizing and any additional infrastructure facilities are adequate to serve the project and are in conformance with EMWD's Master Plan.

Sewer Plan

The project site is within the EMWD service area for wastewater collection and treatment. There is an existing 8-inch force main along Sanderson Avenue which conveys flows into an existing treatment facility located just south of the project boundary. Proposed sewer facilities will range between 12 to 30 inches per the EMWD Master Plan. Streets A, B, and C will have 10-inch lines

that flow to a 15-inch line in Cawston Avenue, while an additional 15-inch line is planned for Odell Avenue. Both of the 15-inch lines will gravity flow toward a 30-inch line in Ramona Boulevard, which will then continue to gravity flow toward the existing EMWD treatment plant. A Plan of Service Study will be completed in accordance with EMWD standards prior to final engineering and construction of all sanitary sewer lines. This will ensure that pipe sizing and any additional infrastructure facilities are adequate to serve the project and are in conformance with EMWD's Master Plan.

Drainage Plan

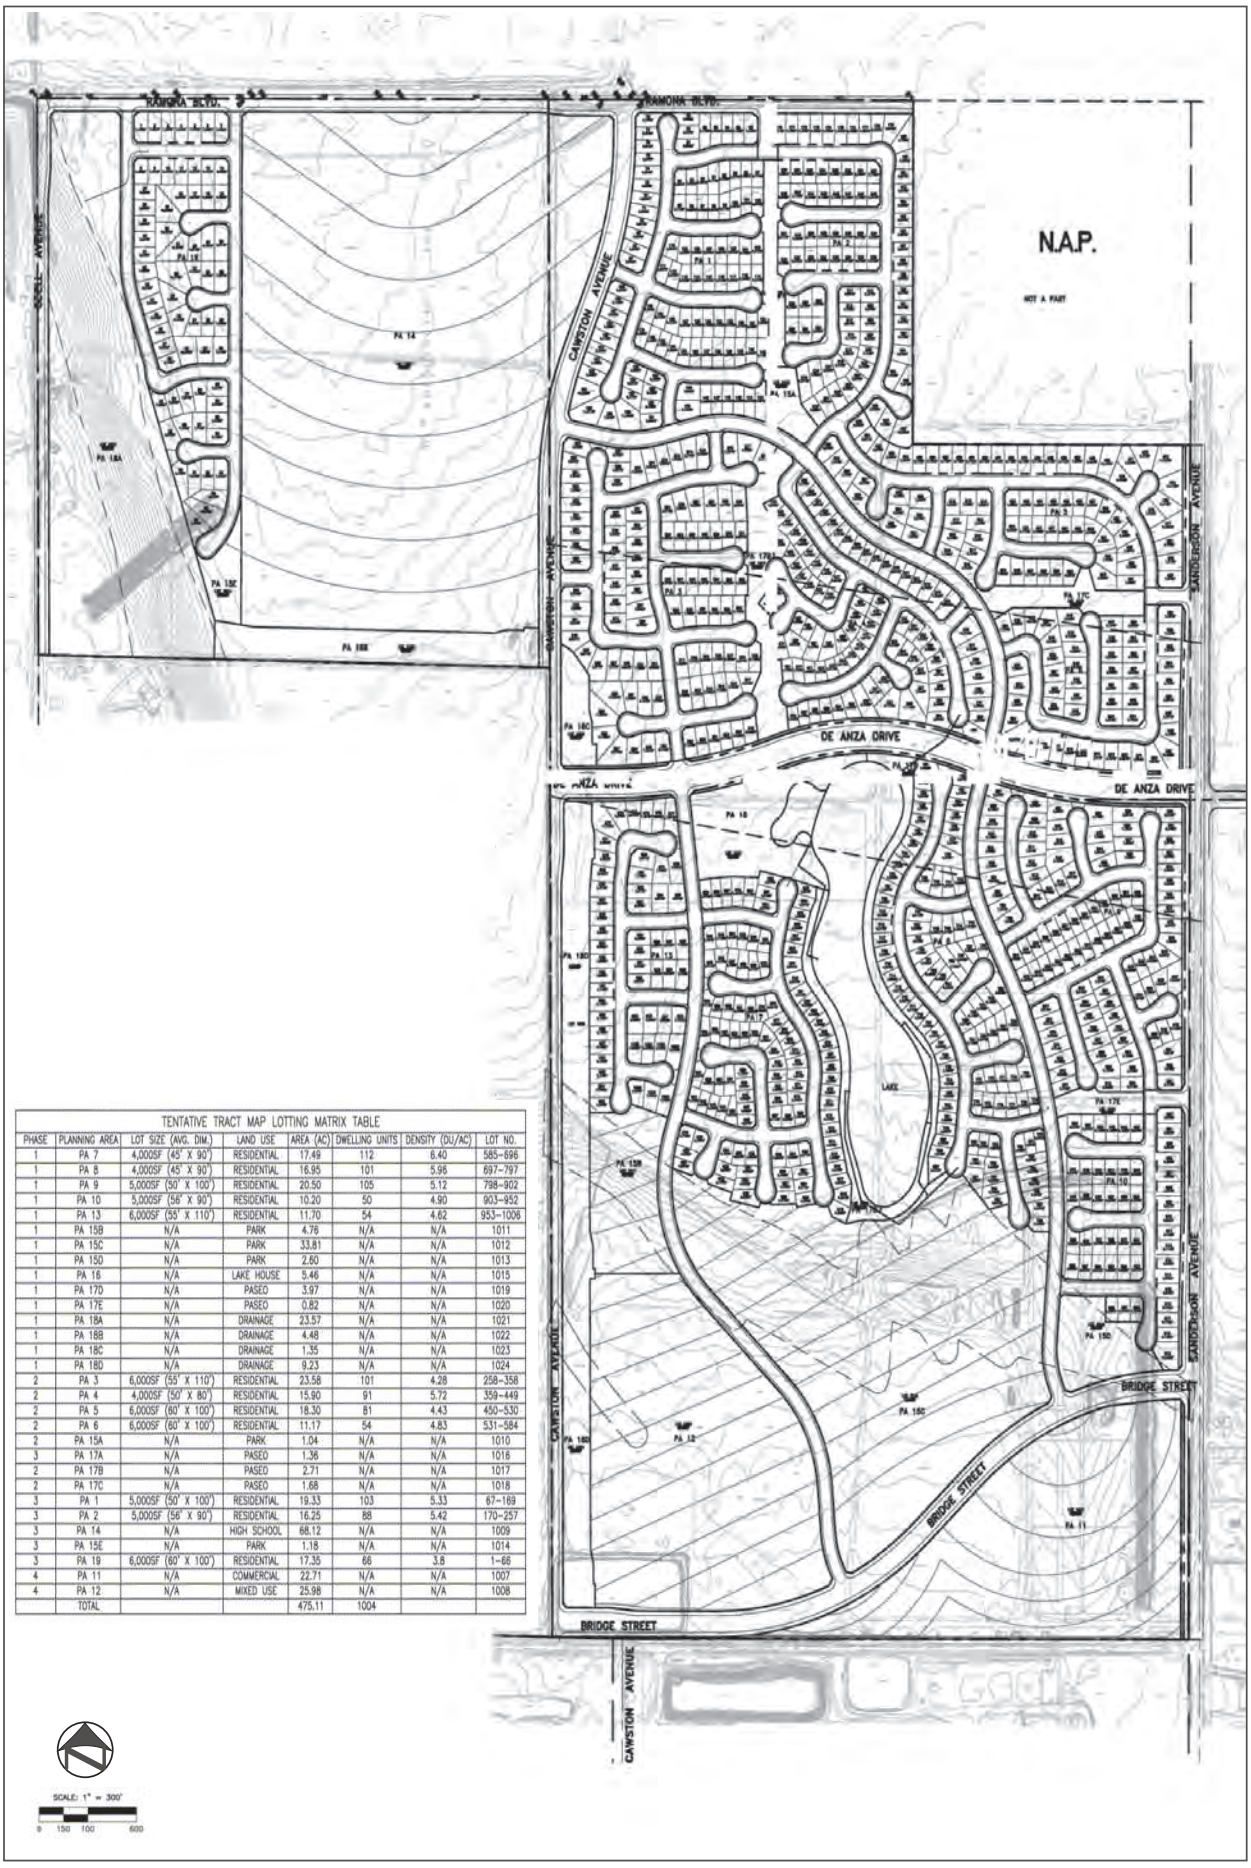
The project site generally drains in a northwesterly direction toward the San Jacinto River, primarily in a sheet flow pattern. The northerly portion of the project site is within the 100-year floodplain. The drainage plan provides 100-year flood protection for the interim and ultimate conditions. The interim condition is based on the absence of the San Jacinto Master Drainage Plan (MDP) systems being in place, while the ultimate condition assumes all the MDP facilities are constructed and functional. The implementation of the San Jacinto MDP is based on the timing of the development of the surrounding area. As a result, the construction timeline for the proposed San Jacinto MDP drainage facilities is unknown. Consequently, the project incorporates a drainage plan that will not impact upstream and downstream property owners but will provide flood protection for the overall project site. The Drainage Plan will incorporate a vegetative channel and a detention/water quality basin, which are designated as Line V and Detention Basin V. These two facilities are the major backbone infrastructure that will collect the runoff that emanates from off-site and on-site areas. Line V and Detention Basin V have been designed to convey and control the interim flow rate and ultimate flow rate. The interim flow rate results in a runoff rate that exceeds the ultimate condition flow rate. The interim condition will require the construction of two interim culvert facilities and the reconstruction of an earthen roadway to eliminate ponding east of the DeAnza Drive and Sanderson Avenue intersection. These interim drainage facilities are required to control and convey the interim flow rates originating from the off-site area. Several storm drain laterals will provide flood protection for the on-site PAs. Further details of the Drainage Plan are contained in *Section 5.8 Water Quality and Hydrology*.

Lake Preliminary Design Report

This report discusses safety features for the proposed lake shoreline, water depth and temperature, treatment of runoff, and water quality management. The treatment process involves reduced concentration of dissolved pollutants, nutrients, and salts through flushing of the lake water volume by utilizing the lake as the irrigation supply source; reduction of nutrient concentrations from inflows, nitrogen and phosphorous, and prevention of algal blooms by using constructed gravel biofilter beds that utilize "biological filtration," and maintaining oxygen levels

through aeration promoting oxygen exchange to prevent anaerobic conditions, which allows natural processes to occur, such as denitrification for removal of nitrogen. The lake operation and maintenance program also includes routine debris removal, algae control, aquatic weed control, pump maintenance, and biofilter maintenance. These processes ensure continued aesthetic appeal and desirable water quality as well as control of vectors, such as mosquitoes and flies.

Tentative Map



A draft tentative map (TM 36188) has also been prepared for the project. *Figure 3.0-5, Tentative Tract Map*, shows individual residential lots, mixed use and commercial areas and accessory uses, including open space, lakes, and roadways. In summary, the Tentative Tract Map, which further defines the Specific Plan Land Use Plan (described above), would allow the following housing units and other land uses to be developed on the project site:

Unit Type Summary

- 6,000-square-foot lots: 359 units
- 5,000-square-foot lots: 349 units
- 4,000-square-foot lots: 308 units

TOTAL: 1,016 units

- 69.1-acre high school site
- 22.7 acres of commercial uses
- 26.3 acres of mixed-use
- 5.1-acre lake house and Swim Lagoon
- 43.0 acres for parks
- 11.0 acres for lake surfaces
- 24.2 acres for water quality/detention basin facilities
- 15.2 acres for drainage channels
- 9.6 acres for paseos
- 48.0 acres for roadways

TENTATIVE TRACT MAP LOTTING MATRIX TABLE

PHASE	PLANNING AREA	LOT SIZE (AVG. DIM.)	LAND USE	AREA (AC)	DWELLING UNITS	DENSITY (DU/AC)	LOT NO.

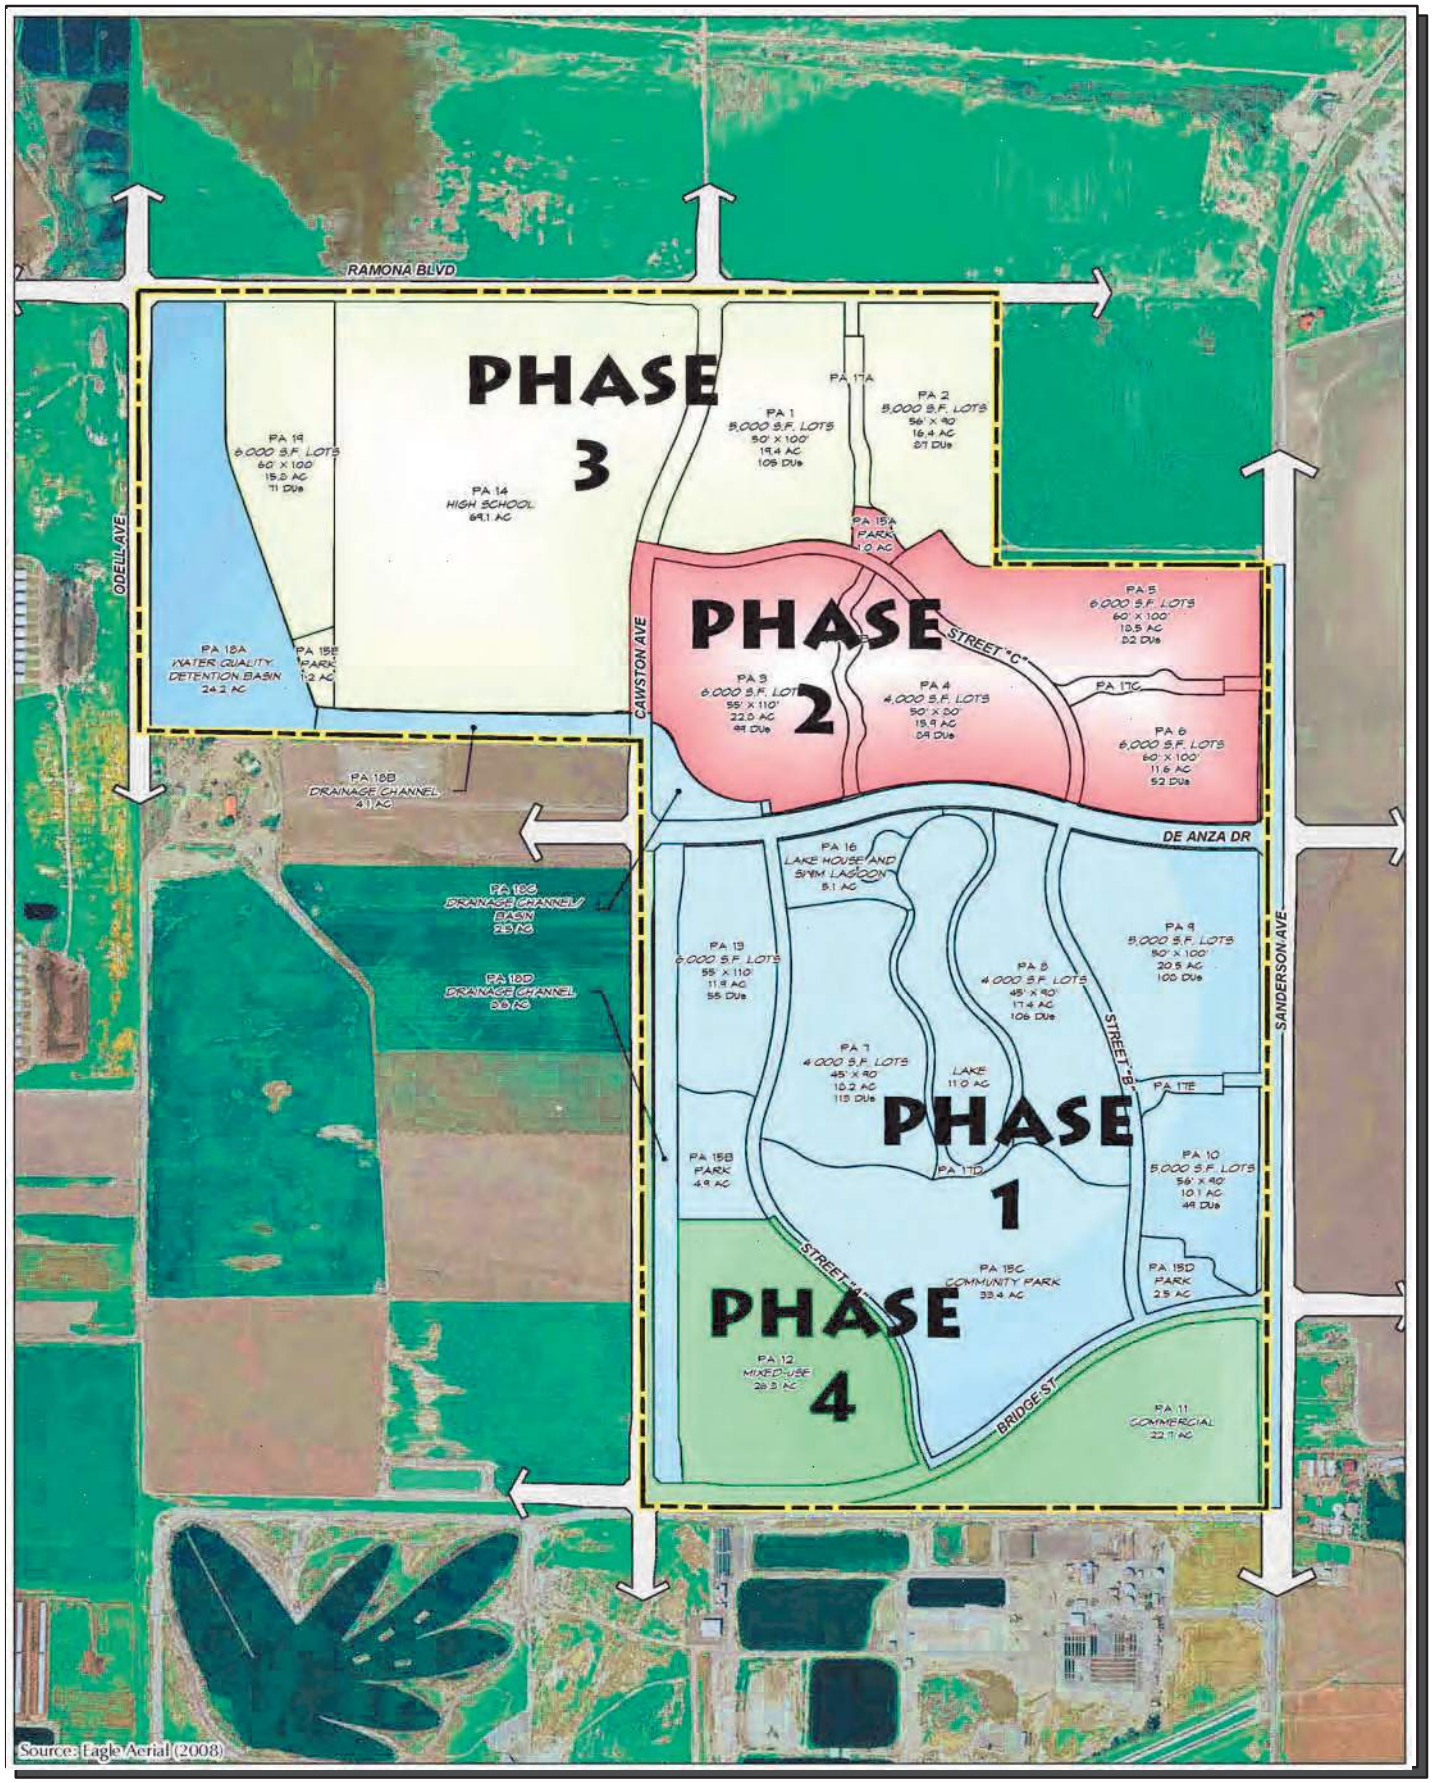
FIGURE 3.0-5

INTENTIONALLY LEFT BLANK

Phasing and Construction Planning

The project is designed to be developed in four phases over an approximate 9-year period in response to market demands and according to a logical and orderly extension of roadways, public utilities, and infrastructure. Development may occur more rapidly or more slowly, depending on the marketability of the community. Project Phasing is shown on *Figure 3.0-6, Conceptual Phasing Plan,* and detailed in *Table 3.0-3, Project Phasing Plan*. It should be noted that the public parks, the private lake, Lake House Beach Club and Swim Lagoon, drainage channels, and detention basins will be constructed as part of Phase I; and that the High School site (PA 14), may, if purchased by the school district, be developed earlier than indicated on the Conceptual Phasing Plan.



The project will be built out in four phases based on the absorption rate of the prior community phase. Each phase will entail fine grading (mass grading will be performed as part of Phase I), followed by installation of sewer, storm drain, and water infrastructure; installation of water crossings; installation of curb and gutter framework for the street system; paving; and construction of residences and commercial/mixed-use buildings. Phase I is anticipated to begin in the winter of 2011 and will last approximately 49 months. Phase I would include mass grading the entire site and will be finished upon completion of 431 residential units. Construction of Phase II will begin at roughly the time Phase I has sold out (estimated January 2016) and will take approximately 24 months to complete. Phase II will be finished upon completion of 322 residential units. Phase III will begin at roughly the time Phase II has sold out (estimated January 2018) and will take approximately 72 months to complete. Phase III will be finished upon completion of 263 residential units, and the high school (or 313 additional residential units if the high school is not developed on-site). Phase IV will begin at roughly the time Phase III has sold out (estimated January 2024) and will take approximately 120 months to complete. Phase IV will be finished upon completion of the project's commercial/mixed-use development. Completion of the project is estimated to be by December 2033.

Table 3.0-3
Project Phasing Plan

Land Use	Acres	Dwelling Units
Phase I		
PA 7 – 4,000-square-foot lots (45' x 90')	18.2	113
PA 8 – 4,000-square-foot lots (45' x 90')	17.4	106
PA 9 – 5,000-square-foot lots (50' x 100')	20.5	108
PA 10 – 5,000-square-foot lots (56' x 90')	10.1	49
PA 13 – 6,000-square-foot lots (55' x 110')	11.9	55
PA 15B, 15C, and 15D – Parks	40.8	—
PA 16 – Lake House and Swim Lagoon	5.1	—
PA 17 – Lake Trail Paseo	3.6	—
Lake Surface	11.0	—
PA 17E – Paseo	1.0	—
PA 18A – Water Quality/Detention Basin	24.2	—
PA 18B – Drainage Channel	4.1	—
PA 15C – Drainage Channel	2.5	—
PA 18D – Drainage Channel	8.6	—
Sanderson Landscape Easement	2.4	—
Circulation	20.6	—
Phase I Subtotal	**202.0**	**431**
Phase II		
PA 3 – 6,000-square-foot lots (55' x 110')	22.8	99
PA 4 – 4,000-square-foot lots (50' x80')	15.9	89
PA 5 – 6,000-square-foot lots (60' x100')	18.5	82
PA 6– 6,000-square-foot lots (60' x100')	11.6	52
PA 15A – Neighborhood Park	1.0	—
PA 17B – Paseo	2.0	—
PA 17C – Paseo	1.5	—
Circulation	6.5	—
Phase II Subtotal	**79.8**	**322**
Phase III		
PA 1 – 5,000-square-foot lots (50' x 100')	19.4	105
PA 2 – 5,000-square-foot lots (56' x 90')	16.4	87
PA 14 – High School*	69.1	313
PA 15E – Neighborhood Park	1.2	—
PA 17A – Paseo	1.5	—
PA 19 – 6,000-square-foot lots (60' x 100')	15.8	71
Circulation	10.3	—
Phase III Subtotal	**133.7**	**576**
Phase IV		
PA 11 – Commercial	22.7	—
PA 12 – Mixed-Use	26.3	—
Circulation	10.6	—
Phase IV Subtotal	**59.6**	**0**
TOTAL	**475.1**	**1,329**

* If PA 14 is not used as a High School Site, it would convert to the following land uses: 113 dwelling units (5,000-square-foot lots) on 21.6 acres, 200 dwelling units (6,000-square-foot lots) on 45.5 acres and a 2.0-acre park.

FIGURE 3.0-6

INTENTIONALLY LEFT BLANK

3.6 DISCRETIONARY ACTIONS

A list of discretionary actions known to be required and the agencies responsible for their approval are listed below; however, this EIR covers all federal, state, and local governmental approvals that may be needed to construct or implement the project, whether explicitly listed or not. All known Responsible and Trustee Agencies as defined by CEQA Guidelines 15381 and 15386 and a list of all subsequent actions anticipated within the scope of this EIR are listed.

In order to implement the project as described above, the City Council will need to take the following actions:

- EIR Certification
- Mitigation Monitoring and Reporting Program Adoption
- General Plan Amendment from LDR, MDR, High Density Residential (HDR), Open Space (OS), Park (P), and Community Commercial (CC) to Specific Plan (SP)
- Municipal Zoning Code Amendment from R-1, R-2 Planned Unit Development (PUD), R-3, and C-2 Zones to Specific Plan (SP)
- Specific Plan #1-04 Adoption
- Design Review Approval
- Tentative Tract Map No. 36188 Approval
- Development Agreement Adoption.

The following additional permits/approval may be required of other Responsible and/or Trustee Agencies that may be considered responsible agencies under CEQA. This EIR may be utilized by the following agencies during CEQA compliance for their specific permit issuance or discretionary action approval:

- Regional Water Quality Control Board: Clean Water Act Section 401 Water Quality Certification, Waste Discharge Requirement, and approval of the Storm Water Pollution Prevention Plan (SWPPP).
- Regional Water Quality Control Board: Official closure action and approval of reuse plan pertaining to historical hazardous materials located on site.
- Riverside County Department of Environmental Health: Official closure action and approval of reuse plan pertaining to historical hazardous materials located on site.
- San Jacinto Unified School District: Construction and operational approval for school site.
- California Department of Fish and Game: Section 1600 Streambed Alteration Agreement.
- EMWD: Water Availability Assessment pursuant to SB 610.

3.7 INTERAGENCY CONSULTATIONS

The project will or has required the City to engage in the following interagency consultation processes:

Senate Bill 18

Senate Bill 18 requires a City to notify any Native American tribe or group who has previously expressed interest in the project study area or who has historically inhabited the project area to determine if they view the project site as a significant point of ancestral heritage. This consultation is required when the City is considering a General Plan Amendment such as proposed for this project. The City conducted consultation per Senate Bill 18 during the early planning process for the project (2005). Given the elapsed time, the City will contact all applicable Native American groups during late summer/fall 2009 to determine if they have any further comments regarding the proposed project.

Federal Clean Water Act/California Fish and Game Code

Pursuant to Section 401 of the Federal Clean Water Act and Section 1600 of the California Fish and Game Code, any modification to surface waters must fist obtain a permit from the Regional Water Quality Control Board and California Department of Fish and Game, respectively. The applicant will be required to obtain permits to alter existing onsite water and/or wetlands prior to grading activities.

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP)

The City is a signatory to the Western Riverside County MSHCP and therefore has the obligation to implement the MSHCP in accordance with all applicable protocols. The City reviewed the project biological resource studies to determine consistency with reserve design and other plan requirements. Although the project is not located within MSHCP "criteria cells," the City contacted the Western Riverside County Regional Conservation Authority, the joint powers authority tasked with overall MSHCP implementation, to confirm that the project is not located within criteria cells and therefore submittal of the project for Joint Project Review was not necessary. The Western Riverside County Regional Conservation Authority confirmed that the project was not located within a criteria cell in a letter dated November 17, 2008.

Storm Water Pollution Prevention Plan

Pursuant to the National Pollution Discharge Elimination System, any project that would disturb soils during construction is required to prepare a Storm Water Pollution Prevention Plan. This

Plan shall be approved by the Regional Water Quality Control Board. The applicant will prepare and process this Plan prior to project grading.

