** Revised **

PATRICIA SCOTT, CHAIR
JOHN GAGNEPAIN, VICE-CHAIR
CORINNE AWAD, SECOND VICE-CHAIR
TAURUS JONES, COMMISSIONER
MICHELLE PETERSON, COMMISSIONER

REGULAR MEETING AGENDA
PLANNING COMMISSION OF THE CITY OF SAN JACINTO
TUESDAY, OCTOBER 27, 2026
6:00 PM OPEN SESSION

COMMUNITY CENTER
625 S. PICO AVENUE
SAN JACINTO, CA 92583
951-487-7330

In compliance with the Americans with Disabilities Act, if you need special assistance to participate in this meeting, please contact the office of the City Clerk at 951-487-7330 ext. 339. Notification 48 hours prior to a meeting will enable the City to make reasonable arrangements to ensure accessibility to that meeting [28 CFR 35.102.35.104 ADA Title II].

The Planning Commission meeting may be observed virtually by accessing https://horizon.agendalink.app/engage-v2/sanjacintoca/agendas and selecting the “Watch” button next to the corresponding agenda for the meeting date, or in person at the San Jacinto Community Center.

Public Comments will only be accepted in person during the meeting or in writing to the Community Development Clerk no later than 3:00 PM on the day of the meeting. Participants viewing the Livestream will not have a comment option.

Watch the Meeting (Official Livestream)
The official way to watch and listen to the Planning Commission meeting is through the City's AgendaLink Livestream by selecting the **"Watch"** option for the applicable meeting on the City's website.

Provide Live Public Comment by Telephone
Members of the public wishing to provide live public comment may participate by telephone using the Microsoft Teams dial-in information below. The telephone line is intended **only** for individuals who wish to address the Planning Commission during the designated Public Comment period.

Dial in by phone:
+1 (951) 465-7684
Conference ID: 706 805 861#

Public Comment Workflow

When the Chair opens the Public Comment portion of the meeting, the process will be as follows:

- Members of the public will call the Teams dial-in number and wait in the Teams lobby.
- Callers should remain in the Teams lobby until the applicable Public Comment period opens. They should not be admitted before the Chair opens Public Comment.
- The Clerk will admit one caller at a time from the lobby as they are ready to speak. If multiple callers are waiting, they should remain in the lobby until it is their turn.
- Once admitted, callers should be able to speak. If necessary, the Clerk can unmute the caller.
- The Chair will recognize the caller, and the caller should first state their name for the record before providing their public comment.
- Each caller will have up to three (3) minutes to speak.
- After completing their comments, callers may either hang up, or the Clerk may remove them from the meeting before admitting the next speaker.

Written public comments ***may only be submitted via email*** to comments@sanjacintoca.gov or by hard copy to the Office of the Community Development Clerk at 595 S. San Jacinto Ave., San Jacinto, CA 92583, no later than 3:00 PM on the day of the meeting. Comments via text and social media (Facebook, Twitter, etc.) will not be accepted. Please identify the agenda item number and "PUBLIC COMMENT" in the subject line of the email or hard copy document. All written correspondence received by the 3:00 PM deadline will be distributed to the legislative body prior to the meeting and retained with the official meeting record. All email comments shall be subject to the same rules as would otherwise govern in-person speaker comments at the Planning Commission meeting.

Reading of Public Comments: The Community Development Clerk will read all email comments, provided that the reading shall not exceed three (3) minutes or such other time as the Chair may provide, consistent with the time limit for speakers at a Planning Commission meeting. The email comments submitted shall become part of the record of the Planning Commission meeting.

1. ORGANIZATION

1.1 Roll Call

1.2 Pledge of Allegiance

2. PUBLIC COMMENTS

3. MINUTES

3.1 Minutes of the Regular Planning Commission Meeting of September 22, 2026
RECOMMENDATION:
Staff recommends that the Planning Commission APPROVE the minutes of the Regular Planning Commission Meeting of September 22, 2026.

4. PUBLIC HEARINGS

4.1 Bradley Gardens Expansion Project
A Conditional Use Permit and Site Plan and Design Review to expand the existing Bradley Gardens Care Facility from 44 beds to 103 beds on a 2.98-acre parcel. The project includes an approximately 17,100-square-foot, building addition (43 beds) and the conversion of an existing 2,596-square-foot office building into a care facility (16 beds).

— DETERMINE that the Project, as analyzed in the Initial Study/Mitigated Negative Declaration (IS/MND) as revised by the Errata, will not have a significant effect on the environment with the incorporation of mitigation measures, and that the Errata does not require recirculation pursuant to CEQA Guidelines §15073.5; and ADOPT the IS/MND, as revised, and the associated Mitigation Monitoring and Reporting Program (MMRP), pursuant to the California Environmental Quality Act (CEQA); and

— APPROVE a Conditional Use Permit, which includes a Nonconforming Adjustment to expand the Bradley Gardens facility from 44 beds to 103 beds, which and covert an existing 2,596 square foot vacant office building to a 16-bed Care Facility.

— APPROVE a Site Plan and Design Review (USE26-0126) for construction of a 17,100 square foot single-story addition to the existing facility.

5. COMMUNITY DEVELOPMENT UPDATE

6. COMMISSIONER COMMENTS

7. ADJOURNMENT

DOCUMENTS RELATED TO OPEN SESSION AGENDAS (SB343) - Any public record, relating to an open session agenda item, that is distributed within 72 hours prior to the meeting is available for public inspection at the public counter located in the Administration Building of City Hall, 595 S. San Jacinto Avenue, San Jacinto, CA 92583.

I, Lori Matley, Community Development Clerk of the City of San Jacinto, do hereby certify that I caused to be posted the foregoing agenda this October 23, 2026 as requested by law.

Lori Matley, Community Development Clerk

Date Posted: October 23, 2026

October 27, 2026

TO:	Planning Commission
REQUESTED BY:	Lori Matley, Community Development Clerk
APPROVED BY:	Kevin White, Community Development Director
SUBJECT:	Minutes of the Regular Planning Commission Meeting of September 22, 2026

RECOMMENDATION:

Staff recommends that the Planning Commission **APPROVE** the minutes of the Regular Planning Commission Meeting of September 22, 2026.

1. ORGANIZATION

1.1. Call to Order

Chair Patricia Scottt called the Meeting to order at 6:00 p.m.

1.2. Roll Call

Community Development Clerk Lori Matley conducted the roll call.

Present: Commissioner Taurus Jones, Commissioner Michelle Peterson, Commissioner Patricia Scott

Absent: Commissioner Awad**,** Commissioner Gagnepain

1.3. Pledge of Allegiance

Commissioner Jones lead the Pledge of Allegiance.

2. PUBLIC COMMENTS

There were no public comments.

3. MINUTES

3.1. Minutes of the Regular Planning Commission Meeting of July 28, 2026

A motion was made by Commissioner Peterson and seconded by Commissioner Jones to approve the Regular Planning Commission Meeting Minutes of July 28, 2026. **Motion carried** 3/0.

AYES:	Jones, Peterson, Scott
NAYS:	None
ABSENT:	Awad. Gagnepain
ABSTAIN:	None

4. PUBLIC HEARING

4.1. Annexation of 43.68 Acres into the City of San Jacinto (Annexation A), a Lot Line Adjustment 22-01, and Tentative Tract Map 34271

Assistant Planner Matthew Kramer presented the Staff Report.

Commissioner Scott opened the Public Hearing at 6:15 pm. The applicant Bryan Menne was present and agreed with the conditions. Chair Scott closed the Public Hearing at 6:29 pm.

Following discussion by the Planning Commission, a motion was made by Commissioner Jones and seconded by Commissioner Peterson to: 1. **DETERMINE** that the proposed Project will not have a significant effect on the environment with the incorporation of mitigation based on the findings set forth in the case record and ADOPT a Mitigated Negative Declaration (MND) and Mitigation Monitoring and Reporting Program, pursuant to the California Environmental Quality Act (CEQA); 2. **AUTHORIZE** the Annexation of 2 parcels on 43.68 acres into the City of San Jacinto, subject to review and approval by the Riverside Local Agency Formation Commission (LAFCO); 3. **APPROVE** Lot Line Adjustment between two parcels, subject to approval of the Annexation by LAFCO and final adoption; and 4. **APPROVE** Tentative Tract Map (TTM) 34271 to subdivide 41.74 acres, into 151 residential lots for the ultimate construction of 151 single-family detached residences, and to create 7 lettered lots for onsite roadways, a detention basin, parks, and on-site landscape subject to the Recommended Conditions of Approval subject to approval of the Annexation by LAFCO and final adoption. (P22-004). **Motion carried** 3/0.

AYES:	Jones, Peterson, Scott
NAYS:	None
ABSENT:	Awad, Gagnepain
ABSTAIN:	None

4.2. Annexation of 143.62 Acres in the City of San Jacinto (Annexation B) P22-084

Assistant Planner Matthew Kramer presented the Staff Report.

Commissioner Scott opened the Public Hearing at 6:29 pm. There were no public comments. Commissioner Scott closed the Public Hearing at 6:29 pm.

Following discussion by the Planning Commission, a motion was made by Commissioner Jones and seconded by Commissioner Peterson to: 1. **DETERMINE** pursuant to the California Code of Regulations the project is exempt from CEQA as the project is consistent with the General Plan policies for which an EIR was certified, CEQA Guidelines Section 15183; and 2. **AUTHORIZE** the Annexation of 94 parcels on 143.62 acres within the City's Sphere of Influence. (P22-084). **Motion carried** 3/0.

AYES: Jones, Peterson, Scott
NAYS: None
ABSENT: Awad, Gagnepain
ABSTAIN: None

5. COMMUNITY DEVELOPMENT UPDATE

5.1. Community Development Director Kevin White provided an update on the following:

- Development Activity
- Beyond Market
- The Magnet
- Trunk or Treat
- State of the City
- Mile on Main Street

6. COMMISSIONER COMMENTS

Commissioners provided their comments.

7. ADJOURNMENT

With no further business to discuss, Commissioner Peterson adjourned the meeting at 6:37 p.m.

Respectfully submitted,

_____
Planning Commission Secretary

City of San Jacinto
Planning Commission

_____
Planning Commission Chair

October 27, 2026

TO:	Planning Commission
REQUESTED BY:	Frank Chen, Associate Planner
APPROVED BY:	Kevin White, Community Development Director
SUBJECT:	Bradley Gardens Expansion Project

RECOMMENDATION:

Staff Recommends that the Planning Commission:

1. **DETERMINE** that the Project, as analyzed in the Initial Study/Mitigated Negative Declaration (IS/MND) as revised by the Errata, will not have a significant effect on the environment with the incorporation of mitigation measures, and that the Errata does not require recirculation pursuant to CEQA Guidelines §15073.5; ADOPT the IS/MND, as revised, and the associated Mitigation Monitoring and Reporting Program (MMRP), pursuant to the California Environmental Quality Act (CEQA); and
2. **APPROVE** a Conditional Use Permit, which includes a Nonconforming Adjustment to expand the Bradley Gardens facility from 44 beds to 103 beds, and covert an existing 2,596 square foot vacant office building to a 16-bed Care Facility.
3. **APPROVE** a Site Plan and Design Review (USE26-0126) for construction of a 17,100 square foot single-story addition to the existing facility.

DISCUSSION:

The proposed project is a submittal by Generations Healthcare to expand the Bradley Gardens Care Facility. The Bradley Gardens site has been utilized as both a Convalescent and Congregate Care facility since 1964. The facility currently has been improved with a 12,132-square-foot facility (Building A) which houses 44 beds, a 2,609-square-foot office (Building B), and a 2,596-square-foot office (Building C) In addition the site includes a 1,074-square-foot maintenance building and a 443-square-foot storage building. The project site is located on a 2.98-acre parcel (APN 435-330-003), located at the southeast corner of 7th Street and Grand Avenue. The site is relatively flat with a gentle slope to the southeast and includes driveways, a parking lot, an outdoor courtyard, and landscaping.

The applicant seeks to continue operating the facility as both a Convalescent and Congregate Care Facility that includes 24-hour Skilled Nursing Facility (SNF), Special Treatment Program (STP), and Psychiatric Health Facility (PHF). The proposed project would also expand the established use within the existing parcel. Specifically, the proposed project would expand Building A with an approximately 17,100-square-foot addition, and convert Building C in the northwest corner of the site to a 16-bed PHF. To construct the addition, the project proposes to demolish the maintenance and storage buildings. Building B, the existing 2,609 square-foot administrative office building, will be left unchanged. With this project, the facility will have a total of 103 beds and 100 new employees across all shifts.

To facilitate the project, the applicant submitted a Conditional Use Permit to expand an existing legal non-conforming use in accordance with the Development Code, and a Site Plan and Design Review for the addition of Building A and the conversion of Building C from an office to patient care.

ANALYSIS:

The General Plan designation for the site is Industrial (I). The Industrial designation provides for low and non-polluting industrial and manufacturing activities, and allows other uses that are determined to be compatible with the primary uses. The site is zoned Industrial Light (IL), which is applied to areas appropriate for light industry, manufacturing, and heavier commercial service uses. The IL zone is consistent with the Industrial General Plan land use designation.

The site is surrounded primarily by industrial zoned land, most of which is vacant. A metal fabrication plant is located across 7th Street to the north. An existing mobile home development is located to the south, beyond one vacant parcel, and to the southwest across Grand Avenue.

Caption

Project Site and Surrounding Land Use, General Plan, and Zoning			
	Land Use	**General Plan**	**Zoning**
Project Site	Convalescent Facility (Skilled Nursing / Psychiatric Care)	Industrial (I)	Industrial Light (IL)
North	Metal Fabrication Plant; Single-Family Residences	Industrial (I)	Industrial Light (IL)
South	Vacant	Industrial (I)	Industrial Light (IL)
East	Vacant	Industrial (I)	Industrial Light (IL)
West	Vacant	Industrial (I)	Industrial Light (IL)
Southwest	Mobile Home Development	High Density Residential (HDR)	Residential, High Density (RH)

Conditional Use Permit

The Bradley Garden Facility is classified as both a Congregate Care Facility and Convalescent Facility, as the existing operations provide for different types of patient care that include skilled nursing, 24-hour care with regular medical attention, and care for persons who may be mentally impaired. Table 2-2 of the Development Code indicates the land uses allowed within each zone and the planning permit required to establish each use. Table 2-2 does not permit Congregate Care or Convalescent facilities in the IL zone, and therefore the existing use is nonconforming. A nonconforming use is a land use that legally existed before the effective date of the Development Code but which is no longer allowed in the zone in which it is located. As previously mentioned, the facility was established in 1964, and the use became legal nonconforming through changes to the Development Code and Zoning Map.

Section 17.705.120 (B)(1) provides a procedure for the City to review requests to continue a legal nonconforming use and allow a legal nonconforming use to be expanded through a Nonconforming Adjustment A Nonconforming Adjustment requires approval by the Planning Commission with a Conditional Use Permit. Approval of the proposed project would allow the continued use and reinvestment in an established healthcare facility that has operated on the site while expanding its capacity to provide needed skilled nursing and psychiatric care services. The proposed expansion is not anticipated to adversely affect surrounding properties or conflict with nearby land uses. Additionally, the existing buildings are specifically configured to support healthcare operations, and their specialized design and layout would make them difficult to re-purpose for other uses permitted within the Industrial Light zone. Allowing the facility to expand within its existing site would promote the productive use of developed property and avoid the potential for prolonged vacancy.

Site Plan and Design Review

The project includes an expansion to Building A and a change of use from an Office to Congregate Care for Building C. The expansion to Building A will connect at the easternmost portion of the existing building and extend to the southeast portion of the site, in place of the existing storage and maintenance buildings that will be demolished. Like the existing building, the expansion will be a single-story building, with a maximum 22 feet in height. It will include patient rooms, a nurse station, kitchen, dining and recreation rooms, a rehabilitation room, offices, and support spaces. Building C will transition from an office building to Congregate Care for the PHF. All proposed changes will be internal except for minor facade upgrades. The 2,596-square-foot building will include patient rooms, a nurse station, dining, activity, and support rooms. The building will remain a single-story, approximately 14 feet in height, at its existing location in the northwest corner of the site.

Other changes to the site include a new open space area with seating, walkways, artificial turf, and decorative planting behind the existing buildings for use by patients, staff, and visitors. These features will be enclosed by the buildings and a combination of fences and decorative walls to control access to portions of the facility. The upgraded facility will also include a new trash enclosure with decorative walls painted to match the structures on site.

Architecture and Materials

The project site is developed with three single-story buildings characterized by a combination of gray, light tan, and beige painted stucco exterior walls and low-pitched gray composition-shingle gable roofs. Architectural elements include painted metal doors, modest roof overhangs, and regularly spaced windows along the building elevations. The proposed building expansion will also utilize complimentary painted stucco, but include stone veneer accents, asphalt shingle roofs, and aluminum windows in brown, beige, and gray tones that match the existing buildings. Staff finds the design consistent with the existing facility and appropriate for its setting.

Access and Circulation

The existing facility currently has three 17-foot-wide driveways that connect to 7th Street, including two driveways near the center of the site and one driveway on the eastern portion of the property. The project proposes to consolidate the two central driveways into a single 24-foot driveway, and widen the eastern driveway from 15 feet to 24 feet. The eastern driveway will wrap around the rear portion of the facility and connect with a new single driveway on Grand Avenue. This connection will serve as an emergency access lane consistent with the requirements of the Fire Department.

Road Improvement

7th Street is classified as a Major roadway in the Mobility Element of the General Plan. To comply with the specifications of a Major roadway, the project will be conditioned to dedicate 3 feet of right-of-way. In addition, the condition of approval will require the developer to install curb, gutter, and sidewalk along 7th Street. The portion of Grand Avenue adjacent to the project site is classified as a Collector roadway. In order to comply with the General Plan, the project will be conditioned to dedicate 6 feet of right-of-way and install curb, gutter, and sidewalk along the project frontage.

Landscaping

The project will add new landscaping within the parking lot and along the 7th Street and Grand Avenue frontages. In addition, new landscaping next to the proposed building additions and the new open space area. In total, approximately 24 percent of the site will be landscaped, which will include 24-inch box trees, shrubs, and succulents concentrated near the expanded portions of building A.

Water, Wastewater, and Drainage

The City of San Jacinto provides water and sewer service. The project connects to the existing 12-inch water line and 8-inch sewer line in 7th Street. Regarding the on-site and off-site drainage the project has been conditioned to remove the existing swale along 7th Street and install a 24-inch storm drain to collect and convey runoff from the project frontage from the easternmost portion of the property, and discharge the flows at the southwest intersection of Grand Avenue and Seventh Street.

Development Standards

The design of the project has been analyzed for compliance with the standards for the IL zone (SJDC Table 2-7), as noted in the table below

Standard	Required	Existing Structures	Compliant?	Proposed Structures	Compliant?
Maximum FAR	0.50	0.15	Yes	0.27	Yes
Maximum Height	45 ft.	~14-20 ft.	Yes	22 ft. (addition)	Yes
Front Setback (7th St.), adjacent to nonresidential	10 ft.	Building A ~68 ft. Building B ~90 ft. Building C ~11 ft.	Yes Yes Yes	Building A 68 ft.	Yes
Street Side Setback abutting nonresidential	10 ft.	Building A ~114 ft. Building B ~10 ft. Building C ~3 ft.	Yes Yes No	Building A 68 ft.	Yes
Rear Setback (south), abutting nonresidential	None required	Building A ~95 ft. Building B ~68 ft. Building C ~211 ft.	Yes Yes Yes	36 ft.	Yes
Maximum Impervious Coverage	80%	72%	Yes	76%	Yes

The existing and proposed structures meet all of the Development Standards except for Building C, which will not be consistent with the street side yard setback after dedication of right-of way for Grand Avenue required by the project. Staff has reviewed the location of the building as it relates to the proposed street improvements and finds that the building will not impact circulation.

Parking

The proposed facility requires 1 space for each on-duty employee and 1 space for every 10 beds. The proposed facility will have 41 employees on the largest shift and 103 beds. Therefore, the Project is required to have 51 parking spaces. The project provides 52 parking spaces, which include 48 standard spaces and 4 accessible spaces. In addition, the project also provides 6 bicycle parking spaces.

ENVIRONMENTAL ANALYSIS

The City of San Jacinto is the lead agency on the proposed Project and has reviewed all submitted drafts, technical studies, and reports. An Initial Study was prepared to evaluate the Project's potential impacts on the environment as required by the California Environmental Quality Act (CEQA). The Initial Study found that the Project would have a less than significant impact on all environmental topics, except Biological Resources, Cultural Resources, and Geology and Soils, which would be less than significant with the mitigation measures described below.

Biological Resources

The site is within the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) area but is not within a Criteria Cell or conservation area. The site is developed and sparsely vegetated, so it does not support native habitat, riparian areas, wetlands, or jurisdictional waters, and no special-status plant or wildlife species were identified. However, existing trees and shrubs could support nesting birds. Mitigation Measure BIO-1 requires a pre-construction nesting bird survey within three days before vegetation removal or ground disturbance during the nesting season (February 1 through August 31).

Cultural Resources

A Cultural Resources Study did not identify any previously recorded cultural resources on the site. Because the site has been developed since 1964, the potential to encounter intact archaeological resources is low, but Mitigation Measure CUL-1 requires work to stop and a qualified archaeologist to evaluate any resources discovered during construction.

Geology and Soils

The site is underlain by Holocene and late Pleistocene-aged young alluvial valley deposits, which have a low potential to yield significant paleontological resources. To address ground disturbance deeper than these deposits, Mitigation Measure GEO-1 requires a Paleontological Resources Impact Mitigation Plan and full-time paleontological monitoring of excavation deeper than 3 feet.