Hazardous Material Closure/Reuse

In order to obtain permission for reuse of a site that formerly supported hazardous materials or substances (ie, such as methane or the former leaking underground storage tank), the Regional Water Quality Control Board and the Riverside County Department of Environmental Health must approve a closure and reuse plan prior to site disturbance. The applicant will prepare such a plan and process it through both agencies.

Water Supply Assessment

For all projects that would result in construction of more than 500 dwelling units, local municipalities must consult with the applicable water agency to determine whether adequate water supplies exist to serve the proposed project. Because the project proposes up to 1,329 dwelling units, the 500 unit maximum would be exceeded, therefore this interagency coordination requirement would be triggered. The City received a Water Supply Assessment from Eastern Municipal Water District on December 15, 2004. The City also received confirmation that the December 15, 2004 Water Supply Assessment was still valid in a May 11, 2009 letter.

INTENTIONALLY LEFT BLANK

SECTION 4.0
ENVIRONMENTAL SETTING

In accordance with Section 15125 of the CEQA Guidelines, the general environmental setting for the project area is provided in this section. More detailed descriptions of the setting specifically pertaining to each environmental issue are provided at the beginning of each impact issue area addressed in *Section 5.0*.

4.1 PHYSICAL SETTING

The site is generally flat and is located on the alluvial plain of the San Jacinto River. The site elevation above sea level ranges from 1,455 feet along the northern edge to 1,490 feet in the southeastern corner. The southeastern corner of the site is a former cattle feed lot with several remaining shade structures. The remainder of the land consists primarily of vacant former agricultural land. Vegetation on site consists of weedy invasive species that have accumulated since the majority of agricultural production was discontinued. There are scattered sod fields in the northern portions of the property, which is the site of the only remaining agricultural operation. Several unnamed, unimproved dirt roadways traverse the site and are associated with former and current agricultural operations. Irrigation canals run along the edges of fields in support of current or former sod farming activities. A detention basin is located along the north-central edge of the project site. There is one abandoned residence and former storage shed located in the east central portion of the site (see *Figure 5.13-1*).

The San Jacinto River is the dominant landform in the project area. The river, which is located less than 1 mile from the project site, is contained within a broad valley formation that is characterized by flat, alluvial terraces surrounded by stark mountains. The project is surrounded by existing agricultural operations on three sides, with the San Jacinto Valley Regional Water Reclamation Facility along the southern boundary of the site. The San Jacinto River area comprises a flat, perennial river characterized by wetland vegetation within the immediate channel and then drier habitats, such as grassland and coastal sage scrub, further from the low flow area. Due to its flat nature and alluvial setting, much of the San Jacinto River floodplain has been utilized for active agriculture for over 100 years.

As discussed previously, agricultural operations on the site have mostly ceased to be active with the exception of some sod farming in the northwest portion of the site. However, the project site contains state-designated Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. *Section 5.3, Agricultural Resources,* describes the impact of converting these designated lands in greater detail. There are no unique aesthetic or visual resources on site (see *Section 5.2, Landform Alteration and Aesthetics*, for additional clarification regarding on-site visual resources). Although the site is highly disturbed from a biological resource perspective,

sensitive and unique wildlife species exist on site (*Section 5.4, Biological Resources,* provides a greater description of on-site biological resources). The project site does not contain any unique cultural resources (*Section 5.5, Cultural Resources,* provides a greater description of on-site cultural resources). The project site contains two fault areas on site (see *Section 5.6, Geology and Soils,* for further discussion of on-site geotechnical resources). The site does not contain any natural hydrologic features; however, it is characterized by the on-site irrigation canals and detention basins. The project site is located near the San Jacinto River; the river's 100-year floodplain traverses part of the project site (see *Section 5.8, Water Quality and Hydrology,* for further discussion on the project's on-site hydrologic features).

On-site infrastructure includes dirt driveways/roadways, a septic system, well water service, and constructed agricultural detention basins to assist with on-site drainage. Currently, public utilities, including electric, gas, and phone service, are located on site.

4.2 APPLICABLE LAND USE PLANS

Section 15125 (d) of the CEQA Guidelines requires that a discussion of the project's relationship to the applicable general plan and relevant regional plans be provided. The consistency analysis for the proposed project with applicable plans, policies, and regulations is provided in *Section 5.1, Land Use, Planning, and Zoning,* of this EIR. The following is a list of plans, policies, and regulations that are applicable to the proposed project:

- City of San Jacinto General Plan
- City of San Jacinto General Plan Update
- City of San Jacinto Municipal Zoning Code
- Western Riverside County Multiple Species Habitat Conservation Plan
- South Coast Air Pollution Control District Regional Air Quality Strategies
- Southern California Association of Government's Regional Comprehensive Plan.

SECTION 5.0
ENVIRONMENTAL ANALYSIS

5.1 LAND USE, PLANNING, AND ZONING

5.1.1 Introduction and Methodology

This section describes the planned land uses associated with the proposed Villages of San Jacinto Specific Plan and Tentative Map and discusses potential project impacts to land use, planning, and zoning that would occur as a result of project implementation. The following discussion includes a description of existing land uses surrounding the project site and provides an analysis of the proposed development's compatibility with planned and existing surrounding land uses. The discussion also evaluates the consistency of the proposed project with all relevant plans and policies, including those policies and development standards of the City's General Plan, Zoning Ordinance, and the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP).

The character of existing land use was determined by field survey, review of aerial photography of the project site and surrounding area, and review of existing documentation and site descriptions. Issues of land use compatibility were analyzed in the context of existing and planned land uses, policies, and planning programs. In addition, issues of land use compatibility have been analyzed in the context of physical environmental factors, such as agriculture, noise, air quality, aesthetics, and traffic, discussed in detail in the respective sections of this EIR.

Applicable City and regional planning documents were reviewed to identify all applicable plans, policies, and development standards to evaluate potential project impacts to existing planning programs. A consistency analysis was conducted for each applicable policy identified and mitigation measures have been provided to address potential project inconsistencies with relevant plans and policies.

5.1.2 Existing Conditions

Existing Land Uses

The 475.1-acre project site is located in the northwest portion of the City of San Jacinto in an area consisting primarily of agricultural uses. The southeastern corner of the site is a former cattle feed lot with several remaining shade structures. The remainder of the land consists primarily of vacant former agricultural land. Vegetation on site consists of weedy invasive species that have accumulated since the majority of agricultural production was discontinued. There are scattered sod fields in the northern portions of the property, which entail the only remaining agricultural operations.

As illustrated in *Figure 5.1-1, Existing Land Uses*, the project site is located in a rural area within approximately 1.25 miles south of the San Jacinto River. The north property boundary of the project site is generally bound by the proposed road alignment for the Ramona Boulevard extension. Beyond this proposed road extension, land uses north of the site consist primarily of cultivated agricultural use in addition to duck ponds, the Colorado River Aqueduct, and the Ramona Expressway. Agricultural land uses occupy most areas west of the of the project site and include cultivated lands and cattle operations. A municipal wastewater treatment plant is located directly south of the project site and the San Jacinto Reservoir is located southeast of the property. The east side of the project site is generally bound by North Sanderson Avenue. Immediately east of North Sanderson Avenue, land uses consist of agricultural cultivation and low density residential use. Land use patterns begin to transition to urban-related uses continuing east-southeast of the project area toward downtown San Jacinto located southeast of the project site.

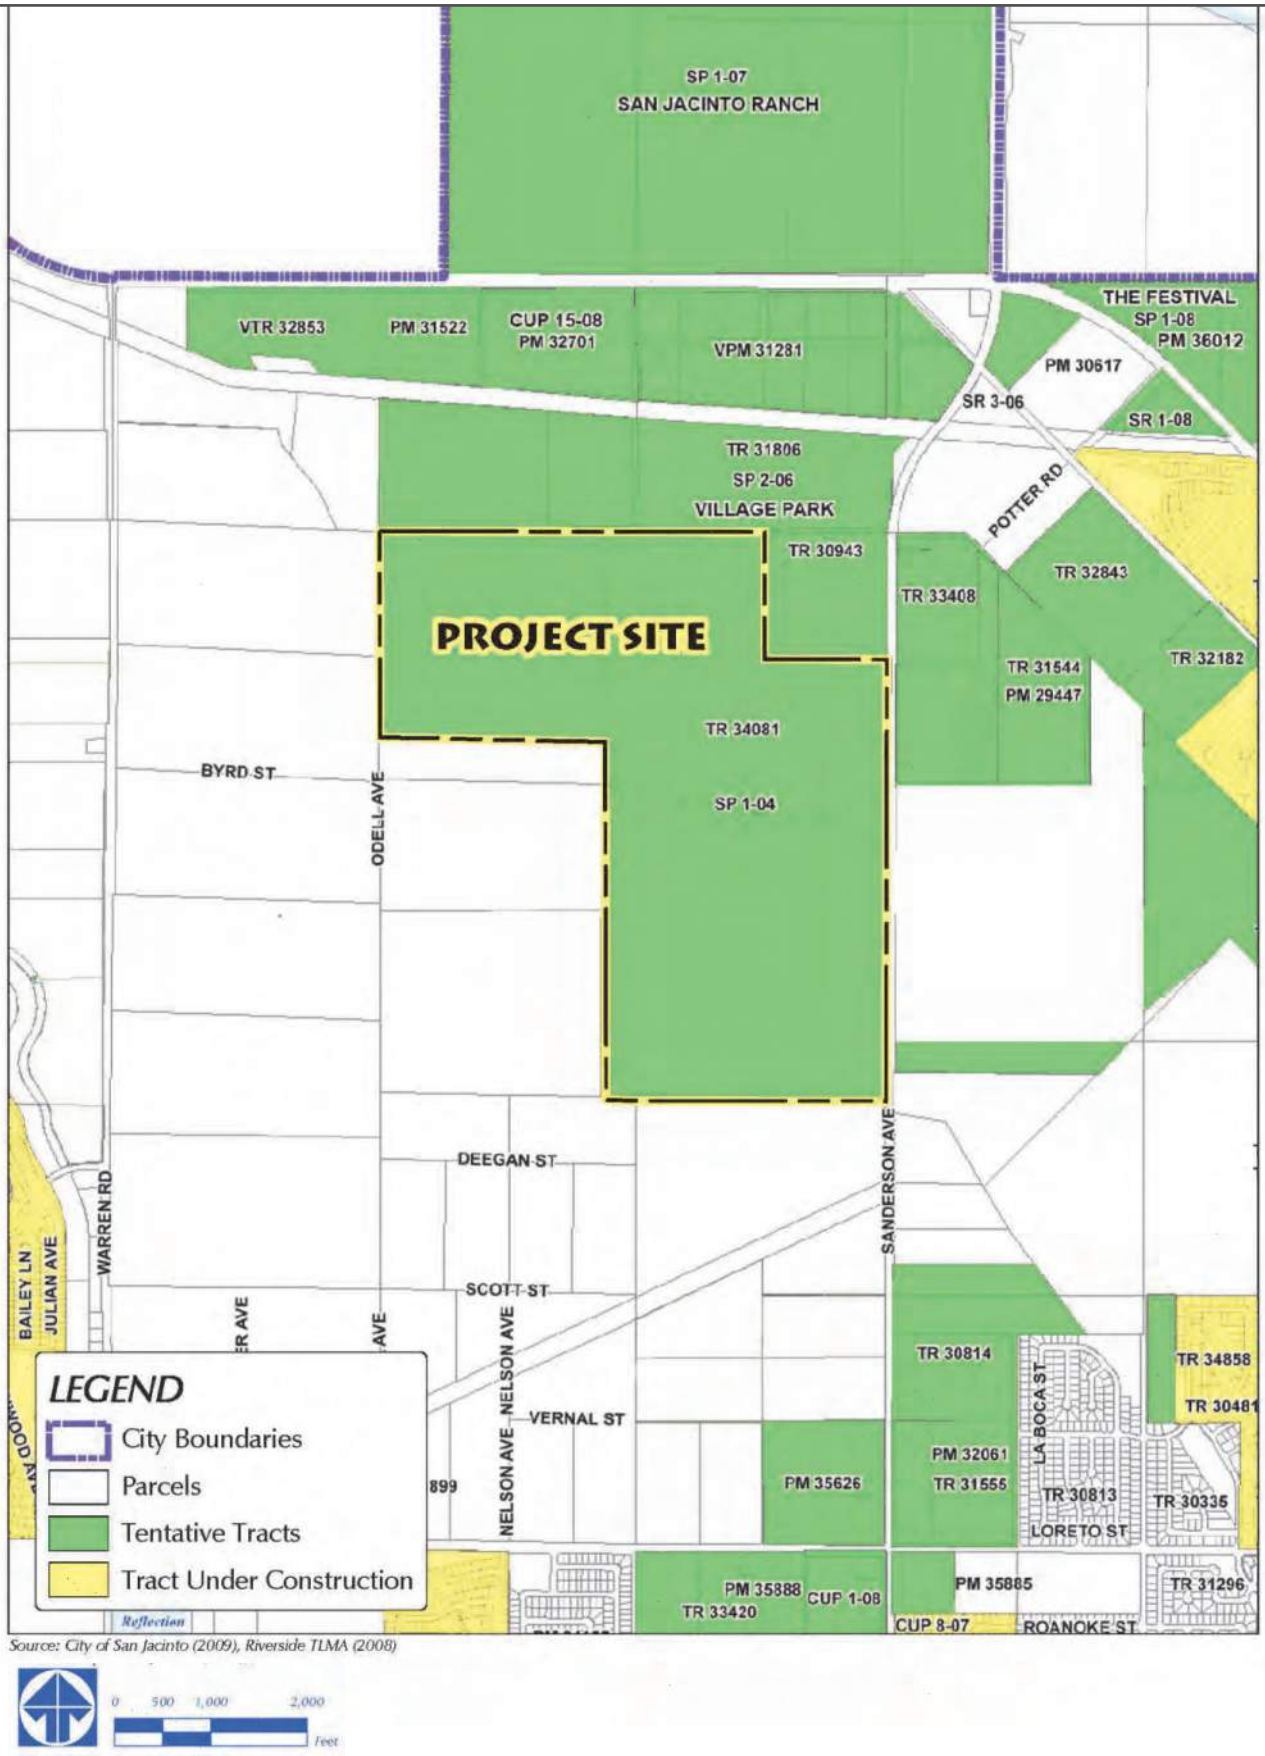
The project site is accessible directly from North Sanderson Avenue or indirectly via various agricultural roads taking access from the Ramona Expressway, Cottonwood Avenue, and Warren Road.

According to the Tentative Map/New Development Map accessed on the City's website (City of San Jacinto 2005), a number of new residential and commercial development projects have been approved or are in the City review process within the City including the area surrounding the project site. *Figure 5.1-2, Surrounding Projects,* depicts surrounding projects within the San Jacinto area at the time of EIR publication. Details of these projects can be found in *Table 6-1, Cumulative Projects List,* in *Section 6.0, Cumulative Impacts.*

Land Use Plans and Policies

City of San Jacinto General Plan

The City of San Jacinto General Plan identifies community goals and planning issues for future growth of the City and establishes goals and policies to provide a comprehensive basis for implementation of plans and programs to achieve community goals. The General Plan contains seven individual Elements: Land Use, Housing, Circulation, Natural Resources Management, Noise, Public Safety and Community Services and Facilities. Existing applicable land use designations and policies are addressed in the policy consistency analysis for the proposed project. The most recent General Plan was adopted on May 4, 2006, and the latest General Plan Land Use Map was approved in February 2009.



Villages of San Jacinto EIR

Surrounding Projects

FIGURE 5.1-2

INTENTIONALLY LEFT BLANK

Figure 5.1-3, General Plan and Specific Plan Comparison, shows that the General Plan designations on the project site have a mix of land uses, which include Community Commercial (CC), Open Space Recreation (OS), Low Density Residential (LDR), and Medium Density Residential (MDR).

As shown on *Figure 5.1-3,* the easternmost portion of the site contains approximately 54.4 acres of the CC land use designation, which typically allows for development of a broad range of service and retail commercial activities at various densities. The central and western portions of the site contain about 44.7 acres of the Open Space land use designation, which is intended to maintain general open space areas for purposes of conservation of natural and scenic resources and protection of public property from natural hazards. Limited residential use is permitted in areas designated as Open Space at a maximum density of 1 unit per 40 acres and limited park and recreation uses are permitted at a maximum Floor Area Ratio (FAR) of 0.10:1.

The remaining portion of the site is designated LDR (136.5 acres) and MDR (239.5 acres). The northwest portion of the site is predominantly designated as LDR, which allows for detached single-family residential development at a maximum density of 5 units per acre. The MDR land use designation exists on approximately half of the site and permits single-family attached and detached units, duplexes, triplexes, fourplexes, townhouses, condominiums, and mobile home parks at a maximum density of 10 units per acre. *Table 5.1-1, General Plan and Specific Plan Comparison,* presents a comparison of acreage and dwelling units of the proposed Specific Plan and existing General Plan designations.

Table 5.1-1
General Plan and Specific Plan Comparison

Open Space	44.7	—	—	67.5	—	—
Non-Residential Subtotal	99.1	—	—	276.6	—	313
Total	**475.1**	**—**	**3,077**	**475.1**	**—**	**1,329**

City of San Jacinto Zoning Ordinance

The Zoning Ordinance of the City of San Jacinto contains site-specific zoning designations and associated development standards that serve to implement the goals and policies of the General Plan.

As shown on *Figure 5.1-4 Zoning and Specific Plan Comparison*, the project site is currently zoned One Family Zone (R-1), Two Family Zone -Planned Unit Development Overlay (R-2 PUD), Multiple Family Zone (R-3), and General Commercial Zone (C-2). The distribution of zoning designations on the site generally corresponds with the land use designation with the southeast corner of the site zoned as C-2 for general commercial uses, most of the northwest portion of the site zoned R-1 for low density residential development, and the majority of the site zoned R-2 for medium density residential development. The main difference between the current zoning and proposed Specific Plan is that rather than high density residential as designated in the southwest corner of the site, the project will provide mixed use and park development in that area.

City of San Jacinto Redevelopment Plan

The City of San Jacinto and Soboba Springs Redevelopment Plans and corresponding 5-year implementation plans address issues related to eliminating blighted areas in designated redevelopment project areas. The Redevelopment Plans address a total of 27 project areas located primarily in the urbanized eastern portion of the City. Due to the location of the project area in the more rural western portion of the City, plans and policies associated with the Redevelopment Plans are not applicable to the proposed project.

Transportation Uniform Mitigation Fee 10-Year Strategic Plan (TUMF)

The Western Riverside Council of Governments (WRCOG) is a council comprising members that represent 15 local jurisdictions in western Riverside County, including the City of San Jacinto. The WRCOG functions to facilitate collective examination by the various representative jurisdictions of issues that are regional in nature such as air quality and traffic. In June 2004, the WRCOG adopted the Transportation Uniform Mitigation Fee (TUMF) 10-Year Strategic Plan (TUMF) and Transportation Improvement Program Development Guidelines.

LAND USE (Acres)	GENERAL PLAN	PROPOSED
Residential		
Low Density (General Plan Range: 2.1-5.0 du/ac	136.5	80.6
Medium Density (General Plan Range: 5.1-10.0 du/ac	239.5	117.9

Villages of San Jacinto EIR

General Plan Comparison – Current Update General Plan vs. Proposed Specific Plan Land Use

FIGURE 5.1-3

INTENTIONALLY LEFT BLANK

Source: T&B PLANNING CONSULTANTS, July 2009

Villages of San Jacinto EIR

FIGURE 5.1-4

Zoning Comparison - Existing Zoning vs. Proposed Specific Plan Zoning

INTENTIONALLY LEFT BLANK

The purpose of the TUMF program is to establish a comprehensive funding source to mitigate the cumulative regional transportation impacts of new development on regional arterial highways (Parsons Brinckerhoff Quade & Douglas, Inc, June 2004). The TUMF program has five primary goals that are articulated as a basis for developing specific regional project priorities and selection criteria. These goals are summarized as follows:

- Sustain Mobility – Mitigate the transportation system impacts of new development
- System Continuity – Enhance the continuity of the regional arterial highway system
- Project Development – Encourage systematic project development and provide flexibility to advance TUMF projects promptly through completion
- Leverage Funds – Secure additional matching funds for TUMF system improvements
- Regional Benefit – Ensure TUMF program revenues are distributed to maximize mitigation of new development impacts.

The TUMF program is intended to address cumulative traffic impacts of new development to the region; therefore, TUMF program funded improvements are focused primarily on regional arterial highways. New development in western Riverside County places additional demand on the regional transportation system to provide safe and convenient access for new residents and employees. The additional demand on the transportation facilities reduces mobility absent adequately and timely funded infrastructure improvements constructed to meet growing demands. As such, the WRCOG has developed and implemented the TUMF program which requires new development to contribute revenues to partially fund improvements that will mitigate the transportation impacts of new developments. TUMF investments are then focused on those regional facilities most impacted by new development.

Western Riverside County Multiple Species Habitat Conservation Plan

The Western Riverside County MSHCP is a comprehensive, long-term habitat conservation program which addresses the needs of a variety of biological resources. The MSHCP provides for the conservation of approximately 160 species and covers approximately 1.25 million acres of land in Riverside County which is experiencing rapid urbanization. The primary goal of the MSHCP is to develop and manage sustainable preserve areas within existing and expanding urban areas. The preserve areas and management efforts contained in the final MSHCP will affect land use planning in the entire City of San Jacinto area.

Southern California Association of Governments Growth Management Plan

The Southern California Association of Governments (SCAG) Growth Management Plan contains recommendations for methods to direct development and build-out of the region in

ways to minimize traffic congestion and protect environmental resources, including efforts to balance land uses, particularly jobs and housing. Goals of the SCAG Management Plan are reflected in the City's General Plan and individual plan elements.

South Coast Air Quality Management Plan

The South Coast Air Quality Management District (SCAQMD) Governing Board adopted the 2003 Air Quality Management Plan (AQMP) on August 1, 2003. The 2003 AQMP updates the attainment demonstration for the federal standards for ozone and particulate matter (PM_{10}); replaces the 1997 attainment demonstration for the federal carbon monoxide (CO) standard, provides a basis for a maintenance plan for CO for the future; and updates the maintenance plan for the federal nitrogen dioxide (NO2) standard that the SCAB has met since 1992.

The South Coast AQMP includes a number of policies and measures to achieve federal and state standards for healthful air quality in the region. The City's General Plan strives to comply with the AQMP by planning land uses in relation to circulation systems, promoting commercial and industrial land uses with convenient access to transportation corridors, and encouraging a balance of land uses that facilitates a complimentary association between jobs and housing.

5.1.3 Significance Criteria

Based on the criteria identified in Appendix G of the CEQA Guidelines, the proposed project would have a significant impact on land use, planning and zoning if it:

1. Physically divides an established community.
2. Conflicts with any applicable plan, policy or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, zoning ordinance, etc.) adopted for the purpose of avoiding or mitigating an environmental effect.
3. Conflicts with any applicable habitat conservation plan or natural community conservation plan.
4. Introduces a land use that is incompatible with existing or proposed surrounding land uses.

5.1.4 Impacts

Would the project physically divide an established community?

As described in detail in *Section 3.0, Project Description*, the proposed project would develop commercial, residential, recreation and school facility land uses in the Specific Plan project area. *Table 3-1* illustrates the total acreage committed to each proposed land use.

The City's General Plan Land Use Map and Zoning Ordinance generally designate the project site and adjacent surrounding land area for future residential and commercial development and, as such, a variety of residential/commercial developments have been approved in the vicinity or are in the City review process. According to the City's Tentative Map/New Development Map illustrating various development projects recently approved or pending City review, a number of new residential and commercial development projects have been approved, or are in the City review process, in the area surrounding the project site.

The project site's location in an existing rural area surrounded by land that currently supports agricultural uses is likely to result in a physical division of a relative contiguous rural area and associated agricultural community. That said, due to existing residential and commercial land use and zoning designations of the subject site and adjacent land, and the apparent pattern of pending residential and commercial development proposals in the vicinity of the project site, it is anticipated that the project area will experience a pattern of rural agricultural land use conversion to urban-type uses which would ultimately alleviate potential land use conflicts between existing agricultural uses and planned residential development. Therefore, no significant impacts related to the division of an established community would occur.

Would the project conflict with any applicable plan, policy or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, zoning ordinance, etc.) adopted for the purpose of avoiding or mitigating an environmental effect?

Land Use Plans and Policies

City of San Jacinto General Plan

The City requires that a Specific Plan be developed for all projects involving 100 acres or more. Government Code Section 65450 states that a planning agency may "prepare specific plans for the systematic implementation of the general plan for all or part of the area covered by the general plan." The project, as proposed, will require an amendment to the General Plan Land Use Map to develop a Specific Plan and modify the land use designations of the project site to remove the HDR designation from the subject property and to reconfigure the existing CC, OS,

LDR, and MDR land use designations, and school site, consistent with the distribution of the land uses for the planned development of the proposed Specific Plan. The proposed Specific Plan is intended to incorporate and implement the comprehensive goals and policies of the City's General Plan for the more detailed development plan of the Villages of San Jacinto. The project land use scenario is generally consistent with the latest General Plan Update Land Use Plan. Therefore, the potential inconsistency with the existing General Plan Land Use Map is considered less than significant from a Land Use Plan Map perspective.

Table 5.1-2, General Plan Policy Consistency Analysis, identifies the City's General Plan policies that are applicable to the proposed Specific Plan and development project. For each listed policy, *Table 5.1-2* includes a discussion of potential project consistency/inconsistency with the policy to determine if the proposed Villages of San Jacinto Specific Plan would conflict with the policy and thereby result in an environmental impact. Environmental issues raised in the policy consistency analysis are also addressed in other sections of this EIR and are referenced where relevant.

Table 5.1-2
General Plan Policy Consistency Analysis

Policy	Project Consistency
Land Use Element: The Land Use Element is a guide to land use planning within the City of San Jacinto and affects many of the issues addressed in the other General Plan elements. The Land Use Element identifies the type and location of future land uses within the City. The specific land uses and their location within the community in turn affect the remaining General Plan elements. For example, the location and type of land uses outlined in the Land Use Element affect the circulation system that is identified in the Circulation Element, and the allowable density of residential land identified in the Land Use Element affects the Housing Element policies. The land uses identified in the Land Use Element also reflect the community's goals for its future form and character.	
Land Use Policy Goal: Balance of Land Uses *– Develop a balanced land use pattern that meets community needs for residential, commercial, industrial, public, and recreational uses.*	
LU Policy 1.1: Promote a land use composition in San Jacinto that provides a balance or surplus between the generation of public revenues and the cost of providing community services and facilities.	The community provides for a variety of public facilities, including educational, municipal, and recreational land uses, as well as residential land uses. The community also designates approximately 22.7 acres for commercial land uses and 26.3 acres of mixed-use land uses. It is anticipated that these mixed-use and commercial land uses will generate additional revenue streams for the City, including sales tax. In addition, the project will be required to contribute development impact fees to cover its "fair share" cost of providing public services and facilities to the site, including fire protection, police protection, and libraries. As such, the balanced land uses provided by THE VILLAGES OF SAN JACINTO will contribute to public revenues and the project is therefore consistent with, and will result in the implementation of, this General Plan policy.
LU Policy 1.2: Create housing opportunities that match employment opportunities within the community.	THE VILLAGES OF SAN JACINTO Specific Plan establishes a high quality, master-planned community that provides for a wide range of residential home product types on lot sizes ranging from 4,000, 5,000, to 6,000 square feet. This variety of lot sizes will result in home sizes designed to appeal to a wide range of potential residents and available in a range of prices.

Table 5.1-2 (Continued)

Policy	Project Consistency
	Furthermore, THE VILLAGES OF SAN JACINTO combines housing, employment, and retail activities on one site. The community contains a maximum of 1,329 residential units, 22.7 acres of commercial land uses, and 26.3 acres of mixed-use land uses (including commercial, office, retail and municipal uses). This balance of land uses within the community contributes towards a greater balance between jobs and housing within the City. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
LU Policy 1.4: Provide public/institutional land use designations and development standards that encourage the location and operation of adequate public facilities to serve the community. LU Policy 1.6: Maintain land use designations and regulations that permit the successful development and operation of public and private educational facilities at appropriate locations within the planning area.	THE VILLAGES OF SAN JACINTO provides a 69.1-acre site for use as a High School campus by the San Jacinto Unified School District in Planning Area 14, 40.8 acres of public parks, and the provision of 26.3 acres of mixed-use land uses (which may include public, municipal, and educational uses). Furthermore, this Specific Plan provides for the development of adequate infrastructure (circulation, water, sewer, etc.) necessary to ensure successful implementation of these public/institutional land uses. Additionally, this Specific Plan provides for amenities, such as landscaping and monumentation, and includes development standards and design guidelines to ensure a high quality of development. Maintenance responsibilities and financing mechanisms also are identified in this Specific Plan to ensure successful long-term operation of these public/institutional land uses. THE VILLAGES OF SAN JACINTO is therefore consistent with these policies.
LU Policy 1.5: Plan and designate adequate open space and parkland to meet the community's parks, open space, and recreational needs.	The community's maximum potential build-out of 1,329 homes would result in approximately 4,000 community residents (at a rate of 3.01 persons per household). The site is planned for a neighborhood park by the General Plan (see Figure CSF-3, Parks and Public Facilities) and per the requirements of the Quimby Act, the community would require approximately 20 acres of active parkland. THE VILLAGES OF SAN JACINTO Specific Plan exceeds this requirement by providing active public park facilities totaling approximately 40.8 acres (Planning Area 15B, 15C, and 15D), in addition to the private recreation facilities and paseos that are provided on 68.7 acres. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
LU Policy 1.3: Attract light industry and other compatible employment generating businesses. LU Policy 1.7: Encourage additional retail development to increase sales tax revenues and expand the range of services available to the community. LU Policy 1.8: Encourage the development of business parks and office parks to expand the number and type of job opportunities in San Jacinto.	THE VILLAGES OF SAN JACINTO includes opportunities for a variety of commercial activities that would generate employment and sales tax revenue. Specifically, 22.7 acres of commercial land uses are located within Planning Area 11 in the southeastern portion of the community and provide for neighborhood retail, entertainment, restaurant and employment opportunities. Additionally, a 26.3-acre mixed-use area (Planning Area 12), which allows for retail commercial, entertainment, office, and municipal land uses, is located in the southwestern portion of the community. The land uses permitted in Planning Area 12 create additional employment opportunities. This variety of land uses within the community would create new jobs, increase sales tax revenues for the City, and expand the range of services available to the surrounding area. THE VILLAGES OF SAN JACINTO is therefore is consistent with these policies.
LU Policy 1.9: Support the provision of outdoor gathering places such as plazas, greens and squares to strengthen social interaction and provide	Section V, *Design Guidelines*, requires the construction of outdoor gathering places such as plazas and green spaces within the commercial and mixed-use area create opportunities for social

Table 5.1-2 (Continued)

Policy	Project Consistency
visual relief in developed areas.	gatherings. The community also includes landscaped paseos and a private lake and swim club to encourage and support social activities within the community. Furthermore, the community features 40.8 acres of public parks containing picnic areas, BBQ pits, benches, tot lots, and other amenities that encourage social interaction. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Land Use Policy Goal: Manage and Direct Growth *– Manage and direct growth so that the community and its neighborhoods are protected and enhanced.*	
LU Policy 2.1: Assure that new development is complementary to the existing character of the City.	THE VILLAGES OF SAN JACINTO will develop the site with a similar building scale and development intensity commonly found in the community. The design theme of THE VILLAGES OF SAN JACINTO is based on a contemporary interpretation of historical southern California architectural styles and features a relaxed landscape feel reminiscent of rural communities. The Specific Plan also includes architectural design standards for site planning, architectural theme and details, building mass and scale, materials and color to create a high-quality living environment, as wellcomplement and enhances the existing character of the City and the surrounding community.
LU Policy 2.2: Encourage infill development to be consistent with and complement the bulk, scale, intensity, and character of the existing surroundings.	
LU Policy 2.3: Ensure that development corresponds to the provision of community services and facilities and new development funds its share of improvements (e.g., parks, schools, trails, utilities).	THE VILLAGES OF SAN JACINTO provides for the development of public parks, public/municipal uses, and a high school. In addition, the community provides for the development of private parks and trails. As described in detail Specific Plan Section IV.7, *Project Phasing Plan*, THE VILLAGES OF SAN JACINTO provides for the development of infrastructure necessary to service the planned land uses and community facilities. The community master developer will also be required to pay development impact fees to cover the project's fair share of community services, including fire protection, police protection, and libraries. Therefore, THE VILLAGES OF SAN JACINTO is consistent with, and results in the implementation of, this General Plan policy.
LU Policy 2.4: Ensure that adequate infrastructure and public services are provided in concert with development so that no negative fiscal or service impact occurs as a result of new development.	
LU Policy 2.7: Locate retail and commercial land uses along major circulation routes at major intersections where there is maximum access and visibility.	THE VILLAGES OF SAN JACINTO includes 22.7 acres of commercial land uses along Bridge Street and Sanderson Avenue. In addition, the community includes 26.3 acres of mixed-use land uses along Bridge Street at the planned extension of Cawston Avenue. Bridge Street acts as a major circulation axis between Sanderson Avenue and Cawston Avenue, and will facilitate efficient access to-and-from the site for patrons and employees, while providing maximum visibility; therefore, ensuring consistency with this policy. It is important to note that the General Plan anticipates that community commercial land uses would be developed on the project site, immediately adjacent to Sanderson Avenue, as depicted on Figure III-2, *General Plan Map*. The project accommodates the commercial uses anticipated by the General Plan, but locates these uses at the southern portion of the site, along Bridge Street (as described above). The layout of mixed-use and commercial land uses planned by THE VILLAGES OF SAN JACINTO is preferred in lieu of the layout identified in the General Plan, as it provides a buffer between the EMWD wastewater treatment plant immediately adjacent to the southern site boundary and the open space and residential uses planned by the project.
LU Policy 2.8: Direct higher density housing and higher intensity employment around commercial uses and job centers near transit nodes and areas served by a well-developed transportation network.	

Table 5.1-2 (Continued)

Policy	Project Consistency
LU Policy 2.9: Where feasible and beneficial to the City and its residents, encourage the joint use of public facilities.	The project includes accommodations for a variety of public facilities (including a high school, public parks, and other municipal uses). The location of these planned uses within the community and their proximity to complementary uses, such as residential and commercial land uses, promotes the joint use of these facilities. Consequently, THE VILLAGES OF SAN JACINTO is consistent with this policy.
Land Use Policy Goal: Environmental Compatibility *– Foster development in San Jacinto that ensures the compatibility of land uses with environmental conditions.*	
LU Policy 3.1: Limit development in the hillsides, ridgelines, floodplains, and other high risk areas.	As discussed in Specific Plan Section III.B, *Environmental Setting*, the site is relatively flat and slopes gently to the northwest; no prominent slopes, hillsides or floodplains exist on-site. The northerly portion of the site is located within the 100-year floodplain. The drainage system (refer to Specific Plan Section IV.3, *Drainage Plan*) has been designed to convey and attenuate 100-year storm flows and provide flood protection for the site. A complete, detailed discussion of potential adverse impacts associated with 100-year storm flows is contained in the EIR accompanying this Specific Plan. As concluded in the EIR, with the incorporation of design measures and mitigation – as needed – implementation of the project will not result in substantial risk to humans or structures.
LU Policy 3.4: Preserve prominent ridgelines by restricting development on slopes of 40% or higher.	
LU Policy 3.2: Explore methods to preserve areas of severe natural hazards, such as landslides, ground subsidence, liquefaction, and flooding as open space.	As discussed in the EIR that accompanies the specific plan for THE VILLAGES OF SAN JACINTO, and as indicated in the Specific Plan, earthquake faults do traverse portions of the site. However, as shown on Figure III-6 of the Specific Plan, *Structural Setbacks*, the site has been designed to preserve areas located in the identified fault zone as recreational open space. As discussed above, the site is not subject to substantial adverse effects related to flooding. Accordingly, THE VILLAGES OF SAN JACINTO is consistent with this policy.
LU Policy 3.3: Permit the joint-use of preserve areas and easements such as seismic faults and drainage basins for open space and recreational uses.	A portion of the Casa-Loma segment of the San Jacinto Fault Zone Complex traverses a portion of the site. The fault segment and the surrounding fault zone buffer is inappropriate for development of residential uses or habitable structures. THE VILLAGES OF SAN JACINTO utilizes a majority of the fault zone area for active and passive recreational uses, site drainage, and internal circulation and is consistent with this policy.
Land Use Policy Goal: Land Use and Circulation Compatibility *– Promote high quality development that ensures compatibility with surrounding land uses and major transportation corridors.*	
LU Policy 4.1: Evaluate the compatibility of new development with surrounding uses when reviewing development proposals and designing the circulation system improvements.	THE VILLAGES OF SAN JACINTO will result in the development of the site with a mix of land uses consistent with the General Plan land use designations for the site. The land uses on-site will be developed with a similar building scale and development intensity commonly found in the surrounding community. Development on-site will be required to be consistent with Section V, Design Guidelines, of THE VILLAGES OF SAN JACINTO, which includes architectural design standards for site planning, architectural theme and details, building mass and scale, materials and color to create a high-quality living environment. In addition, as described in Specific Plan Section III, THE VILLAGES OF SAN JACINTO provides adequate circulation and infrastructure improvements to accommodate development of the site.
LU Policy 4.2: Ensure that new development is compatible with the physical characteristics of the site, surrounding land uses, and available public infrastructure.	

Table 5.1-2 (Continued)

Policy	Project Consistency
LU Policy 4.3: Maximize commercial, retail, and employment opportunities along the City's major corridors and intersections, including SR-79, the Ramona Expressway, Sanderson, and Cottonwood.	As discussed above in the response to General Plan policy 2.7, THE VILLAGES OF SAN JACINTO Specific Plan provides 22.7 acres of commercial land uses and 26.3 acres of mixed-use adjacent to major circulation corridors. The location of mixed-use and commercial land uses along major circulation corridors will maximize visibility of these land uses and will provide site patrons and employees with adequate, efficient circulation to-and-from the site.
LU Policy 4.4: Ensure new development provides roadways that meet the City's standards based on the classifications shown in the Circulation Master Plan and the level of traffic expected to be generated by the proposed project.	THE VILLAGES OF SAN JACINTO Specific Plan includes a roadway network which provides safe and efficient circulation to individual planning areas and land uses. The Specific Plan includes full- and half-width improvements to the following General Plan Circulation Element roadway segments on-site: Sanderson Avenue, De Anza Drive, Bridge Street, Odell Avenue, Cawston Avenue, and Ramona Boulevard. In addition, the project provides for the construction of on-site local roads. All roadways improvements will be constructed to meet City of San Jacinto standards. The community's Circulation Plan, conceptually illustrated on Figure IV-2, *Project Circulation Plan*. The EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan evaluates traffic and circulation impacts that may occur upon implementation of this project and provides mitigation measures to reduce identified impacts to a level below significance, when feasible. The Planning Commission and City Council will review the EIR to ensure adequate provision of circulation facilities. Therefore, THE VILLAGES OF SAN JACINTO Specific Plan is consistent with, and results in the implementation of, this policy of the General Plan.
LU Policy 4.5: Minimize the number of vehicular access points on major corridors by using reciprocal access agreements whenever feasible.	As depicted on Specific Plan Figure IV-2, *Project Circulation Plan*, the project has been designed to minimize vehicular access points on major circulation corridors, including Sanderson Avenue.
LU Policy 4.6: Enhance pedestrian access both within shopping centers and to and from commercial uses to reduce vehicle trips generated within the City.	Section V, *Design Guidelines*, requires that structures within Planning Area 11 (Neighborhood Commercial) and Planning Area 12 (Mixed Use Commercial) be oriented in a pedestrian-friendly manner to take advantage of park views. The commercial land uses are required to provide either street-facing entrances and/or entrances that are easily accessed from the park and parking areas. The scale of the buildings and plan are pedestrian-friendly and encourage pedestrian activity between structures. The design principles set forth in Section V, *Design Guidelines*, requires major projects or individual buildings at key locations within the commercial area to incorporate public plazas at focal points and at activity centers. Furthermore, parking lots within the commercial area shall be pedestrian-friendly in nature, with walkways provided in appropriate locations. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Land Use Policy Goal: Resource Preservation *– Preserve and protect the City's cultural, historic, agricultural, and visual resources.*	
LU Policy 6.1: Balance the benefits of development with potential impacts to existing cultural resources.	The EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan evaluates impacts to cultural resources that may occur upon implementation of this project and provides mitigation measures, as necessary, to reduce identified impacts to a level below significance. The

Table 5.1-2 (Continued)

Policy	Project Consistency
	Planning Commission and City Council will review the EIR to ensure adequate protection of cultural resources.
LU Policy 6.3: Use landscaping for screening, solar control, parking lot shade, and other beautification purposes throughout the City.	THE VILLAGES OF SAN JACINTO Specific Plan includes an extensive set of landscape design guidelines to ensure the community is developed with a cohesive theme that weaves together the residential, recreational, and other components of the community. The landscape design guidelines include provisions for streetscapes, edge conditions between uses, monumentation and community walls and fences, as well as provisions to screen incompatible uses. In addition, the Specific Plan includes guidelines for site design and landscaping and provides solar control and maximizes energy efficiency (see Specific Plan Section V.E., *Energy Efficiency Guidelines*. Therefore, THE VILLAGES OF SAN JACINTO Specific Plan is consistent with this General Plan policy.
LU Policy 6.4: Encourage outdoor gathering spaces, such as mini-parks and plazas that encourage social interaction and also enhance the visual character of the community.	The land use plan for THE VILLAGES OF SAN JACINTO includes numerous outdoor gathering spaces, including public community parks, private paseos, a private lake, and a private lake house and swim lagoon. These outdoor spaces will include passive and active recreational opportunities, picnic areas, BBQ pits, benches, tot lots, landscaping and other amenities that encourage social interaction (as described in Specific Plan Section V, *Design Guidelines*).
LU Policy 6.5: Encourage the use of project design features that reduce impacts to important and local regional environmental resources.	THE VILLAGES OF SAN JACINTO has been carefully planned to minimize impacts to important environmental resources. The drainage plan for the project has been designed to minimize water quality impacts and maximize protection from flood flows; the landscape plan has been designed to maximize water conservation. In addition, the lake on-site will contain recycled water and will be used to irrigate on-site landscaping, further reducing the impact on the water supply. The EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan includes a detailed evaluation of the project's potential to result in significant direct and/or indirect impact to the environment impacts. The EIR includes mitigation measures that will be required in order to reduce impacts to below a level of significance, when feasible. The Planning Commission and City Council will review the EIR to ensure adequate protection of environmental resources. Accordingly, THE VILLAGES OF SAN JACINTO is consistent with this General Plan policy.
LU Policy 6.10: Promote the maintenance of private and public properties to enhance the visual appearance of the community.	Section IV, Specific Plan, of THE VILLAGES OF SAN JACINTO Specific Plan includes a comprehensive maintenance plan (Table IV-4) and a list of potential maintenance entities for various public and private amenities within the community (Table IV-5). It is anticipated that maintenance responsibilities for common public facilities will be divided between the Master Homeowners' Association, Neighborhood Associations, and the City's Landscaping, Lighting and Park District #2 (LLPD#2), and the Riverside County Flood Control District. Final decisions regarding maintenance entities shall be made at a future stage of project design review and in concert with City departments. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.

Table 5.1-2 (Continued)

Policy	Project Consistency
Land Use Policy Goal: Economic Development *– Capitalize on the City's many economic development opportunities to promote a strong and economically health community.*	
LU Policy 7.1: Promote the economic stability of the San Jacinto Area by encouraging diversification of the City's commercial and industrial base by: Encouraging a variety of industries to locate in San Jacinto, including retail, high technology, manufacturing, and professional services in order to promote the development of a mixed economic base; and Encourage the expansion of existing businesses if possible and extending efforts at business retention.	The project includes approximately 26.3 acres of mixed-use and 22.7 acres of commercial land uses. The Specific Plan allows these areas to be developed with a variety of uses, including but not limited to retail commercial, entertainment, restaurant, municipal, professional service, and office park land uses. Development of these uses on-site will positively contribute to the economic stability of the San Jacinto Area. As such, THE VILLAGES OF SAN JACINTO is consistent with, and results in the implementation of, this General Plan policy.
Land Use Policy Goal: Community Design *– Encourage thoughtful community design that enhances San Jacinto's quality of life.*	
LU Policy 9.1: Ensure new development is compatible with its natural surroundings and the built environment in terms of architecture, scale, grading, and massing.	The design theme of THE VILLAGES OF SAN JACINTO is based on a contemporary interpretation of historical southern California architectural styles and features a relaxed landscape feel reminiscent of rural communities. The Specific Plan also includes architectural design standards for site planning, architectural theme and details, building mass and scale, materials and color to create a high-quality living environment. The implementation of this design theme and development standards will ensure that land uses provided by this Specific Plan complement the natural surroundings as well as the growth and development that is anticipated to occur.
LU Policy 9.3: Support pedestrian-friendly and pedestrian-scaled development that encourages more social interaction and less automobile use, including mixed use and clustered developments.	THE VILLAGES OF SAN JACINTO includes an extensive sidewalk, trail, and paseo system connecting residences with the commercial areas, high school site, mixed-use area, and recreational amenities, thereby encouraging pedestrian activity. Furthermore, the community's mixed-use area may include public, professional offices, entertainment uses, churches, libraries emergency services, theatres and public plazas. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
LU Policy 9.4: Provide public spaces and activity centers that encourage involvement, physical activity, and community pride.	THE VILLAGES OF SAN JACINTO provides for parks to encourage active recreation, and a system of trails and paseos is provided to encourage pedestrian and bicycle activity within the community. In addition, the community also features a lake and a lake house and swim lagoon, which will serve as a focal point of the community activities and source of community identification. The planned high school in Planning Area 14 is another element of the community that may be a source of community activities. Accordingly, the project would be consistent with this General Plan policy.
LU Policy 9.5: Support "green" and "sustainable" developments that respect and conserve the region's important resources.	Section V, *Design Guidelines*, includes a plant palette that requires the use of drought-tolerant plants and recycled water for irrigation. Furthermore, Section V, *Design Guidelines*, includes detailed Energy Efficiency Guidelines that identify elements in the site planning, design and construction phases of this Specific Plan that can and should be implemented to achieve a standard of energy efficient performance which is desirable for the homeowner, the landlord, the environment, and builder/developer. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.

Table 5.1-2 (Continued)

Policy	Project Consistency
LU Policy 9.6: Require the use and maintenance of extensive landscaping in new development and redevelopment projects to beautify the surroundings, screen outdoor uses, provide shade, establish pedestrian paths, buffer incompatible land uses, and provide visual interest.	Specific Plan Section V, *Design Guidelines*, includes a detailed description of the landscape design guidelines for the project, including streetscapes, monumentation, walls and fences. Implementation of the landscape design guidelines will provide visual interest throughout the community while uniting the various components of the community (i.e., residential uses, recreational uses, commercial uses) with a common design vocabulary. Specific Plan Section IV.8, *Comprehensive Maintenance Plan*, provides a comprehensive list of maintenance responsibilities for public and private entities to ensure that the community maintains a high level of quality. THE VILLAGES OF SAN JACINTO is consistent with, and results in the implementation of, this General Plan policy.
LU Policy 9.7: Encourage public art, such as murals, sculptures, creative street furniture, and fountains in new public and private developments.	THE VILLAGES OF SAN JACINTO Specific Plan provides for entry treatments and includes design criteria to encourage the creation of public gathering places with site amenities (which may include murals, sculptures, fountains, etc.). In addition, the project provides street furniture in accordance with City of San Jacinto requirements. As such, the project is consistent with this General Plan policy.
LU Policy 9.8: Develop and enforce development standards and design guidelines that provide clear yet flexible direction for achieving quality community design in new development and redevelopment projects throughout the community.	Section V, *Design Guidelines*, establishes standards to provide for high-quality development and to provide an aesthetically cohesive environment for THE VILLAGES OF SAN JACINTO community. The Landscaping Design Guidelines are comprised of key components such as, streetscapes, edge conditions between land uses, monumentation, community walls and fences, parks, and paseos. These guidelines also present requirements relating to the appropriate and water conserving plant palette and ensure that they are compatible with the community design theme. The Architectural Design Guidelines are intended to provide a basis for decisions regarding the structural environment to be built. The architectural design guidelines also include standards for site planning and home layout, as well as for commercial and mixed use development. The guidelines identified in Specific Plan Section V provide developers with clear, yet flexible, guidelines to provide quality development on-site.
Community Services and Facilities Element: The Community Services and Facilities Element addresses the services and infrastructure needed to serve the community. Much of the City of San Jacinto is undeveloped or under agricultural production and is not adequately served by existing community services and facilities to meet the needs of future development. As a result, most future development in the City requires the expansion of services and facilities to meet this increase in demand. Planning for this future increase in demand will ensure that the community service and facility need of future residents are met, while avoiding adverse impacts to the existing community.	
Community Services and Facilities Goal: Law Enforcement *– Provide for the protection of San Jacinto residents and businesses through maintenance of an adequate force of police officers, appropriate physical planning of new development, and a high level of public involvement in crime prevention.*	
CS&F Policy 1.1: Maintain adequate levels of law enforcement service.	The project master developer will be required to pay sufficient development impact fees to cover the project's share of community services and facilities, including police protection services. In addition, one or more Home Owners' Associations will be established for the community. The Home Owners' Association(s) may establish a
CS&F Policy 1.2: Improve law enforcement services through increased cooperation with County, State and Federal law enforcement agencies.	

Table 5.1-2 (Continued)

Policy	Project Consistency
CS&F Policy 1.3: Provide sufficient staffing and facilities to minimize response times to emergency situations.	community involvement crime prevention program (for example, a neighborhood watch program). THE VILLAGES OF SAN JACINTO is therefore consistent with these General Plan policies.
CS&F Policy 1.4: Continue collaboration with other jurisdictions in providing back-up services, equipment, and personnel, when feasible and necessary.	
CS&F Policy 1.5: Expand community outreach programs and promote community involvement in crime prevention.	
CS&F Policy 1.6: Require design features in new development to reduce potential for crime.	THE VILLAGES OF SAN JACINTO Section V, *Design Guidelines*, includes numerous design features that promote safety and reduce criminal activity. These design features include special considerations for the siting of parks, paseos and cul-de-sacs, the use of locked key or security card access gates at paseo/park connections, the lighting of house numbers, the orientation of alley-loaded or rear-load homes towards the adjacent paseo areas, security lighting and sizing of trails within paseos to allow police patrol, and more. Parks have been oriented to provide for "eyes on the street" by surrounding residences and easy police patrol and emergency vehicle access from adjacent streets. Furthermore, homes shall be oriented to face park areas, and to fencing material shall be carefully selected to ensure maximum visibility of the parks from public areas. Common parking areas within the commercial, mixed-use, park, and school areas shall be well-lit for security purposes. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Community Services and Facilities Goal: Fire Protection *– Work with RCOFD to provide a sufficient level of fire protection.*	
CS&F Policy 2.1: Work closely with RCOFD in determining and meeting community needs for fire protection services, facilities, and personnel.	The project master developer will be required to pay sufficient development impact fees to cover the project's share of community services and facilities, including fire protection services. Payment of these fees will offset the incremental increase in demand for fire protection services/facilities that will result from the project. In addition the RCOFD is a reviewing agency of this Specific Plan and subsequent implementing actions will be required to comply with all applicable RCOFD site design standards and regulations. Accordingly, THE VILLAGES OF SAN JACINTO is consistent with these General Plan policies.
CS&F Policy 2.2: Periodically evaluate the level of fire protection service to ensure that San Jacinto has appropriate levels of fire protection service to maintain the adopted level of service standards.	
CS&F Policy 2.4: Plan for the location of convenient and adequate fire stations to serve the existing and future residents of San Jacinto.	
CS&F Policy 2.3: Enforce the continued maintenance of private property, such as weed abatement, to reduce the incidents of fire hazards.	Private property within the community shall be maintained by the HOA or the individual homeowners. Furthermore, Section IV, *Specific Plan*, of THE VILLAGES OF SAN JACINTO Specific Plan establishes comprehensive maintenance plan (Table IV-4) and a list of potential maintenance entities for various public and private amenities within the community (Table IV-5). THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 2.5: Provide and maintain adequate infrastructure, including fire hydrants, fire stations, fire flows, and access points, that meet RCOFD's standards.	The project circulation plan provides adequate primary and secondary emergency access. In addition, the master water plan has been designed to ensure that future development of the site can accommodate applicable infrastructure requirements (including minimum fire flows). Fire protection infrastructure (e.g., fire hydrants) and fire

Table 5.1-2 (Continued)

Policy	Project Consistency
	protection design features (e.g., fire lanes) will be identified on future site plans and/or conditional use permits and are subject to review and approval by the City of San Jacinto. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Community Services and Facilities Goal: Public Education *– San Jacinto is located within the San Jacinto Unified School District (SJUSD) and the Hemet Unified School District (HUSD). Mount San Jacinto College (MSJC) is also located within the City. The City must closely coordinate with SJUSD, HUSD, and MSJC to ensure a sufficient level of public education is available to the community.*	
CS&F Policy 3.2: Promote the development and siting of quality educational facilities to meet the needs of future residents through increased cooperation between the City and school districts.	THE VILLAGES OF SAN JACINTO provides a 69.1-acre site for use as a High School campus by the San Jacinto Unified School District in Planning Area 14 and allows for possible expansion of the High School campus into Planning Area 19. Additionally, THE VILLAGES OF SAN JACINTO Specific Plan permits the development of Planning Areas 12 and 13 as school sites. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 3.5: Minimize the impacts of schools on adjacent properties.	Section V, *Design Guidelines*, of THE VILLAGES OF SAN JACINTO Specific Plan includes design guidelines for transitions between various types of land uses, including residential and public facility/educational uses. The intent of these guidelines are to anticipate and eliminate possible conflicts between land uses. Future development of the site will be required to be consistent with the design guidelines for land use transitions, thus ensuring that impacts of schools on adjacent properties are minimized.
Community Services and Facilities Goal: Water Service *– Work with local, regional, and State water agencies to provide sufficient levels of water service.*	
CS&F Policy 4.1: Provide sufficient levels of water service to meet the water needs of the community through the orderly extension of infrastructure and provision of adequate water supplies. CS&F Policy 4.2: Work closely with the Eastern Municipal Water District and the Lake Hemet Municipal Water District to maintain an adequate level of water service in the planning area.	The Eastern Municipal Water District (EMWD) has prepared a Water Supply Assessment report for the project. The report concludes that EMWD is projected to have adequate water supply to service the project. In addition, the project would minimize its demand for water supplies through the extensive use of recycled water for landscape irrigation; the use of drought-tolerant, native landscape materials; the recommended use of water-efficient faucets, toilets, and shower heads; and the recommended use of water-efficient, zoned irrigation systems. A detailed discussion of the project's impacts to the local water supply is found in the EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan. The master water plan for the community provides a water distribution system that is based on EMWD requirements and will adequately serve the community in a manner consistent with the EMWD Northwest San Jacinto Area Master Plan. Based on the foregoing, THE VILLAGES OF SAN JACINTO is consistent with these General Plan policies.
CS&F Policy 4.3: Encourage water conservation as a means of preserving water resources.	As shown in Figure IV-5, *Master Water Plan*, recycled water pipelines will be installed concurrently with domestic lines. The water from this recycled water system will be used to manage the lake and for irrigation purposes. In addition, Section V, *Design Guidelines*, includes a plant palette that requires the use of drought-tolerant plants. Furthermore, Section V, *Design Guidelines*, includes detailed Energy Efficiency