Mitigated Negative Declaration

Based upon the information contained in the Initial Study, as revised by the Errata, and pursuant to the requirements of CEQA, it has been determined that this Project, with the incorporation of mitigation measures, will not have a significant impact on the environment. The mitigation measures are included in the Mitigation Monitoring and Reporting Program and the conditions of approval. As a result, it is recommended that the Planning Commission adopt a Mitigated Negative Declaration for this Project.

SCAQMD asked that the emergency generator required for care facilities be evaluated and that SCAQMD be identified as a Responsible Agency. In response to the comment from SCAQMD, an Errata to the Initial Study was prepared to evaluate the Project's backup emergency generator; the Errata found that air quality, health risk, energy, greenhouse gas, and noise impacts would remain less than significant and did not change any significance conclusion or add any mitigation measure.

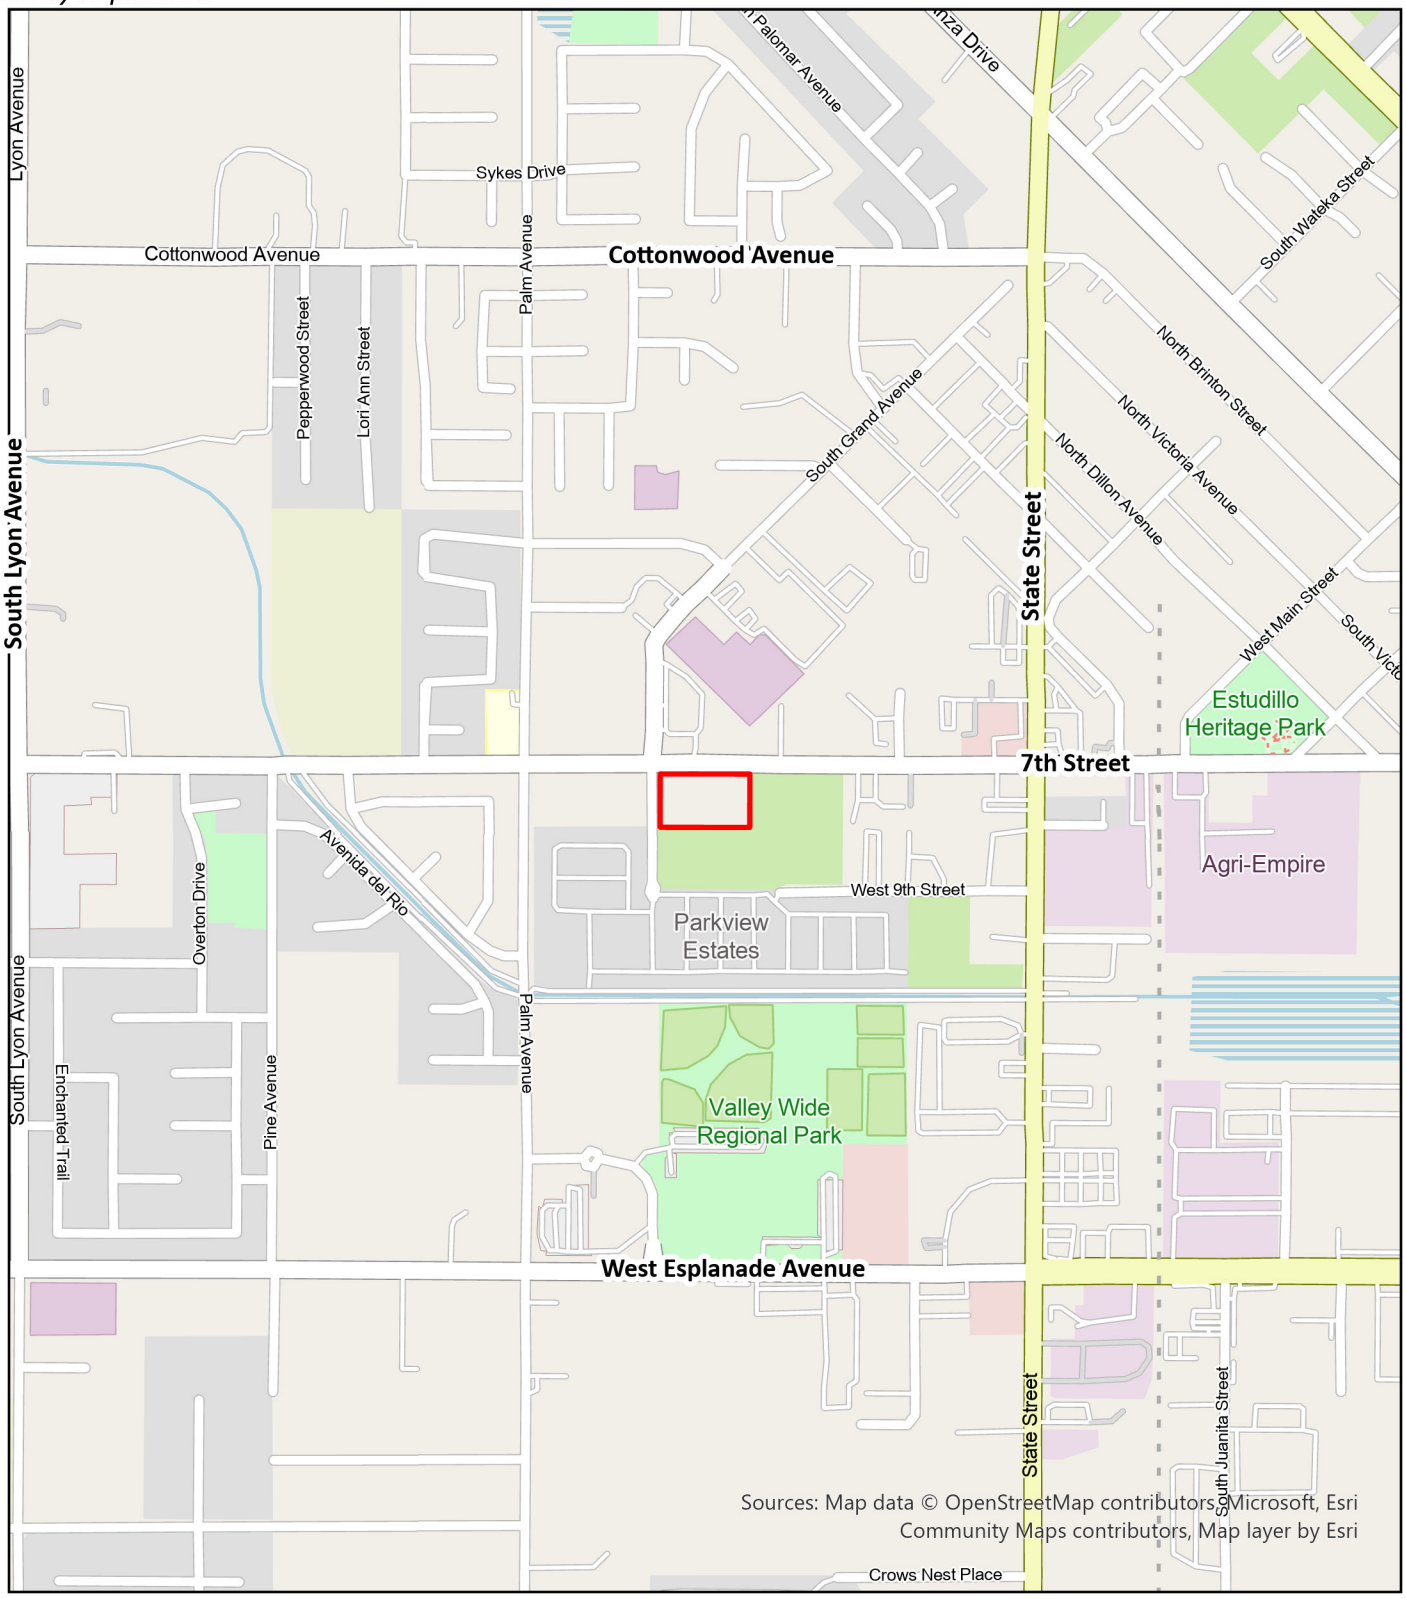
In addition staff received a comment letter from a resident in the vicinity of the project. The resident raised concerns about shift-change traffic, intersection and pedestrian safety, emergency vehicle sirens, site security, and neighborhood compatibility.

The project expands a use that has operated on the site since 1964 and would add only 8 new morning and 13 new evening peak hour trips, as documented in the initial study. Furthermore the project will consolidate driveways on 7th Street and adds sidewalks on both adjacent street frontages. Operational noise at the nearest residences is well below City standards, and the facility will continue to have 24-hour staffing and controlled access. The facility is not a hospital or emergency receiving facility, and patient transfers are generally scheduled and non-emergency. Siren noise from emergency vehicles is exempt from the City's noise standards under SJMC Section 8.40.070(C), which excludes public safety personnel performing official duties.

Written responses to both letters are attached.

PUBLIC NOTICE AND COMMENTS

A 10-day notice of public hearing was advertised on October 17, 2026, in the Press Enterprise. In addition, notices of the public hearing were mailed to all property owners within a 300-foot radius of the project site. No comment letters were received during the review period:



CONCLUSION:

The project expands a care facility that has operated on the site since 1964. The proposed expansion will remain within the existing parcel and all additions will meet the IL zone development standards. With mitigation, all environmental impacts would be less than significant and the conditions of approval will ensure that needed improvement to infrastructure will be constructed. Therefore Staff recommends that the Planning Commission adopt the Mitigated Negative Declaration and approve PROJ25-0178, subject in accordance with the Findings.

FINDINGS OF FACT:

NONCONFORMING ADJUSTMENT FINDINGS – SJDC SECTION 17.705.120(C) (USE25-0092)

Pursuant to Section 17.705.120(B)(1), the Planning Commission may approve a Nonconforming Adjustment with the granting of a Conditional Use Permit. The Nonconforming Adjustment proposed would allow the expansion of the existing Facility from 44 to 103 beds, including the approximately 17,100 square foot addition, convert the existing 2,596 square foot office building to a Care Facility.

1. The Nonconforming Adjustment is necessary because the subject use or structure was legal when it was originally initiated or constructed, but changes in this Development Code or the applicable zone development standards caused the use or structure to become legal nonconforming.

The site has operated as a Congregate Care and Convalescent Facility since 1964. County Assessor records cited in the Phase I Environmental Site Assessment show three of the four buildings constructed in 1964 and the fourth by 1971. Historical directories show occupancy by Colonial Nursing Home (1964), Colonial Convalescent Hospital (1974–1996), and Bradley Gardens Convalescent Center (2001–present). On June 10, 2024, the City issued a Certificate of Occupancy recognizing the facility as a convalescent use, and the operator holds a current City business license BL-004803-2025. These records confirm the use is active and has not been discontinued for 180 or more consecutive days (Section 17.705.070).

The site is zoned Industrial Light (IL). Under Table 2-2 of the Development Code, as comprehensively updated by Ordinance 22-10 (December 2022), the use, classified as Convalescent Facility in combination with Congregate Care Facility, is not permitted in the IL zone; both are allowed only with a Conditional Use Permit in residential or commercial zones. The use therefore became legal nonconforming through a change in the Development Code, not through any act of the owner. Section 17.705.050(A)(4) prohibits the expansion of a nonconforming use except through a Nonconforming Adjustment; the adjustment is therefore necessary to allow the proposed expansion. The setback nonconformity of the PHF building results from the corner cut-back dedication at 7th Street and Grand Avenue required by the City as part of this project, not from any act of the owner; after dedication, the building will be approximately 3 feet from the new corner property line.

2. Approving the Nonconforming Adjustment for the subject use or structure will not pose a serious hazard to the public health or safety of persons residing or working on or adjacent to the subject parcel.

The expansion continues a use that has operated on the site for over 60 years. The Phase I Environmental Site Assessment identified no recognized, controlled, or historical recognized environmental conditions on the property. The site is in FEMA Flood Zone X and is outside an Alquist-Priolo Earthquake Fault Zone, a Very High Fire Hazard Severity Zone, and the Hemet-Ryan Airport Land Use Compatibility Plan area. The addition will be built to current California Building Code seismic standards and the recommendations of the site-specific geotechnical investigation. The skilled nursing facility (SNF) addition is subject to plan review by the California Department of Health Care Access and Information (HCAI), and the PHF conversion is subject to City building permit review. Asbestos and lead-based paint surveys are required before demolition

of the maintenance and storage building. The construction Health Risk Assessment found a maximum cancer risk of 4.88 in one million at the maximally impacted sensitive receptor, below the 10 in one million threshold, with a non-cancer hazard index below 1.0. Operational noise from the project at the nearest residences is 40.7 dBA daytime and 36.1 dBA nighttime, below the City's 65 and 45 dBA standards. The facility is staffed 24 hours a day with controlled access. Fire access is provided by a gated emergency driveway from S. Grand Avenue equipped with a Knox lock and a fire lane along the south and east sides of the addition designed for an 80,000-pound apparatus load, subject to the Riverside County Fire Department conditions of approval.

3. The location, size, and operating characteristics of the legal nonconforming use or structure are compatible with the existing and future land uses in the vicinity.

The facility has coexisted with surrounding industrial uses since 1964, including the metal fabrication plant across W. 7th Street. Land to the south, east, and west is primarily vacant industrial land, and a mobile home development is located to the south beyond one vacant parcel and to the southwest across S. Grand Avenue. The expansion stays within the existing 2.98-acre parcel and does not extend the use onto adjacent land. The addition is single-story, approximately 22 feet in height, and is set back approximately 34 feet from the east property line and 36 feet from the south property line, providing separation from future industrial development on the adjacent vacant parcels. The site floor area ratio increases to 0.27, below the IL maximum of 0.50, and impervious coverage is 76 percent, below the 80 percent maximum. The project generates 180 net new daily trips (8 AM and 13 PM peak hour trips), screens out of vehicle miles traveled analysis, and adds 0.09 dBA CNEL to traffic noise on W. 7th Street. The new patient rooms are located in the addition on the south and east portion of the site, approximately 72 feet from 7th Street, the main noise source in the area, and the new common open space is located between the buildings, away from both street frontages. As conditioned, a recorded disclosure will notify future owners and operators that the adjacent IL land may develop with industrial uses.

CONDITIONAL USE PERMIT FINDINGS – SJDC SECTION 17.605 (USE25-0092)

1. The proposed use is consistent with the General Plan and any applicable specific plan.

The site is designated Industrial (I) in the General Plan. The Industrial designation provides for low- and non-polluting industrial uses and allows other uses that are determined to be compatible with the primary uses. The project continues an established health care use and is consistent with Policy ED-2.3 (Medical Facilities) by expanding local skilled nursing, short-term psychiatric, and psychiatric health facility capacity serving San Jacinto Valley residents and adding approximately 100 jobs. It is consistent with Policy LU 2.1 (Plan for New Development), as it connects to existing water, sewer, and storm drain lines in W. 7th Street and pays applicable development impact fees, and with Policy LU 2.2 (Infill Development), as it reuses a developed site and an existing building and adds sidewalks on both frontages. Consistent with Policy LU 3.1 (Surrounding Uses), the project remains single-story and low-rise. Consistent with Policy LU 3.4 (Environmental Compatibility), the site is outside fault, flood, and landslide hazard areas, and liquefaction potential is addressed through California Building Code design and the geotechnical recommendations. Consistent with Policies PS-6.1 and PS-6.2 (Noise), the new patient rooms are placed approximately 72 feet from W. 7th Street, the dominant noise source, and the common open space is shielded between buildings; project operational noise at the nearest residences is below City standards. The site is not located within a specific plan area.

2. The proposed use is allowed within the applicable zone and complies with all other applicable provisions of this Development Code and the Municipal Code.

The site is zoned IL. The use is classified as Convalescent Home – 7+ persons in combination with Congregate Care Facility – 7+ persons, neither of which Table 2-2 lists as allowed in the IL zone. The existing use is legal nonconforming, as described in Nonconforming Adjustment Finding 1. Section 17.705.050(A)(4) allows a nonconforming use to be expanded through a Nonconforming Adjustment, and Section 17.705.120(B)(1) authorizes the Planning Commission to approve the adjustment with a Conditional Use Permit. With the concurrent Nonconforming Adjustment, the use is allowed in the IL zone. As required by Section 17.705.050(B)(8), the addition complies with the IL development standards of Table 2-7, including floor area ratio (0.27; 0.50 maximum), height (approximately 22 feet; 45 feet maximum), setbacks (approximately 72 feet north, 34 feet east, and 36 feet south), and impervious coverage (76 percent; 80 percent maximum). Parking meets the Congregate Care Facility ratio of one space per on-duty employee plus one space per 10 beds: the 52 spaces provided serve 103 beds and up to 41 on-duty employees, a limit made a condition of approval (Section 17.705.110). Site Plan and Design Review (USE26-0126) is processed concurrently. As conditioned, the project will comply with the Water Efficient Landscape requirements (Chapter 17.325), exterior lighting standards (Section 17.300.080), and permitted construction hours (SJMC Section 8.40.090).

3. The design, location, size, and operating characteristics of the proposed activity will be compatible with the existing and future land uses in the vicinity.

The facts supporting Nonconforming Adjustment Finding 3 are incorporated here. In addition, the addition and the converted PHF building use stucco, stone veneer, asphalt shingle roofs, and aluminum windows in brown, beige, and grey tones, matching the existing skilled nursing building. Landscaping increases by 4,015 square feet to 40,362 square feet, approximately 31 percent of the site, and a new common open space is placed between the existing building and the addition, away from the street frontages. The two central driveways on W. 7th Street are consolidated into

a single 24-foot driveway, and the eastern driveway is widened. Exterior lighting will be shielded to prevent spill toward the residences southwest of the site. The facility's operating characteristics, 24-hour staffed care with controlled access, do not change; the expansion adds beds and staff, not a new type of activity.

4. The proposed use will not be materially detrimental to the health, safety and general welfare of the public or otherwise injurious to the environment or to the property or improvements within the area.

An Initial Study/Mitigated Negative Declaration was prepared and circulated for public review from September 17, 2026, to October 19, 2026 (SCH No. 2026090689). In response to a comment from the South Coast Air Quality Management District, an Errata evaluated the backup emergency generator and found no change to any significance conclusion and no new mitigation. All potentially significant impacts are reduced to less than significant with Mitigation Measures BIO-1 (nesting birds), CUL-1 (cultural resources), and GEO-1 (paleontological resources), which are included in the Mitigation Monitoring and Reporting Program and the conditions of approval. Construction health risk, operational noise at nearby residences, and traffic are below applicable thresholds. Regulated medical waste is handled by a registered medical waste hauler under the Medical Waste Management Act. The facility is licensed and inspected by the State, and the SNF addition is subject to HCAI plan review. The facts supporting Nonconforming Adjustment Finding 2 are incorporated here.

5. The site is physically suitable in terms of:

a. Its design, location, shape, size, and operating characteristics of the proposed use: The 2.98-acre corner parcel has frontage on W. 7th Street and S. Grand Avenue and is relatively flat. It accommodates the addition, the converted PHF, 52 parking spaces, 6 bicycle parking spaces, landscaping, open space, and the fire lane within the IL development standards. The geotechnical investigation found the site suitable for the proposed construction with its recommendations incorporated into the building design, and the Phase I Environmental Site Assessment found no recognized environmental conditions.

b. The provision of public and emergency vehicle (e.g., fire and medical) access: Access is provided from two 24-foot driveways on W. 7th Street with a 27.3-foot drive aisle through the parking lot. A gated emergency driveway from S. Grand Avenue, equipped with a Knox lock, connects to a fire lane along the south and east sides of the addition designed for an 80,000-pound apparatus load. The Riverside County Fire Department has reviewed the project, and as conditioned, it meets their requirements, including approval of the fire lane surface and structural section prior to grading permit. Right-of-way dedications of 3 feet on W. 7th Street and 6 feet on S. Grand Avenue, the corner cutback, and new curb, gutter, and sidewalk improve public access.

c. Public protection services (e.g., fire protection, police protection, etc.): Fire protection and emergency medical services are provided by the Riverside County Fire Department from Station 25, approximately 1.4 miles from the site, and Station 78, approximately 2.5 miles from the site. Police protection is provided under contract by the Riverside County Sheriff's Department from the San Jacinto Station at 160 W. 6th Street, approximately 1.1 miles from the site. The Initial Study found that existing facilities can serve the project without new or expanded stations. The project will pay applicable development impact fees, and 24-hour on-site staffing with controlled access limits demand for police services.

d. The provision of utilities (e.g., potable water, schools, solid waste collection and disposal, storm drainage, wastewater collection, treatment, and disposal, etc.): Eastern Municipal Water District (EMWD) provides water and sewer service. The project connects to the existing 12-inch water line and 8-inch sewer line in W. 7th Street. Added water demand of approximately 7,473 gallons per day is within the supplies projected in EMWD's 2025 Urban Water Management Plan. Wastewater is treated at EMWD's San Jacinto Valley Regional Water Reclamation Facility, which has adequate remaining capacity. Storm drainage is managed on site through pervious concrete, landscape infiltration, and new catch basins in accordance with the approved Water Quality Management Plan, discharging to the existing 24-inch storm drain in W. 7th Street. Southern California Edison and SoCalGas serve the existing facility. Solid waste will be disposed of at Riverside County landfills with remaining permitted capacity, and regulated medical waste is collected separately by a registered hauler. The project adds no residential units and generates no direct school enrollment; statutory school fees will be paid to the San Jacinto Unified School District at building permit issuance, as applicable.

General Notes, Requirements, and Conditions of Approval
PROJ25-0178 (USE26-0126 and USE25-0092)

Approval Date: TBD
Effective Date: TBD
Expiration Date: TBD

PROJECT LOCATION: The project site is located at 980 W. 7th Street, at the corner of W. 7th Street and S. Grand Avenue. APN: 435-330-003.