Table 5.1-2 (Continued)

Policy	Project Consistency
	Guidelines, including water conservation measures that identify elements in the site planning, design and construction phases of this Specific Plan that can and should be implemented to achieve a standard of energy efficient performance which is desirable for the homeowner, the landlord, the environment, and builder/developer. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Community Services and Facilities Goal: Sewer Service *– Work with the Eastern Municipal Water District to provide a wastewater collection, treatment, and disposal system to adequately serve existing and future development in San Jacinto.*	
CS&F Policy 5.3: Ensure compatible development occurs surrounding the San Jacinto Waste Water Treatment Facility.	THE VILLAGES OF SAN JACINTO has been carefully designed and planned to ensure that development on-site is compatible with the San Jacinto Waste Water Treatment Facility, which is located immediately adjacent to the southern project boundary. The mixed-use and commercial land uses (Planning Areas 11 and 12) buffer the community from the Waste Water Treatment Facility and complement the residential and recreational components of the community. In addition, three public parks (Planning Areas 15B, 15C, and 15D) provide an additional buffer between the off-site Waste Water Treatment Facility and planned residential uses. Accordingly, implementation of THE VILLAGES OF SAN JACINTO Specific Plan would ensure that compatible development occurs adjacent to the Waste Water Treatment Facility and would ensure that community residents are not exposed to adverse edge-effects. As such, the project is consistent with this General Plan policy.
CS&F Policy 5.4: Encourage water conservation as a means of reducing sewage generation.	THE VILLAGES OF SAN JACINTO encourages the use of water-efficient faucets, high-efficiency toilets, and water conserving shower heads to maximize water conservation and reduce sewage generation. The project encourages the use of a pool filtration system with a zero water backwash system to reduce the need to drain the pool for regular maintenance purposes. In addition, as described in Section V, Design Guidelines, the plant palette for the project has been designed to feature native or naturalized, drought-resistant plant material, and the conceptual landscape design will minimize the use of turf. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 5.5: Expand the use of reclaimed water.	As shown in Figure IV-5, *Master Water Plan*, recycled water pipelines will be installed concurrently with domestic lines. The water from this recycled water system will be used to maintain the lake volume and provide water storage for irrigation purposes. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 5.6: To reduce potential negative impacts to groundwater, minimize the use of septic systems.	THE VILLAGES OF SAN JACINTO Specific Plan does not provide for the use of septic systems on site. Wastewater generated by the community will conveyed via a sanitary sewer system to existing EMWD sewer facilities, as described in Specific Plan Section 4.B, and conceptually illustrated in Figure IV-6, *Master Sewer Plan*.
Community Services and Facilities Goal: Power *– Work effectively with providers of natural gas and electricity to provide sufficient levels of these services.*	
CS&F Policy 6.1: Work closely with local service providers in determining and meeting the needs of the community for energy.	Energy demands associated with the project are addressed through long-range planning by energy purveyors and can be accommodated as they occur. Therefore, project implementation is not anticipated to result in adverse impacts related to energy demand. Required electrical transmission lines on-site would be installed by the responsible energy
CS&F Policy 6.4: Minimize the visual and environmental impacts of the development and	

Table 5.1-2 (Continued)

Policy	Project Consistency
operation of energy facilities on the community.	utility. THE VILLAGES OF SAN JACINTO is consistent with these policies of the General Plan.
Community Services and Facilities Goal: Communications *– Work effectively with providers of communications to provide sufficient levels of these services.*	
CS&F Policy 7.2: Encourage all new development to provide the technology to support multiple telecommunications facilities and providers such as multi-media products, wireless technologies, and satellite communications.	THE VILLAGES OF SAN JACINTO will accommodate telecommunications as necessary and required to service the project site. If feasible, the master developer will work with an internet provider to establish a project-wide wifi network. THE VILLAGES OF SAN JACINTO is, therefore, consistent with the San Jacinto General Plan.
Community Services and Facilities Goal: Flood Control *– Work effectively with providers of flood control services and facilities to provide and maintain sufficient levels of service.*	
CS&F Policy 8.1: Ensure that adequate flood control facilities are provided to protect the lives and property of San Jacinto's residents.	As described in THE VILLAGES OF SAN JACINTO EIR, the community provides for adequate flood control facilities. Furthermore, a portion of the regional area drainage plan, the San Jacinto Valley Master Drainage Plan, traverses THE VILLAGES OF SAN JACINTO community along its western boundary. The community design acknowledges and accommodates these regional drainage facilities, utilizing a series of storm water channels, water quality control basins, and detention basins to collect and transport stormwater through the site. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Community Services and Facilities Goal: Waste Disposal *– Work effectively with providers of waste disposal to provide sufficient levels of these services.*	
CS&F Policy 9.1: Reduce the amount of solid waste requiring disposal at landfills.	Section V, *Design Guidelines*, includes detailed Energy Efficiency Guidelines that identify elements in the site planning, design and construction phases of this Specific Plan that can and should be implemented to achieve a standard of energy efficient performance which is desirable for the homeowner, the landlord, the environment, and builder/developer. Included within the Energy Efficiency Guidelines are specific recommendations to minimize the amount of landfill waste generated by the project, including the use of long-lasting construction products (for example, engineered lumber) and sustainable building materials. In addition, THE VILLAGES OF SAN JACINTO Specific Plan encourages the provisions of exterior storage areas for recyclables and adequate recycling containers in public areas, in addition to the establishment (by the HOA) of community compost sites for green waste. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Community Services and Facilities Goal: Recreation and Open Space *– Provide sufficient parks, recreational, and open space facilities.*	
CS&F Policy 10.1: Work with the Valley-Wide Recreation and Park District and other organizations to provide active and passive parks, recreational, and open space facilities that meet the needs of all segments of the community.	The community's maximum potential buildout of 1,329 dwelling units would result in approximately 4,000 community residents (at a rate of 3.01 persons per household). Per the requirements of the Quimby Act, the community would require approximately 20 acres of active parkland. THE VILLAGES OF SAN JACINTO Specific Plan exceeds this requirement by providing an extensive paseo and trail system and 40.8 acres of active public park facilities (Planning Area 15B, 15C, and 15D). In addition to the public parks, paseos, and trails, the community includes a 1.0-acre private neighborhood park (Planning Area 15A), a 1.2-acre private neighborhood park (Planning Area 15E), and a private 5.1-acre Lake

Table 5.1-2 (Continued)

Policy	Project Consistency
	House and Swim Lagoon. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 10.2: Cooperate with private developers and public agencies to create a network of equestrian, biking, and hiking trails that link to adjacent regional and local trails networks.	THE VILLAGES OF SAN JACINTO links the residential, commercial, recreational, mixed-use, and school land uses via a 9.6-acre system of paseos, which connects to city sidewalks. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 10.3: Use flood control facilities for passive recreational activities when appropriate.	Flood control facilities, including drainage channels and detention basins, have been incorporated into the design of the project (Planning Areas 18A-18D). The flood control facilities provided on-site are not considered appropriate for recreational activities. As such, THE VILLAGES OF SAN JACINTO is consistent with this General Plan policy.
CS&F Policy 10.4: Encourage the joint use of City and other public agency facilities for recreational purposes, education, and flood control whenever feasible.	THE VILLAGES OF SAN JACINTO provides for a high school campus and a mixed-use area (which may accommodate public/municipal/ institutional land uses). The distribution of these land uses adjacent to recreational and residential uses promotes the joint use of public facilities.
CS&F Policy 10.5: When feasible, use less developable or undevelopable lands, including utility corridors, fault zones, channels, and easements for passive and active recreational uses that have minimal potential for impacts on the environment.	The project site contains a portion of the Casa-Loma segment of the San Jacinto fault zone project. The fault segment and the surrounding fault zone buffer are inappropriate for development with residential uses or habitable structures. THE VILLAGES OF SAN JACINTO utilizes a majority of the fault zone area for active and passive recreational uses, flood control facilities, and internal circulation – uses that have a minimal potential for impacts on the environment or residents/visitors of the site. Accordingly, the project is consistent with this General Plan policy.
CS&F Policy 10.6: Encourage the development of private recreational facilities to expand recreational opportunities of the City's residents.	THE VILLAGES OF SAN JACINTO includes a variety of public and private recreational amenities. In addition to the 40.8 acres of public parks and an extensive paseos and trails system, the community includes a 1.0-acre private neighborhood park (Planning Area 15A), a 1.2-acre private neighborhood park (Planning Area 15E), and a 5.1-acre Lake House and Swim Lagoon. In addition, the uses permitted in Planning Area 12 include private recreation such as skating rinks, health clubs, etc. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
CS&F Policy 10.7: Encourage neighborhood groups, organizations, clubs and businesses to take a greater interest and financial responsibility in the improvement of the park and recreation system in the City.	THE VILLAGES OF SAN JACINTO Specific Plan provides 40.8 acres of active public park facilities (Planning Area 15B, 15C, and 15D). In addition to the public parks, the community includes a 1.0-acre private neighborhood park (Planning Area 15A), a 1.2-acre private neighborhood park (Planning Area 15E), a 5.1-acre Lake House and Swim Lagoon, and a paseo system. Private recreational facilities will be maintained by a Homeowners' Association and public facilities will be maintained by the City of San Jacinto, pursuant to the maintenance responsibility schedule established within this Specific Plan. THE VILLAGES OF SAN JACINTO is consistent with this policy.
CS&F Policy 10.8: Actively pursue all available sources of financing for parkland acquisition and maintenance.	

Table 5.1-2 (Continued)

Policy	Project Consistency
Circulation Element: The City of San Jacinto is served by a diverse circulation network consisting of roadways, rail service and trails. Convenient access to the community has been provided for many years by a combination of regional and local roadways. The Circulation Element guides the continued development and improvement of the circulation system to support existing and planned development, while the Land Use Element identifies the City's existing and planned development pattern. The development of additional land in the future will increase the demand for local and regional roadway improvements and construction. The Circulation Element also establishes acceptable roadway service levels and identifies improvements to maintain the service levels. The use of other modes of transportation, such as transit, walking and bicycling is promoted to reduce the demand on the circulation system and to improve air quality.	
Circulation Goal: Local Circulation System *– Provide for the protection of San Jacinto residents and businesses through maintenance of an adequate force of police officers, appropriate physical planning of new development, and a high level of public involvement in crime prevention.*	
C Policy 1.1: Provide a balanced circulation system that ensures the safe and efficient movement of people and goods throughout the City. C Policy 1.2: Improve the San Jacinto circulation system to desired standards in concert with land development to maintain sufficient levels of service.	THE VILLAGES OF SAN JACINTO Specific Plan includes a roadway network which provides safe and efficient vehicular and pedestrian circulation to individual planning areas and land uses. The Specific Plan includes full- and half-width improvements to the following General Plan Circulation Element roadway segments on-site: Sanderson Avenue, De Anza Drive, Bridge Street, Odell Avenue, Cawston Avenue, and Ramona Boulevard. In addition, the project provides for the construction of on-site local roads. All roadways improvements will be constructed to meet City of San Jacinto standards. The community's Circulation Plan, conceptually illustrated on Figure IV-2, *Project Circulation Plan*. The EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan evaluates traffic and circulation impacts that may occur upon implementation of this project and provides mitigation measures to reduce identified impacts to a level below significance, when feasible. The Planning Commission and City Council will review the EIR to ensure adequate provision of circulation facilities. Therefore, THE VILLAGES OF SAN JACINTO Specific Plan is consistent with, and results in the implementation of, this policy of the General Plan.
C Policy 1.6: Require new development to provide roadway, sidewalk, and median improvements that enhance the visual character of the roadway system and encourage pedestrian and bicycle safety.	THE VILLAGES OF SAN JACINTO is consistent with this policy and implementation program because the community includes a Circulation Plan that allows traffic to move efficiently on-site and off-site. As described in THE VILLAGES OF SAN JACINTO EIR, implementation of the proposed Circulation Plan would result in an efficient and safe roadway system for vehicles, pedestrians, and bicyclists. The Master Developer for THE VILLAGES OF SAN JACINTO is required to provide roadway, sidewalk, landscaped parkways, and raised or landscaped median improvements to internal project roadways and project frontage roads in accordance to the traffic study prepared by Urban Crossroads. Furthermore, Specific Plan Section V, *Design Guidelines*, includes landscape guidelines that serve to ensure the aesthetic and cohesive appearance of the community's streetscapes. An extensive trails and paseo system is also included in THE VILLAGES OF SAN JACINTO. Furthermore, THE VILLAGES OF SAN JACINTO Circulation Plan is consistent with the circulation requirements and roadway configurations included in the adopted General Plan. THE VILLAGES OF SAN JACINTO is therefore is consistent with this policy.

Table 5.1-2 (Continued)

Policy	Project Consistency
C Policy 1.7: Encourage the provision of traffic calming measures in new residential areas and planned developments.	As described in Specific Plan Section IV.2, *Circulation Plan*, THE VILLAGES OF SAN JACINTO traffic calming measures may be installed along major pedestrian corridors within the community, Cawston Avenue between De Anza Drive and Ramona Boulevard (if determined to be necessary and appropriate by the project traffic engineer and the City). These traffic calming measures will promote safe pedestrian circulation through the site and will ensure consistency with this General Plan policy.
Circulation Goal: Alternative Modes of Travel *– Promote the increased use of public and multi-modal transportation, and provide adequate facilities for these modes of transportation.*	
C Policy 4.1: Require developers to incorporate facilities for public and other alternative modes of transportation, such as park-and-ride lots, bicycle and pedestrian trails, bicycle racks, and bus turnouts in the design of future developments.	THE VILLAGES OF SAN JACINTO encourages alternative modes of transportation through an extensive trails, paseo, and sidewalk system. Furthermore, park and ride lots may be accommodated within Planning Area 11 (Commercial) of Planning Area 12 (Mixed-Use), and Sanderson Avenue is a bus route. Any amenities for public transportation, (such as bus benches or turn-outs) would be incorporated into the design of the project at the tentative map stage as directed by the City of San Jacinto. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
C Policy 4.2: Incorporate design features such as bus turnouts, bicycle racks and park-and-ride lots into public improvement projects that promote and support the use of public and alternative modes of transportation.	
C Policy 4.3: Link Community Commercial development, employment centers, public facilities, and community parks and open spaces to the alternative transportation system, wherever feasible.	THE VILLAGES OF SAN JACINTO provides an extensive, interconnected circulation system that links residential, educational, recreational, mixed-use and commercial land uses and promotes pedestrian and bicycle travel via trails, paseos, and sidewalks. The project is therefore consistent, and results in the implementation of, these policies.
C Policy 4.4: Require Specific Plans and Planned Unit Developments to include well-developed and funded alternative transportation features.	
Circulation Goal: Trails System *– Provide an extensive and regionally linked public bicycle, pedestrian, and equestrian trails system.*	
C Policy 5.1: Provide and maintain an extensive trails network that supports bicycles, pedestrians and horses and is linked to the trails systems of adjacent jurisdictions.	As illustrated in Figure V-29, *Conceptual Trails and Parks Plan*, the project provides an extensive system of sidewalks, trails, and paseos that link the residential, educational, recreational, mixed-use and commercial components of the community. The sidewalks, trails, and paseos have been designed to accommodate pedestrian and bicycle use. THE VILLAGES OF SAN JACINTO is consistent with this policy.
C Policy 5.2: Link major activity centers, residential neighborhoods, schools, shopping centers and employment centers through bicycle, equestrian and pedestrian trails.	
C Policy 5.3: Encourage the use of open space and utility easements for bicycle and pedestrian trails, where feasible.	
C Policy 5.4: Require Specific Plans and Planned Unit Developments to include well-developed and designed trails that link to adjacent existing or planned local and/or regional trails.	

Table 5.1-2 (Continued)

Policy	Project Consistency
Circulation Goal: Transportation Demand Management *– Create transportation management strategies to comply with the County Congestion Management Plan.*	
C Policy 6.1: Create and implement transportation demand and congestion management mitigation measures in areas experiencing high levels of congestion.	The EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan evaluates the project's consistency with the Congestion Management Plan and establishes mitigation measures (as necessary) to reduce identified impacts to below a level of significance (as feasible). The Planning Commission and City Council will review the EIR to ensure adequate provision of circulation facilities and future development will be required to comply with the mitigation measures established in the EIR. As such, THE VILLAGES OF SAN JACINTO is consistent with these General Plan policies.
C Policy 6.2: Review development proposals for compliance with the Congestion Management Plan.	
C Policy 6.3: Require developers to assist with improvements to the circulation system that will minimize congestion related to their projects.	THE VILLAGES OF SAN JACINTO is consistent with this policy and implementation program because the project includes street design which allows traffic to move efficiently on-site and off-site. As part of implementation of the Specific Plan, the Master Developer is responsible for constructing full-width improvements to internal roadways, including Street "A," Street "B," Street "C," De Anza Drive, and portions of Cawston Avenue. The Master Developer is also responsible for constructing half-width improvements to community frontage roads, including Ramona Boulevard, Sanderson Avenue (from Ramona Boulevard to the southern community boundary), O'Dell Avenue, and portions of Cawston Avenue. A traffic study was prepared by Urban Crossroads, which provides recommendations for improvements. As described in THE VILLAGES OF SAN JACINTO EIR, implementation of the proposed Circulation Plan would result in an efficient and safe roadway system.
Resource Management Element: The San Jacinto Resource Management Element meets the State requirements for the Conservation ands Open Space Elements as defined in Sections 65302(d) and 65301(e) of the Government Code, respectively. According to these requirements, the Conservation Element must contain goals and policies to protect and maintain natural resources such as water, soils, wildlife and minerals, and prevent wasteful resource exploitation, degradation and destruction. The Open Space Element must contain goals and policies to manage open space areas including undeveloped lands and environmentally constrained areas. Specifically, the Open Space Element must address several open space categories such as those used for the preservation of natural resources and managed production of resources, as well as open space maintained for public health and safety reasons. This last category of open space is addressed in more detail in the Public Safety Element. Although briefly mentioned in this Element, the Community Services and Facilities Element provides a detailed description of the parks, trails and recreational facilities in San Jacinto.	
Resource Management Goal: Natural Resources *– Conserve and protect natural resources.*	
RM Policy 1.2: Work closely with the County of Riverside to implement the Multiple Species Habitat Conservation Plan that meets the goal of preservation, but allows for economic development of the community.	The Specific Plan is consistent with this policy. As stated in Section 5.4, Biological Resources, the project is consistent with the Western Riverside County MSHCP, and will not interfere with the City, other jurisdictions or the Western Riverside County Regional Conservation Authority's ability to implement the MSHCP. .
RM Policy 1.7: Encourage the planting of native trees and drought tolerant vegetation.	THE VILLAGES OF SAN JACINTO Section V, *Design Guidelines*, includes the community's plant palette. This palette includes California native and drought tolerant plants which compatible with the San Jacinto area climate, and which reflect the overall theme of THE VILLAGES OF SAN JACINTO Specific Plan, and are drought tolerant. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.

Table 5.1-2 (Continued)

Policy	Project Consistency
Resource Management Goal: Water Resources *– Conserve and protect surface water, ground water and imported water resources.*	
RM Policy 2.1: Coordinate water quality and supply programs with responsible water agencies.	A Waster Supply Assessment report has been prepared for the project by EMWD. Based on the findings of the Water Supply Assessment, EMWD projects that they will have adequate supply to serve the project. Accordingly, THE VILLAGES OF SAN JACINTO is not anticipated to adversely affect the local water supply and would be consistent with this General Plan policy.
RM Policy 2.2: Ensure the placement of infrastructure for water supply and treatment to support development in areas designated for urban growth.	THE VILLAGES OF SAN JACINTO Section IV, *Specific Plan*, describes the community's Master Water Plan. Based on EMWD requirements, the recommended water distribution system to provide services to THE VILLAGES OF SAN JACINTO is shown on Figure IV-5, *Master Water Plan*. Prior to final engineering and construction of all domestic and recycled water lines, a Plan of Service Study will be completed in accordance with EMWD standards to ensure the aforementioned pipe sizes and any additional infrastructure facilities as required to serve this project are in conformance with EMWD's Master Plan. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
RM Policy 2.3: Ensure sufficient water capacity is available for new development.	
RM Policy 2.4: Protect the aquifer and encourage ground water recharge.	As discussed in the EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan, implementation of the project is not anticipated to result in any adverse impacts related to local groundwater resources or groundwater recharge. The project is therefore consistent with these policies.
RM Policy 2.5: Cooperate with federal, State, and county governments and other agencies on the maintenance and improvement of the quality and quantity of local and regional groundwater resources.	
RM Policy 2.6: Promote water conservation by encouraging the use of reclaimed water, promoting the use of water efficient landscaping and requiring development to utilize water conservation measures such as water efficient plumbing and xeriscape landscaping.	As shown in Figure IV-5, *Master Water Plan*, recycled water pipelines will be installed concurrently with domestic lines. The water from this recycled water system will be used to restore the lake and for irrigation purposes. In addition, Section V, Design Guidelines, includes a plant palette that requires the use of drought-tolerant plants. Furthermore, Section V, *Design Guidelines*, includes detailed Energy Efficiency Guidelines that identify elements in the site planning, design and construction phases of this Specific Plan that can and should be implemented to achieve a standard of energy efficient performance which is desirable for the homeowner, the landlord, the environment, and builder/developer. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
RM Policy 2.10: Expand the use of reclaimed water, whenever feasible.	
Resource Management Goal: Agricultural Resources *– Where appropriate, conserve agricultural lands and avoid the premature conversion of agricultural land to urban uses.*	
RM Policy 5.2: Foster development techniques and agricultural practices that minimize the incompatibility of agricultural activities with urban development while maximizing agricultural production.	THE VILLAGES OF SAN JACINTO has been designed to minimize impacts on adjacent land uses, including agricultural uses. Development of the site is expected to follow the phasing plan depicted on Figure IV-9, *Conceptual Phasing Plan*. Conformance with the phasing plan will further minimize incompatibility with adjacent residential uses.
RM Policy 5.3: Protect agricultural lands from premature conversion to urban uses.	The project site is planned for residential and commercial development as shown in the General Plan, and is neither protected by an agricultural overlay zone nor located in an agricultural preserve. Implementation of THE VILLAGES OF SAN JACINTO will develop the site in accordance with the City's overall vision for the area as identified in the General Plan and will

Table 5.1-2 (Continued)

Policy	Project Consistency
	not result in the premature conversion of agricultural lands to urban uses.
Resource Management Goal: Air Quality *– Improve Air Quality*	
RM Policy 6.3: Achieve a greater balance between jobs and housing in San Jacinto.	THE VILLAGES OF SAN JACINTO combines housing, employment, and retail activities on one site. The community contains 1,329 residential units, 22.7 acres of commercial land uses, and 26.3 acres of mixed-use land uses. This balance of land uses within the community would contribute towards a greater balance between jobs and housing within the City. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
RM Policy 6.8: In appropriate areas, allow mixed use development that combines housing, employment, and retail activities on one site.	
RM Policy 6.5: Promote energy conservation and recycling by the public and private sectors.	Section V, *Design Guidelines*, includes detailed Energy Efficiency Guidelines that identify elements in the site planning, design and construction phases of this Specific Plan that can and should be implemented to achieve a standard of energy efficient performance which is desirable for the homeowner, the landlord, the environment, and builder/developer. Included within the Energy Efficiency Guidelines are specific recommendations to maximize energy efficiency and water quality/conservation (i.e., green building standards), minimize landfill waste (by providing adequate recycling areas/containers, for example), and encouraging pedestrian activity and use of bike paths.
RM Policy 6.10: Support sustainable development patterns and green building standards that reduce energy use.	
RM Policy 6.6: Encourage alternative modes of transportation to reduce vehicular emissions and improve air quality.	THE VILLAGES OF SAN JACINTO includes an extensive trails, paseo, and sidewalk system that encourages alternative modes of transportation between the residences, school, commercial areas, recreational amenities, and mixed-use area. Use of the alternative circulation options by pedestrians and bicycles will reduce vehicular emissions and will improve local air quality. THE VILLAGES OF SAN JACINTO is therefore consistent with these policies.
RM Policy 6.7: Encourage pedestrian scale development and pedestrian friendly access to reduce vehicle emissions.	
Resource Management Goal: Energy Conservation *– Promote the conservation of energy.*	
RM Policy 7.1: Encourage the efficient use of energy resources.	Section V, *Design Guidelines*, includes detailed Energy Efficiency Guidelines that identify elements in the site planning, design and construction phases of this Specific Plan that can and should be implemented to achieve a standard of energy efficient performance which is desirable for the homeowner, the landlord, the environment, and builder/developer. The design recommendations have been categorized according to the following goals: 1) Maximize Energy Efficiency; 2) Maximize Water Quality and Conservation; 3) Minimize Landfill Waste; 4) Promote Health by Improving Indoor Air Quality; and 5) Encourage Pedestrian Activities and Use of Bike Paths. The use of energy efficient building materials, equipment, and design will reduce operating costs and contribute to the reduction in environmental impacts associated with air quality, hydrology, water quality, hazards, and utilities. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
RM Policy 7.3: Support the use of energy efficient building materials, equipment, and design in City facilities and infrastructure.	
Public Safety Element: The purpose of the Public Safety Element is to identify and address those features or characteristics existing in or near the City that represent a potential hazard to the citizens, structures, and infrastructure in the community. The Public Safety Element establishes policies to minimize the danger to residents, workers and visitors while identifying actions needed to manage crises such as earthquakes, fires and floods. Additionally, the Public Safety Element contains specific policies and programs to regulate existing and proposed development in hazard-prone areas. Emergency preparedness and evacuation routes are also addressed.	

Table 5.1-2 (Continued)

Policy	Project Consistency
Public Safety Goal: Natural Hazards *– Minimize the risk of injury and the loss of life and property related to geologic conditions, seismic activity, wildfires, and flooding.*	
PS Policy 1.1: Reduce the risk of impacts from geologic and seismic hazards by applying proper and up to date land use planning, development engineering, building construction, and retrofitting requirements.	The project site contains a portion of the Casa-Loma segment of the San Jacinto fault zone project. The fault segment and the surrounding fault zone buffer are inappropriate for development with residential uses or habitable structures. THE VILLAGES OF SAN JACINTO utilizes a majority of the fault zone area for active and passive recreational uses, flood control facilities, and internal circulation – uses that have a minimal potential for impacts on the environment or residents/visitors of the site. In addition, a geotechnical engineering report was prepared for the project and is discussed in the EIR that accompanies THE VILLAGES OF SAN JACINTO Specific Plan. Mandatory compliance with the design recommendations included within the project geotechnical report, State building code, and City of San Jacinto building requirements will ensure that adverse impacts related to geologic and seismic hazards will be reduced to the maximum feasible extent. Accordingly, implementation of the project is consistent with this General Plan policy.
PS Policy 1.2: Encourage landscaped open space uses for areas within identified fault zones, and prohibit residential development in these areas.	As described in the geotechnical report prepared by Leighton & Associates for THE VILLAGES OF SAN JACINTO EIR, a California Earthquake Fault Hazard Zone traverses several portions of the project. Based on analysis of the fault trace and disturbance zones, the report recommended structural setback limits from faults for residential development. These setback criteria were utilized during the design process, resulting in parks provided on the portions of the project where faults exist. THE VILLAGES OF SAN JACINTO is therefore is consistent with this policy.
PS Policy 1.5: Protect the community from flooding hazards by providing and maintaining flood control facilities and limiting development within the flood plain.	The northerly portion of the site is located within the 100-year floodplain. The drainage system (refer to Specific Plan Section IV.3, *Drainage Plan*) has been designed to convey and attenuate 100-year storm flows and provide flood protection for the site. A maintenance plan has been established in THE VILLAGES OF SAN JACINTO Specific Plan to ensure that on-site drainage facilities operate at maximum efficiency. A complete, detailed discussion of potential adverse impacts associated with 100-year storm flows is contained in the EIR accompanying this Specific Plan. As concluded in the EIR, with the incorporation of design measures and mitigation – as needed – implementation of the project will not result in substantial adverse impacts related to flood hazards.
Public Safety Goal: Human Activity Hazards *– Protect the community from hazards related to air pollution, dam inundation, hazardous materials, structural fires, ground transportation, and criminal activity.*	
PS Policy 2.6: Provide sufficient levels of police, fire, and emergency response service to reduce the risk of criminal activity.	Upon ultimate development of the site, the master developer of THE VILLAGES OF SAN JACINTO will be required to contribute development impact fees to cover its "fair share" cost of providing sufficient public services and facilities to the site, including fire protection, police protection, and emergency response service. The project is therefore consistent with this General Plan policy.

Table 5.1-2 (Continued)

Policy	Project Consistency
PS Policy 2.7: Ensure projects include design features that promote safety and reduce criminal activity.	THE VILLAGES OF SAN JACINTO Section V, Design Guidelines, includes numerous design features that promote safety and reduce criminal activity. These design features include special considerations for the siting of paseos and cul-de-sacs, the potential use of locked key or card gates at paseo/park connections, the lighting of house numbers, the orientation of alley-loaded or rear-load homes towards the adjacent paseo area, and more. Homes shall be oriented to face park areas, and to fencing material shall be careful selected to ensure maximum visibility of the park from public areas. Common parking areas within the commercial, mixed-use, park, and school areas shall be well-lit for security purposes. THE VILLAGES OF SAN JACINTO is therefore consistent with this policy.
Noise Element: The Noise Element addresses noise sources in the community and identifies ways to reduce the impacts of these noise sources. The Noise Element contains policies and programs to achieve and maintain noise levels compatible with various types of land uses. The Element identifies those land uses that are sensitive to noise and assures that noise-generating land use are located so that they do not impact those sensitive areas.	
Noise Goal: Noise and Land Use Planning *– Minimize the effects of noise through proper land use planning and development techniques.*	
N Policy1.1: Use the City's adopted noise/land use compatibility standards as a guide for future planning and development decisions.	THE VILLAGES OF SAN JACINTO incorporates several design elements to minimize noise impacts on sensitive receptors. A buffer is provided along Sanderson Avenue to minimize effects of traffic related noise on community residents, and on-site residential uses are buffered from the off-site Waste Water Treatment Facility and on-site mixed-use and commercial land uses. A noise analysis was conducted for THE VILLAGES OF SAN JACINTO and is summarized in the EIR accompanying this Specific Plan. As described in the EIR, this analysis evaluated potential noise impacts and provided mitigation to reduce levels to below the required CNEL for residential and non-residential land uses. With incorporation of these mitigation measures, no significant noise impacts will result upon implementation of THE VILLAGES OF SAN JACINTO, and the project is therefore consistent with this policy.
N Policy 1.2: Require noise control measures, such as berms, walls, and sound attenuating construction in areas of new development or rehabilitation.	
N Policy 1.3: When necessary, require buffer areas between noise sources and sensitive receptors.	
N Policy 1.4: Use creative techniques to mitigate potential noise incompatibilities, particularly in areas with a mixture of uses.	
Noise Goal: Transportation Related Noise *– Minimize the effects of transportation-related noise.*	
N Policy 2.1: Reduce transportation-related noise impacts to sensitive land uses through the use of noise control measures.	Where appropriate and necessary, THE VILLAGES OF SAN JACINTO provides buffers to minimize transportation-related noise impacts to sensitive land uses. In addition, the Specific Plan establishes planning and site design criteria that would result in the reduction of unwanted sound, to the maximum feasible extent. As described in detail in the EIR accompanying THE VILLAGES OF SAN JACINTO Specific Plan, a noise analysis was prepared for the project and provided mitigation to reduce levels to acceptable levels for sensitive uses. With mandatory compliance with these mitigation measures, no significant noise impacts will result upon implementation of THE VILLAGES OF SAN JACINTO, and the project is therefore consistent with this policy.
N Policy 2.2: Require sound-reduction design in development projects impacted by transportation-related noise, particularly along highways and major arterials.	

Table 5.1-2 (Continued)

Policy	Project Consistency
Housing Element: The Housing Element is a guide for housing within the City of San Jacinto. The Element provides an indication of the need for housing in the community in terms of affordability, availability, adequacy, and accessibility. The Element provides a strategy to address housing needs and identifies a series of specific housing programs to meet community needs. A detailed Housing Needs Assessment was prepared as part of the Housing Element update and serves as the technical background document to the Housing Element.	
Housing Goal: Provide Adequate Housing Sites *– Provide Adequate sites for new residential construction to meet the needs of all segments of the community without compromising the character of the City.*	
Housing Goal: Assist in Development of Housing *– Assist in the development of a housing supply which is affordable to all segments of the community.*	
H Policy 2.2: Provide adequate sites for a range of housing types and prices.	THE VILLAGES OF SAN JACINTO provides for a maximum of 1,329 homes in a variety of residential product types and styles and home sizes, including single-family homes on 4,000 s.f., 5,000 s.f., and 6,000 s.f. lots. This variety of residential housing products would appeal to homebuyers of different incomes and family sizes. These homes would be required to conform to the Design Guidelines included in Section V, ensuring the development of an attractive and safe community. THE VILLAGES OF SAN JACINTO is therefore is consistent with this policy.
H Policy 3.1: All for the development of housing affordable to all income groups by utilizing a variety of public and private efforts.	
H Policy 3.3: Promote the development of attractive and safe housing to meet community needs.	

City of San Jacinto Zoning Ordinance

The proposed Specific Plan includes a zone change for the property which would result in removing the existing C-2, R-1, R-2 (PUD) and R-3 zoning designations and application of a Specific Plan zoning designation to the entire site. The Villages of San Jacinto Specific Plan is generally consistent with the provisions of the General Plan and Zoning Ordinance which require initiation of Specific Plans for large-scale planned development. When adopted by legislative action, the Specific Plan document will serve both planning and regulatory functions for the proposed development. The intent of the Specific Plan zoning designation is to establish base zoning and applicable development standards specific to the defined project area to direct new growth and development in the process of implanting the General Plan. Adopted Specific Plan zoning and development standards will take precedence over the general standards of the Zoning Ordinance, except where the Specific Plan does not contain an applicable development standard, in which case the standards of the Zoning Ordinance apply.

Transportation Uniform Mitigation Fee 10-Year Strategic Plan (TUMF)

The WRCOG is a council which is comprised of members representing 15 local jurisdictions in western Riverside County, including the City of San Jacinto. The WRCOG functions to facilitate collective assessment of regional issues, such as traffic, by the various representative jurisdictions. In June 2004, WRCOG adopted the TUMF 10-Year Strategic Plan and Transportation Improvement Program Development Guidelines.

The purpose of the TUMF program is to establish a comprehensive funding source for infrastructure improvements to mitigate cumulative regional transportation impacts of new development on regional arterial highways (Parsons Brinckerhoff Quade & Douglas, Inc. 2004). The WRCOG has developed and implemented the TUMF program which requires new development to contribute revenues to partially fund improvements that will mitigate the transportation impacts of new developments. The proposed project would be required to contribute funds to the TUMF program based on the proposed number of residential dwelling and the applicable defined residential land use fee rate to ensure project compliance with the program. Additional discussion of the proposed project's compliance with applicable TUMF program requirements is included in *Section 5.9, Transportation, Circulation, and Access.*

South Coast Air Quality Management Plan

The South Coast Air Quality Management District Governing Board adopted the 2003 Air AQMP on August 1, 2003, and adopted the 2007 AQMP on June 1, 2007. The 2003 AQMP updates the attainment demonstration for the federal standards for O_3 and PM_{10}; replaces the 1997 attainment demonstration for the federal CO standard, provides a basis for a maintenance plan for CO for the future; and updates the maintenance plan for the federal NO_2 standard that the SCAB has met since 1992. The 2007 AQMP includes the same updates as the 2003 AQMP and also incorporates significant new scientific data, primarily in the form of updated emissions inventories, ambient measurements, new meteorological episodes and new air quality modeling tools. As part of the 2007 AQMP, the SCAQMD request that EPA "bump up" the O_3 nonattainment status from severe to extreme to allow additional time for the SCAB to achieve attainment with the federal standard. The additional time would provide for implementation of state and federal measures that apply to sources over which the SCAQMD does not have control. The 2007 AQMP has been approved by CARB but is undergoing review by EPA.

The South Coast AQMP includes a number of policies and measures to achieve federal and state standards for healthful air quality in the region. The City's General Plan strives to comply with the AQMP by planning land uses in relation to circulation systems, promoting commercial and industrial land uses with convenient access to transportation corridors, and encouraging a balance of land uses that facilitates a complimentary association between jobs and housing. Additional discussion of potential project air quality impacts and applicable AQMP program requirements is included in *Section 5.10.*

Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Western Riverside County Multiple Species Habitat Conservation Plan

The Western Riverside County MSHCP is a comprehensive, long-term habitat conservation program which addresses the needs of a variety of biological resources. The primary goal of the MSHCP is to develop and manage sustainable preserve areas within existing and expanding urban areas. The preserve areas and management efforts contained in the final MSHCP will affect land use planning in the entire City of San Jacinto area. *Section 5.4, Biological Resources*, provides an in depth discussion of the project's relationship and consistency with the Western Riverside County MSHCP.

Would the project introduce a land use that is incompatible with existing or proposed surrounding land uses?

The proposed project would potentially result in significant urban/rural land use conflicts between the planned residential, commercial and mixed use development and existing agricultural uses surrounding the project site. Such conflicts could include fertilizer and pesticides application drift into the proposed residential area, residential complaints about noise and dust resulting from site preparation activities associated with adjacent agricultural activities, and increased trespassing onto agricultural lands. Additional discussion of potential project impacts associated with rural agricultural and urban residential land use conflicts is included in *Section 5.3, Agricultural Resources.*

Development of the proposed Villages of San Jacinto Specific Plan area is located immediately adjacent to the Hemet/San Jacinto Regional Water Reclamation Facility currently owned and operated by the Eastern Municipal Water District (EMWD). New residential development located near industrial-type facilities such as the wastewater treatment plant can result in potentially significant land use conflicts derived from residential complaints about noise and odors generated from plant operations. However, the proposed Specific Plan would designate land directly adjacent to the wastewater treatment facility as commercial and mixed-use business park. The commercial and mixed-use areas are buffered from on-site residential land uses by parks and intervening roadways. The nearest residential lots to the treatment plant would be located over 1,000 feet from the plant boundary. As such, the proposed Villages of San Jacinto development incorporates buffers into the development to minimize potential land use impacts between the proposed residential, commercial development, and the adjacent wastewater treatment facility. Additional discussion of potential land use conflicts associated with plant operation odors is included in *Section 5.10, Air Quality,* and plant operation noise is included in *Section 5.11, Noise.* Noise impacts potentially associated with traffic generated by the project are

not expected to result in significant noise impacts along access roads to and within the project area, as described in *Section 5.11*.

5.1.5 Mitigation Measures

The proposed project would not divide an established community or conflict with applicable plans, policies or regulations including the Western Riverside Multiple Habitat Conservation Plan. Therefore, no mitigation is proposed for these issues. Mitigation is provided in *Section 5.2, Landform Alteration and Aesthetics*, and *Section 5.11, Noise*, which requires notification of homeowners in the vicinity of the school site that there may be lighting impacts and noise associated with outdoor activities in the future should the school district proceed with plans for the proposed high school. Additionally, mitigation requiring notification for potential urban/rural land use conflicts between the project and existing agricultural uses is provided in *Section 5.3, Agricultural Resources* .

5.1.6 Residual Impacts/Level of Significance after Mitigation

Land use and planning impacts, outside of those related to noise, aesthetics, and agricultural resources (as indicated above in *Section 5.1.5*), have not been identified, therefore mitigation measures are not necessary.

INTENTIONALLY LEFT BLANK

5.2 LANDFORM ALTERATION AND AESTHETICS

5.2.1 Introduction and Methodology

This section addresses the potential for the Villages of San Jacinto project to produce visual impacts or affect visual character upon implementation. The analysis primarily focuses on the large-scale configuration and distribution of land use types on the site, and architectural/design standards of the Specific Plan.

Existing visual conditions were compiled through a site visit and review of aerial photographs. Public vantage points near the proposed project site were identified and the existing visual character summarized. Analysis of impacts is based on an assessment of how the view would change in addition to an assessment of the project's compliance with viewshed and other aesthetic policies in the City's General Plan.

5.2.2 Existing Conditions

Existing Setting

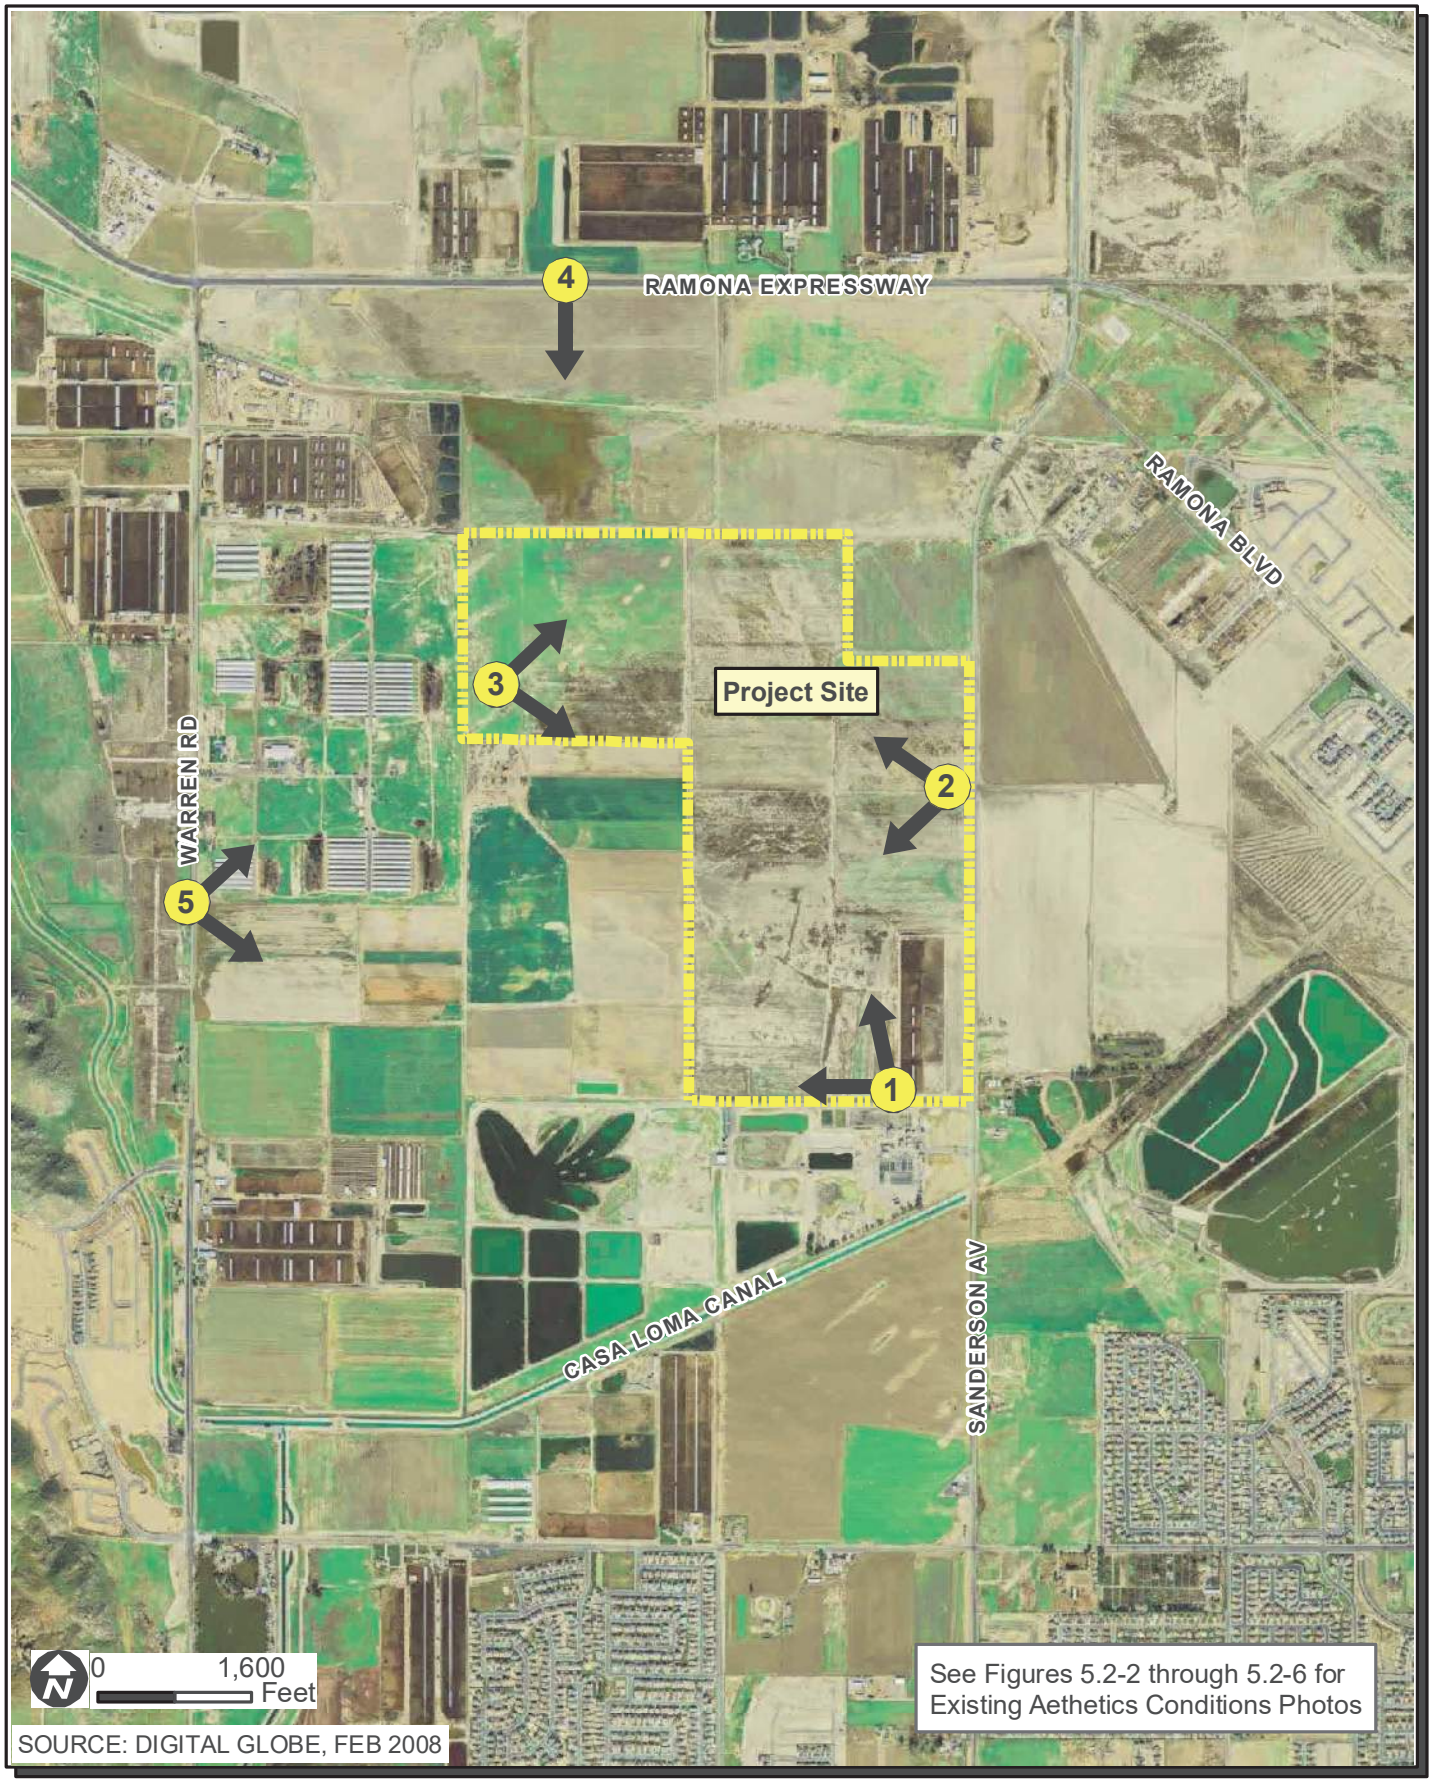
The project site is located in the San Jacinto Valley. The San Jacinto Valley is a northwest/southeast trending geographic feature formed by an "elbow" in the San Jacinto Mountain Range. The face of the San Jacinto Range faces southwest along the easterly side of San Jacinto Valley; at the southern end of the San Jacinto Valley near the town of Hemet, the San Bernardino range swings westward and the face of the range is oriented northwest. On the westerly side of the San Jacinto Valley, the valley is defined by the Lakeview Mountains and Bernaconi Hills. Vistas of the surrounding mountain ranges are essentially available in all directions within San Jacinto and are an important component of the regional aesthetic landscape. The San Jacinto River flows in a generally northwest to southeast direction approximately 1.5 miles north of the project site. This river is a dry wash during most of the year except for short periods following substantial rainfall or snowmelt occurring in the San Jacinto Mountains. The river course is not visible from the project site.

The project site is oriented with a long axis approximately north/south. The project site is essentially flat with surface elevation ranging from approximately 1,455 feet above mean sea level (AMSL) along the northern edge to approximately 1,490 feet AMSL in the southeastern corner. By contrast, Mt. Rudolph (the highest peak in the Lakeview Mountains west of the site) is at elevation 2,649 AMSL. The Bernaconi Hills have a peak elevation of approximately 2,100 feet AMSL; Mt. Edna (a part of the San Bernardino Range north of the project) is at elevation 2,587 AMSL; San Jacinto Peak towers above the valley floor at approximately 10,830 feet AMSL. Given the elevation difference between the ground surface at the site and surrounding mountain features, background mountain views are currently available across the subject site

from the public roadways surrounding the site. Existing views from surrounding roadways are discussed in greater detail in the sub-section below.

Existing Visual Quality of Project Site

The visual character of the site itself can be described as primarily vacant, former agricultural land. Vegetation on site consists of weedy invasive species or natural vegetation that has accumulated since the majority of agricultural production was discontinued. Existing on-site improvements and activities include covered shade structures as part of a former cattle feed lot in the southern portion of the property, an abandoned house and scattered debris in the south-central portion of the site, primarily fallow field along the eastern property boundary, and scattered sod fields in the northern portions of the property. The aesthetic quality of the site itself would be considered low for the portions containing structural development and moderate for the cultivated agricultural portions of the site. However, as shown in the site photos below, cultivated agriculture is not highly visible from adjacent roadways.



The site is essentially flat and there are no unique visual resources on site, such as tree stands, rock outcrops or water bodies. Therefore there are no current landforms of visual significance that exist on the site.

Figures 5.2-1 through *5.2-6* depict the existing visual quality of the project site as well as existing mountain views available from within and adjacent to the site.

Existing Views

The project site is generally visible from three existing primary viewpoints within the City of San Jacinto, each associated with a roadway. The project site is not visible from any existing roadway facility to the south of the subject site. Sanderson Avenue (east), Ramona Expressway (north), and Warren Avenue (west) each provide existing view opportunities of the project site. Each of the existing views described below are illustrated in *Figures 5.2-2 to 5.2-6.*

Sanderson Avenue is currently a heavily traveled regional roadway facility oriented north/south and located along the east side of the subject property. The roadway is at the same elevation as the site and views of the site are directly available to drivers on this roadway. The posted speed is 55 MPH and the site is approximately 6,000 feet (or roughly 1 mile) long; mobile viewers therefore have approximately 1 minute of exposure to direct views of the site along Sanderson Avenue when driving at the posted speed limit. Clearly visible elements of the property's visual character from this vantage *(Figures 5.2-2* and *5.2-3*) include covered shade structures associated with the former feed lot, an abandoned house to the west of former feed lot, and fallow agricultural land in the foreground with mountain vistas in the background to the west and north.

Villages of San Jacinto EIR

Existing Aesthetics Conditions

FIGURE 5.2-6

INTENTIONALLY LEFT BLANK

Ramona Expressway is currently a heavily traveled regional roadway facility oriented roughly east/west and located approximately one half mile to the north of the project's northern property boundary. At this vantage distance, the site is primarily a component of the background vista which is subordinate to the mountains (San Jacinto Range). The posted speed is 65 MPH and the site is approximately 4,800 feet wide; mobile viewers therefore have approximately 1 minute of exposure to distant views of the site along Ramona Expressway while driving at the posted speed limit (*Figure 5.2-5*). The existing on-site structures are barely visible from this vantage point, and would probably not be noticed by a mobile viewer.

Warren Avenue is currently a heavily traveled regional roadway facility oriented north/south and located approximately one half mile to the west side of the subject property. At this vantage distance, the site is again primarily a component of the background vista, which is subordinate to the mountains (San Bernardino Range and San Jacinto Mountains). The posted speed is 45 MPH and the site is approximately 6,000 feet (or roughly one mile) long; however, structures on the property immediately adjacent to the west side of the project site occupy about two thirds of the length of the project site. Therefore, distant views from Warren Avenue to the site are available roughly along the southern-most 2,000 feet of the property. This one glimpse of the site, at 45 MPH would equate to about 0.5 minute for the mobile viewer (*Figure 5.2-6*). The existing improvements on the property (i.e., covered shade structures and abandoned house) are barely visible and are completely subordinate to the background mountain views.

Figure 5.2-4 depicts an internal view from the northwest corner of the subject property facing east. Primary views from this location include fallow agricultural land in the foreground; sod fields that can be seen in the mid-foreground, scattered in the distance adjacent to Sanderson Avenue; and the dominant view is of the San Jacinto Mountains in the background.

Applicable Visual Policies

City of San Jacinto General Plan

The current City of San Jacinto General Plan was adopted May 4, 2006. The General Plan is the primary long-range planning document that guides growth and development in San Jacinto. There are a number of goals and policies in the Land Use Element and Resource Management Element that are relevant to visual resources as described below.

Land Use Element

The following goals and policies relate to maintaining and enhancing the visual character of the community and surrounding scenic vistas.

Land Use Goal 2 Manage and direct growth so that the community and its neighborhoods are protected and enhanced.

Policy 2.1 Assure that new development is complementary to the existing character of the City.

Policy 2.7 Locate retail and commercial land uses along major circulation routes at major intersections where there is maximum access and visibility.

Land Use Goal 6 Preserve and protect the City's cultural, historic, agricultural, and visual resources.

Policy 6.7 Preserve and enhance public views of the mountains and hillsides and other scenic vistas.

Policy 6.10 Promote the maintenance of private and public properties to enhance the visual appearance of the community.

Land Use Goal 9 Encourage thoughtful community design that enhances San Jacinto's quality of life.

Policy 9.1 Ensure new development is compatible with its natural surroundings and the built environment in terms of architecture, scale, grading and massing.