APPLICANT: Generations Healthcare
Attn: Thomas Jurbala
6 Hutton Centre Dr. Suite 400
Santa Ana, CA 92707

ACCEPTED AND AGREED TO BY: _____
Applicant **Date**

PROJECT DESCRIPTION:

A proposal by Generations Healthcare, for a Conditional Use Permit (USE25-0092) and Site Plan and Design Review (USE26-0126), processed under the legal nonconforming provisions of SJMC Section 17.705.120 (Nonconforming Adjustment), to expand the existing Bradley Gardens skilled nursing facility with an 17,100 square-foot single-story addition (43 additional skilled nursing beds) and to convert an existing 2,596 square-foot vacant office building into a 16-bed psychiatric health facility, for a total capacity of 103 beds, on 2.98-acres in the Industrial Light (IL) zone. The project also includes parking, landscaping, drainage, driveway and frontage improvements.

General Requirements & Information – CUP/SPDR

A) The applicant shall by accepting these conditions agree to defend (with legal counsel of City's selection), indemnify, and hold harmless the City and its elected and appointed officials, agents, attorneys, employees and officers, from any action, claim or proceeding brought against the City or its elected and appointed officials, agents, employees and officers to attack, set aside, void, or annul a discretionary land use approval of the City, which action is brought within the applicable statute of limitations. The required indemnification shall include damages awarded against the City, if any, costs of suit, attorneys' fees and other costs and expenses incurred in connection with the action.

B) All plans subsequently submitted to the City shall be in substantial conformance with the plans in this approval, as conditioned. This condition applies to site plans, grading plans, landscape plans, building plans, elevations, and all other illustrations, text, or plans submitted to the City in connection with the Project.

C) A copy of all pages of these conditions shall be included in the construction drawing packages on the first sheet of all grading, improvement, building, landscape, and irrigation plan sets submitted to the City or to HCAI.

D) The effective date of issuance of this Project is **TBD**. This approval shall expire three (3) years after the effective date unless, before that date, a City grading permit or an HCAI or City building permit for the Project has been issued and construction has commenced and is diligently pursued, as determined by the Community Development Director pursuant to SJMC § 17.660.080, or unless a time extension is approved by the City's applicable review authority pursuant to SJMC § 17.660.090. Applications for time extensions must be received prior to the expiration date.

E) The Project shall comply with all required standards of the Development Code and Municipal Code in their entirety, except for the following deviations approved under the Nonconforming Adjustment (SJMC Section 17.705.120): the existing building to be converted to the psychiatric health facility may encroach into the front setback of 10 feet at the corner of Seventh Street and Grand Avenue, resulting from the right-of-way dedication required by COA 53 or COA 54, as applicable. This deviation applies only to that existing building, as shown on the approved Site Plan. New construction, and any enlargement or reconstruction of that building beyond the scope of this approval, shall meet the setback standards of the Development Code.

F) The project authorized under this permit shall be in compliance with and not violate any federal, state, or local laws, rules, regulations or ordinances, or any conditions of approval. Failure to comply with these requirements may constitute grounds for modification or revocation of this approval, following notice and hearing pursuant to SJMC § 17.725.070, or if the project is operated or maintained in a manner that constitutes a nuisance or adversely affects public health, safety, or welfare.

G) Upon reasonable notice (except in an emergency), the City shall have the right to inspect the exterior site and the non-patient-care areas of the facilities, in a manner consistent with patient privacy laws, to ensure compliance with the conditions of approval and other requirements and to recover its costs related to such inspections pursuant to the City's adopted fee from the property owner, tenant, or any responsible party.

H) The developer, applicant, or successor-in-interest shall pay any outstanding planning application or processing fees within ten (10) days of the City's written request, and in all cases prior to issuance of the first grading, building, or encroachment permit. Failure to do so will be grounds for revocation of PROJ25-0178 (USE26-0126 and USE25-0092).

I) The added skilled nursing/short-term psychiatric beds and the psychiatric health facility authorized by this approval shall not commence operation until all conditions of approval with a timing requirement at or before occupancy have been satisfied, as verified by the Planning Division. This condition does not affect the continued operation of the existing licensed facility.

J) **All mitigation measures in the Mitigation Monitoring and Reporting Program (MMRP) adopted on October 27, 2026 with the Mitigated Negative Declaration ("MND") for the Bradley Gardens Skilled Nursing Facility Expansion Project (CEQA26-0019), attached as an Exhibit ,are conditions of this approval. Compliance with mitigation measures is required as specified in the Mitigation Monitoring and Reporting Program or MND, including timeframes. No permit or occupancy release shall be issued while a mitigation measure due at or before that milestone remains unsatisfied.**

K) In the event of a conflict between any conditions for this approval, the more restrictive requirement shall apply, as determined by the Community Development Director, and a mitigation measure in the MMRP shall control over any conflicting condition.

L) The facility shall not exceed a total capacity of 103 licensed beds, consisting of 87 skilled nursing and 16 psychiatric health facility beds, as analyzed in CEQA26-0019. Any increase in beds or floor area, or any change of use, shall require review and approval by the City.

M) The required parking and loading features (e.g., landscaping, parking surfaces, striping, signs, etc.) shall be continuously maintained in good condition by the person having control of the premises (e.g., lessee, owner, tenant, etc.) as follows:

a. Landscaping shall be kept alive and continually maintained in compliance with Section 17.330.090 (Landscaping Standards for Parking Areas) and Chapter 17.325 (Water Efficient Landscape and Irrigation).
b. Parking surfaces shall be kept free of holes and substantial deterioration.
c. Striping shall be visible.
d. Signs shall be kept in place, legible, and continually maintained.
e. Parked vehicles shall not extend over a property line or into a public right-of-way.

N) Nothing in this approval substitutes for State licensure or State building approval of the facility. The applicant shall obtain and maintain all licenses, permits and approvals required by the California Department of Public Health, the Department of Health Care Services, the Department of Health Care Access and Information, and any other agency with jurisdiction over the skilled nursing facility and the psychiatric health facility.

Engineering Department General Requirements & Information

O) The project grading shall be in a manner to perpetuate existing natural patterns. Any deviation from this, concentration or increase in runoff must have approval of adjacent property owners and City Engineer. The developer/property owner shall accept the offsite runoff and convey to acceptable outlet.

P) The developer/property owner shall secure City's and appropriate agencies' clearances and approvals of the improvement plans.

Q) Prior to commencement of any construction or installation of fencing in public right-of-way, an encroachment permit shall be obtained from the City Engineer's office.

R) Any work within public right-of-way shall require an encroachment permit and shall be coordinated with City Engineer for inspections and acceptance.

S) The Project consists of (1) the skilled nursing facility addition and (2) the psychiatric health facility conversion of the existing office building. Unless a condition states otherwise: frontage improvements, utility undergrounding, and CFD annexation are tied to the skilled nursing addition; on-site conditions apply to each component to the extent of its scope of work; and construction-period conditions timed prior to grading permit shall also be satisfied prior to the first demolition or building permit for the psychiatric health facility conversion if that component proceeds without a grading permit.

Conditions of Approval

Timing	Responsible Department	Condition of Approval	Met ?
Prior to a Specific Date			
Within 3 Days Prior to Vegetation Removal or Ground Disturbance (Feb 1 – Aug 31)	Planning	1. **MM BIO-1: Pre-Construction Nesting Bird Survey.** Per MM BIO-1 of the IS/MND: a qualified biologist shall conduct a nesting bird clearance survey within 3 days before vegetation removal or ground disturbance during the nesting season, and document negative findings in a letter report to the Lead Agency. If an active nest is found, the biologist sets a no-disturbance buffer, marked in the field and overseen by a biological monitor, that stays in place until the young have fledged and the biologist confirms the nest is no longer active.*	☐
Prior to Issuance of Grading Permit / Earthwork Activities			
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	2. An Archaeological Mitigation and Monitoring Plan (AMMP) prepared by a qualified archaeologist shall be submitted to and approved by the Planning Division prior to issuance of the first demolition or grading permit, whichever occurs first. The plan shall involve monitoring of ground-disturbing activities in native (previously undisturbed) soils by an archaeologist on the City or County List of Qualified Archaeologists, consistent with MM CUL-1 and the archaeological monitoring recommendation of the Cultural Resources Study (Appendix D); tribal monitoring is governed by the Treatment and Disposition Agreement required by condition 3. The plan shall include a protocol for the mitigation and significance testing of inadvertent archaeological finds. The archaeologist and any tribal monitor shall have the authority to halt and redirect earthmoving activities within 50 feet of a find so that it can be evaluated in accordance with MM CUL-1 and/or the TDA required by condition 3.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	3. Prior to issuance of the first grading permit, the applicant/developer shall submit to the Planning Division an executed Treatment and Disposition Agreement (TDA) with the Soboba Band of Luiseño Indians to address treatment and disposition of archaeological, or Tribal Cultural Resources and human remains associated with	☐

		the Soboba Band of Luiseño Indians that may be uncovered or otherwise discovered during ground-disturbing activities related to the project. *	
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	4. Prior to issuance of the first demolition, grading, or building permit for each Project component, the contractor shall submit to Planning a signed letter acknowledging and agreeing to implement the following during construction: a. Construction activities shall be limited to the hours permitted by SJMC § 8.40.090. Construction shall be permitted only between 7:00 a.m. and 7:00 p.m. on weekdays and Saturdays, and between 9:00 a.m. and 6:00 p.m. on Sundays and holidays, subject to any applicable restrictions under the Municipal Code. b. SCAQMD Rule 403 dust control: all clearing, grading, earth-moving, or excavation activities cease when winds exceed 25 mph; disturbed unpaved roads and disturbed areas are watered with complete coverage at least 3 times daily during dry weather; traffic speeds on unpaved roads and project site areas are 15 miles per hour or less; and the contractor provides regular street sweeping and removes mud and dirt from equipment and vehicles before they leave the site. (PPP AQ-1)* c. SCAQMD Rule 1113: only paints with no more than 50 grams/liter of VOC and/or High Pressure Low Volume (HPLV) applications are used for architectural coatings. (PPP AQ-2)* d. SCAQMD Rule 402: no discharge of air contaminants or other material that causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public. (PPP AQ-3)* e. Signs are posted at the job site entrance(s) and within the on-site construction zones prohibiting unnecessary engine idling; all other equipment is turned off if not in use for more than 5 minutes. f. Loaded trucks maintain a minimum buffer distance of 10 feet, and small bulldozers a minimum buffer distance of 1 foot, from the existing building. (PPP N-1)* g. Construction worker parking, equipment staging, and material storage shall occur on the project site or at an off-site location approved by the City Engineer,	☐

		and not on adjacent residential streets; haul trucks shall use a haul route approved by the City Engineer.	
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	5. **MM CUL-1: Inadvertent Discovery.** Per MM CUL-1 of the IS/MND: if potential archaeological resources are discovered, work ceases within 50 feet of the find until a qualified archaeologist from the City or County List of Qualified Archaeologists evaluates whether it is a unique archaeological resource (PRC Section 21083.2(g)); if it appears Native American in origin, a Native American Monitor evaluates it and may consult on treatment and curation; the discovery is reported to the City and the South Central Coastal Information Center (SCCIC). Before issuing any permit for ground-disturbing activity, the City ensures grading and construction plans require halting work and contacting an archaeologist.*	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	6. **MM GEO-1: Paleontological Monitoring.** Per MM GEO-1 of the IS/MND: before grading permit issuance the applicant shall provide a letter from a professional paleontologist confirming a qualified paleontologist is retained, and a Paleontological Resources Impact Mitigation Plan (PRIMP) approved by the City, which requires the paleontologist at the pre-grading meeting. Planning verifies the grading and construction plans specify the PRIMP and unanticipated discovery requirements. Full-time monitoring is required from 3 feet below the surface; ground disturbance within 50 feet of a find ceases until the paleontologist evaluates it under Society of Vertebrate Paleontology guidelines. Recovered resources go to an accredited repository under a repository agreement in hand before recovery, at the applicant's expense, and a final monitoring report is submitted to the City.* In addition to the requirements of MM GEO-1, the PRIMP shall provide for bulk sampling and screening of fine-grained sedimentary deposits that show indications of microfossil potential (approximately 600 pounds for a test sample and 6,000 pounds for a standard sample, per Society of Vertebrate Paleontology guidelines), shall identify an accredited repository.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning / Engineering Department	7. Prior to grading permit issuance, the Project developer shall have a Final WQMP approved by the City Engineer. The project shall comply with the San Jacinto Municipal Code and the Municipal Separate Storm Sewer System (MS4) permit requirements in effect for the Santa Ana Regional Water Quality Control Board	☐

		(RWQCB) at the time of grading permit to control discharges of sediments and other pollutants during operations of the Project. (PPP HYD-2)*	
Prior to Issuance of Grading Permit / Earthwork Activities	Engineering Department	8. Prior to grading permit issuance, the Project developer shall have a SWPPP prepared by a Qualified SWPPP Developer (QSD) pursuant to the San Jacinto Municipal Code Chapter 17.600. The SWPPP shall incorporate all necessary BMPs and other City requirements to comply with the NPDES requirements to limit the potential of polluted runoff during construction activities. Project contractors shall be required to ensure compliance with the SWPPP and permit periodic inspection of the construction site by San Jacinto City staff or its designee to confirm compliance. (PPP HYD-1)*	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	9. Prior to issuance of a grading permit, the applicant shall obtain Riverside County Fire Department approval (load rating per COA 33) and City Engineer approval (as a WQMP BMP) of, and shall submit to Planning the manufacturer's cut sheet for, the pervious surface of the fire access lane along the south and east sides of the SNF-STP addition. The surface product shall be identified consistently on the site plan, precise grading plan, and Final WQMP.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	10. All parking and drive aisles shall be shown on the grading and site improvement plans in compliance with Chapter 17.330 (Off-Street Parking and Loading Standards). Parking areas adjacent to a street shall have a landscape border of not less than 10 feet in depth. The site shall provide a total of 52 passenger vehicle parking spaces, including 4 accessible spaces, and 6 bicycle parking spaces.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	11. Trash areas and receptacles shall be enclosed by a six-foot (6') high solid decorative masonry wall with solid gates, a solid roof, and ADA-accessible pedestrian access. Provide a color elevation of the trash enclosure to ensure consistency with the proposed color palette of the building.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	12. All ground-mounted equipment (i.e., gas/electric meters, utility/mechanical cabinets, etc.) shall be screened from view from adjacent public streets with walls or landscaping at least as tall as the equipment, to the extent permitted by the serving utility's and the Fire Department's access and visibility requirements (e.g., backflow	☐

		devices, meters, and fire department connections). Solid walls or landscape features may be used for ground screening; Chain-link fencing is not an approved ground screening material.	
Prior to Issuance of Grading Permit / Earthwork Activities	Planning	13. Submit Wall and Fence Plan(s) and application(s), pursuant to Development Code and Landscape Design Guidelines, for review and approval.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Engineering Department	14. The developer/property owner shall have approved grading and improvement plans, executed grading agreement as directed by the City Engineer, and posted securities.	☐
Prior to Issuance of Grading Permit / Earthwork Activities	Engineering Department	15. The developer/property owner shall submit the following plans and reports to the City Engineer for review and approval: a. Onsite Grading and Erosion Control Plans – Plans shall show the approved WDID number. b. Geotechnical Report (for reference) c. Street Improvement Plan d. Storm Drain Improvement Plans e. Hydrology and Hydraulic Analysis f. Final WQMP (for reference) including WDID No. g. Sewer and Water Improvement Plan, per Fire Department and EMWD standards, shall be submitted to the City Engineer for review and approval. Fire Department and City of San Jacinto approval of Water Improvement Plan is required prior to City Engineer's approval. h. Street Light Plan prepared by a registered Electrical Engineer i. Signing and Striping Plan	☐
Prior to Issuance of Grading Permit /	Engineering Department	16. The plans and reports shall comply with EMWD, RCFCD, Riverside County Transportation Department, Caltrans, City of San Jacinto, and ADA most recent	☐

Earthwork Activities		standards, criteria, and requirement and in effect at the time of construction and shall be coordinated with the approved plans of the adjacent developments.	
Prior to Issuance of Grading Permit / Earthwork Activities	Cal Fire – Riverside County Fire Department	17. Water Plans-Fire: The applicant or developer shall furnish one copy of the water system plans to the Fire Department for review. Plans shall be signed by a registered civil engineer, containing a Fire Department approval signature block, and shall conform to hydrant type, location, spacing and minimum fire flow. Once plans are signed by the local water company, the originals shall be presented to the Fire Department for signature.	☐
Prior to Issuance of Grading Permit	Planning	18. Grading plans shall carry notes for SCAQMD Rule 403 dust control, the PPP N-1 equipment buffer distances, the permitted construction hours, MM BIO-1, MM CUL-1, MM GEO-1, and the human remains requirements of Health and Safety Code Section 7050.5, State CEQA Guidelines Section 15064.5(e) and Public Resources Code Section 5097.98 (PPP CUL-1)*.	☐
Prior to the Issuance of Building Permits (City or HCAI)			
Prior to Issuance of Building Permits	Building & Safety	19. Prior to issuance of any demolition or building permit that disturbs existing building materials, the applicant shall submit verification to the Building and Safety Division that asbestos and lead-based paint surveys have been conducted for all areas of existing buildings to be demolished or renovated. If asbestos or asbestos-containing material is found, the applicant shall follow all procedural requirements and regulations of SCAQMD Rule 1403, including notification of SCAQMD prior to construction activity, asbestos removal in accordance with prescribed procedures, placement of collected asbestos in leak-tight containers or wrapping, and proper disposal. If lead-based paint is found, the applicant shall follow all procedural requirements and regulations for proper removal and disposal, including CCR Title 8, Section 1532.1. (PPP HAZ-1, HAZ-2)*	☐
Prior to the Issuance of Building Permits	Building & Safety/ SCAQMD	20. Prior to issuance of the permit for any emergency generator, boiler, or other equipment requiring an SCAQMD permit, the applicant shall provide the Building and Safety Division with the SCAQMD Permit to Construct (Rule 201) or documentation that the equipment is exempt. Prior to operation of the equipment,	☐

		the applicant shall provide the SCAQMD Permit to Operate (Rule 203) or other SCAQMD authorization to operate.	
Prior to Commencement of Construction of the PHF	Building & Safety	21. Prior to commencement of construction for the psychiatric health facility conversion, the applicant shall obtain a building permit from the City's Building and Safety Division.	☐
Prior to HCAI Building Permit Issuance of the SNF	Planning	22. The applicant shall submit to Planning for review and approval architectural plans showing exterior improvements to the existing skilled nursing facility that visually integrate it with the new addition. Improvements may include, but are not limited to, stone veneer, awnings, wall-plane or roofline articulation, trim, window treatments, and coordinated colors and materials. The design, extent and location of the improvements shall be determined in consultation with Planning, and the approved improvements shall be incorporated into the construction plans submitted to HCAI.	☐
Prior to HCAI Building Permit Issuance of the SNF	Planning / HCAI	23. Prior to HCAI building permit issuance for the SNF submit for Planning approval an outdoor lighting plan with photometric plan for site and parking lighting. a. All parking lot light standards (25 feet maximum height, measured from the usable parking or driving surface), building-mounted fixtures, up-lighting, walk lights and lighting diffused off wall surfaces, with cut sheets for all fixtures. b. Lighting that is indirect and hooded, arranged to reflect light away from adjoining properties and streets in compliance with Section 17.300.080 (Outdoor Light and Glare), and shielded to prevent light or glare beyond the property line, upon right-of-way, or upward to the sky. (PPP AES-1)* c. A minimum of one-foot candle at parking, drive aisles and pedestrian areas and no more than one-half foot candle along the property lines, with beam spreads and/or photometric calculations.	☐
Prior to HCAI Building Permit Issuance of the SNF	Planning / HCAI	24. The construction plans submitted to HCAI (skilled nursing facility) and to the City (psychiatric health facility) shall conform to the elevations approved with this entitlement. Before submitting plans to HCAI or the City, the applicant shall obtain Planning Division approval of the elevation sheets, accompanied by the architect's letter certifying conformance. Any HCAI-required change to the exterior elevations,	☐

		rooftop equipment, or site layout shall be submitted to the Planning Division for a substantial-conformance determination before the changed element is constructed.	
Prior to HCAI Building Permit Issuance of the SNF	Planning / HCAI	25. Rooftop Mechanical Screening & Noise: Prior to submitting building plans to HCAI or the City Building Division, the applicant shall submit construction plans and an architect's line-of-sight exhibit to the Planning Division demonstrating that: a. All rooftop HVAC and mechanical equipment is fully screened from public view by parapet walls or integrated screens at least as tall as the equipment; and b. Operational equipment complies with City stationary noise limits (SJMC § 8.40.050), consistent with the Noise and Vibration Impact Analysis (Appendix J, June 2026).	☐
Prior to HCAI Building Permit Issuance of the SNF	Engineering Department	26. The developer/property owner shall submit to Building and Safety, prior to submittal of plans to HCAI for skilled nursing facility addition, a compaction certification from the Soils Engineer in compliance with the approved geotechnical/soils report and the pad elevation certification from the Civil Engineer in compliance with the approved Precise Grading Plan.	☐
Prior to HCAI Building Permit Issuance of the SNF	Engineering Department	27. Prior to issuance of the first encroachment or public improvement permit, and in all cases prior to Temporary Occupancy of the PHF, the developer/property owner shall have approved improvement plans, executed public improvement agreement, and posted securities.	☐
Prior to HCAI Building Permit Issuance of the SNF	Engineering Department	28. All weather access per Fire Department standards shall be provided to the proposed buildings per the Precise Grading Plan. All-weather access shall also be in place before combustible construction materials are delivered to the skilled nursing facility addition site.	☐
Prior to HCAI Building Permit Issuance of the SNF	Engineering Department	29. Drainage facilities, including catch basins with sump conditions, shall be designed to convey the tributary storm flows and shall include a secondary emergency overflow route. The proposed 24-inch storm drain shall collect and convey runoff from the project frontage, including flows in the roadside swale located at the easternmost portion of the property. The storm drain shall discharge at the southwest intersection of Grand Avenue and Seventh Street. An adequate outlet	☐

		shall be provided, with the discharge daylighting within the Seventh Street right-of-way. The existing culvert shall be removed. The San Jacinto Valley Master Drainage Plan (MDP), Line E-4, from Grand Avenue to the existing Line E channel, is identified in the City's Capital Improvement Program (CIP). The proposed drainage improvements shall be coordinated with the planned CIP improvements to ensure consistency with the overall drainage system.	
Prior to HCAI Building Permit Issuance of the SNF	Special District	30. ***Prior to permit issuance, the entirety of the project is subject to conditions A & B:*** a. Establish a funding mechanism for the maintenance of public improvements. Annexation into the Public Facilities Maintenance Community Facilities District (CFD 2020-1) is an option to fulfill the funding requirement for maintenance of public improvements. If a property owner opts not to annex into a CFD, the funding mechanism (HOA/POA) must be fully established to satisfy this condition. b. Annex into the Public Safety Community Facilities Districts (CFD 2003-1) to fulfill the funding requirement for public safety services. *Funding of services under the City's CFDs will consist of an annual assessment based on the costs of such services, as determined by a Maintenance Cost Estimate.*	☐
Prior to Commencement of Construction of the SNF / Building Permit of the PHF	Building & Safety	31. The developer/applicant or successor in interest shall pay school fees as required by State law. The developer/applicant or successor in interest shall receive written clearance from the San Jacinto Unified School District. Clearance shall be provided prior to commencement of construction of the skilled nursing facility addition and prior to issuance of the building permit for the psychiatric health facility conversion, as applicable.	☐
Prior to Issuance of Building Permits (HCAI or City)	Building & Safety	32. The Project is required to comply with the California Building Standards Code as included in Section 15.04.020 of the San Jacinto Municipal Code to preclude significant adverse effects associated with seismic and soils hazards. CBC related and geologist and/or civil engineer specifications for the proposed Project shall be incorporated into grading plans and building specifications as a condition of construction permit approval. (PPP GEO-1)*	☐