Policy 9.6 Require the use and maintenance of extensive landscaping in new development and redevelopment projects to beautify the surroundings, screen outdoor uses, provide shade, establish pedestrian paths, buffer incompatible land uses and provide visual interest.

Policy 9.8. Develop and enforce development standards and design guidelines that provide clear yet flexible direction for achieving quality community design in new development and redevelopment projects throughout the community.

Resource Management Element

Resource Management Goal 3 Prevent incompatible development in areas that should be preserved for scenic, historic, conservation, mineral extraction, or public safety purposes.

Policy 3.1: Ensure incompatible development is avoided in those areas that are designated for scenic, historic, conservation, mineral extraction, or public safety purposes.

5.2.3 Significance Criteria

Based on the criteria identified in Appendix G of the CEQA Guidelines, the proposed project would have a significant impact on landform alteration and aesthetics if it:

1. Has a significant adverse effect on a scenic vista
2. Substantially damages scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway
3. Substantially degrades the existing visual character or quality of the site and its surroundings
4. Creates a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

5.2.4 Impacts

The proposed Specific Plan contains several aesthetic features that have been assumed as part of the project and therefore shape the following impact analysis.

Applicable Visual Policies

An assessment of the project's relationship to visual resource policies in the General Plan is summarized below in *Table 5.2-1, Consistency Determinations for General Plan Policies*.

Table 5.2-1
Consistency Determinations for General Plan Policies

Policy	Consistency Determination
General Plan Land Use Element	
Land Use Goal 2: Manage and direct growth so that the community and its neighborhoods are protected and enhanced.	
Policy 2.1: Assure that new development is complementary to the existing character of the City.	The Specific Plan sets forth the architectural and site design guidelines for the project, which ensures consistent high quality development that reflects the scale and development intensity of the community while allowing for flexibility in design. Therefore, the project is consistent with this policy.
Policy 2.7: Locate retail and commercial land uses along major circulation routes at major intersections where there is maximum access and visibility	The commercial portion of the project will be located adjacent to Sanderson Avenue, a major entry point into the City where it intersects with the future Bridge Street, which is one of the main project access points. Therefore, the project is consistent with this policy.
Land Use Goal 6: Preserve and protect the City's cultural, historic, agricultural, and visual resources.	
Policy 6.7: Preserve and enhance public views of the mountains and hillsides and other scenic vistas.	Mountain views are currently afforded across the site from public roadways in the project vicinity. Some lower mountain views may be temporarily obstructed by the project in some areas. Although there may be brief, interrupted views for passing motorists, there will be no permanent view blockage from surrounding areas.
Policy 6.10: Promote the maintenance of private and public properties to enhance the visual appearance of the community.	The project will provide a significant enhancement to the community by utilizing a variety of compatible architectural styles, and specific standards and design guidelines for each Planning Area. It will also include extensive landscape treatments along adjacent highways and internal streets as well as the paseo walkways between land uses.
Land Use Goal 9: Encourage thoughtful community design that enhances San Jacinto's quality of life.	
Policy 9.1: Ensure new development is compatible with its natural surroundings and the built environment in terms of architecture, scale, grading and massing.	The project Specific Plan establishes compatible design guidelines, including landscape design for roadways, parks, and other common use areas, and architectural guidelines for all residences, commercial and mixed-use development. These guidelines will ensure that each of the project components relate to one another as well as to surrounding land uses.
Policy 9.6: Require the use and maintenance of extensive landscaping in new development and redevelopment projects to beautify the surroundings, screen outdoor uses, provide shade, establish pedestrian paths, buffer incompatible land uses and provide visual interest.	The project Specific Plan establishes landscaping design guidelines that provide a variety of landscape treatments along adjacent highways and internal streets, which include planted medians, parkway trees, shrubs, and groundcovers. There will also be landscaped walkways, drainages, and parks, which separate the various land uses.
Policy 9.8: Develop and enforce development standards and design guidelines that provide clear yet flexible direction for achieving quality community design in new development and redevelopment projects throughout the community	The Specific Plan Design Guidelines for architecture and landscaping ensure consistent development standards throughout the project and will therefore be consistent with this policy.

Would the project have a significant adverse effect on a scenic vista?

The General Plan identifies hillside and mountain views as significant resources which should be protected and enhanced. Views to mountain backdrops/background are currently available across the site from existing roadways west, north, and south of the site. Due to the distance of the site from Ramona Expressway and Warren Road, future structural development of the Villages of San Jacinto would not physically obstruct the distant "background" views of the San Bernardino or San Jacinto mountain ranges from these roadways. The skyline and surrounding rural landscape is typical of what motorists experience as they travel along the adjacent roadways to the project site. However, development of the project may result in partial obstruction of existing lower mountain views for auto travelers along Sanderson Avenue, although this would be perceived only for a short distance, as views of the distant mountains would open up again once they have driven by the development. The project would not obstruct views of the surrounding mountains as seen from any nearby parks, trails, or other recreational uses, as these types of uses are not found in close proximity to the project site. Consequently, the proposed development, including the required 11-foot sound barrier along Sanderson Avenue (see *Section 5.11.5, Mitigation Measures, Mitigation Measure 5.11-a*), will not result in a significant visual impact to the existing views of the surrounding mountain backdrops. However, in order to soften the potential visual monotony of a continuous 11-foot wall along Sanderson Avenue, the wall will be constructed atop a landscaped berm of varying heights between 3 to 5 feet high, and would have extensive landscaping between the street and wall to help minimize any perceived visual impact of the wall. Therefore, the wall, combined with the berm will constitute an 11-foot sound barrier. According to the Specific Plan, this project frontage along Sanderson Avenue will include a 6-foot meandering sidewalk within a 16-foot landscaped parkway that features clusters of palm trees, pine trees, background shrubs and other shrub and ground cover plantings. The project site is not located within or adjacent to a State Scenic Highway (http://www.dot.ca.gov), and the project would not have a significant adverse visual impact on existing residences.

The project will include an extensive system of parks and paseos along with landscaping on major internal and adjacent roadways that will provide a consistent plant theme throughout the project. These elements along with the other open space enhancements as described above will result in a net visual improvement of the project site that provides a high quality aesthetically attractive development. Therefore, the project will not have a significant adverse impact on a scenic vista and no mitigation measures are required.

Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

State Highway 74, which is approximately four miles south of the project site, is listed as an eligible but not officially designated State Scenic Highway on the California Scenic Highway Mapping System (http://www.dot.ca.gov/hq/LandArch/scenic_highways/index.htm) in the

project vicinity. State Highway 74 is an Officially Designated State Scenic Highway approximately 5.5 miles southeast of the project site where it descends from the San Jacinto Mountains. However, due to the distance from this highway and intervening uses, the proposed project will not be visible. The proposed project does not currently support rock outcroppings or trees, and therefore would not involve disturbance of any trees, rock outcroppings or historic buildings, and would not damage a scenic resource.

Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Visual Quality of Site

The existing visual quality of the site varies from very low, for those portions with structures or other improvements, to moderate, for those areas employed for grass sod cultivation. However, the most prominent visual feature of the project site, where it is most visible along Sanderson Road, is vacant agricultural land consisting of weedy invasive species that have accumulated since the majority of agricultural production was discontinued. The cultivated agricultural portions are not highly visible from adjacent roadways. Therefore, the overall visual quality of the project site itself is considered low.

Implementation of the Villages of San Jacinto project would result in the development of the site with urban uses and structures including commercial, residential, and school buildings. The character of the site will be changed from one of mixed agriculture and fallow agriculture fields to one of a suburban/developed nature. However, the proposed project includes five parks totaling approximately 40 acres, including three public parks and two private neighborhood parks that provide a significant open space buffer among developed areas. Other open space amenities include an 11-acre lake and associated swim lagoon and beach area as well as a system of landscaped trails or "paseos" that serve as pedestrian linkages between land uses. There will also be extensive landscape treatments along adjacent highways and internal streets, which include planted medians, parkway trees, shrubs, and groundcovers, which will enhance the roadways and provide further visual contrast between proposed uses. Another feature that provides visual transition is a vegetated detention basin/drainage channel system along the western perimeter of the project site. The proposed system of open spaces would provide both on-site and off-site visual benefits to compensate for the loss of existing open space character of the site and surroundings, and would not conflict with the planned residential, commercial and open space uses in the adjacent community.

The project Specific Plan establishes compatible design guidelines including landscape design for roadways, parks and other common use areas and architectural guidelines for all residences, commercial and mixed-use development. These guidelines will ensure consistent development standards throughout the project that will not result in substantially degrading the existing visual

character or quality of the site and its surroundings. As discussed in Section 3.0, Project Description, the project will result in up to 1,329 low and medium density single-family residences, 22.7 acres of commercial uses, and 26.3 acres of mixed-use development. The residences will have a variety of architectural styles and will vary between one and two stories up to a maximum height of 35 feet. Architectural design guidelines will also be used to provide direction and inspiration for final design of the commercial and mixed use portions of the project. Building masses will be clustered to avoid long straight building facades and variation of building heights up to a maximum height of 35 feet will be required. Approval and implementation of the Specific Plan shall constitute compatibility with existing visual character, and no further mitigation measures are required.

Would the project create a new source of substantial light or glare that would adversely affect day or nighttime views in the area?

Light and Glare

The project would introduce additional night lighting within the project vicinity as well as potential new sources of glare (i.e., glass and reflective exterior surfaces). Particularly the commercial components of the site have the potential to produce significant night lighting impacts upon adjacent uses in the vicinity as well as proposed residential land uses within the project itself. Additionally, the project will require street lighting, trail lighting, and lighting associated with outdoor recreational activities. The Specific Plan requires that there are uniform lighting standards throughout the project and that lighting along trails shall be a minimum of 20-feet from rear or side yards to reduce light spill-over effects. All exterior lights are required to be shielded and focused to minimize spill light into the night sky or adjacent properties. Should Planning Area 14 be purchased by the San Jacinto Unified School District for development as a high school, any potential light or glare impacts would need to be addressed by the School District in the course of their environmental compliance for that project. However, a mitigation measure has been added (see *Section 5.2.5, Mitigation Measures, Mitigation Measure 5.2-b)* which requires notification of homeowners in the vicinity of the school site that there may be lighted ball fields in the future should the school district proceed with plans for the proposed high school. Metal or other reflective exterior surfaces and finishes within the commercial components of the site could create new sources of light or glare resulting in significant glare impacts for adjacent residential, park, and agricultural uses. In order to reduce this potential impact to a less than significant level, mitigation is provided (see *Section 5.2.5, Mitigation Measures, Mitigation Measure 5.2-a).*

5.2.5 Mitigation Measures

5.2-a To avoid light and glare impacts, future submittals for commercial portions of the project development shall be required to prepare a photometric lighting plan. The lighting plan shall demonstrate that project lighting is shielded from surrounding properties and that only the minimum amount of lighting required for safety purposes is provided to avoid adverse effects on surrounding areas. In general, lighting fixtures shall be shielded downward and away from the adjacent residential areas and public roadways. Commercial development plans shall also be reviewed by the City to ensure the avoidance of substantial areas of reflective surfaces for building exteriors.

5.2-b A Notice-to-Property Owner shall be recorded on a separate buyer information sheet with the final map providing notice to potential future property owners in the vicinity of the school site (i.e., Planning Areas 1, 3, and 19) that there may be lighted ball fields in the future should the school district proceed with plans for the proposed high school.

5.2.6 Residual Impacts/Level of Significance after Mitigation

With the application of the above mitigation measure, project impacts related to light and glare would be reduced to levels below significance. No significant impacts related to aesthetics, visual conditions, or landform modification have been identified.

5.3 AGRICULTURAL RESOURCES

5.3.1 Introduction and Methodology

This section describes existing agricultural uses of the project site and discusses potential project impacts to local, regional, and statewide agricultural resources.

The character of existing agricultural uses of the subject site and surrounding areas was determined based on a field survey and review of aerial photography. In addition, State of California (2006) Resources Agency on-line mapping information was reviewed to assist in characterizing the agricultural resources of the site. Finally, the agricultural characteristics of the site as they relate to agricultural viability and importance as a significant agricultural resource were defined and analyzed utilizing the California Agricultural Land Evaluation Site Assessment (LESA) model (State of California 1997), included as *Appendix B*. The LESA model evaluates soil resource quality of the site, project site size, water availability, surrounding agricultural lands, and surrounding protected resource lands. These characteristics are then rated, weighed, and combined, resulting in a single numeric score that is the basis for making a determination of the project site's agricultural value, and thereby to identify the significance of potential project impacts of converting the agricultural land resources to other land uses. The LESA model is identified in the CEQA Guidelines as an optional methodology for addressing impacts to farmland and agricultural resources. Additional information regarding the LESA model is provided in *Section 5.3.4*.

5.3.2 Existing Conditions

Existing Land Uses

The 475.1-acre project site is located in the northwest portion of the City of San Jacinto in an area consisting primarily of rural agricultural uses. The project site has been used as pasture land and/or a farming operation, similar to surrounding properties, for over 100 years. The subject site formerly occupied predominantly by active agricultural cultivation in the form of turf farming with various support facilities, including roads, irrigation systems, and minor appurtenant buildings used for storage of farm materials and equipment. However, only a small portion of the project site is currently being used for turf farming, with the remainder being vacant and containing mostly weedy invasive plants or natural vegetation. In addition, the southeast portion of the site, approximately 16 acres, has been recently utilized as a feedlot (supporting an average of 500 head of cattle). Water resources used to sustain the existing agricultural operations is provided primarily as recycled water by the Eastern Municipal Water District (EMWD), which is supplemented by groundwater produced by three on-site wells for which there are no restrictions on private use. Currently, irrigation for the turf farm operation consists of a combination of 95%

reclaimed water and 5% groundwater. Water supply for the feedlot operation consists of groundwater produced by an on-site well.

Land uses north of the site continue to consist primarily of cultivated agricultural use in addition to duck ponds, the Colorado River Aqueduct, and the Ramona Expressway. Agricultural land uses occupy most areas directly west and east of the project site, including cultivated land and greenhouse operations, with the exception of rural residential development located just southeast of the project site and a residential neighborhood located northeast of the property where North Sanderson Avenue and the Ramona Expressway intersect. A municipal wastewater treatment plant owned and operated by EMWD is located directly south of the project site, and the San Jacinto Reservoir is located southeast of the property. The San Jacinto Valley has traditionally supported agriculture and rural residential land uses, but has recently been experiencing increased urbanization.

On-line mapping information posted by the State of California (2006) Resources Agency pursuant to the Farmland Mapping and Monitoring Program (accessed at www.conservation.ca.gov) indicates that the project site contains Prime Farmland, Unique Farmland, and Farmland of Statewide Importance and Local Importance defined as follows:

- Prime Farmland has the best combination of characteristics for producing crops. It produces sustained high yields when properly managed, and is not in or committed to urban development.
- Unique Farmland is other than prime farmland but capable of producing high-value crops.
- Farmland of Statewide or Local Importance does not qualify as Prime or Unique Farmlands, but is irrigated land determined to be important by state and local governments.

5.3.3 Significance Criteria

Based on the criteria identified in Appendix G of the CEQA Guidelines, the proposed project would have a significant impact on agricultural resources if it:

1. Would convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use
2. Would conflict with existing zoning for agricultural use, or a Williamson Act contract
3. Would involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use.

5.3.4 Impacts

Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

The proposed project is located on a site that has been designated by the California Resources Agency as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. This impact is considered significant and is further quantified by use of the State of California (1997) Department of Conservation LESA model (see below).

Agricultural land throughout western Riverside County is under increasing pressure of conversion to urban uses. The proposed project would result in conversion of the entire project site, approximately 475.1 acres of land consisting of designated important agricultural resources, to urban-related uses.

Although analysis of agricultural impacts through use of the California Agricultural LESA model (State of California 1997) is not specifically tied to a significance criterion, the recent conversion of agricultural uses to urban land uses throughout the western Riverside County area is an issue of concern for many stakeholders. Therefore, in an abundance of caution, the LESA model is used for rating the relative quality of land resources based upon site-specific measurable features, such as soil resource quality, project site size, water availability, surrounding agricultural lands, and surrounding protected resource lands. The LESA method was developed by the Department of Conservation (in 1995), intended to provide CEQA lead agencies with an optional methodology to ensure that significant effects on the environment of agricultural land conversions are quantitatively and consistently considered in the environmental review process (Public Resources Code Section 21095).

The LESA model is composed of six different factors. Two Land Evaluation factors are based on measures of soil resource quality. Four Site Assessment factors provide measures of project size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands. For a given project, each of these factors is separately rated on a 100-point scale. The factors are then weighted relative to one another and combined, resulting in a single numeric score for a given project, with a maximum attainable score of 100 points. It is the total project score that becomes the basis for making a determination of a project's potential significance, based upon a range of established scoring thresholds.

The LESA model worksheets are found in *Appendix B*. Using the LESA model, the Land Evaluation portion of the model equals 22.53, and the Site Assessment portion equals 38.93, for a total project score of 61.46. According to the LESA manual, a score of 60 to 79 points is considered significant unless either the Land Evaluation or Site Assessment subscore is less than

20 points. Because the Land Evaluation and the Site Assessment subscores (22.53 and 38.93, respectively) are both greater than 20, the overall score of 61.46 indicates that the agricultural lands of the project site are considered a significant resource and, therefore, conversion of the project site's agricultural lands would significantly impact the agricultural resources of the project site.

The proposed project would irreversibly convert land currently under agricultural production and identified as containing significant agricultural resources to urban uses and would contribute to incremental urbanization of a predominantly rural area sustaining existing agricultural land uses. As such, the proposed project would potentially result in a significant, unmitigable, adverse impact to agricultural resources of both local and regional importance. As discussed below in Section 5.3.6, Residual Impacts/Level of Significance after Mitigation, there are no feasible mitigation measures to reduce this impact below a level of significance.

In addition, development of the proposed project would potentially result in significant urban/rural land use conflicts between the planned development and existing agricultural uses surrounding the project site. Conflicts would potentially include fertilizer and pesticide application drift into the proposed residential area, residential complaints about noise, odor and dust resulting from site preparation activities associated with adjacent agricultural uses, and increased trespassing onto agricultural lands. Implementation of *Mitigation Measure 5.3-a,* identified in *Section 5.3.5, Mitigation Measures,* would serve to alleviate land use conflicts associated with new residential development and existing agricultural land uses. Further, fencing and vegetation set-backs contained in the Specific Plan will help to reduce potential inconsistencies with surrounding agricultural land. However, potentially significant impacts to sustained agricultural resources would result from the proposed project development, as the identified land use conflicts associated with urbanization of agricultural lands may ultimately result in making agricultural operations more difficult to sustain, and thereby more susceptible to conversion over time, resulting in cumulative impacts to agricultural resources of the area.

Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

The proposed project would not conflict with existing zoning for agricultural use. No portion of the project site is currently zoned for agricultural use; therefore, no conflicts are anticipated to occur with respect to the proposed residential conversion of the property and existing zoning designations. In addition, the site is not covered by special agricultural status, such as a Williamson Act contract. Therefore, no impacts related to agricultural zoning or a Williamson Act contract would occur.

Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use?

The project itself may contribute to surrounding lands being more susceptible to conversion over time, resulting in cumulative impacts to agricultural resources of the area.

5.3.5 Mitigation Measures

Project-Specific Mitigation Measures

5.3-a A Notice-to-Property-Owner shall be recorded on a separate buyer information sheet with the final map providing notice to potential future property owners of the proposed development that the property is located in an area of active agricultural land uses that may potentially result in inconvenience and/or discomfort associated with adjacent agricultural operations including noise, odors and dust generation, and chemical drift.

5.3.6 Residual Impacts/Level of Significance after Mitigation

The proposed project would result in the direct loss of agricultural land resources determined to be significant pursuant to the California Agricultural LESA model, and which are identified as important farmlands by the State of California (2006) Resources Agency Farmland Mapping and Monitoring Program. There are no identified mitigation measures that would substantially reduce the impacts associated with the permanent loss of the site's agricultural resources. The City's General Plan EIR (January 2006) discusses a number of reasons mitigation for loss of agriculture is infeasible. Rising land costs to replace agricultural lands, rising water costs, labor costs, urbanization and environmental regulations all contribute to ongoing conversion of farmland. Although the conclusion that agricultural preservation was infeasible for the above reasons was conducted several years ago, these factors are still prevalent and remain as constraining factors to agricultural conservation. Without property owner cooperation and substantial financial incentives, it is infeasible to provide permanent on or offsite mitigation to replace converted farmland. Mitigation measures for the proposed development have been identified to reduce the magnitude of significant impacts associated with potential land use conflicts resulting from development of the proposed residential development in an area supporting existing agricultural uses. However, a residual significant, unmitigable impact would remain due to the inherent incompatibility of agricultural and urban land uses, and due to the cumulative effects of pressure to convert adjacent agricultural lands associated with urban development encroachment into the predominantly rural project area.

Therefore, given the above considerations, potential project impacts to agricultural resources are considered significant and not fully mitigable. As such, pursuant to CEQA, approval of the proposed project is likely to result in significant unavoidable agricultural resource impacts and requires that the decision makers provide findings of overriding consideration of project benefits that make the significant effects acceptable.

INTENTIONALLY LEFT BLANK

5.4 BIOLOGICAL RESOURCES

5.4.1 Introduction and Methodology

This section describes existing biological resources on the project site and discusses potential project impacts to resources. This analysis is based on the August 2005 Dudek and Associates Biological Resources Technical Report prepared for the project. This report is included as *Appendix C* to this EIR. Methods used to conduct the biological resources field reconnaissance and impact analysis are contained therein.

5.4.2 Existing Conditions

Setting

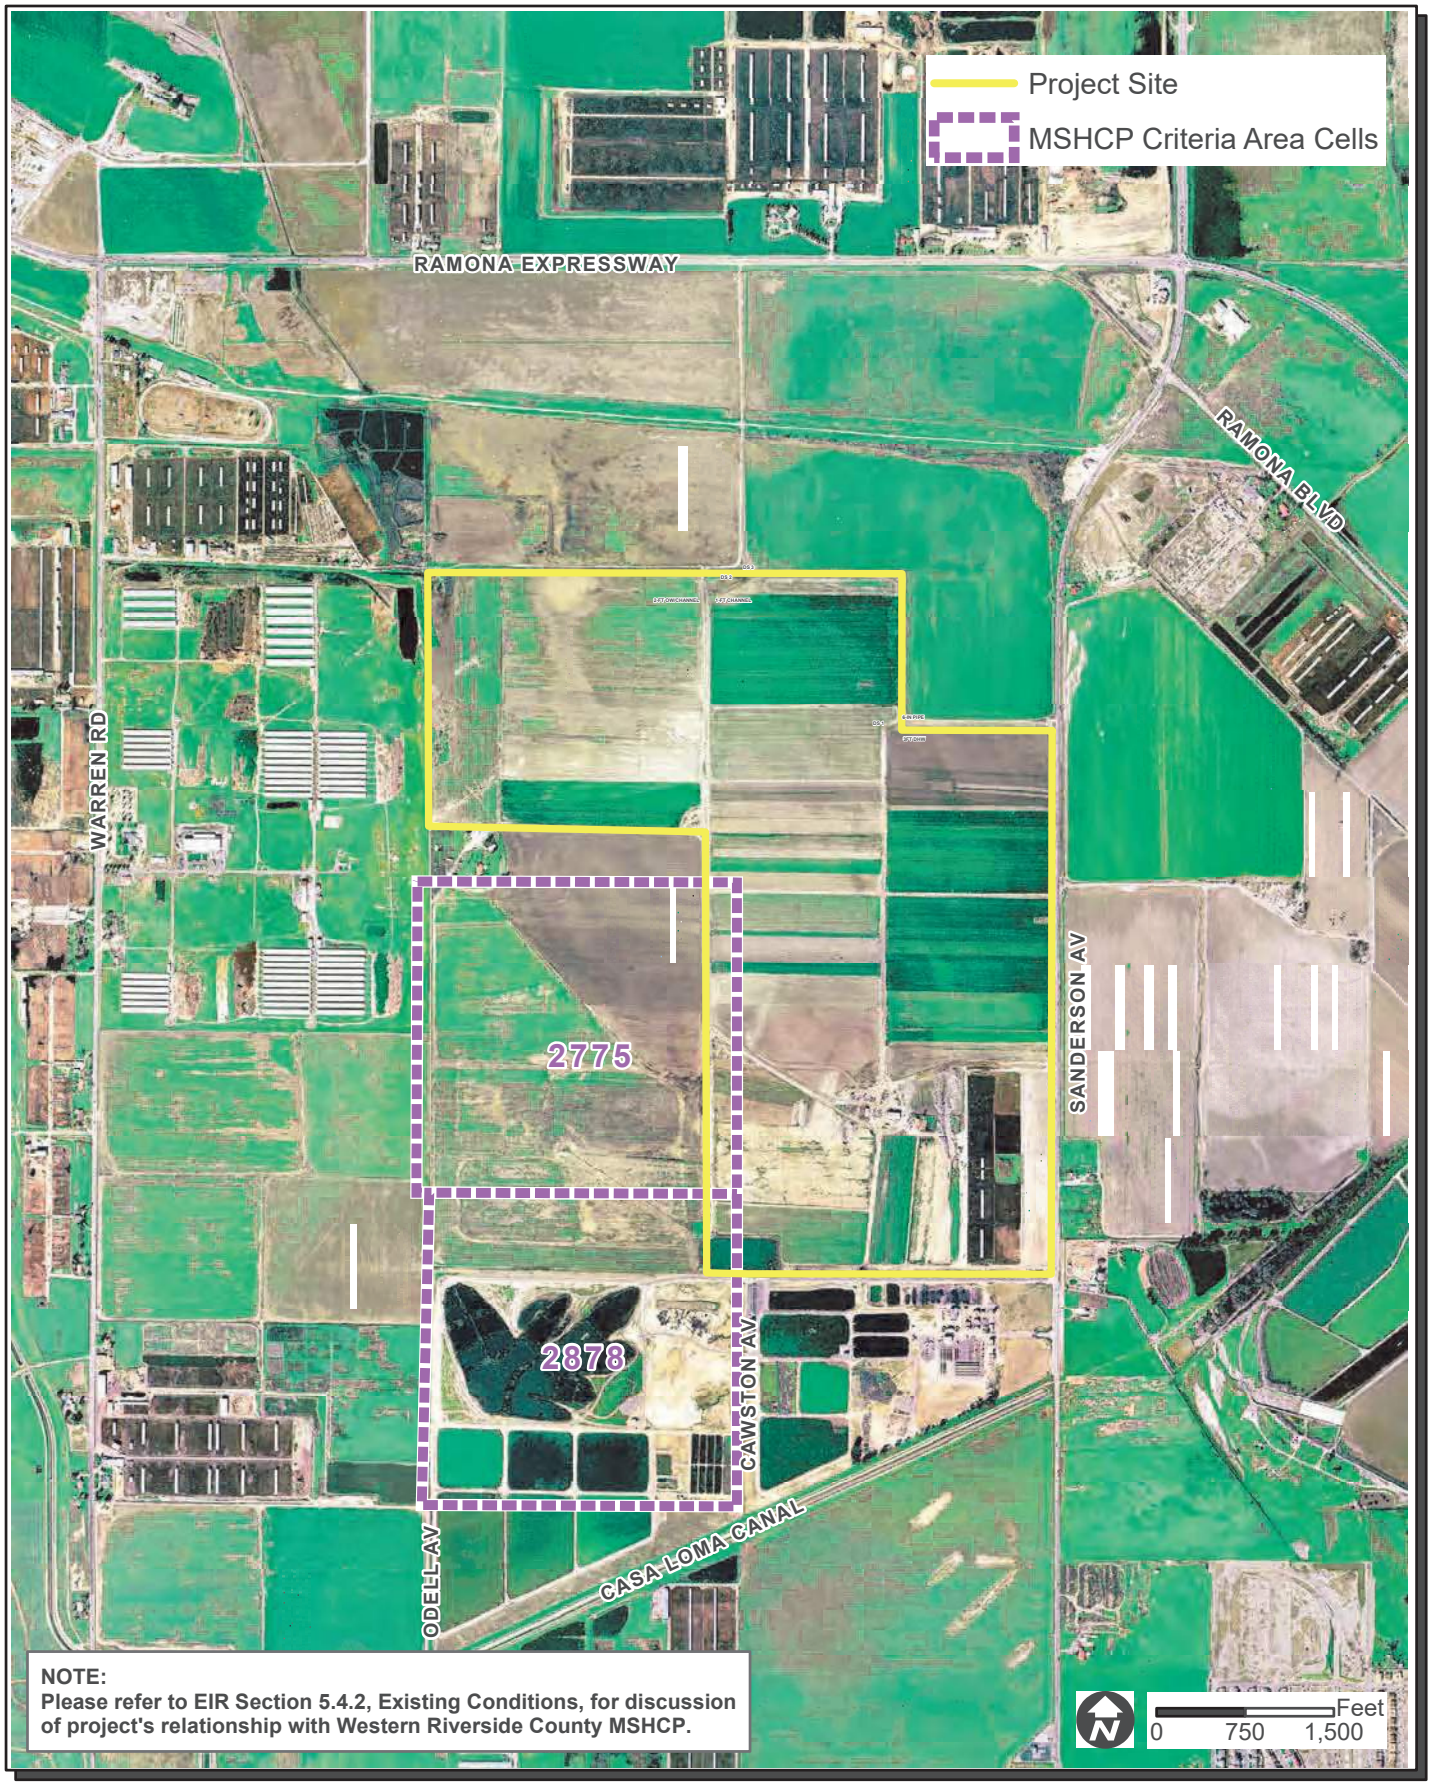
Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP)

The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is a comprehensive, multi-jurisdictional habitat conservation plan (HCP) focusing on conservation of species and their associated habitats in Western Riverside County. This plan is one of several large, multi-jurisdictional habitat-planning efforts in Southern California with the overall goal of maintaining biological and ecological diversity within a rapidly urbanizing region. The MSHCP will allow Riverside County and its cities to better control local land-use decisions and maintain a strong economic climate in the region while addressing the requirements of the state and federal Endangered Species Acts.

The MSHCP serves as an HCP pursuant to Section 10(a)(1)(B) of the federal Endangered Species Act of 1973, as well as a Natural Communities Conservation Plan (NCCP) under the NCCP Act of 2001. The MSHCP allows the participating jurisdictions to authorize "Take" of plant and wildlife species identified within the plan area. The United States Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFG) have authority to regulate the take of threatened, endangered, and rare species. Under the MSHCP, the wildlife agencies have granted "take authorization" for otherwise lawful actions—such as public and private development that may incidentally take or harm individual species or their habitat outside of the MSHCP conservation area—in exchange for the assembly and management of a coordinated MSHCP conservation area.

The MSHCP is a "criteria-based plan" and does not rely on a hardline preserve map. Instead, within the MSHCP Plan Area, the MSHCP reserve will be assembled over time from a smaller subset of the Plan Area referred to as the Criteria Area. The Criteria Area consists of Criteria Cells (Cells) or Cell Groupings, and flexible guidelines (Criteria) for the assembly of conservation within the Cells or Cell Groupings have been developed for each Cell/Cell

Grouping. Cells and Cell Groupings also may be included within larger units known as Cores, Linkages, or Habitat Blocks.



The Villages of San Jacinto project is located within the San Jacinto Valley Area Plan of the MSHCP. A GIS overlay of MSHCP San Jacinto Valley Area Criteria Cells with the Villages of San Jacinto project boundary shows that the project lies outside of the Criteria Area with the exception of a small overlap of the southwestern portion of the site with Cells 2775 and 2878. This overlap is approximately 250 feet wide and extends approximately 3,240 feet along the western property boundary. This slight Cell overlap does not correspond to any observable change in site features such as biological resources or topography; the site is in active agriculture (turf grass farm) both within and outside the area of overlap. For this reason, it was agreed (personal communication, Ken Graff, Riverside Regional Conservation Authority) that the overlap is a map registration issue, and MSHCP Criteria for Cells 2775 and 2878 would not apply to the Villages of San Jacinto Project but rather to the adjacent parcels to the west (see *Figure 5.4-1, Project Relationship to Western Riverside County MSHCP*). A letter from Charles V. Landry, Executive Director of the Western Riverside County Regional Conservation Authority (RCA), dated November 17, 2008, provides written confirmation of the previous conversation with Mr. Graff. This letter and the letter from the City requesting the RCA's written confirmation is provided in *Appendix C*. However, certain plan-wide requirements would apply to the project, including habitat assessments/survey requirements for narrow endemic plant species and burrowing owl. The project has also been analyzed for consistency with MSHCP Section 6.1.2, Riparian/Riverine Resources.

Topography

The study area ranges from flat in the central and southern regions of the project site to gently sloping in the northeastern region just east of the proposed Odell Avenue. The highest elevational area on site is the western boundary of the site [approximately 1,480 feet above mean sea level (amsl)]; the lowest elevational area is on the north-central boundary of the site [approximately 1,460 feet amsl].

Soils

The project site consists of several soil categories. All of the soils developed in alluvium from granitic parent materials. Dello, Chino, and Grangeville soils are present in alluvial areas or on floodplains; Traver soils are present on valley plains and in basins. With the exception of Grangeville soils, these soils are all in shallowly-sloping areas (0%–5% slopes); Grangeville soils are sloped from 0%–15%. Dello and Chino soils are slowly permeable, while Grangeville and Traver soils are moderately well-drained. Traver soils are from slightly to strongly saline, and, in addition to other soil types not mapped on the project study area, are often associated with narrow endemic plant species.

Villages of San Jacinto EIR

Project Relationship to Western Riverside County MSHCP

FIGURE 5.4-1

INTENTIONALLY LEFT BLANK

Vegetation Communities

Several native vegetation communities/land cover types as well as non-native/non-natural land covers are located on the project site. Wetland vegetation communities are also found on the project site. A total of nine vegetation communities were identified on the project site—six native and three non-native. The three non-native types include agriculture, ruderal land and disturbed/developed land. The native vegetation types include open water, freshwater marsh, southern willow woodland, disturbed herbaceous wetlands, cismontane alkali marsh, and intermittent unvegetated stream channel.

Wildlife Resources

Wildlife found in the project area includes species generally associated with the habitat types identified above. A complete list of observed and expected sensitive wildlife species is provided in *Appendix C* to this EIR.

Site Observations

Figure 5.4-2, Biological Resources Map, depicts resources observed and mapped on site during the January through August 2005 field visits to the site. It should be noted that the project site undergoes regular mechanical disturbance associated with the agricultural operations, therefore updated biological resource studies have not been prepared.

Vegetation Communities

The entire 475.1 acre site was surveyed for biological resources. This survey area includes developed lands associated with the existing agricultural operations on site in addition to remaining undeveloped/undisturbed portions of the site. *Table 5.4-1*, *Existing Biological Resources*, provides a summary of each type of vegetation community found on the project site. A description of each vegetation community is included in *Table 5.4-1*.

Table 5.4-1
Existing Biological Resources

Vegetation Community	Existing Acreage
Native Plant Communities/Land Cover Types	
Open Water	4.22
Freshwater Marsh	0.23
Southern Willow Woodland	0.07
Disturbed Herbaceous Wetlands	0.05
Disturbed Herbaceous Wetlands (CDFG jurisdiction only)	0.16
Cismontane Alkali Marsh	0.01
Intermittent Unvegetated Stream Channel	0.01
Subtotal	*4.75*

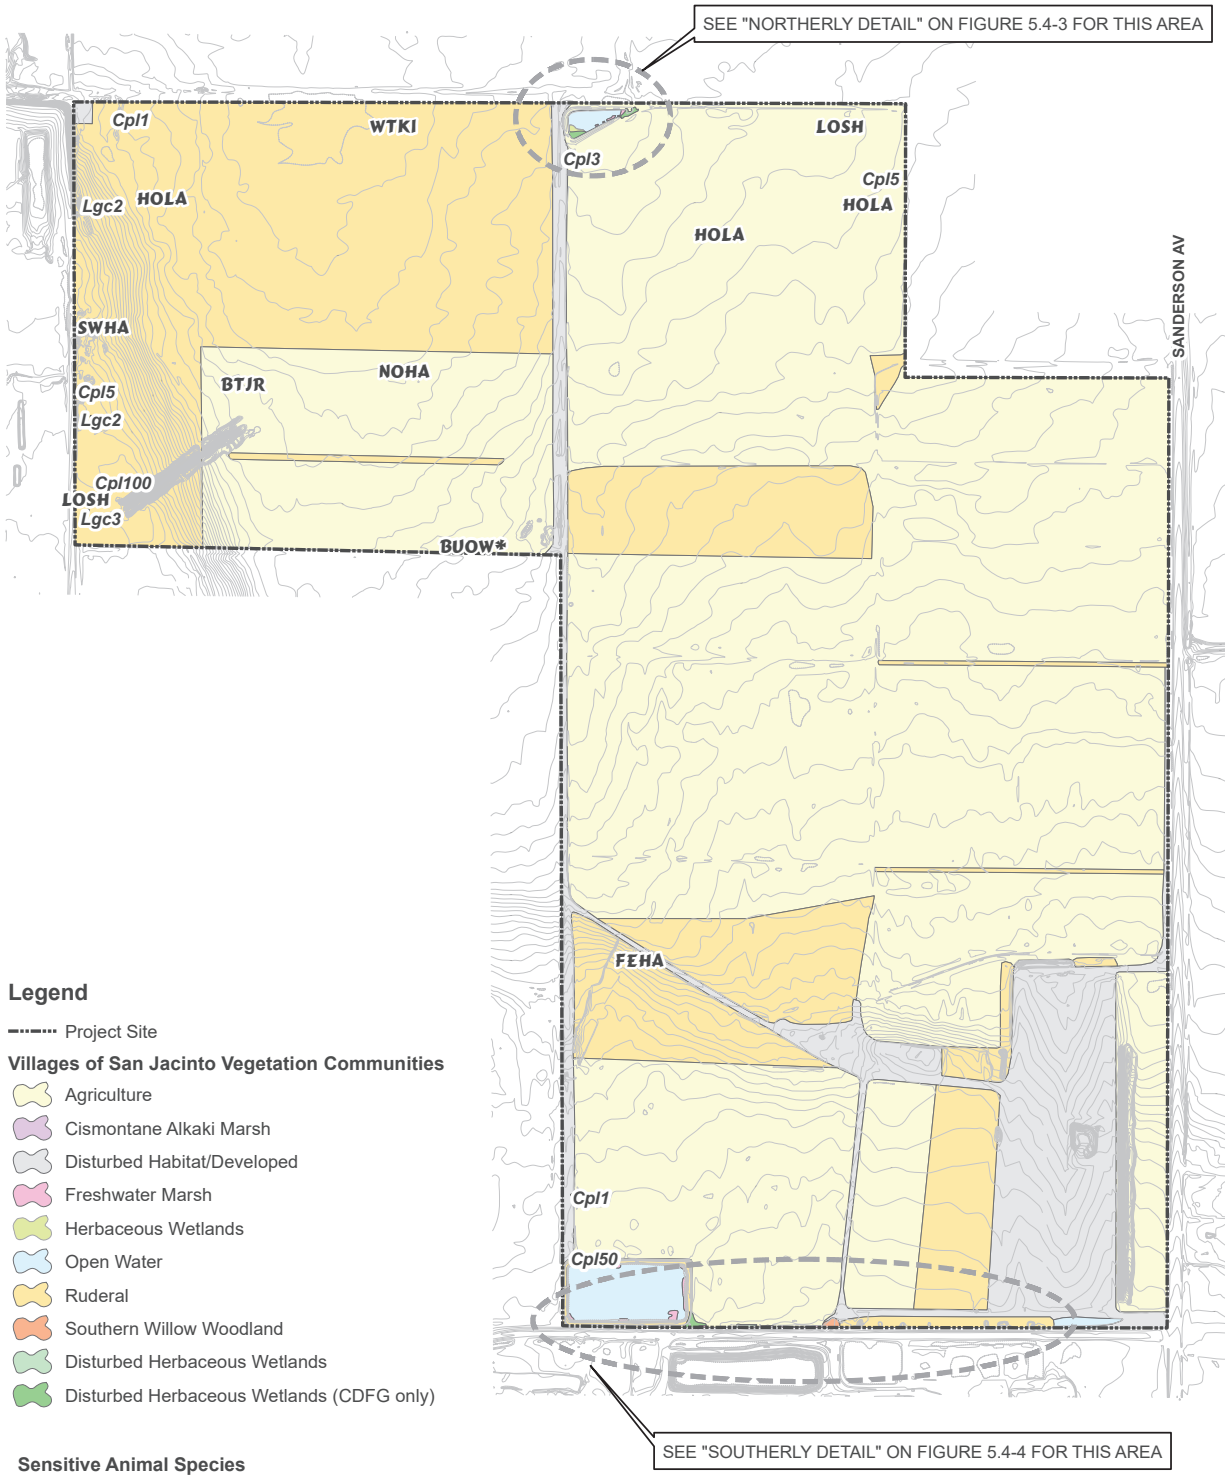
Table 5.4-1 (Continued)

Vegetation Community	Existing Acreage
Non-Native Habitat Types	
Agriculture	307.08
Ruderal	126.87
Disturbed/Developed	36.42
Subtotal	*470.37*
Total	**475.12**

Open Water

Open water (i.e., pond) is a type of aquatic area that typically lacks emergent vegetation but supports hydrophytic vegetation, such as mule fat scrub, southern willow scrub, and freshwater marsh around its margins. Ponds represent an important resource for a variety of migratory waterfowl and provide habitat for amphibians and numerous species of aquatic insects. Areas of open water, in concert with the surrounding riparian vegetation, may receive considerable use by species more typical of upland habitats during the drier times of the year.

Three areas of open water totaling 4.22 acres are present within the study area: two detention basins—one along the northern property boundary and one along the southwestern property boundary—and one shallow depression along the southeastern property boundary. At the time of the wetlands delineation, these areas were filled with water and supported a variety of waterfowl. Since the areas of open water on site have no connection to navigable Waters of the U.S., they are under the jurisdiction of CDFG and RWQCB only.



None of these areas mapped as open water on site would be classified as MSHCP riparian/riverine since they were artificially created.

Freshwater Marsh

Freshwater marsh is a wetland habitat type that develops where the water table is at or just above the ground surface, such as around the margins of lakes, ponds, slow-moving streams, ditches, and seepages. It typically is dominated by tall, emergent monocots, such as cattail (*Typha* sp.) and bulrush (*Scirpus* sp.).

Freshwater marsh on site is located around the perimeters of the detention basins and along the intermittent stream channel along the southern boundary of the site. This vegetation community occupies 0.23 acre and is dominated by cattails and bulrushes. Freshwater marsh on site is under the jurisdiction of CDFG and RWQCB only.

None of the areas mapped as freshwater marsh on site would be classified as MSHCP riparian/riverine since there were artificially created.

FIGURE 5.4-2

INTENTIONALLY LEFT BLANK

Southern Willow Woodland

Southern willow woodland is similar to the southern willow scrub plant community described by Holland (1986) as "dense, broadleafed, winter-deciduous riparian thickets dominated by several species of Salix [willows], with scattered emergent *Populus fremontii* [Freemont cottonwood] and *Platanus racemosa* [western sycamore]." The understory is usually arrested in growth owing to the dense canopy. The 0.07-acre area of the study site mapped as southern willow woodland consists of a small group of larger, more mature Goodding's black willows (*Salix gooddingii*) with an open understory. Soils within this vegetation type are hydric (Chroma 1), and evidence of hydrology exists as water stained leaves and drainage patterns. This habitat is fed by two 1-foot pipes that outlet onto the property along the southern boundary. However, since this wetlands habitat type is not connected to navigable Waters of the U.S., it is not under the jurisdiction of the ACOE. Southern willow woodland on site is under the jurisdiction of CDFG and RWQCB only.

None of the areas mapped as southern willow woodland on site would be classified as MSHCP riparian/riverine since there were artificially created.

Disturbed Herbaceous Wetlands

Herbaceous wetlands were mapped in association with the northern detention basin on site. Herbaceous wetlands support a predominance of low, herbaceous, hydrophytic vegetation. Within this 0.05-acre habitat type on site, yellow nutsedge (*Cyperus esculentus*), a hydrophytic species, dominates the cover. Drainage patterns are evident, and soils are considered hydric (Chroma 2 with mottles). This habitat type lacks a surface connection to navigable Waters of the U.S., however, and thus is under the jurisdiction of CDFG and RWQCB only.

Disturbed herbaceous wetlands were also mapped in an area dominated by the non-native perennial pepperweed (*Lepidium latifolium*). No indicators of hydrology are present, and soils are not hydric (Chroma 2 without mottles), so disturbed herbaceous wetlands on site are under the jurisdiction of CDFG only. A total of 0.16 acre of disturbed herbaceous wetlands are present on site.

None of the areas mapped as disturbed herbaceous wetlands on site would be classified as MSHCP riparian/riverine since there were artificially created.

Cismontane Alkali Marsh

According to Holland (1986), vegetation classified as cismontane alkali marsh occurs in areas of alkaline soils that are saturated or inundated during most of the year. Characteristic species often in cismontane alkali marsh include yerba mansa (*Anemopsis californica*), sedges, salt grass, rushes, alkali heath (*Frankenia salina*), cattails, salt marsh fleabane (*Pluchea purpurascens*), and

cattails. Species dominating the 0.01-acre patch of cismontane alkali marsh along the southern property boundary include salt grass, alkali-mallow (*Malvella leprosa*), and salt heliotrope (*Heliotropium curassavicum*).

None of the areas mapped as cismontane alkali marsh on site would be classified as MSHCP riparian/riverine since there were artificially created.

Unvegetated Intermittent Stream Channel

Unvegetated channel refers to the intermittent drainage connecting several small patches of wetlands vegetation south of the detention basin along the southern boundary of the site. Intermittent waters generally have a surface flow that, although not perennial, may be present for relatively long periods (greater than 24 hours) following rainfall events. Intermittent waters on site vary from two to three feet in diameter and occupy 0.01 acre of the project site. These channels are under the jurisdiction of CDFG and RWQCB.

None of the areas mapped as intermittent stream channel on site would be classified as MSHCP riparian/riverine since there were artificially created.

Agriculture

Agricultural lands, occupying 307.08 acres, compose the majority of the site. Most of the areas mapped as agriculture consist of an active turf-grass farming operation. A cattle feed lot, in the southeastern portion of the site, was also mapped as agriculture.

Ruderal

Ruderal habitat was mapped in areas not in active turf-farming operations which have been allowed to recolonize with weedy, non-native vegetation. Ruderal areas on site occupy 126.87 acres and are dominated by weedy species such as henbit (*Lamium amplexicaule*), knotweed (*Polygonum arenastrum*), red-maids (*Calindrinia ciliata*), rescue grass (*Bromus catharticus*), shepherd's purse (*Capsella bursa-pastoris*), (*Sisymbrium irio*), sow thistles (*Sonchus* spp.), short-podded mustard (*Hirschfeldia incana*), cheeseweed (*Malva parviflora*), and common purslane (*Portulaca oleracea*).

Disturbed/Developed

Areas mapped as disturbed or developed refer to areas lacking vegetation, such as dirt roads, graded areas, structures, and buildings. A total of 36.42 acres of disturbed/developed area is present within the study area.

Wildlife Diversity

A total of 79 species of both non-sensitive and special-status wildlife was observed or detected on site. The complete list of wildlife species identified is provided as *Appendix B* of the Biological Resources Technical Report, included as *Appendix C* to this EIR.

Birds

Sixty bird species were observed during the survey visits (*Appendix B*). The diversity of birds is limited due to the high levels of agriculture and relatively low habitat quality, or lack of native habitats throughout the study area. The habitats and land covers within the study area provide foraging habitat for a variety of special-status bird species such as the burrowing owl (Speotyto [Athene] *cunicularia hypugaea*) (which is a MSHCP survey species), white-tailed kite (*Elanus caeruleus*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), northern harrier, (*Circus cyaneus*), American kestrel (*Falco sparverius*) and horned lark (*Eremophila alpestris*). The ponds on site provide habitat for waterfowl including western grebe (*Aechmorphus occidentalis*), white-faced ibis (*Plegadis chihi*), northern shoveler (*Anas clypeata*), mallard (*Anas platyrhynchos*), lesser scaup (*Aythya affinis*), bufflehead (*Bucephala albeola*), ruddy duck (*Oxyura jamaicensis*), American coot (*Fulica americana*), common moorhen (*Gallinula chloropus*), least sandpiper (*Calidris minutilla*), and common snipe (*Gallinago gallinago*). A full list of species detected is presented in *Appendix B* to the Biological Resources Technical Report.

Reptiles and Amphibians

Two reptile species were observed on site: side-blotched lizard (*Uta stansburiana*) and western fence lizard (*Sceloporus occidentalis*). These species are not considered special-status. No amphibian species were observed during the survey; however, one or more of the following non-sensitive species may occur within the study area: garden slender salamander (*Batrachoseps attenuatus*), western toad (*Bufo boreas*) and Pacific treefrog (*Hyla regilla*). Habitat quality for reptiles and amphibians is low, and the diversity of these species is expected to be low because of the small amount of habitat available and the likely negative effects of the active agriculture on site.

Mammals

Nine mammal species, or their sign, were observed within the study area during the survey including: black-tailed jackrabbit (*Lepus californicus*), brush rabbit (*Sylvilagus bachmani*), desert cottontail (*Sylvilagus audubonii*), Botta's pocket gopher (*Thomomys bottae*), California ground squirrel (*Spermophilus beecheyi*), coyote (*Canis latrans*), striped skunk (*Mephitis mephitis*), bobcat (*Lynx rufus*), and domestic cattle (*Bos bovis*). Brush rabbit and black-tailed jackrabbit are considered special-status.

Invertebrates

Seven non-sensitive species of butterfly and one fairy shrimp species were recorded during surveys including: Sara orange-tip (*Anthocharis sara sara*), cabbage butterfly (*Pieris rapae*), common white (*Pontia protodice*), pygmy blue (*Brephidium exile*), West Coast lady (*Vanessa annabella*), red admiral (*Vanessa atalanta rubria*), painted lady (*Vanessa cardui*), and versatile fairy shrimp (*Branchinecta lindahli*).

Sensitive Biological Resources

Sensitive Habitats

Sensitive habitats are those that are considered rare within the region, support sensitive plant and/or wildlife species, function as corridors for wildlife movement, or are regulated by local, state or federal agencies. Habitat types found on site that are considered sensitive include open water, freshwater marsh, southern willow woodland, disturbed herbaceous wetland, cismontane alkali marsh and intermittent unvegetated stream channel.

MSHCP Riparian/Riverine Areas, Vernal Pools and Fairy Shrimp Habitat

No MSHCP riparian/riverine areas or vernal pools were located on site. However, some water resources on site were initially determined potentially suitable for threatened or endangered species of fairy shrimp; therefore, focused vernal pool branchiopod (i.e., fairy shrimp) surveys were conducted. No sensitive species of fairy shrimp were found on site (see *Table 5.4-2, Jurisdictional Waters (Including Wetlands) Present on the Villages of San Jacinto Project Site*).

Table 5.4-2
Jurisdictional Waters (Including Wetlands)
Present on the Villages of San Jacinto Project Site

Plant Community	Area (Acres)	MSHCP Riverine/Riparian?	RWQCB- and/or CDFG-jurisdictional
Freshwater Marsh	0.23	No	Both RWQCB and CDFG
Southern Willow Woodland	0.07	No	Both RWQCB and CDFG
Herbaceous Wetlands	0.03	No	Both RWQCB and CDFG
Disturbed Herbaceous Wetlands	0.02	No	Both RWQCB and CDFG
Disturbed Herbaceous Wetlands	0.16	No	CDFG only
Intermittent Unvegetated Ephemeral Stream Channel	0.01	No	Both RWQCB and CDFG
Open Water	4.22	No	Both RWQCB and CDFG

These areas are also under the jurisdiction of wetlands agencies as discussed below.

Jurisdictional Waters

Since none of the wetlands or non-wetlands waters on site show a surface connection with "navigable Waters of the U.S.," none of these areas are under the jurisdiction of the U.S. Army Corps of Engineers (ACOE). All of these areas are under the jurisdiction of both RWQCB and CDFG, or, in the case of some areas of disturbed herbaceous wetlands, CDFG only (see *Table 5.4-2, Jurisdictional Waters (Including Wetlands) Present on the Villages of San Jacinto Project Site*). A total of 4.22 acres of open water, 0.23 acre of freshwater marsh, 0.07 acre of southern willow woodland, 0.05 acre of herbaceous wetlands (including 0.02 acre of disturbed herbaceous wetlands), 0.01 acre of cismontane alkali marsh, and 0.01 acre of intermittent unvegetated stream channel, all under the jurisdiction of RWQCB and CDFG, are present on site. An additional 0.16 acre of disturbed herbaceous wetlands under the jurisdiction of CDFG only is also present on site (See *Table 5.4-2* and *Figures 5.4-2, 5.4-3, and 5.4-4*). Data station forms for the wetlands delineation can be found in *Appendix F* of the Biological Resources Technical Report (included in *Appendix C* to this EIR).