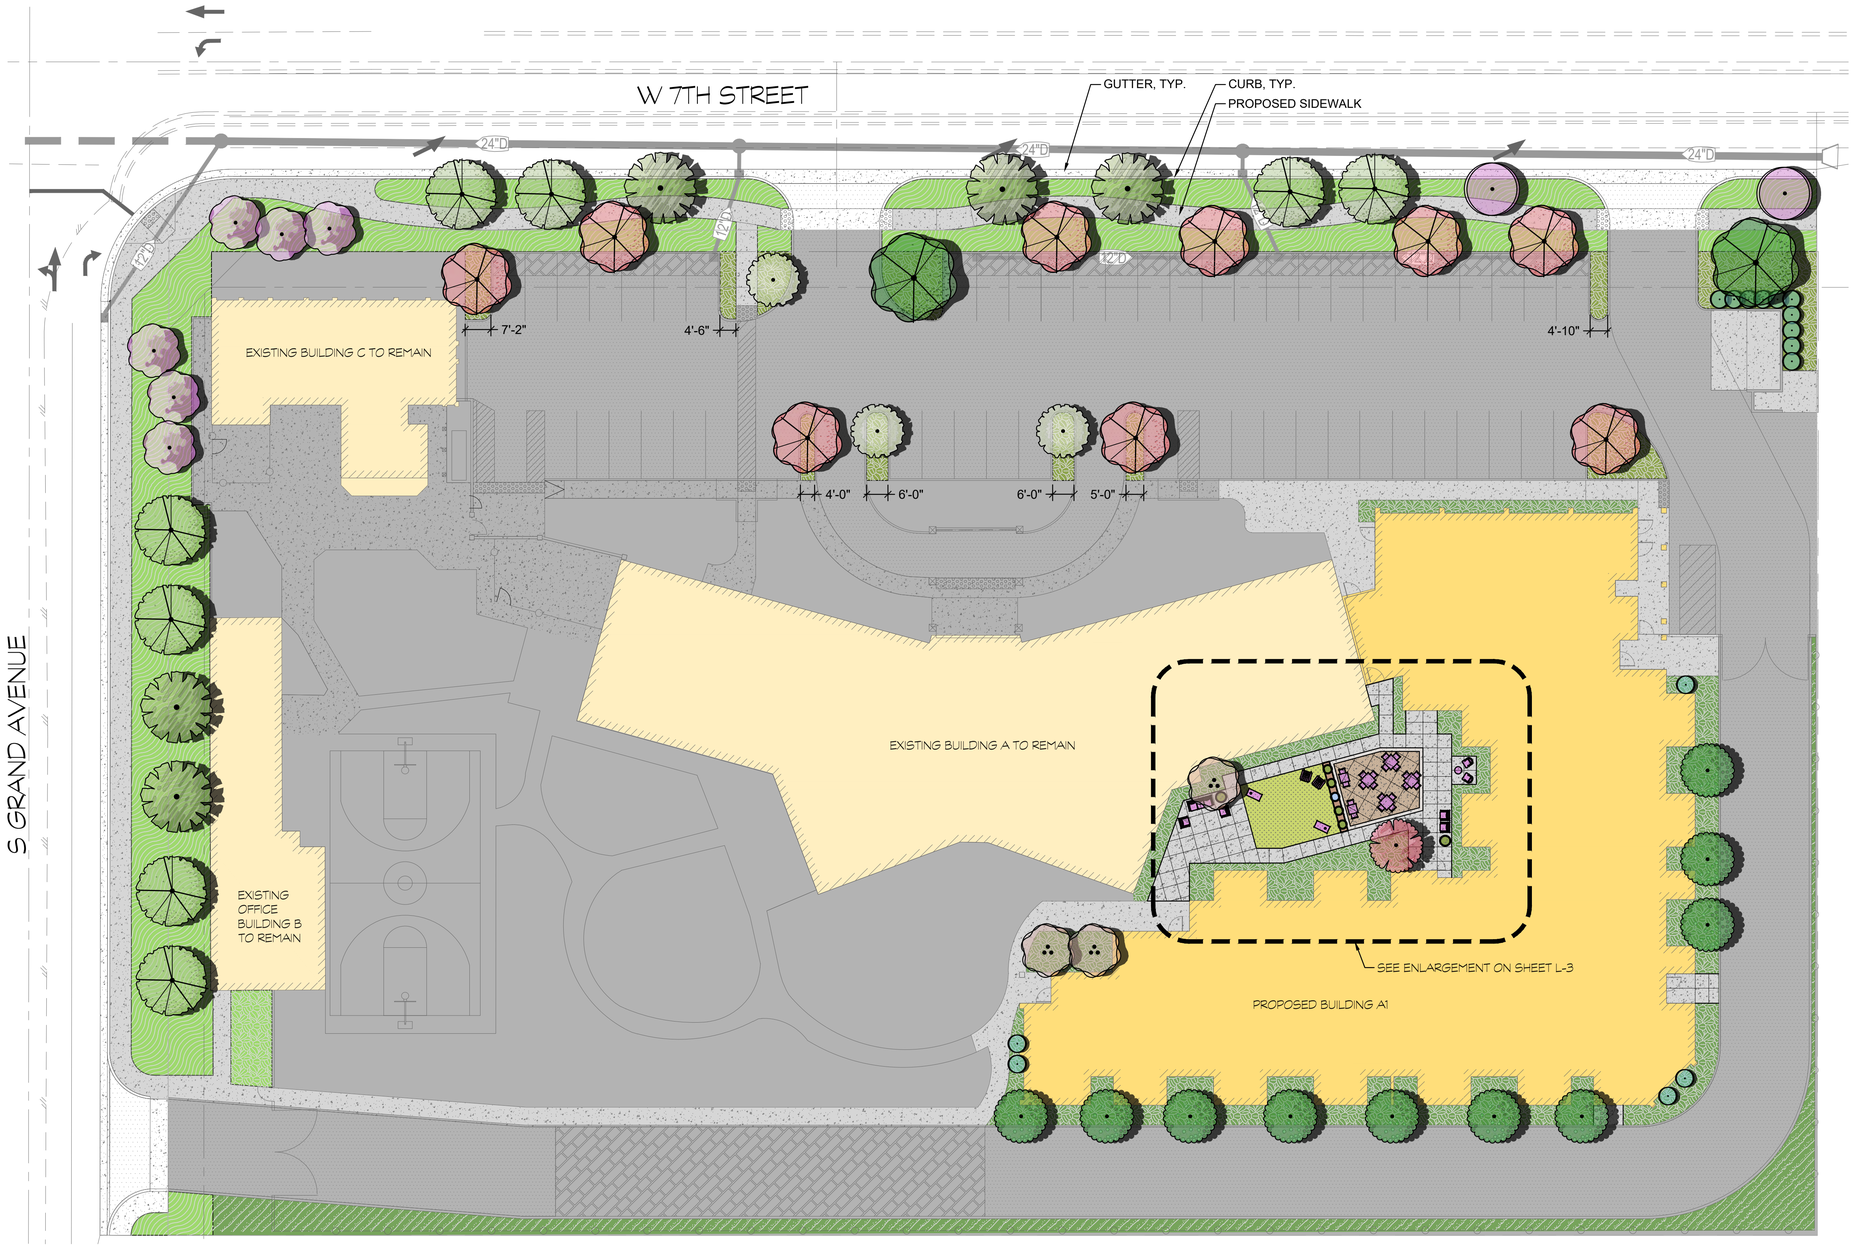
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	33. Fire Protection Water Supplies/Fire Flow - Minimum fire flow for the construction of all buildings is required per CFC Appendix B. Prior to building permit issuance for new construction, the applicant shall provide documentation to show there exists a water system capable of delivering the required fire flow. Specific design features may increase or decrease the required fire flow. Reference CFC 507.3.	☐
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	34. Fire Protection Water Supplies/Hydrants - The minimum number of fire hydrants required, as well as the location and spacing of fire hydrants, shall comply with CFC Appendix C and NFPA 24. Fire hydrants shall be located no more than 400 feet from all portions of the exterior of the building along an approved route on a fire apparatus access road, unless otherwise approved by the Fire Department. Fire hydrants shall be at least 40 feet from the building it is serving. A fire hydrant shall be located within 20 to 100 feet of the fire department connection for buildings protected with a fire sprinkler system. The size and number of outlets required for the approved fire hydrants are 4” x 2 ½” x 2 ½” (super hydrant). Reference CFC 507.5, CFC Appendix C and NFPA 24.	☐
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	35. Fire Department Access - Fire apparatus access roads shall be provided to within 150 feet of all exterior portions of buildings, unless otherwise approved by the Fire Department. Fire apparatus access roads shall have an unobstructed width of not less than 24 feet. Dead-end fire apparatus access roads in excess of 150 feet shall be provided with an approved turn around. The minimum required turning radius of a fire apparatus access road is 45 feet outside radius and 21 feet inside radius. The construction of the fire apparatus access roads shall be all weather and capable of sustaining 80,000 lbs. Unless otherwise approved, the grade of a fire apparatus access road shall not exceed 16 percent and the cross slope shall not exceed 2.5 percent. The angles of approach and departure for fire apparatus access roads shall be a maximum of 6 percent grade change for 25 feet of approach/departure. Reference CFC 503.1.1, 503.2.1 as amended by the County of Riverside and Riverside County Office of the Fire Marshal Guidelines.	☐
Prior to the Issuance of	Cal Fire – Riverside	36. Fire Department Access Turn Around - Dead-end fire apparatus access roads in excess of 150 feet in length shall be provided with a bulb turnaround at the terminus measuring a minimum of 45 feet outside radius and 21 feet inside radius. Parallel	☐

Building Permits (City or HCAI)	County Fire Department	parking around the perimeter of the bulb is acceptable provided the bulb outside turning radius is increased by 8 feet. In-lieu of a bulb, a hammer-head type turnaround is acceptable where the top of the "T" dimension is 120 feet with the stem in the center. Additional turnaround designs may be acceptable as approved by the Fire Department. Reference CFC 503.1.1, 503.2.1 as amended by the County of Riverside and Riverside County Office of the Fire Marshal Guidelines.	
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	37. Fire Department Building Construction Plan Review - Submittal of construction plans to the Fire Department will be required. This will require a separate permit application submitted directly to the Fire Department. This shall include a full site plan including all fire apparatus access roads. Final fire and life safety conditions will be addressed when the Fire Department reviews the plans. These conditions will be based on California Fire Code, California Building Code (CBC), and related codes/standards adopted at the time of construction plan submittal. Contact the Fire Department for submittal instructions. Reference CFC 105.1.	☐
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	38. Fire Sprinkler System - All new commercial buildings and structures 3,600 square feet or larger will be required to install a fire sprinkler system. Reference CFC 903.2 as amended by the County of Riverside.	☐
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	39. Fire Alarm and Detection System - A water flow monitoring system and/or fire alarm system may be required as determined at time of building construction plan review. Reference CFC 903.4 and CFC 907.2.	☐
Prior to the Issuance of Building Permits (City or HCAI)	Cal Fire – Riverside County Fire Department	40. Gate Access: All electronically operated gates shall be provided with Knox key switches and automatic sensors for access. These gates shall be provided with access to gate equipment or another method to open the gate if there is a power failure. (Manual gates shall not be locked unless a Knox Box containing the key to the lock is installed in an approved location on the approach side of the gate). A pedestrian gate, if used to provide access, shall be a minimum 3 feet wide and provided with a Knox Box/Padlock if locked. Reference CFC 506.1.	☐
Prior to Occupancy (Temporary Occupancy of the PHF / Final Occupancy of the PHF and SNF)			

Prior to Final Occupancy of the SNF / Final Occupancy of the PHF	Building & Safety	41. The applicant shall provide the final HCAI approval or closure of the building permit for the skilled nursing facility addition and the City final for the psychiatric health facility.	☐
Prior to Issuance of Temporary Occupancy of the PHF	Planning	42. Submit Landscape and Irrigation Plan(s) and application(s), pursuant to Development Code and Landscape Design Guidelines, for review and approval. The plans shall be consistent with the approved conceptual landscape plan(s), unless deviation approved by City Planning.	☐
Prior to Final Occupancy of the SNF	Planning	43. All landscaping including 24-inch box trees, irrigation systems, walls and fences (including the 7-foot western boundary block wall), and pedestrian walkways shown on the approved landscape plan shall be installed and accepted by the Planning Division.	☐
Prior to Final Occupancy of the SNF	Planning	44. The developer/applicant or successor in interest shall submit the following items for the landscape and irrigation development and maintenance: a. The signed Landscape Certificate of Completion pursuant to Section 17.325.070 – Certificate of Completion of the Development Code; b. The irrigation scheduling pursuant to Section 17.325.080 – Irrigation Scheduling of the Development Code; c. The Landscape and Irrigation Maintenance Schedule pursuant to Section 17.325.090 – Landscape and Irrigation Maintenance Schedule of the Development Code; and d. The Irrigation Audit, Irrigation Survey, and Irrigation Water Use Analysis are pursuant to Section 17.325.100 — Irrigation Audit, Irrigation Survey, and Irrigation Water Use Analysis of the Development Code.	☐
Prior to Final Occupancy of the SNF	Planning	45. Prior to final occupancy, the applicant shall submit letters from the project paleontologist, archaeologist, and any tribal monitor confirming completion of field monitoring. The paleontologist's final monitoring report required by MM GEO-1 (including the repository acceptance letter required by COA 7), the archaeological	☐

		monitoring report required by the AMMP, and any tribal monitoring documentation under the TDA shall be submitted to and accepted by the Planning Division.	
Prior to Final Occupancy of the SNF	Planning / Engineering Department	46. The engineer of record shall certify that the WQMP BMPs, including the pervious surfaces and infiltration features, were built per the approved Final WQMP, and the recorded BMP maintenance agreement, including the inspection schedule, shall be on file with the City. (PPP HYD-2)*	☐
Prior to Final Occupancy of the SNF	Planning	47. The applicant shall request a Planning Division inspection; exterior lighting shall be shielded per the approved photometric plan PPP AES-1, and rooftop HVAC units shall be located and screened per the approved roof plan and line-of-sight exhibit.*	☐
Prior to Temporary Occupancy of the PHF or Final Occupancy of the SNF, Whichever Occurs First	Planning	48. Facility Security and Operations Plan. Prior to occupancy release for the skilled nursing facility addition or the psychiatric health facility, whichever occurs first, the applicant shall submit to the Planning Division for approval, after consultation with the law enforcement agency serving the City and the Riverside County Fire Department, a Facility Security and Operations Plan covering the entire facility. The plan shall address, at a minimum: (a) controlled building entries and exits and visitor check-in; (b) procedures to prevent and respond to unauthorized patient departure, including immediate notification of law enforcement; (c) arrangements so that patients are not discharged to the public street without arranged transportation or release to a responsible party; (d) emergency incident response and coordination with law enforcement, fire, and emergency medical services; and (e) the facility liaison required by these conditions. The plan may incorporate policies required by State licensing and shall be updated when those policies materially change. The approved plan shall be implemented for the life of the use and provided to the City upon request.	☐
Prior to Final Occupancy of the SNF	Building & Safety	49. Specific addresses for each building shall be provided to make such number plainly visible from the public street, avenue, court, or alley upon which property fronts, and shall be contrasting color and background.	☐

Prior to Final Occupancy of the SNF	Special Districts	50. Prior to occupancy, the entirety of the project is subject to conditions a - e: a. Annexation into the applicable CFDs must be complete. b. Development must comply with Storm Water Basin & Pump Specifications and Standards. Privately maintained storm water and water quality systems will be required to submit an Irrevocable Offer of Dedication, or similar dedication language upon map recordation, for each basin lot. c. Development must comply with Landscape and Irrigation Design Guidelines. d. Landscape improvements shall include irrigation meters and backflow devices with tampering preventive cage, exclusive for right-of-way landscaping. Right-of-way landscaping must be divided from private property by form or mow-curb or other approved materials. e. Landscape areas in the right-of-way shall include an independent irrigation control system, with separate electric meter, exclusive for right-of-way landscaping. Cal-Sense version approved by the Public Utilities Superintendent is required for City maintained irrigation areas. *(Must be operational and certified by Cal-Sense)*	☐
Prior to Issuance of Temporary Occupancy of the PHF	Engineering Department	51. Application for property line corner cutbacks shall submitted per County of Riverside Standard No. 805.	☐
Prior to Issuance of Temporary Occupancy of the PHF	Engineering Department	52. The developer/property owner shall sign the consent and waiver form to join the City's Lighting and Landscape Districts and City's Flood Control District as appropriate. The proposed streetlights shall be maintained by the City and cost paid by the developer/property owner through the said annexation.	☐
Prior to Issuance of Temporary Occupancy of the PHF	Engineering Department	53. Application for all easements and/or street rights-of-way shall be offered for dedication to the public or other appropriate agencies in perpetuity and shall continue in force until the City or the appropriate agency accepts or abandons such offers.	☐



Prior to Issuance of Temporary Occupancy of the PHF	Engineering Department	54. Grand Avenue is classified as a Collector (78'/44') per the City General Plan. A 33-foot wide halfwidth right-of-way is currently dedicated along the property's easterly frontage. The developer/property owner shall submit application to dedicate the required additional 6 feet (6') of right-of-way to provide for a 39-foot wide halfwidth right-of-way.	☐
Prior to Issuance of Temporary Occupancy of the PHF	Engineering Department	55. Seventh Street is classified as a Major (106'/64') per the City General Plan. A 50-foot wide halfwidth right-of-way is currently dedicated along the property's northerly frontage. The developer/property owner shall submit application to dedicate the required additional 3 feet (3') of right-of-way to provide for a 53-foot wide halfwidth right-of-way.	☐
Prior to Final Occupancy of the SNF	Engineering Department	56. NOTICE OF DRAINAGE FEES: Notice is hereby given that this property is located in San Jacinto Valley Area Drainage Plan which was adopted by the City of San Jacinto pursuant to Ordinance 13-01 and Section 66001, et seq, of the Government Code and that said property is subject to fees for said drainage area. Notice is further given that, pursuant to Ordinance 13-01, payment of the drainage fees shall be paid to the City of San Jacinto prior to issuance of the occupancy permit for a parcel, and that the property owner shall pay the fee required at the rate in effect at the time of issuance of the actual permit.	☐
Prior to Final Occupancy of the SNF	Engineering Department	57. The following improvements shall be deemed complete by the Engineering Department: a. Onsite Grading and Erosion Control Plans – Plans shall show the approved WDID number. b. Geotechnical Report (for reference) c. Street Improvement Plan d. Storm Drain Improvement Plans e. Hydrology and Hydraulic Analysis f. Final WQMP (for reference) including WDID No. g. Sewer and Water Improvement Plan, per Fire Department and EMWD standards, shall be submitted to the City Engineer for review and approval. Fire	☐

		Department and City of San Jacinto approval of Water Improvement Plan is required prior to City Engineer's approval. h. Street Light Plan prepared by a registered Electrical Engineer i. Signing and Striping Plan j. Traffic Signal Plan (if necessary)	
Prior to Final Occupancy of the SNF	Engineering Department	58. Grand Avenue shall be improved to provide for a 39-foot wide halfwidth right-of-way, asphalt paving (using a TI of 7.0 and PG 70-10), 8-inch curb and gutter 22 feet east of centerline, a 17-foot wide parkway consisting of landscaping, a 6-foot wide sidewalk, and streetlights subject to photometric analysis per City of San Jacinto, County of Riverside, and Caltrans standards.	☐
Prior to Final Occupancy of the SNF	Engineering Department	59. Seventh Street shall be improved to provide for a 53-foot wide halfwidth right-of-way, asphalt paving (using a TI of 9.0 and PG 70-10), 8-inch curb and gutter 32 feet south of centerline, a Class II: Buffered Bike Lane per the City of San Jacinto Trails Master Plan, and a 21-foot wide parkway consisting of landscaping, a 6-foot meandering sidewalk, and streetlights subject to photometric analysis per City of San Jacinto, County of Riverside, and Caltrans standards.	☐
Prior to Final Occupancy of the SNF	Engineering Department	60. If the existing pavement is in substandard condition the developer/property owner may use grind and overlay technique as determined by the City Engineer.	☐
Prior to Final Occupancy of the SNF	Engineering Department	61. All driveways shall be improved to comply with County of Riverside Standard No. 207A.	☐
Prior to Final Occupancy of the SNF	Engineering Department	62. The developer/property owner shall provide for utility trench surface repair as directed by the City Engineer if applicable.	☐
Prior to Final Occupancy of the SNF	Engineering Department	63. Associated existing public and private pavement and appurtenances damaged or broken during the development of this project shall be repaired or removed and replaced and grinded and overlayed by the developer/property owner to the satisfaction of the City Engineer. Any survey monuments damaged or destroyed	☐

		shall be reset by qualified professional pursuant to the California Business and Professional Code 8771.	
Prior to Final Occupancy of the SNF	Engineering Department	64. This development is within the City of San Jacinto sewer and water service area. Water and sewer improvements shall be designed and installed per EMWD Standards. City of San Jacinto sewer and water will-serve letters.	☐
Prior to Final Occupancy of the SNF	Engineering Department	65. Curb ramps shall include truncated domes per Riverside County Standard 403.	☐
Prior to Final Occupancy of the SNF	Engineering Department	66. 7th street taper conforms with traffic engineer's recommendation and is approved by city engineer.	☐
Prior to Final Occupancy of the SNF	Engineering Department	67. Existing power poles with cables 66kV and under shall be removed and cables undergrounded per the Municipal Code, Section 15.32.010. Poles with cables over 66kV shall be relocated as necessary, but other utilities on the pole must be undergrounded. Provide an undergrounding of utilities study by a utility consultant/electrical engineer analyzing and determining the extent of conformance.	☐
Operational Conditions			
Operational	Planning	68. The use of parking and loading spaces for patients, visitors and employees, including ADA spaces, shall not be prevented, prohibited, limited, restricted, eliminated or adapted for other use, unless City Planning provides written approval. Required parking shall remain usable and accessible.	☐
Operational	Planning	69. Parking Management. The operator shall direct all employees, vendors, and patient-transport providers to park on the project site. If the City determines, based on documented complaints or staff observation, that parking generated by the facility regularly occurs on adjacent public streets, the operator shall, within 30 days of written notice, submit a Parking Management Plan for Planning Division approval (which may include staggered shift-change times, designated employee parking, off-site employee parking with shuttle service, or rideshare incentives) and shall implement the approved plan within 30 days of approval.	☐

Operational	Planning	70. Facility Liaison. Prior to occupancy and for the life of the use, the operator shall designate a facility liaison, reachable 24 hours a day, to respond to neighborhood concerns. The liaison's name and telephone number shall be provided to the Planning Division and updated within 10 days of any change. The operator shall keep a log of complaints received and actions taken and provide it to the City upon request.	☐
Operational	Planning	71. Deliveries, loading and unloading activities, and trash pick-up hours shall be limited to daytime hours only (7:00 a.m. to 7:00 p.m.). This condition does not restrict emergency vehicle access or patient transport. Non-emergency patient transport, delivery, and vendor vehicles shall load and unload on-site and shall not stage, queue, or idle on public streets.	☐
Operational	Planning	72. No outdoor storage and display of supplies or equipment is permitted, except within enclosures shown on the approved site plan (refuse/recycling, regulated medical waste, medical gas storage, and emergency generator).	☐
Operational	Planning	73. The added skilled nursing/short-term psychiatric beds and the psychiatric health facility shall not admit patients until the applicant provides the Planning Division a copy of the license or license amendment issued by the California Department of Public Health or the Department of Health Care Services, as applicable.	☐
Operational	Engineering Department	74. The BMPs and infiltration features shall be maintained and inspected per the approved Final WQMP and the recorded maintenance agreement.	☐
Operational	Planning	75. Rooftop mechanical equipment screening shall be maintained, and the facility shall not discharge air contaminants or odors that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public (SCAQMD Rule 402). (PPP AQ-3)*	☐

*Denotes mitigation measure or plan, program or policy (PPP) from the Mitigated Negative Declaration (CEQA26-0019) in effect.

PROPOSED LANDSCAPE DEVELOPMENT

N.A.P.

SQUARE FOOTAGE OF LANDSCAPE:

- OVERALL: 4,015 SF

LANDSCAPE CONCEPT NOTE:

THIS LANDSCAPE WILL CONSIST OF CALIFORNIA-FRIENDLY, LOW AND MEDIUM WATER USE PLANT MATERIAL. ALL PLANTS HAVE BEEN CHOSEN FROM THE LOW OR MEDIUM WATER USE CATEGORY ACCORDING TO WUCOLS. PLANTS HAVE BEEN CHOSEN TO CREATE A UNIFORM THEME ACROSS THE SITE CONSISTING OF MEDITERRANEAN AND CALIFORNIA FRIENDLY PLANT MATERIAL. MAINTENANCE AND LONGEVITY OF PLANT MATERIAL HAS BEEN TAKEN INTO CONSIDERATION. ROOT PANELS AND BARRIERS WILL BE UTILIZED ON ALL TREES NECESSARY, CONSISTENT WITH ALL STANDARDS AND SPECIFICATIONS. A 3" LAYER OF BARK MULCH WILL BE USED IN ALL LANDSCAPE AREAS. ALL LANDSCAPE AREAS WILL CONFORM TO ALL CURRENT LANDSCAPE GUIDELINES.

IRRIGATION CONCEPT NOTE:

THE IRRIGATION DESIGN WILL INCORPORATE THE LATEST IN SMART IRRIGATION TECHNOLOGIES. ALL NEW LANDSCAPE AREAS WILL INCLUDE HIGH EFFICIENCY, LOW WATER USE IRRIGATION EQUIPMENT AND METHODS. A SMART IRRIGATION CONTROLLER WITH A RAIN SHUT OFF DEVICE WILL ALSO BE INCORPORATED. BARK MULCH WILL BE USED TO RETAIN MOISTURE AND REDUCE EVAPORATION AND AN IRRIGATION SCHEDULE WILL BE PROVIDED TO PROGRAM THE CONTROLLER. TWO IRRIGATION SCHEDULES SHALL BE PREPARED, ONE FOR PLANT ESTABLISHMENT AND ONE FOR MAINTENANCE. ALL NEW IRRIGATION SYSTEMS WILL COMPLY WITH ALL CURRENT LANDSCAPE GUIDELINES.

ALL STREET LANDSCAPE WITHIN THE CITY OF SAN JACINTO RIGHT-OF-WAY, LMD/CFD, PARKS, OPEN SPACE AREAS, AND ALL OTHER PUBLIC LANDSCAPE IRRIGATION SYSTEMS SHALL BE INSTALLED WITH CAL-SENSE CONTROLLERS. THE CAL-SENSE CONTROLLER INSTALLATION SHALL INCLUDE THE CONTROLLER ASSEMBLY, FLOW SENSOR, ET GAUGE, AND TIPPING RAIN-BUCKET. CONTROLLER INSTALLATIONS SHALL BE CERTIFIED BY CAL-SENSE.

THE LANDSCAPE PLANS SHALL COMPLY WITH ALL APPLICABLE WITH THE SAN JACINTO LANDSCAPE DESIGN GUIDELINES.

Re: Air Quality, Energy, and Greenhouse Gas Impact Analysis for the Bradley Gardens Skilled Nursing Facility Expansion Project EPD Project No. 26-017

Project Overview

This technical memorandum evaluates the proposed Bradley Garden Skilled Nursing Facility Expansion Project ("Project," or "proposed Project"). The Project site is within the southwestern portion of the City of San Jacinto in Riverside County, California. The Project site is located at 980 West (W.) 7th Street, at the southeast corner of the intersection of W. 7th Street and South (S.) Grand Avenue. Regional access to the Project site is provided by State Route (SR) 79 and SR 74. Local access to the site is provided by W. 7th Street and S. Grand Avenue. The Project site consists of one parcel encompassing approximately 2.98 acres. The site is identified as Assessor's Parcel Number (APN) 435-330-003. The Project site is developed and currently operates as the Bradley Gardens facility, which offers a variety of psychiatric-focused care to patients with varying health needs, including supervised Psychiatric Health Facility (PHF) care beds, Skilled Nursing Facility (SNF) and Short-Term Psychiatric (STP) care beds, and rehabilitation and therapy programs.

The Project proposes the expansion of the existing Bradley Gardens Nursing Facility on the 2.98-acre site. The Project includes demolition of the existing 1,074-square-foot (SF) maintenance and storage building for the construction of an 18,000 SF building addition to the existing 44-bed SNF building that would provide 43 additional SNF and STP beds, resulting in a total capacity of 87 beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building into a 16-bed PHF. The Project would also include a proposed emergency generator. The existing emergency generator has a temporary use permit and would be replaced as part of the Project. Because the existing generator would be removed, its emissions were not included in this analysis. The proposed Project would result in a floor area ratio (FAR) of 0.27. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, and pavement of parking areas and driveways. With the completion of the proposed Project, there would be a total of 103 beds (SNF, STP, and PHF beds) on the Project site. The Project site has an existing General Plan land use designation of Industrial (I) and is zoned as Industrial Light (IL). The proposed Project site plan is shown in Figure 1, *Conceptual Site Plan*. It should be noted that the Project site plan shows 17,372 SF for the 43-bed addition; this analysis utilized 18,000 SF for this 43-bed addition, presenting a conservative analysis.

To support the California Environmental Quality Act (CEQA) documentation for the Project, this report analyzes the proposed Project's construction and net operational impacts to air quality (emission of criteria pollutants), energy usage, and GHG emissions using the California Emissions Estimator Model

(CalEEMod Version 2022.1) and Emission Factor model (EMFAC Version 2021). The Project site is within the jurisdiction of the South Coast Air Quality Management District (SCAQMD). Therefore, significance thresholds from the SCAQMD are used in this analysis.

Table 1, *Construction Schedule*, shows the construction schedule modeled. Construction would last approximately 11 months.

Table 1: Construction Schedule

Activity	Start Date	End Date	Total Working Days
Demolition	12/1/2026	12/9/2026	7
Site Preparation	12/10/2026	12/16/2026	5
Grading	12/17/2026	12/23/2026	5
Building Construction	12/24/2026	12/8/2027	250
Paving	12/24/2026	12/30/2026	5
Architectural Coating	11/24/2027	11/30/2027	5

Source: CalEEMod output sheets are provided in Attachment A.

Modeling Assumptions and Adjustments

The following non-default assumptions and adjustments were used in the CalEEMod emission model for this analysis:

- **Land Use:** The lot acreage was adjusted to match the site plan provided by the applicant.
- **Construction Phases:** The following phases were adjusted to adhere to the construction start date and occupancy year as provided by the client:
    - Demolition: reduced from 20 days to 7 days.
    - Site Preparation: increased from 3 days to 5 days.
    - Grading: reduced from 6 days to 5 days.
    - Building Construction: increased from 220 days to 250 days.
    - Paving: reduced from 10 days to 5 days.

  Additionally, the paving phase was revised to begin concurrently with building construction. Architectural coating was set to begin two weeks before the completion of building construction. Reduced phase durations and overlapping phases during construction would result in a conservative analysis.
- **Construction Equipment:** It was assumed that all construction equipment would be used 8 hours a day per workday. Tractor/loaders/backhoes were replaced with crawler tractors in the site preparation and grading construction phases.
- **Demolition:** Based on client-provided information, the demolition of the existing building and hardscape is anticipated to generate approximately 5 tons of debris.
- **Construction Earthmoving Activity:** Based on client-provided grading information, the Project is anticipated to achieve a balanced site condition; however, for conservative analysis purposes, approximately 1,000 cubic yards of export are assumed to account for potential on-site spoils during grading activities.

- **Operations:** Hearths, wood stoves, and wood fireplaces were removed in accordance with SCAQMD Rule 445, which prohibits the installation of wood-burning devices in an effort to reduce particulate matter and production of volatile organic compounds (VOCs).[1] Gas and propane fireplaces were also removed as neither are proposed for the Project.
- **Operational Trip Rates:** Weekday, Saturday, and Sunday trip rates were adjusted based on the Institute of Transportation Engineers (ITE) *Trip Generation Manual, 12th Edition*, to match the auto trip rates for Nursing Homes (Land Use Code 620).
- **Emergency Generator:** The Project would include a proposed emergency diesel generator, modeled at 236 horsepower (hp), with a load factor of 0.73 and up to 200 hours of operation per year. Annual diesel fuel consumption and associated emissions were calculated based on these operating parameters.

EMFAC Off-Model Adjustment Factors

EMFAC2021 currently accounts for emissions reductions attributed to compliance with several regulations: the Advanced Clean Trucks Regulation, Zero-Emission Airport Shuttle Regulation, Heavy-Duty Warranty Amendments (Phase 1), and the Heavy-Duty Omnibus Regulation. On June 12, 2025, three congressional resolutions were signed into law to disapprove previously approved preemption waivers which allowed the enforcement of these regulations. Therefore, the California Air Resources Board (CARB) released the EMFAC2021 Off-Model Adjustment Factors (Adjustment Factors), which negates emissions reductions attributed to these regulations. On November 21, 2025, the EPA approved use of the Adjustment Factors.[2] These factors are provided for each vehicle under EMFAC2021's vehicle categories, for every year from 2022 to 2050. In addition, factors are provided for different fuel types (diesel, gas, natural gas, electric, and plug-in hybrid electric).

CalEEMod v. 2022.1 uses emissions data from EMFAC2021. However, CalEEMod has not yet incorporated the Adjustment Factors due to the recency of its approval. To account for the potential increase in emissions, diesel adjustment factors from the construction years of 2026 through 2027 were applied to construction off-site emissions from hauling and vendor trips. Adjustment factors were not applied to the operational mobile emissions, as the EMFAC adjustment factors provided for passenger vehicles are 1.0. Calculations to obtain the adjusted emission rates are provided in Attachment B.

Summary of Air Quality, Energy, and GHG Impacts

Air Quality

The construction and operation of the proposed Project would not exceed SCAQMD thresholds for any of the criteria pollutants. Projects that do not exceed the regional thresholds are assumed to not have a significant impact on both a project level and cumulative level. Additionally, the proposed Project aligns with the SCAQMD'S 2022 Air Quality Management Plan (AQMP), reflecting adherence to regional air quality management goals and standards. Furthermore, odors produced by the construction and operation of the proposed Project would be minimal and comply with SCAQMD Rule 402. Therefore, impacts to air quality from the proposed Project would be less than significant. No mitigation would be required.

Energy

The proposed Project's energy consumption for construction activities would be conditioned to require compliance with existing fuel standards, machinery efficiency standards, and California Air Resources Board (CARB) requirements that limit idling of construction trucks and equipment. There are no unusual Project characteristics that would cause the use of construction equipment that would be less energy efficient compared with other similar construction sites in other parts of the state. Additionally, through compliance with existing standards, the operation of the Project would not result in an energy demand on a per-development basis that is greater than that of other development projects in Southern California. The proposed Project would be required to meet the California Code of Regulations (CCR) Title 24 energy efficiency standards and comply with all applicable City energy codes. Therefore, the Project would not inhibit the use of renewable energy. Additionally, the Project would not result in inefficient, wasteful, or unnecessary consumption of energy. Impacts related to energy would thus be less than significant. No mitigation would be required.

GHG Emissions

The proposed Project's construction and operational greenhouse gas (GHG) emissions would total 810 metric tons of carbon dioxide equivalent ($MTCO_2e$). When compared to emissions from the existing buildings, the Project would result in a net increase of 478 $MTCO_2e$ per year, which is below the SCAQMD Tier III significance threshold of 3,000 $MTCO_2e$ per year. The Project would comply with applicable regulatory requirements, including the California Building Standards Code (Title 24), and would be consistent with applicable measures of the Western Riverside Council of Governments' (WRCOG) 2021 Subregional Climate Action Plan. The Project would not conflict with the GHG reduction framework established in the 2022 Scoping Plan adopted by the California Air Resources Board and would be consistent with applicable GHG reduction policies of the City of San Jacinto, as implemented through the WRCOG Subregional Climate Action Plan. Therefore, the Project would have a less-than-significant impact on GHG emissions. No mitigation would be required.

Air Quality

Regional Emissions

The SCAQMD has adopted maximum daily emission thresholds (pounds/day) for the criteria pollutants during the construction and operation of a project.[3] While incremental regional air quality impacts of an individual project are generally very small and difficult to measure, the SCAQMD's regional maximum emission thresholds set standards to reduce the burden of the SCAQMD to attain and maintain ambient air quality standards. The CalEEMod Project emissions, along with regional construction and operational thresholds for each of the criteria pollutants, are listed in Table 2, *Regional Construction Emission Estimates*, and Table 3, *Regional Operation Emission Estimates*, respectively. These emission thresholds include the Project emissions generated both from on-site sources (such as off-road construction equipment and fugitive dust) and off-site sources (vehicle travel arriving at and leaving from the site). In addition, Project construction would be required to comply with several SCAQMD rules and regulations, which would further reduce potential construction-related air quality emissions. These rules include:

- Rule 402, Public Nuisance, which prohibits the discharge of air contaminants that cause injury, nuisance, or annoyance to the public or damage to property;
- Rule 403, Fugitive Dust, which aims to minimize fugitive particulate matter dust emissions during construction activities;
- Rule 1113, Architectural Coatings, which requires the use of low-VOC paints; and
- Rule 1403, Asbestos Demolition and Removal, which establishes work practice requirements to limit asbestos emissions from building demolition or renovation, including asbestos surveying, notification, removal and handling procedures, and disposal requirements.
- Rule 1470 operational hour requirements, which limit stationary emergency diesel engines to 50 hours per year for maintenance and testing, with a permit allowing up to 200 hours of total annual operation.

The CalEEMod output sheets for the proposed Project can be found in Attachment A, *CalEEMod Output Sheets.* In addition, detailed tables showing emissions for each construction phase are provided in Attachment B, *Detailed Calculation Sheets*. As noted in Table 2, maximum daily construction emissions would not exceed the SCAQMD regional construction thresholds and thus would result in a less-than-significant regional operational air quality impact.

[3] SCAQMD. (March 2023). *South Coast AQMD Air Quality Significance Thresholds*. Referenced at https://www.aqmd.gov/docs/default-source/ceqa/handbook/south-coast-aqmd-air-quality-significance-thresholds.pdf?sfvrsn=25.

Table 2: Regional Construction Emission Estimates*

Construction Year	Maximum Daily Regional Emissions (pounds/day) [1,2,3]					
	ROG	**NOx**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
2026	2.3	15.6	23.5	<0.01	4.1	1.8
2027	52.7	11.3	17.5	<0.01	1.6	0.6
Maximum Daily Emissions (2026-2027)	**52.7**	**15.6**	**23.5**	**<0.01**	4.1	1.8
SCAQMD Significance Thresholds	75	100	550	150	150	55
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: ROG = reactive organic gases, NOx = nitrogen oxides, CO = carbon monoxide, SO2 = sulfur dioxide, PM_{10} = particulate matter 10 microns in diameter, $PM_{2.5}$ = particulate matter 2.5 microns in diameter

1. Values may vary slightly due to rounding.

2. Winter and Summer emissions rates were compared across all pollutants; the table above presents the greater emission rate for each season and therefore presents a conservative analysis.

3. Emissions for ROG, NOx, PM_{10}, and $PM_{2.5}$ have accounted for the 2026 and 2027 Adjustment Factors.

Source: CalEEMod output sheets are provided in Attachment A. Detailed calculation sheets are provided in Attachment B.

* Regional construction emissions presented in this table are analyzed based on full buildout of the expanded facility, including a total of 103 beds. Because the analysis assumes construction emissions associated with the entire expanded facility rather than only the proposed expansion, the results represent a conservative estimate. Actual construction emissions associated with the new building, which would accommodate 43 additional SNF-STP beds, are anticipated to be much lesser than the emissions presented in this table.

The estimated maximum daily regional operational emissions associated with the existing facility, proposed expansion, and expanded facility are provided in Table 3, *Regional Operational Emission Estimates.* Emissions from operations of the existing facility on-site were subtracted from the expanded facility's operational emissions to obtain the net emissions associated with operation of the proposed Project. As shown, proposed Project operational emissions and expanded facility operational emissions would remain below all applicable SCAQMD regional thresholds. Therefore, the Project would result in less-than-significant regional operational air quality impacts, and no mitigation would be required.

Table 3: Regional Operation Emission Estimates

Operational Activity	Maximum Daily Regional Emissions (pounds/day) [1,2]					
	ROG	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Mobile	1.2	1.3	12.3	<0.01	3.1	0.8
Area	1.4	0.1	6.0	<0.01	<0.01	<0.01
Energy	<0.01	0.4	0.2	<0.01	<0.01	<0.01
Stationary	0.4	1.1	1.0	<0.01	0.1	0.1
Total Expanded Facility Operational Emissions	**3.0**	**2.9**	**19.5**	**<0.01**	**3.2**	**0.9**
Existing Operational Emissions	1.1	0.8	7.9	<0.01	1.3	0.4
Net New Operational Emissions (proposed Project Emissions)	**1.9**	**2.1**	**11.6**	**<0.01**	**1.9**	**0.5**
SCAQMD Significance Thresholds	55	55	550	150	150	55
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

1. Values may vary slightly due to rounding.
2. Winter and Summer emissions rates were compared across all pollutants, the table above presents the greater emission rate for each season and therefore presents a conservative analysis.
Source: CalEEMod output sheets are provided in Attachment A. Detailed calculation sheets are provided in Attachment D.