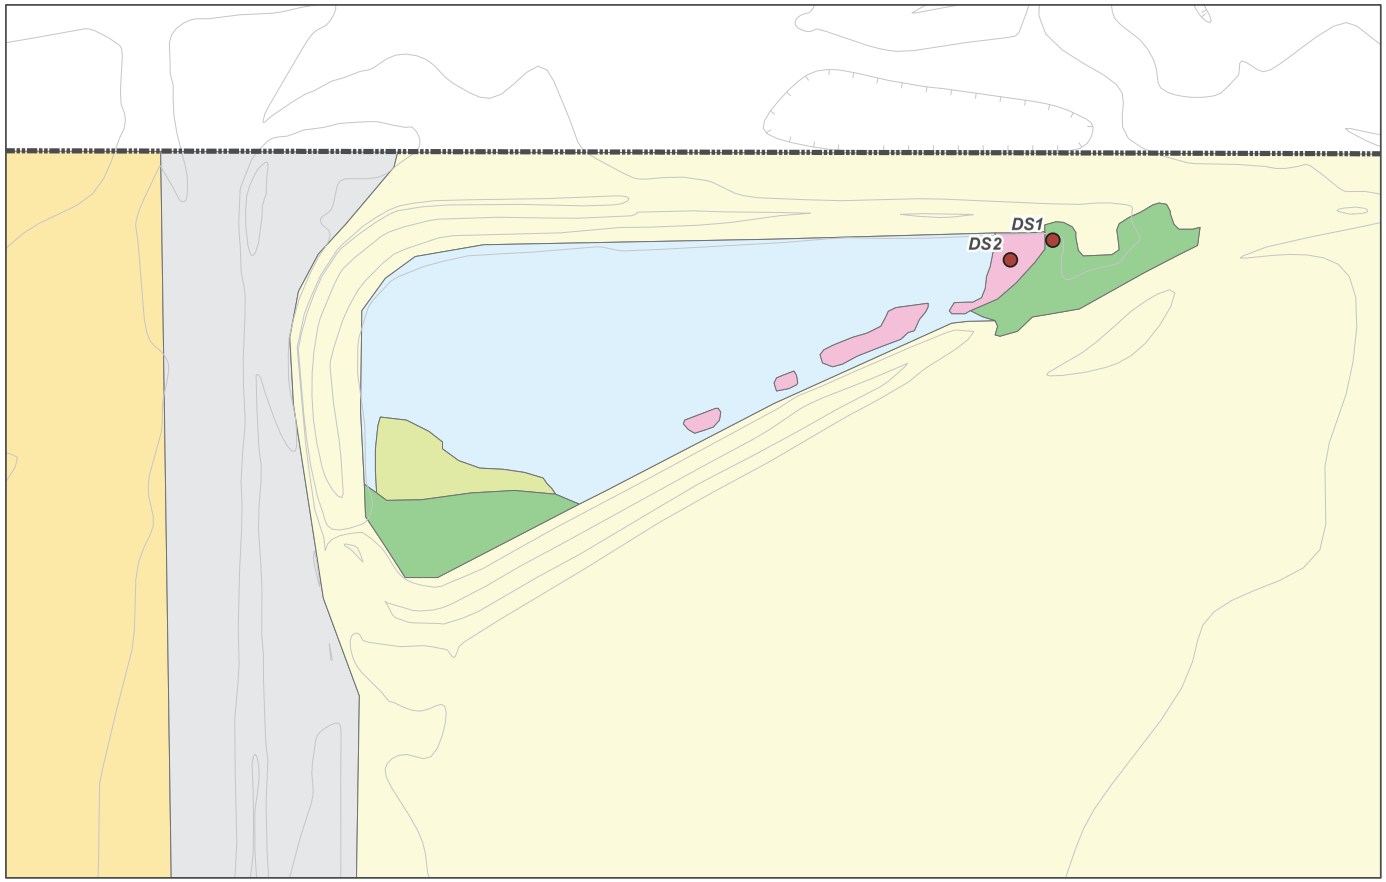
Sensitive Plants (MSHCP Narrow Endemic Plant Species)

Because the MSHCP includes coverage for certain plant species for which limited information was available at the time of creation of the MSHCP plan (generally plants of limited distribution considered narrow endemic plants), these plants were conditionally covered by the MSHCP. For these species, surveys are required within suitable habitat. The Villages of San Jacinto project is located within MSHCP Narrow Endemic Plant Species Survey Area (NEPSA) 3. Species of concern in NEPSA 3 are Munz's onion, San Diego ambrosia, many-stemmed dudleya, spreading navarretia, California Orcutt grass and Wright's trichocoronis. Focused surveys were conducted for these species. Because suitable habitat was present for the San Jacinto Valley crownscale, Parish's brittlescale, Davidson's saltscale, smooth tarplant, Coulter's goldfields, thread-leaved brodiaea, little mousetail and mud nama, focused surveys were also conducted for these species.

Prior to the survey, a search was also conducted using the CNDDB (2004) to thoroughly assess the sensitive floral resources that may occur on site. Table 4 in the Biological Resources Technical Report (included as *Appendix C* to this EIR) lists potentially occurring sensitive species according to the detailed search of the CNDDB and Dudek's knowledge of biological resources of this area. *Table 3* in the Biological Resources Technical Report (included as *Appendix C*) includes a list of all sensitive plant species, their sensitivity status, habitat associations and likelihood for presence on site. No sensitive plant species in the NEPSA 3 survey suite were located on site. Approximately 170 smooth tarplant individuals were observed on site as were approximately seven Coulter's goldfields individuals.

Sensitive Wildlife

Table 4 in the Biological Resources Technical Report (included in *Appendix C*) includes a list of all sensitive wildlife species, their sensitivity status, habitat associations and likelihood for presence on site. A summary of this table follows:



Reptiles and Amphibians

No sensitive reptiles or amphibians were observed on site, and no state- or federally-listed reptiles or amphibians are expected to occur. Table 5 in the Biological Resources Technical Report (included as *Appendix C*) includes all sensitive reptiles and amphibians that have the potential to occur within the project study area. Sensitive reptile and amphibian species classified as California Special Concern (CSC) Species and having at least a moderate potential to occur on site include the western newt and the western spadefoot toad.

Birds

Focused surveys for the western burrowing owl were conducted per MSHCP requirements for the project site, which is located within the Burrowing Owl Survey Area. One pair of burrowing owls and several burrows were observed during the surveys (*Figure 5.4-2*, see also Appendix E, Burrowing Owl Focused Survey Report, to the Biological Resources Technical Report, included as *Appendix C* to this EIR, for more information). The pair is assumed to be nesting on site. Two individuals of Swainson's hawk (*Buteo swainsoni*), a state-listed threatened species, were observed perched on trees within the site (*Figure 5.4-2*). Ferruginous hawk, northern harrier, and horned lark were observed foraging within the study area; the loggerhead shrike, a federal species of concern and CSC species, was observed nesting and foraging on site (*Figure 5.4-2*). White-tailed kite and turkey vulture were observed foraging on site (*Figure 5.4-2*). White-faced ibis was observed flying over the site during one survey visit. All of these species are covered species in the MSHCP.

In addition to these sensitive species observed, the great blue heron, prairie falcon, peregrine falcon, merlin and mountain plover could all utilize habitat on site during winter months. All of these species are covered species in the MSHCP. Western bluebird (sometimes considered sensitive by local environmental groups) also has a potential to forage on site during the winter months. Western bluebird is not a MSHCP covered species.

Mammals

Three sensitive mammal species or their sign were observed on site: black-tailed jackrabbit, bobcat and coyote, all are covered species in the MSHCP. Three additional species were assumed to utilize habitat on site, although were not observed: long-tailed weasel, gray fox and brush rabbit. Brush rabbit is a covered species in the MSHCP while long-tailed weasel and gray fox are not.

Invertebrates

No sensitive invertebrate species were observed on site during general wildlife surveys or are expected to occur within the project study area due to lack of suitable habitat (see Table 5 in Biological Resources Report). The vernal pool branchiopod survey that was conducted during the 2004-2005 wet season was negative for sensitive branchiopod species (see Appendix D of the Biological Resources Technical Report [included as *Appendix C* to this EIR] for vernal pool branchiopod survey report).

Fish

No sensitive fish species were observed on site during general wildlife surveys or are expected to occur within the project study area due to lack of suitable habitat (see Table 5 in Biological Resources Technical Report, included as *Appendix C* to this EIR).

Wildlife Corridors and Habitat Linkages

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for the immigration and emigration of animals. Habitat linkages may function as wildlife corridors for some species and permanent habitat for others. Wildlife corridors and habitat linkages contribute to population viability in several ways: (1) they assure the continual exchange of genes between populations which helps maintain genetic diversity; (2) they provide access to adjacent habitat areas representing additional territory for foraging and mating; (3) they allow for a greater carrying capacity of species populations; and (4) they provide routes for colonization of habitat lands following local population extinctions or habitat recovery from ecological catastrophes (e.g., fires).

As illustrated in *Figure 3-3, Site Location Map*, the project study area is surrounded by agricultural lands to the north, east, and southwest; a water reclamation facility lies to the southeast of the site. Therefore, the project study area is not of high importance as a regional wildlife corridor or habitat linkage, i.e., it does not connect larger habitat areas or provide for regional wildlife movement. Furthermore, the site is not included a MSHCP Linkage or Constrained Linkage which has been identified constructed to maintain regional habitat linkages.

5.4.3 Significance Criteria

Based on the criteria identified in Appendix G of the CEQA Guidelines, the proposed project would have a significant impact on biological resources if it would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Services?
3. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filing, hydrological interruption or other means?
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
5. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional, or state habitat conservation plan?

5.4.4 Biological Resource Impacts

Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies or regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

No sensitive reptiles or amphibians were observed on site, and no state- or federally-listed reptiles or amphibians are expected to occur. Three sensitive mammal species or their sign were observed on site: black-tailed jackrabbit, bobcat and coyote, all are covered species in the MSHCP (see full discussion of consistency with the MSHCP below). No sensitive invertebrate species were observed on site during general wildlife surveys or are expected to occur within the project study area due to lack of suitable habitat. No sensitive fish species were observed on site during general wildlife surveys or are expected to occur within the project study area due to lack of suitable habitat.

Focused surveys for the western burrowing owl were conducted per MSHCP requirements for the project site. One pair of burrowing owls and several burrows were observed during the surveys. In order to avoid potential indirect impacts related to burrowing owls, mitigation is provided (see *Section 5.4.5, Mitigation Measures*, Mitigation Measure 5.4-b).

Two individuals of Swainson's hawk (*Buteo swainsoni*), a state-listed threatened species, were observed perched on trees within the site (*Figure 5.4-2*). Ferruginous hawk, northern harrier, and horned lark were observed foraging within the study area; the loggerhead shrike, a federal species of concern and CSC species, was observed nesting and foraging on site (*Figure 5.4-2*). White-tailed kite and turkey vulture were observed foraging on site (*Figure 5.4-2*). White-faced ibis was observed flying over the site during one survey visit. Because impacts to other sensitive wildlife species are covered under the MSHCP, no additional mitigation is proposed for impacts to these species. The project will therefore, not have substantial adverse impacts on any sensitive specieThe project would impact 100% of all onsite habitats, many of which are suitable habitat for special-status species regulated by local plans/policies (i.e., MSHCP) or the US Fish and Wildlife Service or California Department of Fish and Game. *Table 5.4-3, Impacts to Vegetation Communities and Land Covers*, provides a summary of on-site habitats.

Table 5.4-3
Impacts to Vegetation Communities and Land Covers

Vegetation Community/Land Cover Type	Impact Acreage
Native Plant Communities/Land Cover Types	
Open Water	4.22
Freshwater Marsh	0.23
Southern Willow Woodland	0.07
Herbaceous Wetlands	0.03
Disturbed Herbaceous Wetlands	0.18
Cismontane Alkali Marsh	0.01
Intermittent Unvegetated Stream Channel	0.01
Subtotal	*4.75*
Uplands	
Agriculture	307.08
Ruderal	126.87
Disturbed/Developed	36.42
Subtotal	*470.37*
Total	**475.12**

Impacts to upland habitat types are not considered significant from a biological resources perspective. Impacts to wetland habitats are considered significant (see below for a discussion of these impacts in the context of Section 404 of the Clean Water Act and the MSHCP).

Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Please see discussion below regarding the project's relationship with the MSHCP. Please see discussion above regarding the project's potential impacts to wetland or riparian habitats which may be protected under local or regional plans, policies regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.

Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filing, hydrological interruption or other means?

Direct impacts associated with the development of the proposed project were calculated and are shown in *Table 5.4-4, Impacts to Jurisdictional Waters (Including Wetlands) Present on the Villages of San Jacinto Project Site).* As is shown in the table, all biological resources within the project boundaries were considered 100% lost. This includes 4.22 acres of open water, 0.23 acre of freshwater marsh, 0.07 acre of southern willow woodland, 0.03 acre of herbaceous wetlands (including 0.18 acre of disturbed herbaceous wetlands) and 0.01 acre of intermittent unvegetated stream channel (see *Table 5.4-4*).

Table 5.4-4
Impacts to Jurisdictional Waters (Including Wetlands)
Present on the Villages of San Jacinto Project Site

Plant Community	Impact Area (Acres)	MSHCP Riverine/Riparian?	RWQCB and/ or CDFG-Jurisdictional
Freshwater Marsh	0.23	No	Both RWQCB and CDFG
Southern Willow Woodland	0.07	No	Both RWQCB and CDFG
Herbaceous Wetlands	0.03	No	Both RWQCB and CDFG
Disturbed Herbaceous Wetlands	0.02	No	Both RWQCB and CDFG
Disturbed Herbaceous Wetlands	0.16	No	CDFG only
Intermittent Unvegetated Ephemeral Stream Channel	0.01	No	Both RWQCB and CDFG
Open Water	4.22	No	Both RWQCB and CDFG

Impacts to these habitats are considered significant, therefore mitigation is provided (see *Section 5.4.5, Mitigation Measures*, Mitigation Measure 5.4.-a).

Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

As discussed above, under Existing Conditions, the project study area is surrounded by agricultural lands to the north, east, and southwest; a water reclamation facility lies to the southeast of the site. Therefore, the project study area is not of high importance as a regional wildlife corridor or habitat linkage, i.e., it does not connect larger habitat areas or provide for regional wildlife movement. Furthermore, the site is not included a MSHCP Linkage or Constrained Linkage which has been identified constructed to maintain regional habitat linkages. Therefore, the project will not have a significant impact on established migratory wildlife corridors.

Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The project site is located within the MSHCP Planning Area. Consistency with this plan is discussed below. There are no other local policies ordinances protecting biological resources that would affect the proposed project.

Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional, or state habitat conservation plan?

As indicated in *Section 5.4.2, Existing Conditions*, the project has been determined not to be subject to reserve assembly criteria under the MSHCP due to the determination that cell designations located on the project site are the result of a mapping/registration error. Therefore, from a reserve assembly perspective (or absence of criteria area), the project is consistent with the MSHCP. That said, the project was also subject to additional MSHCP requirements, namely narrow endemic plant surveys, burrowing owl surveys, fairy shrimp surveys and riparian/riverine resources guidelines.

On-site water resources were also analyzed for consistency with riparian/riverine resources. While the project supports numerous wetland and water habitat, the man-made nature of these resources (largely for use in agricultural operations) eliminate them from being characterized as riparian/riverine per the MSHCP (see below for further discussion of MSHCP consistency). Therefore, the proposed project would be consistent with the MSHCP in terms of preservation of riparian/riverine resources. Suitable habitat on the project site was surveyed for sensitive fairy shrimp species. While common fairy shrimp species were observed in on-site habitat, sensitive fairy shrimp species were not observed. Therefore, the project would be consistent with MSHCP fairy shrimp survey and conservation directives. Suitable habitat was surveyed for all NEPSA 3 plant species. These species were not observed on site, therefore the project would not conflict

with MSHCP narrow endemic survey and conservation requirements. Two sensitive plant species, Coulter's goldfields (seven individuals) and smooth tarplant (approximately 170 individuals), were observed within the proposed impact area. Coulter's goldfields and smooth tarplant are covered species under the MSHCP but are not considered narrow endemic species by the MSHCP plan. These plants would be directly impacted by the proposed project. Impacts to these species would not be considered significant; the loss of 170 individuals of smooth tarplant and seven individuals of Coulter's goldfields are relatively small impacts to these species, which are fairly well distributed throughout the MSHCP plan area. In addition, these species are not MSHCP narrow endemic plants, and impacts to these species on the Villages of San Jacinto Project Site do not require any project-specific conservation measures such as salvaging for transplantation on another site. Because these species are covered under the plan, avoidance or impact minimization measures such as transplantation or seed salvaging is not necessary.

One pair of burrowing owls was observed on site. The project's impacts to these species are covered in accordance with the Species Conservation Objectives for the burrowing owl listed in the MSHCP. The project site does not support long-term conservation value for burrowing owl because of limited occupation of the species on the site. That said, in order to comply with the specific Burrowing Owl Survey Area provisions of the MSHCP, passive relocation to avoid direct impacts to known individuals will be required. In order to comply with MSHCP Burrowing Owl requirements, mitigation is provided. (see *Section 5.4.5, Mitigation Measures,* Mitigation Measure 5.4-b).

Adjacent MSHCP Lands

The Villages of San Jacinto Project is directly east of Criteria Cells 2775 and 2878. Although no development or establishment of MSHCP conservation areas has occurred as of yet in these criteria cells, some level of conservation may occur in the easternmost portions of the cells, directly adjacent to the Villages of San Jacinto Project site. Depending on proximity of these MSHCP conservation lands to the Villages of San Jacinto Project site, some level of edge effects on the conservation area may occur. Section 6.1.4 of the MSHCP, Guidelines Pertaining to the Urban/Wildlands Interface, addresses the indirect effects associated with locating development in proximity to the MSHCP conservation area and discusses measures to minimize these indirect effects. Several types of potential indirect effects on adjacent MSHCP conservation areas are discussed: drainage, toxics, lighting, noise, and exotic species.

Drainage

MSHCP requires that proposed developments in proximity to the MSHCP conservation area shall incorporate measures required through the NPDES requirements, to ensure that the quantity and quality of runoff discharged to the MSHCP conservation area is not altered in an adverse way. In particular, measures shall be put in place to avoid discharge of untreated surface runoff from developed and paved areas into the MSHCP conservation area. Stormwater systems shall

be designed to prevent the release of toxins, chemicals, petroleum products, exotic plant materials or other elements that might degrade or harm biological resources or ecosystem processes within the MSHCP conservation area.

The Villages of San Jacinto Project contains an extensive system of drainage basins, greenbelts, and detention basins/lakes engineered to provide for treatment of surface runoff prior to leaving the site. In addition, a SWPPP addressing construction-related and post-construction related erosion and runoff issues will be prepared and implemented (see *Section 5.8, Water Quality and Hydrology*). Therefore, indirect impacts on potential adjacent MSHCP conservation area lands due to drainage of harmful elements are not anticipated.

Toxics

Land uses proposed in proximity to the MSHCP conservation area that use chemical bioproducts such as manure that are potentially toxic or may adversely affect wildlife species, habitat, or water quality are required to incorporate measures to ensure that application of such chemicals does not result in discharge to the MSHCP conservation area. Although chemical bioproducts such as manure are not anticipated to be used on the Villages of San Jacinto Project site, project design measures and implementation of the SWPPP as discussed above would also prevent discharge of potential toxics into any adjacent MSHCP conservation areas. Therefore, indirect impacts on potential adjacent MSHCP conservation area lands due to toxic materials on the Villages of San Jacinto Project site are not anticipated.

Lighting

Due to the land uses proposed by the project, an increase in night lighting is anticipated. In order to avoid potential indirect impacts related to night lighting, mitigation is provided (see *Section 5.4.5, Mitigation Measures*, Mitigation Measure 5.4-c).

Noise

The MSHCP requires that "proposed noise-generating land uses affecting the MSHCP conservation area shall incorporate setbacks, berms or walls to minimize the effects of noise on MSHCP Conservation Area resources." For planning purposes, wildlife within the MSHCP Conservation Area should not be subject to noise that would exceed residential noise standards. Since the proposed land uses on a portion of the project site would be located adjacent to offsite MSHCP criteria cells include residential, school, park, and commercial/mixed use, noise is not expected to exceed residential noise standards (see *Section 5.11, Noise*). Therefore, impacts on potential adjacent MSHCP conservation lands due to increased noise are not anticipated.

Invasives

Due to the project's location adjacent to land that could potentially be conserved through the MSHCP Plan, potential indirect impacts related to invasive species may occur. In order to avoid potential impacts, mitigation is provided (see *Section 5.4.5, Mitigation Measures*, Mitigation Measure 5.4-d).

Indirect impacts to adjacent vegetation communities primarily would result from adverse "edge effects" as cited above. For the proposed project, the potential indirect impacts resulting from construction activities include dust, noise, and general human presence that may temporarily (or in the case of general human presence, permanently) disrupt species and habitat vitality and lead to construction-related soil erosion and runoff. However, all project grading will be subject to the typical restrictions (e.g., Best Management Practices) and requirements that address erosion and runoff, including the federal Clean Water Act, NPDES, and preparation of a SWPPP. In addition, as the site is surrounded by agriculture and an EMWD water reclamation facility, impacts to sensitive vegetation types adjacent to the project site are highly unlikely. See *Section 5.8, Water Quality and Hydrology*.

Non-MSHCP Covered Species

The June 17, 2003, Final MSHCP EIR/EIS analyzed other, non-covered species considered to be sensitive in the western Riverside County area. This EIR determined that other species which were not covered under the plan, would not be significantly affected by adoption of the plan. Therefore, any non-covered species in the MSHCP would not be considered significant.

5.4.5 Mitigation Measures

Project Specific Mitigation Measures

5.4-a Mitigation for impacts to jurisdictional wetlands and non-wetlands waters as required by RWQCB and CDFG, will consist of: (1) off-site creation, (2) a combination of off-site creation and enhancement of wetlands of equal or higher habitat quality, or (3) purchase of wetlands mitigation credits in an approved mitigation bank. Because wetlands/waters on the Villages of San Jacinto project site are isolated, of low overall quality (contain large quantities of non-native species), and are surrounded by agricultural lands, they do not provide high quality habitat for riparian-dependant wildlife species, therefore mitigation onsite would not result in equal or greater wetland habitat value. Mitigation for on-site wetlands/waters impacts would be a biologically equivalent or superior alternative to avoidance of these impacts. The above not withstanding, wetlands areas created, enhanced, or preserved through the project's wetlands mitigation plan would be connected to other wetlands/riparian/riverine areas and would provide overall biological value to the peregrine falcon and other sensitive wildlife and plant species. Wetland

mitigation ratios are based on past experience developing appropriate mitigation for impacts to similar wetland and/or Waters of the US.

Herbaceous Wetlands, Open Water, Freshwater Marsh and Intermittent Stream Channel

Mitigation for impacts to 4.22 acres of open water, 0.23 acre of freshwater marsh, 0.21 acre of herbaceous wetlands, and 0.01 acre of intermittent unvegetated stream channel would be accomplished through the creation or purchase of wetlands mitigation credits from an approved mitigation bank at a 1:1 ratio (i.e., 4.67 acres total) (*see Table 5.4-5, Mitigation Requirements for Impacts to Sensitive Vegetation Communities on the Villages of San Jacinto Project Study Area*).

Cismontane Alkali Marsh

Mitigation for impacts to 0.01 acre of cismontane alkali marsh would be accomplished through the creation, or a combination of creation and enhancement, of wetlands of equal or higher habitat quality at a 3:1 ratio (i.e., 0.03 acre). Mitigation can also be accomplished through the purchase of wetlands mitigation credits in an approved mitigation bank.

Southern Willow Woodland

Mitigation for impacts to 0.07 acre of southern willow woodland would be required at a ratio of 4:1 (i.e., 0.28 acre) (see *Section 5.4 in the EIR)*. Mitigation can be accomplished through the creation, or a combination of creation and enhancement of wetlands of equal or higher habitat quality. Mitigation can also be accomplished through the purchase of wetland mitigation credits in an approved mitigation bank.

Table 5.4-5
Mitigation Requirements for Impacts to Sensitive Vegetation Communities on the Villages of San Jacinto Project Study Area

Plant Community/Land Cover Type	Impact Acreage	Mitigation Ratio	Required Mitigation Acreage
Open Water	4.22	1:1	4.22
Freshwater Marsh	0.23	1:1	0.23
Herbaceous Wetlands	0.03	1:1	0.03
Disturbed Herbaceous Wetlands	0.18	1:1	0.18
Intermittent Unvegetated Stream Channel	0.01	1:1	0.01
Cismontane Alkali Marsh	0.01	3:1	0.03
Southern Willow Woodland	0.07	4:1	0.28
Total	**4.75**		**4.98**

5.4-b Per MSHCP, because of the site does not support long term conservation value for burrowing owls, mitigation for impacts to this pair of owls can include passive or active relocation of owls following accepted protocols per the burrowing owl Species Account in Volume II-B of the MSHCP. In addition, MSHCP requires that:

> Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present will be conducted for all Covered Activities through the life of the permit. Surveys will be conducted within 30 days prior to disturbance. Take of active nests will be avoided. Passive relocation (use of one way doors and collapse of burrows) will occur when owls are present outside the nesting season.

Because impacts to other sensitive wildlife species are covered under the MSHCP, no additional mitigation is proposed for impacts to these species. However, if construction activity is to take place during the breeding season (i.e., January through October), a one-time biological survey for nesting bird species would be conducted within the proposed impact area no earlier than 72 hours prior to construction. This survey is necessary to assure avoidance of impacts to nesting native birds (per the federal Migratory Bird Treaty Act). If nesting birds are detected within vegetation which is to be impacted, the nest location(s) will be protected. A buffer of 25 to 300 feet (specific width to be determined by the project biologist according to species of bird) around the nest will be avoided until fledging.

5.4-c MSHCP requires that night lighting shall be directed away from the MSHCP conservation area. Shielding will be incorporated by the project to ensure that ambient lighting in the MSHCP conservation area is not increased; therefore impacts on potential adjacent MSHCP conservation area lands due to increased lighting would be avoided.

5.4-d Table 6.2 of the MSHCP lists landscape plant species that shall be avoided for all portions of developments that are located adjacent to (within 1,000 feet) the MSHCP conservation areas. These plant species will be avoided on the areas of the Villages of San Jacinto project site adjacent to Criteria Cells 2775 and 2878 to the west of the project site. This would be achieved by including language in the residential sale documents to ensure that future property owners understand the types of plants that are restricted. Sample language for inclusion in sale documents would be submitted to the Planning Department for approval prior to approval of a certificate of occupancy. Therefore no indirect effects due to invasive species are anticipated.

5.4.6 Residual Impacts/Level of Significance after Mitigation

The proposed project is consistent with the Western Riverside County MSHCP which, aside from Clean Water Act requirements, fully mitigates for impacts to biological resources within western Riverside County. Implementation of suggested mitigation measures will ensure that project impacts are mitigated to a level below significance.

INTENTIONALLY LEFT BLANK

5.5 CULTURAL RESOURCES

5.5.1 Introduction/Methodology

The following discussion focuses on the project's relationship to existing cultural resources, potential impacts to these resources and mitigation measures required to reduce these impacts to a level below significance. A residual impact statement has been included in order to characterize the level of significance of impacts after mitigation measures have been applied.

Preparation of this section involved summarizing information contained in the December 2004 Cultural Resources Study for the project site, prepared by ASM Affiliates. This section summarizes existing condition information, and uses the City of San Jacinto CEQA Significance Thresholds, specifically the cultural resource thresholds, to determine if cultural resource impacts were considered significant under CEQA. Mitigation measures were developed by cultural resource consultants, ASM Affiliates.

For reference purposes, the March 2005 Cultural Resources Study for the project is included as *Appendix D* to this EIR. Methods used in the preparation of this December 2004 report are contained therein.

5.5.2 Existing Conditions

Cultural History

The project area is located in a region intermediate between the desert regions to the east and the coastal region to the west. As such, it is likely to have been affected by population movements from both the coastal and desert regions. There is a significant body of research that was developed during the Eastside Reservoir Project (now referred to as Diamond Valley Lake) planning and environmental study which has helped to provide a cultural resource chronology baseline for the western slopes of the Santa Rosa and San Jacinto Mountains. These sources can be applied for the purposes of a general cultural history, especially for the Late Prehistoric period, assuming that Native American mobility and resource use practices extended across the environmental zones from the deserts to the mountains, as evident from ethnohistoric sources. These sources can not provide clarification on patterns of social organization, settlement, territoriality and seasonality as they relate to the deep past. It is likely that these patterns changed over time with changing environmental conditions, resident tribal affiliation and demographics.

The prehistoric chronology is divided into three periods, each characterized by differing patterns of socio-political organization, technology, resource focus and land use. They include the Paleoindian, Archaic and Late Prehistoric periods.

Paleoindian Period

The Paleoindian period is represented by several archaeological complexes, including what are referred to as the related Fluted-Point and Western Pluvial Lakes traditions in the Mojave Desert, and the Paleo-Coastal tradition on the Pacific coastal plane. Among the best known archaeological complexes of tool types and settlement distributions in the desert is the Lake Mojave complex. On the coastal plane and Imperial Valley is the San Dieguito complex.

Small, highly mobile bands of hunters and gatherers depended on various game animals and an extensive rather than intensive pattern of plant exploitation. Sites tend to occur along former pluvial lakes and desert pavements, or along major stream channels. Milling tools are absent in the desert and rare on the coast, suggesting minimal use of hard seeds. The stone tool kit included foliate points or knives, long-stemmed points, lanceolate bifaces, discoidals, burins, crescents, flake and core scrapers, choppers, hammerstones, cores, drills, gravers and casual flake tools.

Archiac Period (8000–1500 B.P.)