Local Emissions

Localized significance thresholds (LSTs) were also adopted by the SCAQMD to evaluate projects which would not exceed the regional emission significance thresholds but may have the potential to exceed State and national air quality standards within a project's vicinity. These thresholds set the maximum rates of daily construction or operational emissions from a project site that would not exceed a national or State ambient air quality standard.[4] The differences between regional thresholds and LSTs are as follows:

1. Regional thresholds include all sources of project construction and operational emissions generated from on-site and off-site emission sources whereas the LSTs only consider the emissions generated from on-site emission sources.
2. LSTs only apply to carbon monoxide (CO), nitrogen oxides (NOx), and particulate matter (PM_{10} and $PM_{2.5}$), while regional thresholds include both reactive organic gases (ROG) and sulfur dioxide (SO_2).
3. Regional thresholds apply to emission sources located anywhere within the SCAQMD whereas the LSTs are location dependent and rely on the size of the project and emission location relative to the nearest sensitive receptor. A sensitive receptor is defined as an individual who is most susceptible to negative health effects when exposed to air pollutants and includes children, the elderly, and adults with chronic health issues. Locations for sensitive receptors include residences, schools, elderly care centers, and hospitals.

[4] SCAQMD. (2008). *Final Localized Significance Threshold Methodology*. Referenced at http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf

The SCAQMD provides screening tables (Appendix C of the SCAQMD *2008 Final Localized Significance Threshold Methodology*) for projects that disturb less than or equal to 5 acres in a day.[5] These tables were created to easily determine if the daily emissions of NOx, CO, PM_{10}, and $PM_{2.5}$ from a project could result in a significant impact to the local air quality. The thresholds are determined by:

- Source receptor area (SRA), which is the geographic area within the SCAQMD that can act as both a source of emissions and a receptor of emission impacts (the Project is located within SRA 28, Hemet/San Jacinto Valley);
- Size of grading disturbance (construction)/size of the project (operation); and
- Distance to the nearest sensitive receptor.

Using the SCAQMD methodology for estimating acres of ground disturbance, the site preparation and grading phases would result in a maximum of 1.5 acres of disturbance per day. Construction emissions were evaluated by interpolating between the 1-acre and 2-acre disturbance threshold tables to approximate LST values corresponding to a 1.5-acre daily disturbed area, consistent with SCAQMD guidance for conditions that fall between published threshold categories. Site disturbance calculations are provided in Attachment B. The nearest sensitive receptor is located at 943 W 7th Street, approximately 90 feet (27 meters) north of the Project site boundary. Therefore, the 25-meter receptor distance category was applied, consistent with the nearest available distance category in the SCAQMD LST lookup tables. There are also existing sensitive receptors located on-site associated with the operations of the existing facility. Although portions of the Project may be closer than 25 meters to the existing facility operations, the lowest applicable SCAQMD threshold category (25 meters) was conservatively applied. Construction activities within the proposed 16-bed PHF building would consist of interior renovations and would not involve continuous operation of heavy construction equipment. Additionally, windows in buildings occupied by sensitive receptors would be kept closed during construction to minimize potential exposure to construction-related emissions.

Table 4, *Localized Construction Emission Estimates,* shows the thresholds and estimated maximum daily construction emissions for the proposed Project. As shown in Table 4, the proposed Project would not exceed the SCAQMD LST screening thresholds and would therefore have a less-than-significant localized construction air quality impact.

[5] SCAQMD. (2008). *Final Localized Significance Threshold Methodology Appendix C*. Referenced at http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/appendix-c-mass-rate-lst-look-up-tables.pdf?sfvrsn=2.

Table 4: Localized Construction Emission Estimates*

Construction Activity	Maximum Daily Localized Emissions (pounds/day)			
	NOx	**CO**	**PM_{10}**	**$PM_{2.5}$**
2026				
Demolition	10.9	10.8	0.4	0.4
Site Preparation	13.4	13.2	3.1	1.5
Grading	13.4	13.2	3.5	1.6
Building Construction	9.9	11.5	0.3	0.3
Building Construction and Paving	14.9	18.7	0.6	0.5
Maximum On-Site Emissions (2026)	***14.9***	***18.7***	**3.5**	**1.6**
2027				
Building Construction	9.5	11.4	0.3	0.3
Building Construction and Architectural Coating	10.6	12.9	0.3	0.3
Architectural Coating	1.1	1.5	<0.01	<0.01
Maximum On-Site Emissions (2027)	***10.6***	***12.9***	***0.3***	***0.3***
Maximum On-Site Emissions	**14.9**	**18.7**	**3.5**	**1.6**
SCAQMD Screening Thresholds	198.0	925.0	5.5	3.5
Threshold Exceeded?	**No**	**No**	**No**	**No**

Notes: NOx = nitrogen oxides, CO = carbon monoxide, PM_{10} = particulate matter 10 microns in diameter, $PM_{2.5}$ = particulate matter 2.5 microns in diameter
Source: CalEEMod output sheets are provided in Attachment A. Detailed calculation sheets are provided in Attachment B.
* Localized construction emissions presented in this table are analyzed based on the full buildout of the expanded facility, including a total of 103 beds. Because the analysis assumes construction emissions associated with the entire expanded facility rather than only the proposed expansion, the results represent a conservative estimate. Actual construction emissions associated with the new building, which would accommodate 43 additional SNF-STP beds, are anticipated to be much lesser than the emissions presented in this table.

The localized significance thresholds for operation are determined by the size of the Project site and the distance to the nearest sensitive receptor, as well as the maximum trip length possible within the Project site. As the Project site is 2.98 acres, operational LSTs were estimated by interpolating between the 2-acre and 5-acre site thresholds to approximate values corresponding to the Project site area. Consistent with the localized construction emissions analysis, the 25-meter receptor distance category was applied. The operational LSTs, including emissions from mobile, area, energy, and stationary sources, are included in this analysis.

As shown in Table 5, *Localized Operational Emission Estimates,* the Project is estimated to generate emissions of NOx, CO, PM_{10}, and $PM_{2.5}$ that would be below the applicable localized significance thresholds established by the SCAQMD. Therefore, localized operational air quality impacts would be less than significant.

Table 5: Localized Operational Emission Estimates

Operational Activity	Maximum Daily Localized Emissions (pounds/day)			
	NOx	**CO**	**PM_{10}**	**$PM_{2.5}$**
Mobile	0.3	1.9	<0.01	<0.01
Area	0.1	6.0	<0.01	<0.01
Energy	0.4	0.2	<0.01	<0.01
Stationary	1.1	1.0	0.1	0.1
Total Project Emissions	**1.9**	**9.1**	**0.1**	**0.1**
SCAQMD Significance Thresholds	260.9	1,269.5	2.4	1.2
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: CalEEMod output sheets are provided in Attachment A. Detailed calculation sheets are provided in Attachment B.

Air Quality Management Plan Consistency

The SCAQMD's CEQA Handbook provides the following two criteria to determine whether a project would be consistent with the 2022 AQMP:

1. The Project would not generate population and employment growth that would be inconsistent with Southern California Association of Governments (SCAG)'s growth forecasts from the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS); or
2. The Project would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

Consistency Criterion No. 1 refers to the SCAG's growth forecasts, and associated assumptions included in the AQMP. The future air quality levels projected in the AQMP are based on SCAG's growth projections, which are based, in part, on the general plans of cities located within the SCAG region. Therefore, if the level of housing and employment growth related to the proposed Project is consistent with the applicable assumptions used in the development of the AQMP, the Project would not jeopardize attainment of the air quality levels identified in the AQMP. While SCAG has updated the RTP/SCS to the Connect SoCal 2024, which provides growth and forecasting estimates for 2024 through 2050, this update was adopted after the 2022 AQMP. Therefore, the analysis below uses assumptions from the 2020-2045 RTP/SCS for consistency with the most recent AQMP.

The Project site has an existing General Plan land use designation of Industrial (I) and is zoned Industrial Light (IL). The Industrial (I) General Plan designation supports industrial and employment-generating uses, including light industrial, manufacturing, warehouse, service commercial, and related support uses. The IL zoning district allows for general manufacturing uses and light industrial activities, including auto repair services, pest control services, pool maintenance services, and woodworking shops. Other uses may be permitted where determined to be compatible with the primary allowed uses.

The proposed Project includes demolition of the existing 1,074 SF maintenance and storage building and construction of a new 18,000 SF building addition to the existing skilled nursing facility (SNF), resulting in

a total of 87 beds within the SNF building. In addition, the existing 2,596 SF vacant office building would be converted into a 16-bed Psychiatric Health Facility (PHF), resulting in a total campus capacity of 103 beds.

The proposed Project represents the expansion of an existing health care facility. Given that it does not propose the development of housing, the Project would not directly generate a permanent residential population. The Project also does not include infrastructure improvements or extensions that would directly induce population growth.

The existing Bradley Gardens facility has a total of 150 employees, and the proposed Project would add 100 new employees, resulting in a total of 250 employees. The employees that would fill these roles are anticipated to come from within the City or the region.

According to SCAG's 2020-2045 RTP/SCS Demographics and Growth Forecast Technical Report[6], the City of Jacinto is projected to add approximately 6,200 jobs between 2016 and 2045. Based on these growth projections, the full buildout of the proposed Project would represent approximately 4 percent of projected employment growth within the City of San Jacinto. Thus, the employment growth that would occur from the proposed Project is within the growth projections used to prepare SCAG's 2020-2045 RTP/SCS.

The Project site is designated Industrial under the City's General Plan, which allows a maximum FAR of 0.5. The proposed Project would result in an FAR of approximately 0.27, which is within the FAR allowed by the existing General Plan land use designation of the site. The Project would not introduce new land uses beyond the institutional healthcare uses already occurring on-site.

Therefore, the proposed Project would be within the development intensity anticipated for the site under the General Plan and would remain consistent with the growth framework for the area. Accordingly, the Project would be consistent with the growth assumptions used in the development of the 2020-2045 RTP/SCS and would not jeopardize attainment of the air quality levels identified in the AQMP. With the required City approvals, the Project would be consistent with the applicable General Plan and zoning designations and thus satisfies Consistency Criterion No. 1.

Consistency Criterion No. 2 refers to the California Ambient Air Quality Standards. An impact would occur if the long-term emissions associated with the proposed Project exceed the SCAQMD's regional significance thresholds for construction and operational emissions. As presented in Tables 3 and 4 above, the proposed Project would not result in emitting emissions that exceed SCAQMD established thresholds. Therefore, the proposed Project would be consistent with Criterion No. 2. Since the Project would be consistent with both Criterion No. 1 and 2, impacts related to consistency with the AQMP would be less than significant.

[6] Southern California Association of Governments (SCAG). 2020. *Demographics and Growth Forecast Technical Repor*t. Retrieved from 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy: https://scag.ca.gov/sites/default/files/2024-05/0903fconnectsocal_demographics-and-growth-forecast.pdf

Odors

Odors would be produced during the construction of the proposed Project due to the operation of heavy-duty off-road equipment. The primary odor emitted would be diesel particulate matter from the vendor trucks and heavy-duty off-road equipment. This odor may be noticeable by nearby residents; however, these odors would be expected and not necessarily objectionable. These odors would also dissipate quickly and would be temporary. Therefore, due to the nature of the odor produced during construction as temporary and non-objectionable to a substantial number of people, the odor impact from the construction of the proposed Project would be less than significant.

For operational odor emissions, the SCAQMD's *CEQA Air Quality Handbook* describes odor complaints associated with the following land uses:

- Agricultural uses
- Chemical plants
- Composting activities
- Dairies
- Fiberglass molding
- Food processing plants
- Landfills
- Refineries
- Wastewater treatment plants

The Project does not propose any of the above land uses and is required to comply with SCAQMD Rule 402, *Nuisance*, which states:

> *A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health, or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property. The provisions of this rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals.*

Thus, impacts associated with odor produced by the operation of the proposed Project would be less than significant.

Conclusion

The proposed Project's maximum daily regional and localized construction and operational emissions would not exceed the SCAQMD's regional thresholds of significance, as detailed in Tables 2 through 5. All construction activities would comply with applicable SCAQMD rules and regulations, ensuring minimal and temporary odor exposure during construction. Operational impacts are also anticipated to be minimal and consistent with surrounding land uses. In addition, the proposed Project is consistent with the SCAQMD'S 2022 AQMP, reflecting adherence to regional air quality management goals and standards. During construction, any odors produced will be temporary and not significantly objectionable. Additionally, the proposed Project involves land uses that do not typically generate significant odor complaints and would comply with SCAQMD Rule 402, which addresses potential odor impacts. Overall, the proposed Project's impacts related to air quality would be less than significant. No mitigation would be required.

Energy

The State CEQA Guidelines do not have quantitative thresholds for energy consumption. Rather, the criteria in Appendix G: VI Energy ask (a) "[Would the proposed Project] Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?" and (b) "[Would the project] Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?"[7] Therefore, for the purpose of this analysis, a significant impact would occur if:

(a) The project design and/or location encourages wasteful, inefficient, and unnecessary consumption of energy, especially fossil fuels such as coal, natural gas, and petroleum, as well as the use of fuel by vehicles anticipated to travel to and from the project; or
(b) The project design impedes the growth of future renewable energy developments.

Southern California Edison and the Southern California Gas Company would provide electricity and natural gas, respectively, for construction and operation of the proposed Project. The following assumptions were used to calculate the energy (electricity, natural gas, and petroleum) consumption of the proposed Project:

- Construction equipment fuel consumption was derived from the CARB OffRoad2021 emission model.
- Fuel consumption from vehicle travel was derived from the CARB EMFAC2021 emission model.
- Electrical and natural gas usage was derived from CalEEMod (Version 2022.1).

Construction

Electricity and Natural Gas Usage

Due to the Project size and the fact that construction is temporary, the electricity used during construction of the proposed Project would be substantially less than that required for Project operation and would have a negligible contribution to the Project's overall energy consumption. The electric power used would be for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers. Natural gas is not anticipated to be needed for construction activities. Any natural gas consumption during construction would be minor and negligible in comparison with countywide consumption.

Petroleum Fuel Usage

The equipment associated with construction activities (off-road/heavy duty vehicles) would rely on diesel fuel as would vendor and haul trucks involved in delivering building materials and removing soil material from the Project site. Construction workers would travel to and from the Project site throughout the duration of construction, and for a conservative analysis, it is assumed that construction workers would travel in gasoline-powered passenger vehicles. The trips included worker vehicles, vendor vehicles, and haul vehicles. Table 6, *Total Construction Fuel Usage*, shows the overall fuel consumption for Project

[7] California Energy Commission. (2023). *CEQA Statutes and Guidelines Attachment 10 Appendix G: Environmental Checklist Form*. Referenced at: https://www.energy.ca.gov/sites/default/files/2024-01/11_Attachment_10_-_Appendix_G_from_CEQA_Handbook_ada.docx

construction, obtained from the CARB OffRoad 2021 emission model and the CARB EMFAC2021 model. Detailed tables of fuel consumption by construction equipment and on-road vehicles can be found in Attachment B.

Table 6: Total Construction Fuel Usage*

Construction Source	Gallons of Diesel Fuel	Gallons of Gasoline Fuel
Construction Vehicles	7,730	25,025
Off-Road Construction Equipment	25,320	-
Total	**33,050**	**25,025**
Riverside Countywide Consumption	50,504,775	430,881,899
Percentage Increase (%)	**0.07**	**<0.01**

Source: CalEEMod Output Sheets (see Attachment A) and Detailed Calculation Sheets (see Attachment B).
[1]OFFROAD2021 (v1.0.5) emissions inventory model output for Riverside County, covering calendar year 2027.
* Total construction fuel usage presented in this table is analyzed based on the full buildout of the expanded facility, including a total of 103 beds. Because the analysis assumes construction emissions associated with the entire expanded facility rather than only the proposed expansion, the results represent a conservative estimate. Actual construction emissions associated with the new building, which would accommodate 43 additional SNF-STP beds, are anticipated to be much lesser than the emissions presented in this table. Assumed all construction equipment would consume diesel fuel as a conservative analysis.

As shown in Table 6, construction of the proposed Project would require a total of 33,050 gallons of diesel fuel and 25,025 gallons of gasoline fuel from construction vehicles. This would result in a 0.07 percent increase in countywide construction diesel fuel consumption and a <0.01 percent increase in countywide on-road gasoline consumption. Thus, increased energy consumption from the construction of the proposed Project would be nominal. Additionally, it should be noted that this total fuel consumption is a conservative analysis and would likely overstate the amount of fuel usage, as specific construction equipment is not expected to operate during the entire duration of the construction activity.

Operation

The operation of the proposed Project would consume electricity, natural gas, and petroleum (gasoline). Electricity and natural gas consumption can be found in the CalEEMod Output Sheets attached (Attachment A). The gasoline consumption rates utilize the same assumptions that were used for the worker vehicles. The Project's estimated net energy consumption is shown in Table 7, *Project Net Annual Operational Energy Consumption*, below.

The most recent data available for electricity from the California Energy Commission is from 2023. In 2023, electricity consumption in Riverside County was estimated at 16,286,000,000 kilowatt-hours.[8] The most recent data available for natural gas from the California Energy Commission is from 2024, when natural gas consumption in Riverside County was estimated at 42,670,000,000 British thermal units (Btu).[9] As

[8] California Energy Commission. (2023). *Electricity Consumption by County.* Referenced at: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/california-energy-consumption-dashboards-0
[9] California Energy Commission. (2024). *Natural Gas Consumption by County.* Referenced at: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/california-energy-consumption-dashboards-1

previously shown in Table 6, gasoline consumption in Riverside County in 2027 is estimated at 430,881,899 gallons (see Attachment B). The proposed Project is expected to require electricity, natural gas, gasoline, and diesel. However, the proposed Project's energy consumption would be consistent with that of similar-sized projects and would not constitute an inefficient use of energy. As shown in Table 7, operation of the proposed Project would result in a countywide net increase of less than 0.01 percent in electricity consumption, less than 0.01 percent in natural gas consumption, less than 0.01 percent in gasoline consumption, and less than 0.01 percent in diesel consumption. Accordingly, the Project's operational electricity, natural gas, and gasoline consumption would be minimal at the countywide scale. The Project would not result in wasteful, inefficient, or unnecessary consumption of energy. The proposed Project would result in less-than-significant operational energy impacts. No mitigation would be required.

Table 7: Project Net Annual Operational Energy Consumption

Operational Source	Energy Usage	Countywide Energy Consumption	Percentage Increase in Countywide Consumption from Project
Electricity (Kilowatt-Hour)			
Proposed Project	646,337	NA	
Existing Conditions	313,592		
Net Electricity Consumption from Project	332,746	16,286,000,000	<0.01%
Natural Gas (Thousands British Thermal Units)			
Proposed Project	1,399,933	NA	
Existing Conditions	639,257		
Net Natural Gas Consumption from Project	760,676	42,670,000,000	<0.01%
Petroleum (Gasoline Fuel) Consumption (Gallons)			
Proposed Project	52,117	NA	
Existing Conditions	22,263		
Net Petroleum (Gasoline) Consumption from Project	29,853	430,881,899	<0.01%
Petroleum (Diesel Fuel) Consumption (Gallons)			
Proposed Project	1,723	NA	
Net Petroleum (Diesel) Consumption from Project	1,723	227,147,767	<0.01%

NA=Not Applicable, as this analysis compares the net increase of the Project in countywide consumption.
Source: CalEEMod Output Sheets (see Attachment A) and Detailed Calculation Sheets (see Attachment B).

Future Renewable Energy Developments

The proposed Project would be required to meet the CCR Title 24 energy efficiency standards in effect during permitting of the proposed Project and comply with all applicable City energy codes. The City's administration of the CCR Title 24 requirements includes review of design components and energy conservation measures that occur during the permitting process, which ensures that all requirements are met. In addition, Project design and operation would comply with State Building Energy Efficiency

Standards, appliance efficiency regulations, and green building standards. As such, the Project would not inhibit the use of renewable energy.

Conclusion

The proposed Project's energy consumption for construction activities would be conditioned to require compliance with existing fuel standards, machinery efficiency standards, and California Air Resources Board (CARB) requirements that limit idling of construction trucks and equipment. There are no unusual Project characteristics that would cause the use of construction equipment that would be less energy efficient compared with other similar construction sites in other parts of the state. Additionally, through compliance with existing standards, the operation of the Project would not result in an energy demand on a per-development basis that is greater than other development projects in Southern California. Furthermore, the proposed Project would be required to meet the California Code of Regulations (CCR) Title 24 energy efficiency standards and comply with all applicable City energy codes. The Project would comply with applicable Title 24 Part 6 energy code requirements for healthcare facilities. Therefore, the Project would not inhibit the use of renewable energy. Additionally, the Project would not result in inefficient, wasteful, or unnecessary consumption of energy. Thus, impacts related to energy would be less than significant. No mitigation would be required.

Greenhouse Gas Emissions

Regulatory Background and Thresholds

California State Executive Order S-3-05, issued by Governor Arnold Schwarzenegger in June 2005, established comprehensive GHG reduction targets for the state.[10] It mandated reducing GHG emissions to 2000 levels by 2010, to 1990 levels by 2020, and to 80 percent below 1990 levels by 2050. This Executive Order laid the foundation for subsequent climate change mitigation efforts in California, including the development of various policies and programs aimed at reducing emissions across sectors such as transportation, energy, and industry. The objective of the Executive Order is to contribute to capping worldwide CO_2 concentrations at 450 parts per million (ppm), stabilizing global climate change.

The SCAQMD convened a GHG Emissions CEQA Significance Threshold Working Group to help lead agencies determine significance thresholds for GHG emissions where the SCAQMD is not the lead agency. The last working group was held in September 2010 (Meeting No. 15) and proposed a tiered approach (Tier I to Tier V), equivalent to the existing consistency determination requirements in CEQA Guidelines Sections 15064(h)(3) or 15125(d).[11] The applicable screening threshold tier for the City of San Jacinto is described in further detail below.

Tier III – Numerical Screening Thresholds

The SCAQMD's draft threshold uses the Executive Order S-3-05 goal as the basis for the Tier III screening level. Tier III consists of screening values which the lead agency can choose from, but it must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project impact would be less than significant:

- Option 1, all land use types: 3,000 $MTCO_2e$ per year
- Option 2, based on land use type:
    - Residential: 3,500 $MTCO_2e$ per year
    - Commercial: 1,400 $MTCO_2e$ per year
    - Mixed-use: 3,000 $MTCO_2e$ per year

Based on the foregoing guidance, the City has elected to rely on compliance with the SCAQMD threshold in the determination of significance of project-related GHG emissions. Specifically, the City has selected the 3,000 $MTCO_2e$ per year threshold recommended by SCAQMD staff against which to compare Project-related GHG emissions.

The City understands that the 3,000 $MTCO_2e$ per year threshold was proposed by the SCAQMD a decade ago and was adopted as an interim policy; however, no permanent, superseding policy or threshold has since been adopted. The 3,000 $MTCO_2e$ per year threshold was developed and recommended by the

[10] Executive Department State of California. Executive Order S-3-05. Referenced at: https://www.library.ca.gov/wp-content/uploads/GovernmentPublications/executive-order-proclamation/5129-5130.pdf

[11] SCAQMD. (2010). *Minutes of the GHG CEQA Significance Threshold Stakeholder Working Group #15*. Referenced at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-minutes.pdf.

SCAQMD, an expert agency, based on substantial evidence as provided in the *Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold* document and subsequent Working Group meetings (latest of which occurred in 2010).[12] The SCAQMD has not withdrawn its support of the interim threshold and all documentation supporting the interim threshold remains on the SCAQMD website on a page that provides guidance to CEQA practitioners for air quality analysis (and where all SCAQMD significance thresholds for regional and local criteria pollutants and toxic air contaminants also are listed). Further, as stated by SCAQMD, this threshold "uses the Executive Order S-3-05 goal (80 percent below 1990 levels by 2050) as the basis for deriving the screening level," and thus remains valid for use in year 2026 and for purposes of this analysis. Lastly, this threshold has been used for hundreds of GHG analyses performed for projects located within the SCAQMD jurisdiction.

Project GHG Emissions

The Project's construction GHG emissions are shown in Table 8, *Project Construction GHG Emissions*, and the overall construction and operational emissions are shown in Table 9, *Total Project GHG Emissions*, below. Similar to the previous energy analysis, this GHG analysis likely overstates the Project's GHG emissions, since Title 24 measures have not been accounted for in the model. Therefore, this report provides a conservative analysis of potential GHG impacts.

These emissions were estimated using CalEEMod. Construction emissions were amortized over 30 years and combined with operational greenhouse gas (GHG) emissions for evaluation. As shown in Table 9, the proposed Project's total construction and operational GHG emissions would be 810 metric tons of carbon dioxide equivalent ($MTCO_2e$). When compared to emissions from the existing buildings, the Project would result in a net increase of approximately 478 $MTCO_2e$ per year, which is below the SCAQMD Tier III significance threshold of 3,000 $MTCO_2e$ per year. Therefore, the Project would result in a less-than-significant GHG impact.

Table 8: Project Construction GHG Emissions*

Construction Year	Annual GHG Emissions ($MTCO_2e$)
2026	33
2027	386
Total Emissions	**419**
Total Emissions Amortized Over 30 Years	14

Source: CalEEMod Output Sheets (see Attachment A) and Detailed Calculation Sheets (see Attachment B).
* Construction GHG emissions presented in this table are analyzed based on full buildout of the expanded facility, including a total of 103 beds. Because the analysis assumes construction emissions associated with the entire expanded facility rather than only the proposed expansion, the results represent a conservative estimate. Actual construction emissions associated with the new building, which would accommodate 43 additional SNF-STP beds, are anticipated to be much lesser than the emissions presented in this table.

[12] SCAQMD. (2008). *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans*. Referenced at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf.

Table 9: Total Project GHG Emissions

Activity	Annual GHG Emissions ($MTCO_2e$)
Mobile	509
Area	2
Energy	177
Water	12
Waste	96
Refrigeration	0.1
Stationary	18
Total Project Operation Emissions	**814**
Amortized Project Construction Emissions	14
Total Project Emissions	**828**
Existing Emissions	349
Net New Emissions	**478**
Tier III Significance Threshold	3,000
Threshold Exceeded?	**No**

Source: CalEEMod Output Sheets (see Attachment A) and Detailed Calculation Sheets (see Attachment B).
* Total Project GHG emissions presented in this table are analyzed based on full buildout of the expanded facility, including a total of 103 beds. Because the analysis assumes construction emissions associated with the entire expanded facility rather than only the proposed expansion, the results represent a conservative estimate. Actual construction emissions associated with the new building, which would accommodate 43 additional SNF-STP beds, are anticipated to be much lesser than the emissions presented in this table.

Project Consistency with Plans, Policies, and Regulations

CARB's 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) sets California's GHG emission reduction target for 2045 at 85 percent below 1990 levels, which was codified by Senate Bill (SB) 32.[13] In addition to the CARB 2022 Scoping Plan, the City of San Jacinto is one of 12 Western Riverside Council of Governments (WRCOG) jurisdictions that participated in preparing the 2021 Subregional Climate Action Plan (WRCOG Subregional CAP).[14] The WRCOG Subregional CAP establishes a community-wide emissions reduction target of 15 percent below 2010 levels by 2020 and 49 percent below 2010 levels by 2035, consistent with guidance from CARB and the Governor's Office of Planning and Research. CARB and the California Attorney General have determined that this approach is consistent with the statewide AB 32 goal of reducing emissions to 1990 levels.

[13] California Air Resources Board. (2022). *California's 2022 Climate Change Scoping Plan Table 2-1: Actions for the Scoping Plan Scenario: AB 32 GHG Inventory Sectors.* Referenced at: https://ww2.arb.ca.gov/sites/default/files/2023-04/2022-sp.pdf

[14] Western Riverside Council of Governments. (2022). *Subregional Climate Action Plan.* Referenced at: https://wrcog.us/DocumentCenter/View/9987/Climate-Action-Plan-Toolkit

As shown below in Table 10, *2022 Scoping Plan Consistency Summary,* and Table 11, *WRCOG Subregional CAP Consistency Summary,* the Project would be consistent with applicable policies and measures in the 2022 Scoping Plan and the WRCOG Subregional CAP.

Table 10: 2022 Scoping Plan Consistency Summary

Action	Consistency
GHG Emissions Reductions Relative to the SB 32 Target	
40 percent Below 1990 levels by 2030.	**Consistent.** The proposed Project would comply with applicable Title 24, Part 6 building energy efficiency standards and other State and local requirements supporting statewide greenhouse gas reduction targets consistent with SB 32.
Smart Growth/Vehicle Miles Traveled VMT	
VMT per capita reduced 25 percent below 2019 levels by 2030, and 30 percent below 2019 levels by 2045.	**Consistent.** The Project site has an existing General Plan land use designation of Industrial (I) and is zoned Industrial Light (IL). The Industrial (I) designation supports industrial and employment-generating uses, including light industrial, manufacturing, warehouse, service commercial, and related support uses. The IL zoning district allows for general manufacturing and light industrial activities, including auto repair services, pest control services, pool maintenance services, and woodworking shops, as well as other compatible uses. The proposed Project includes demolition of an existing 1,074-square-foot storage building and construction of a new 18,000-square-foot building addition to the existing SNF, resulting in a total of 87 SNF beds. The Project also includes the conversion of an existing 2,596-square-foot vacant office building into a 16-bed PHF, resulting in a total campus capacity of 103 beds. The Project would have a floor area ratio (FAR) of approximately 0.27, which is consistent with the development intensity permitted by the existing General Plan land use designation. The Project represents the expansion of an existing institutional healthcare facility and does not introduce residential uses. It would not generate substantial population or employment growth beyond that anticipated under the General Plan or regional growth forecasts. As previously evaluated in the air quality analysis, the Project is consistent with the SCAG's 2020–2045RTP/SCS and would not conflict with regional VMT reduction strategies or statewide greenhouse gas reduction targets.
Light-Duty Vehicle (LDV) Zero-Emission Vehicles (ZEVs)	
100 percent of LDV sales are ZEV by 2035.	**Consistent.** The proposed Project would be designed and constructed in accordance with Title 24, Parts 6 and 11 requirements applicable to healthcare facilities,

Action	Consistency
	including provisions for electrical infrastructure to support future electric vehicle charging where required by code.
New Residential and Commercial Buildings	
All electric appliances beginning 2026 (residential) and 2029 (commercial), contributing to 6 million heat pumps installed statewide by 2030.	**Consistent.** The proposed Project would comply with Title 24, Part 6 energy efficiency requirements, including the installation of electrical wiring for built-in appliances. Although the Project would include natural gas use on-site, the Project would incorporate energy-efficient building design features and would not result in inefficient energy consumption.
Construction Equipment	
25 percent of energy demand electrified by 2030 and 75 percent electrified by 2045.	**Consistent.** The proposed Project would be required to use construction equipment that is registered by CARB and meet CARB's standards. CARB sets its standards to be in line to reduce energy demand by 25 percent in 2030 and 75 percent in 2045.
Transportation Electrification	
Create a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide (such as permit streamlining, infrastructure siting, consumer education, or preferential parking policies).	**Consistent.** The proposed Project would be designed and constructed in accordance with the Title 24 Part 6 and Part 11 requirements, which include constructing homes to allow for electric vehicle charging. Therefore, the proposed Project would not interfere with the implementation of a ZEV ecosystem within the City.
VMT Reduction	
Adopt and implement Complete Streets policies and investments, consistent with general plan circulation element requirements.	**Consistent.** The Project includes redevelopment of an existing SNF campus and consists of building expansion, conversion of an existing vacant office building into a PHF, and associated site improvements, including drive aisles, driveways, landscaping, and pedestrian pathways. The Project would provide internal pedestrian circulation improvements through on-site pathways connecting building areas and access points. The Project would also include widening improvements along W. 7th Street and S. Grand Avenue. These improvements are limited to the Project site and do not include modifications to the surrounding public roadway network. The Project would not conflict with the implementation of Complete Streets policies or planned circulation improvements.
Increase public access to shared clean mobility options (such as planning for and investing in electric shuttles, bike share, car share, transit).	**Consistent.** The Project includes redevelopment of an existing SNF campus and consists of building expansion, conversion of an existing vacant office building into a PHF, and associated site improvements, including drive aisles, driveways, landscaping, and pedestrian pathways. The Project would not include shared mobility services such as shuttle programs, bike share, or car share systems. However, it would maintain internal pedestrian

Action	Consistency
	circulation through on-site pathways connecting building areas and access points. The nearest public transit stop is the S. State Street and W. 7th Street bus stop (Stop ID: 3214), located approximately 0.28 miles (approximately 1,500 feet) from the Project site. This stop provides access to regional bus transit services. Given the Project's infill location within an existing developed area, it would not conflict with implementation of transit services or regional shared mobility programs and would remain accessible to existing multimodal transportation options in the vicinity.
Amend zoning or development codes to enable mixed-use, walkable, and compact infill development (such as increasing allowable density of the neighborhood).	**Consistent.** The General Plan includes policies that encourage amendments to zoning and development codes to support mixed-use, walkable, and compact infill development. While the Project does not propose zoning amendments or mixed-use development, it represents infill redevelopment of an existing developed healthcare campus through the expansion of a SNF and conversion of an existing vacant office building to a PHF. The Project site has a zoning designation of Industrial Light (IL). The IL zoning designation allows for general manufacturing uses, auto repair services, pest control services, pool maintenance services, and woodworking shops. The Project does not include a change in land use designation or zoning. The proposed redevelopment would occur within an existing developed urbanized site and reflects efficient use of previously developed land consistent with infill development objectives and compact growth patterns. Therefore, the Project is consistent with the intent of this policy and does not conflict with the General Plan's objectives for compact and efficient land use patterns
Building Decarbonization	
Adopt all-electric new construction reach codes.	**Consistent.** The proposed Project would comply with Title 24 Parts 6 and 11, which include electric heat pumps installed during construction and electric hookups for all appliances.
Adopt policies and incentive programs to reduce electrical loads from equipment plugged into outlets (such as purchasing Energy Star equipment for municipal buildings, occupancy sensors, smart power strips, equipment controllers, etc.).	**Consistent.** The proposed Project would be constructed in accordance with Title 24 CALGreen requirements, which include the installation of Energy Star equipment and appliances in new buildings.
Facilitate deployment of renewable energy production and distribution and energy storage.	**Consistent.** The proposed Project would be constructed in accordance with the CALGreen Building Energy Efficiency Standards (Title 24 Part 6) and meet all other requirements related to energy efficiency standards.

Source: California Air Resources Board. (2022). *California's 2022 Climate Change Scoping Plan Table 2-1: Actions for the Scoping Plan Scenario: AB 32 GHG Inventory Sectors.* Referenced at: https://ww2.arb.ca.gov/sites/default/files/2023-04/2022-sp.pdf

Table 11: WRCOG Subregional CAP Consistency Summary

Measure	Consistency
Energy	
LE-1: Expand Local Renewable Energy Production. Increase solar PV installations on new and existing buildings.	**Consistent.** The Project would comply with Title 24 Part 6 building energy requirements and applicable California Energy Code provisions for healthcare facilities.
LE-4: Building & Appliance Electrification. Transition energy use away from fossil natural gas to clean electricity and renewable natural gas.	**Consistent.** The Project would comply with Title 24 Part 6 energy efficiency and electrification requirements for nonresidential healthcare facilities, including building systems and equipment electrification to the extent required by code.
LE-6: Shade Trees. Strategically plant trees to reduce the urban heat island effect.	**Consistent.** The Project would provide private open space for each proposed residence, as well as common open space and landscaped areas totaling approximately 4,015 square feet. These landscaped areas would allow for the incorporation of shade trees and vegetation throughout the Project site, including within open space areas and along pedestrian circulation routes, which supports reduction of localized heat island effects consistent with the intent of this policy.
LT-2: Pedestrian Infrastructure Improvements. Expand and improve pedestrian infrastructure, including sidewalks, crosswalks, and pedestrian signals.	**Consistent.** The Project includes internal site improvements consisting of pedestrian pathways, drive aisles, and driveways that provide circulation within the existing campus and connect building areas and site access points. These on-site pedestrian improvements would enhance internal pedestrian connectivity and access to existing public sidewalks in the surrounding area. The Project would also include widening and frontage improvements along W. 7th Street and S. Grand Avenue that would enhance pedestrian access adjacent to the site. The Project would not modify the public roadway network but would support improved pedestrian access consistent with LT-2.
LT-7: Increase Housing Density. Increase the density of planned housing units within the city.	**Consistent.** The Project does not propose residential development or any increase in housing density. It involves the expansion of an existing healthcare facility on a site designated Industrial (I) and zoned Industrial Light (IL). The Project does not affect housing capacity assumptions under the General Plan or regional growth forecasts.
LT-8: Increase Land Use Diversity. Provide for a variety of development types and uses.	**Consistent.** The Project site is designated Industrial (I) and zoned Industrial Light (IL), which allows for a range of industrial, service commercial, and compatible uses. The Project involves the expansion of an existing SNF and conversion of a vacant office building to a PHF within an existing developed campus. The Project does not introduce new land use categories or require a change in land use designation or zoning. It represents continued use and expansion of institutional healthcare services within an existing developed industrial setting.

LT-9: Transit-Oriented Development. Place new developments in close proximity to transit services.	**Consistent.** The Project is located approximately 0.28 miles (approximately 1,500 feet) from the nearest transit stop (S. State Street and W. 7th Street, Stop ID: 3214), providing access to regional transit services. The Project supports transit accessibility by locating redevelopment within an existing developed area near transit service.
LT-10: Local ZEV Programs. Provide charging stations and other support for zero emission vehicles (ZEVs).	**Consistent.** The proposed Project would be designed and constructed in accordance with Title 24, Part 6 and Part 11 requirements, which include EV-ready infrastructure to support electric vehicle charging on-site. Electric vehicle charging stations would be provided in surface parking areas and/or designated parking locations associated with the medical facility.
Solid Waste	
LS-1: Zero Waste Initiatives. Support the State's mandates and strive for zero waste.	**Consistent.** The proposed Project would be required to comply with applicable City of San Jacinto solid waste and recycling requirements implemented in accordance with statewide regulations, including AB 341 and SB 1383. These regulations require recycling of commercial solid waste and diversion of organic waste from landfills through recycling and organics collection programs, supporting statewide waste reduction and landfill methane reduction goals.

Source: Western Riverside Council of Governments. (2022). *Subregional Climate Action Plan.* Referenced at: https://www.wrcog.us/wp-content/uploads/2025/08/Climate-Action-Plan-Toolkit-1.pdf

In addition to the CARB 2022 Scoping Plan and the WRCOG Subregional CAP, the Project would comply with all applicable State and local regulatory requirements in effect at the time of construction and operation, including the California Building Standards Code (Title 24), which incorporates the California Energy Code and CALGreen requirements. The Project is also consistent with Connect SoCal 2024 (2024–2050 RTP/SCS), which establishes long-range regional transportation, land use, and emissions reduction strategies for the SCAG region, including transportation investments, programming, and regional growth considerations. These policies are implemented at the regional and local level through agency coordination and planning processes. The Project would not conflict with Connect SoCal 2024 and would remain consistent with regional growth assumptions, as it involves the expansion and conversion of an existing institutional healthcare facility, does not include residential development, and would not alter regional population or housing growth patterns.

Overall, the Project would not conflict with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emissions.

Conclusion

As described above, the proposed Project's total construction and operational GHG emissions would be 810 $MTCO_2e$. When compared to emissions from the existing buildings, the Project would result in a net increase of approximately 478 $MTCO_2e$ per year, which is below the SCAQMD significance threshold of 3,000 $MTCO_2e$ per year. Furthermore, as shown in Tables 10 and 11, the Project is consistent with applicable measures of the WRCOG Subregional CAP and 2022 Scoping Plan. The Project would also comply with applicable regulatory requirements, including Title 24 energy efficiency and CALGreen Code standards, and would not conflict with applicable plans, policies, or regulations adopted for the purpose

of reducing greenhouse gas emissions. Therefore, the Project's GHG emissions impacts would be less than significant, and no mitigation would be required.

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	26-017 Bradley Gardens San Jacinto-Proposed Project -10-19
Construction Start Date	12/1/2026
Operational Year	2028
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50000
Precipitation (days)	22.4000
Location	980 W 7th St, San Jacinto, CA 92582, USA
County	Riverside-South Coast
City	San Jacinto
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5571
EDFZ	11
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas

Data Field	Value
App Version	2022.1.1.46

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Congregate Care (Assisted Living)	103.000	Dwelling Unit	0.75000	32,741.0	40,362.0	—	333.000	Congregate Facility Units
Other Non-Asphalt Surfaces	1.70000	Acre	1.70000	0.02000	0.00000	—	1,040.00	—
Parking Lot	52.0000	Space	0.47000	0.00000	0.00000	—	—	Parking Space
General Office Building	2.60900	1000sqft	0.06000	2,609.00	0.00000	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	ROG	NOx	CO	SO2	PM10E	PM10T	PM2.5T	CO2e

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	23.2500	annual days of extreme heat
Extreme Precipitation	3.30000	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.49000	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

Indicator	Result for Project Census Tract
AQ-Ozone	93.6279
AQ-PM	39.6017

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	59.0000
Healthy Places Index Score for Project Location (b)	7.00000
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Adjusted based on information provided on the Site Plan.
Construction: Construction Phases	The construction start date and operational date were provided by the client, along with the number of days for each construction phase. The paving phase was set to begin concurrently with the building construction phase, and would be completed after the default amount of days. Architectural coating was set to begin approximately 2 weeks before building construction was completed, and would span the CalEEMod default amount of days.
Construction: Off-Road Equipment	Assumed all construction will be utilized 8 hours per work day. Replaced Tractors/Loaders/Backhoes with Crawler Tractors in the Site Preparation and Grading Phases.
Construction: Dust From Material Movement	Adjusted per the client's grading information to balance the site.
Operations: Vehicle Data	Adjusted rates for Weekday Trips (based on ITE 12th Edition), Saturday Trips, and Sunday Trips to match ITE trip rates for 620 – Nursing Home.
Operations: Hearths	Fireplaces and Wood Stoves are removed in accordance with SCAQMD Rule 445.

8.3. Land Use

Model Parameter	Units	Default Value	New Value
Lot Area	acre	6.43750	0.75000
Building Area	sq. ft	109,180	32,741.0
Landscape Area	sq. ft	—	40,362.0

236* 0.73 *200 * 0.050= 1,723 gal/year

The U.S. EPA's Greener Cleanups methodology specifies an assumed diesel brake-specific fuel consumption (BSFC) of 0.050 gallons per horsepower-hour, based on a fuel energy value of 7,000 Btu/HP-hour and diesel's higher heating value of 139,000 Btu/gallon.

EXHIBIT 3.11B – QUANTIFYING FUEL USE FOR HEAVY EQUIPMENT USE

The following table can be used to organize and calculate fuel use associated with heavy equipment use. Two different calculation options are provided in decreasing order of known information. It is preferable to use the calculation Option 1 where possible. Option 2 can be used if the information is not available for Option 1.

Activity	Input #1		Input #2		Fuel Use
Option 1 – Known Fuel Use or Equipment Owner Estimated Fuel Use					
	Event	×	**Fuel use per event**	=	**Fuel Use (gals)**

Option 2 – Known or Estimated Horsepower Rating, Fuel Type, and Hours of Operation									
	HP	×	**Hours**	×	**BSFC**	×	**PLF**	=	**Fuel Use (gals)**

Notes:
Option 1 – "Event" can refer to a specific task, time period, or entire scope of work. Fuel use per event is assumed to be a reasonable estimate by the equipment owner based on fuel use for a similar, but previously executed event.
Option 2 – "HP" = horsepower rating of equipment "Hours" = hours of operation
"BSFC" brake-specific fuel capacity "PLF" = partial load factor

The assumed BSFC for diesel and biodiesel is 0.050 gallons per HP-hr.
The assumed BSFC for gasoline is 0.056 gallons per HP-hr.

BSFC values are consistent with 7,000 British thermal units (Btu)/HP-hr (as used by EPA AP-42, Compilation of Air Pollutant Emission Factors, Chapter 3) and fuel higher heating values of 139,000 Btus for diesel and 124,000 Btus for gasoline (as used by Climate Leaders).

The following table provides HP and PLF values for common types of equipment.

Equipment Type	HP	PLF	Production Rate
Medium/large excavator (2 CY bucket)	175	0.75	720 cy/day
Medium loader (3 CY bucket)	200	0.75	1200 cy/day
Medium dozer, 100+ foot haul	200	0.75	500 cy/day
Direct-push rig for soil sampling	60	0.75	250 ft/day
Hollow-stem auger for well installation	150	0.75	100 ft/day
Air or mud rotary for well installation	500	0.75	200 ft/day

Production rates and equipment sizes are generally consistent with production rates reported RS Means Building Construction Cost Data and are representative averages. Actual production rates may vary due to a number of factors including site conditions and operator experience. Site teams are encouraged to use more site-specific production rates if they can be documented. Absent other information a PLF of 0.75 is a reasonable estimate for heavy equipment. The PLF may decrease if work is inefficient for a variety of reasons. Many of the same inefficiencies would also reduce the production rate. Therefore, if the assumed production rate is lower, it is appropriate for the PLF to be lowered by a commensurate amount resulting in no net change in fuel use.

ion

Construction Fuel Consumption Summary

Construction Source	Gallons of Diesel Fuel	Gallons of Gasoline Fuel
Countywide	50,504,775.2	430,881,898.5

1 INTRODUCTION

This Health Risk Assessment (HRA) evaluates the potential impacts of the proposed Bradley Gardens Skilled Nursing Facility Expansion Project ("Project", or "proposed Project"). The Project site is within the southwestern portion of the City of San Jacinto in Riverside County, California. The Project site is located at 980 West (W.) 7th Street, at the southeast corner of the intersection of W. 7th Street and South (S.) Grand Avenue. Regional access to the Project site is provided by State Route (SR) 79 and SR 74. Local access to the site is provided by W. 7th Street and S. Grand Avenue. The Project site consists of one parcel encompassing approximately 2.98 acres. The site is identified as Assessor's Parcel Number (APN) 435-330-003. The Project site is developed and currently operates as the Bradley Gardens facility, which offers a variety of psychiatric-focused care to patients with varying health needs, including supervised Psychiatric Health Facility (PHF) care beds, Skilled Nursing Facility (SNF) and Short-Term Psychiatric (STP) care beds, and rehabilitation and therapy programs. The proposed Project is within the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The Project site location is shown in Figure 1, *Project Aerial.*

The Project proposes the expansion of the existing Bradley Gardens Nursing Facility on the 2.98-acre site. The Project includes demolition of the existing 1,074-square-foot (SF) maintenance and storage building for the construction of an 18,000 SF building addition to the existing 44-bed SNF building that would provide 43 additional SNF and STP beds, resulting in a total capacity of 87 beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building into a 16-bed PHF. The Project would also include a proposed emergency generator. The existing emergency generator has a temporary use permit and would be replaced as part of the Project. Because the existing generator would be removed, its emissions were not included in this analysis. The proposed Project would result in a floor area ratio (FAR) of 0.27. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, and pavement of parking areas and driveways. With the completion of the proposed Project, there would be a total of 103 beds (SNF, STP, and PHF beds) on the Project site. The Project site has an existing General Plan land use designation of Industrial (I) and is zoned as Industrial Light (IL). The proposed Project site plan is shown in Figure 2, *Conceptual Site Plan*. It should be noted that the Project site plan shows 17,372 SF for the 43-bed addition; this analysis utilized 18,000 SF for this 43-bed addition, presenting a conservative analysis.

1.1 Access and Parking

Access to the proposed Project would be provided via three driveways. The Project would consolidate the two existing driveways on W. 7th Street that are located along the center of the site's northern boundary into one 24-foot-wide driveway. The existing driveway on W. 7th Street in the northeastern corner of the site would be widened to a width of 24 feet. Both these driveways would provide unrestricted ingress and egress for automobiles. In addition, a gated 25-foot-wide driveway is proposed from S. Grand Avenue in the southwest corner of the site to provide emergency vehicle access to the site. A 27.3-foot-wide drive aisle would be constructed in the surface parking lot.

Upon implementation of the proposed Project, the expanded Bradley Gardens facility would include a total of 52 passenger vehicle parking spaces, including 4 accessible spaces. The proposed parking spaces would be provided in a surface lot along the northern boundary of the Project site for employees, patients, and visitors. In addition, up to 3 short-term bicycle parking spaces and 3 long-term bicycle parking spaces would be provided near the entrance to the existing SNF building for a total of 6 bicycle parking spaces.

1.2 Construction Characteristics

Construction of the Project would have a duration of approximately 11 months, as shown below in Table 1, *Construction Schedule*. Construction activity was assumed to occur eight hours per day, five days a week.

Table 1: Construction Schedule

Activity	Start Date	End Date	Total Working Days
Demolition	12/1/2026	12/9/2026	7
Site Preparation	12/10/2026	12/16/2026	5
Grading	12/17/2026	12/23/2026	5
Building Construction	12/24/2026	12/8/2027	250
Paving	12/24/2026	12/30/2026	5
Architectural Coating	11/24/2027	11/30/2027	5

Source: CalEEMod Output Sheets (see Appendix A)

1.3 Operational Characteristics

The Project is analyzed as a healthcare facility. Typical operational characteristics include employees, patients, and visitors traveling to and from the site. The proposed Project would not change the existing operations of the Bradley Gardens facility, which operates 24 hours a day, seven days a week. The proposed

Project would add 100 new employees across all shifts to the existing facility, which currently includes 150 employees, resulting in a total employee count of 250. The existing facility currently has a capacity of 44 beds. Implementation of the proposed Project would add 59 beds, consisting of 43 additional SNF/STP beds and 16 PHF beds, resulting in a total capacity of 103 beds at the facility. Operational characteristics include trips from residents (passenger vehicles), as well as an emergency generator operating at a maximum of 200 hours per year. The Project is expected to begin operation in 2028.

1.4 Purpose of the Report

To support the California Environmental Quality Act (CEQA) document for the proposed Project, this report evaluates the potential health impacts to sensitive receptors from the construction and operation of the Project. This HRA focuses on diesel particulate matter (DPM) emissions from on-road vehicles and off-road equipment used during Project construction, as well as emissions from the proposed emergency generator during Project operation. DPM has been identified by the California Air Resources Board (CARB) as a carcinogenic substance responsible for nearly 70 percent of the airborne cancer risk in California (California Air Resources Board, 2017). The estimated health risk impacts from the Project construction were compared to the health risk significance thresholds recommended by the SCAQMD for use in CEQA assessments.

This HRA employed the following tools to estimate the health impact of the Project:

- The California Air Pollution Control Officers Association (CAPCOA) California Emissions Estimator Model (CalEEMod, Version 2022.1) to calculate exhaust emissions from mobile sources such as diesel trucks and construction equipment, such as crawler tractors and cranes, during the construction of the Project.
- The United States Environmental Protection Agency (USEPA) AMS/EPA Regulatory Model (AERMOD Version 26135) air dispersion model to estimate DPM impacts to sensitive receptors.
- Cancer risk methodology from the California Office of Environmental Health Hazards Assessment (OEHHA) (California Office of Environmental Health Hazards Assessment, 2015) and the SCAQMD (South Coast Air Quality Management District, 2017).
- The California Air Resources Board (CARB) EMFAC2021 emissions model to estimate diesel particulate matter (DPM) emissions from the proposed emergency generator during Project operation, based on the generator's horsepower, load factor, and annual operating hours.

1.5 Summary of the Results

The emissions from the Project's construction and operation, would not result in cancer health risks that exceed the lifetime cancer risk threshold of 10 in one million at the maximum impacted sensitive receptors. The Project's emissions for construction and operation would also not result in a non-cancer risk greater than the 1.0 non-cancer hazard index threshold. The Project's maximum construction, operational, and combined health risk impacts would result in the following. The Project's maximum health risk results are summarized below.

Maximum Project Construction Health Risk Results:

- Sensitive/residential receptor: 4.76 in one million
- Worker receptor: 0.13 in one million
- Sensitive/residential receptor chronic non-cancer HI: 0.01
- Worker receptor chronic non-cancer HI: 0.01

Maximum Project Operational Health Risk Results:

- Sensitive/residential receptor for the 30-year lifetime exposure duration: 2.21 in one million
- Worker receptor: 0.24 in one million
- Sensitive receptor chronic non-cancer HI: <0.01
- Worker receptor chronic non-cancer HI: 0.05

Combined Project Construction and Operational Cancer Risk Results:

- Sensitive/residential receptor for the 30-year exposure duration: 2.37 in one million
- Worker receptor: 0.36 in one million

The Project construction and operational individual and cumulative health risk results, would not exceed the SCAQMD significance threshold of 10 in one million or the HI threshold of 1.0. Therefore, the construction and operation of the proposed Project would result in a less-than-significant project-level and cumulative impact for cancer and non-cancer health risk.

2 HEALTH RISK ASSESSMENT

A Health Risk Assessment (HRA) is a guide that helps determine whether the risks from current or future exposures to a toxic chemical or substance in the environment could affect the health of a population. In general, the quantification of risk from the development of a project depends on the following factors:

- Identification of the toxic air contaminants (TACs) that may be present in the air;
- Estimation of the amount of TACs released from all emission sources using emission models;
- Estimation of the airborne concentrations of TACs in the geographic area of concern using air dispersion models with information about emissions, source locations, weather, and other factors;
- Estimation of the level of exposure to different concentrations of the TACs at different geographic locations and their consequential health impacts.

Thus, an HRA identifies the TACs that could affect public health, identifies the sources and quantities of the TAC emissions, estimates where the emissions are transported by prevailing meteorological conditions, and assesses the consequential health impacts due to the identified exposures.

The State of California Office of Environmental Health Hazards Assessment (OEHHA) has developed methods for conducting HRAs. As defined under the Air Toxics "Hot Spots" Information and Assessment Act:

> "*A health risk assessment means a detailed, comprehensive analysis prepared pursuant to Section 44361 to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure.*" *(California Health and Safety Code, 1987)*

The methodology used to estimate health risks and hazards that could potentially affect nearby sensitive receptors from the emissions of TACs is described below. The methodology includes assumptions regarding emission source quantification, configurations and locations, receptor locations, air dispersion modeling, and health risk modeling. As noted above, this HRA focused on DPM emissions that the CARB has identified as the principal airborne carcinogenic substance in California. For purposes of this HRA, DPM was assumed to be comprised of PM_{10} vehicle exhaust emissions, which measure particulate matter with a diameter of 10 microns or less (California Air Resources Board, n.d.)

2.1 SCAQMD Significance Thresholds

Project-Level

Riverside County has not adopted a numerical significance threshold for cancer risk or non-cancer chronic health risk impacts. Therefore, the significance thresholds recommended by the SCAQMD were used for this assessment. The relevant significance thresholds are provided below:

- Cancer Risk: 10 persons per million population as the maximum acceptable incremental cancer risk due to exposure to TACs.
- Non-Cancer Hazard Index (HI): 1.0.

These thresholds are discussed further in Section 2.2, *Health Risk Estimation Methodology*.

Cumulative

The SCAQMD conducted an analysis of the cumulative effects of TACs within the South Coast Air Basin as part of its *Multiple Air Toxics Exposure Study in the South Coast Air Basin* (MATES-V, the draft version of this MATES study series*)* (South Coast Air Quality Management District, 2021a). The MATES-V study expresses cumulative TAC impacts in terms of potential increased cancer risks. Cumulative impact thresholds for this Project are derived from this study, since the Project site is within the MATES-V Study area. The MATES-V Study estimates that the cumulative TAC-source cancer risk for the localized area encompassing the Project site ranges from 300 to 400 in one million. DPM-source cancer risks are reflected in the area's ambient cumulative cancer risk along with all other TAC-source risks, and account for the predominance (68 percent) of the total risk. A cancer risk upper limit of 400 in a million was assumed to comprise the impact from existing TAC emission sources in the region, without the impacts from the Project.

The TAC emissions inventory used in the MATES-V study to estimate health impacts was representative of emissions for the year 2018. In addition to the MATES-V cumulative TAC-source cancer risk noted above, other new or proposed potential TAC-generating projects (related projects) in the Project area not included in the MATES-V study could contribute to cumulative TAC impacts. The SCAQMD has published a white paper addressing cumulative impacts from air pollution (South Coast Air Quality Management District, 2003). The white paper recommends a 1,000-foot distance from a proposed project to identify other development projects that could contribute to cumulative impacts (South Coast Air Quality Management District, 2019). The 1,000-foot evaluation distance is supported by research-based findings concerning TAC emission dispersion rates from roadways and large sources, showing that emissions diminish substantially between 500 and 1,000 feet from emission sources. While the cumulative analysis incorporates future emissions within 1,000 feet of the source, the project-specific and cumulative significance thresholds of 10 in one million for cancer risk and 1 in one million for non-cancer risk remain the same.

2.2 Health Risk Estimation Methodology

Cancer Risk

Cancer risks are estimated as the upper-bound incremental probability that an individual would develop cancer due to exposure to potential carcinogens over a specified exposure duration. The estimated risk is expressed as a probability since there is no level below which some level of impact may occur. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake, or dose, at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). Cancer risk is expressed in terms of expected incremental incidence per million population. The SCAQMD has established an incidence rate of 10 persons per million as the maximum acceptable incremental cancer risk due to DPM exposure. This threshold serves to determine whether a given project has a potentially significant project-level and cumulative-level impact. The threshold of 10 in one million implies a likelihood that up to 10 persons out of one million, equally exposed, would develop cancer if exposed continuously to the levels of toxic air contaminants over a specified duration of time. This risk is an excess cancer risk in addition to any environmental cancer risk borne by a person not exposed to these air toxins.

The exposure dose is the amount of a chemical taken into the body at a given time. In particular, the exposure dose through inhalation ($Dose_{air}$) is a function of the breathing rate, the exposure frequency, and the concentration of exposure. Breathing rates change over time for different age groups and are determined for specific age groups. The $Dose_{air}$ is calculated for each of the following age groups: third trimester to birth, and 0 to 2, 2 to 16, and 16 to 30 years of age. The OEHHA recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans (California Office of Environmental Health Hazards Assessment, 2015). The risks for each age group are summed together to provide a total estimate of lifetime cancer risks for sensitive receptors. To estimate the cancer risk, the $Dose_{air}$ is estimated by applying the following equation to the DPM concentration at each receptor as calculated by the air dispersion model:

$$Dose_{air} = C_{DPM} \times DBR_i \times A \times CF_i \qquad \text{(EQ-1)}$$

Where:

$Dose_{air}$ = dose through inhalation (mg/kg/day)

C_{DPM} = period average concentration of DPM as estimated by the air dispersion model ($\mu g/m^3$)

DBR = daily breathing rate for each age group (liters/kg-day) (see Table 2)

A = Inhalation absorption factor (unitless = 1)

CF = construction-source emission frequency (days per year)

i – number of age groups

The dose is multiplied by the cancer potency factor, the age sensitivity factors (ASF), the exposure duration (ED), and the fraction of time spent at home (FAH, for sensitive/residential receptors only) divided by averaging time (AT) to arrive at an estimate of cancer risk:

$$\text{Cancer Risk} = \text{Dose}_{air,i} \times \text{CPF} \times \text{ASF}_i \times \text{ED}_i \times \text{FAH}_i/\text{AT} \quad \text{(EQ-2)}$$

Where:

Cancer Risk = Total individual excess inhalation cancer risk, defined as the cancer risk a hypothetical individual faces if exposed to carcinogenic emissions from a particular source for specified exposure durations; this risk is summed over all age groups; cancer risk is expressed in terms of risk per million exposed individuals.

$\text{Dose}_{air,i}$ = inhalation dose through inhalation (mg/kg-day)

CPF = inhalation cancer potency factor $(\text{mg/kg-day})^{-1}$

ASF_i = age sensitivity factors (see Table 2)

ED_i = exposure duration (years) (see Table 2)

AT = averaging time of lifetime cancer risk (70 years or 25550 days)

FAH_i = fraction of time spent at home (see Table 2)

n = number of age groups

For the purposes of this HRA, the operational 30-year exposure duration for sensitive/residential receptors, consistent with the OEHHA/SCAQMD guidance, was assumed to span the time period of the third trimester pre-birth in 2027 (the Project's opening year) to the year 2057. The OEHHA recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans. Estimates of cancer risk were also provided for informational purposes for child exposure (third trimester pre-birth to 9 years), and an adult exposure (30 years) using the maximum operational DPM emissions. A 25-year duration was utilized for the maximally impacted worker receptor using the maximum operational DPM emissions. Analysis of the Project's operation utilizes the OEHHA recommended 30-year exposure. The Project's construction duration is estimated to span 0.99 years. Thus, the construction health risk impact is only calculated across the 0.99 years of construction, utilizing the maximum construction DPM emissions. This encompasses the third trimester pre-birth in 2026 (start of construction) to the year of construction completion in 2027.

The combined construction and operational health risk uses an exposure duration of 30.25 years, consisting of the third trimester pre-birth and the 30-year exposure duration as recommended by OEHHA. The combined construction and operational health risk analyzes the third trimester pre-birth and the first 0.99 years (construction duration) using the maximum construction DPM emissions, with the remaining 29.26 years utilizing the maximum operational DPM emissions.

Table 2, *Exposure Assumptions for Cancer Risk–OEHHA/SCAQMD Guidance*, provides the values for the various cancer risk parameters shown in equations EQ-1 and EQ-2 for the receptor groups examined in

this assessment for both construction and operation of the Project. For DPM, the value of the CPF is 1.1 milligrams per kilogram per day.

Table 2: Exposure Assumptions for Cancer Risk–OEHHA/SCAQMD Guidance

Age Group	Exposure Frequency (EF)				Exposure Duration (ED) (Years)		Age Sensitivity Factors (ASF)	Time at Home (TAH)	Daily Breathing Rate[1] (DBR) (L/kg-day)
	Construction		Operation		Construction	Operation			
	Hours/Day	Days/Year	Hours/Day	Days/Year

Chronic Non-Cancer Hazard

TACs can also cause chronic (long-term) effects on non-cancer illnesses such as reproductive effects, birth defects, or adverse environmental effects. Non-cancer health risks are conveyed in terms of the Hazard Index (HI), which is a ratio of the predicted concentration of the facility's reported TAC emissions to a concentration considered acceptable to public health professionals. A significant risk is defined as an HI of 1.0 or greater. An HI of less than 1.0 indicates that no significant health risks are expected from the facility's TAC emissions. The following equation gives the relationship for the non-cancer hazards for TACs:

$$HI = C_{ann}/REL \quad \text{(EQ-3)}$$

Where:

HI = Hazard Index: an expression of the potential for chronic non-cancer health risks

C_{ann} = Annual average TAC concentration ($\mu g/m^3$)

REL = Reference Exposure Level: the DPM concentration at which no adverse health effects are anticipated

Annual concentrations of DPM, which are estimated by the air dispersion model, are used to estimate chronic non-cancer hazards. The OEHHA has defined an REL for DPM of 5 $\mu g/m^3$.

2.3 Estimation of Project DPM Emissions

Construction DPM Emissions

Construction emissions were calculated using CalEEMod Version 2022.1. DPM construction emissions were based on the CalEEMod construction runs for the proposed construction schedule and equipment inventory, using exhaust PM_{10} construction emissions to represent DPM emissions. Construction-related DPM emissions are expected to primarily occur as a function of heavy-duty equipment that would operate on-site during the construction phase. Additional DPM emissions would occur from the operation of construction vehicles that travel to/from the Project during construction, which include vendor trucks, hauling, and worker vehicles. This analysis conservatively assumes that all haul and vendor trucks would use diesel fuel.

Construction Equipment Emission Inventory Development

The first requirement to conduct the HRA involves identifying and quantifying the sources of construction DPM air emissions from the Project, also termed an emissions inventory. Each piece of equipment that emits DPM is identified in terms of its location and physical characteristics (release height, exhaust temperature, etc.) and the chemical nature of the emissions. The predominant sources of DPM emissions resulting from the construction of the Project derive from the heavy-duty diesel trucks that travel to, from, and within the Project site each day, as well as the off-road construction equipment used during the six construction phases: demolition, site preparation, grading, building construction, paving, and architectural

coating. The Project's DPM exhaust emissions were calculated using the PM_{10} exhaust emissions calculated from CalEEMod. Table 3, *Project Construction Equipment Inventory*, shows the Project's proposed construction equipment. Table 4, *Project Construction Vehicle Use*, shows the proposed construction vehicle use for worker, hauling, and vendor trips. Table 5, *Project On-Site and Off-Site Construction Source DPM Daily Emissions*, depicts the maximum daily DPM emissions of the Project's construction. Figure 3, *Locations of the Project's Construction On-Site and Off-Site DPM Emission Sources,* provides the locations of the on-site and off-site construction DPM emission sources, including the off-site sewer extension.

Table 3: Project Construction Equipment Inventory

Activity	Equipment	Number	Hours per day	Horse-power	Load Factor
Demolition	Concrete/Industrial Saws	1	8	33	0.73

Notes: Numbers may vary due to rounding
EMFAC Off-Model Adjustment Factors have been applied to the Off-Site DPM emissions.

Figure 3: Locations of the Project's Construction On-Site and Off-Site DPM Emission Sources

Operational Emission Sources

The operational HRA evaluates DPM emissions from the proposed emergency generator, which represents the single operational emission source included in the analysis. The generator's emissions were estimated based on its rated capacity, assumed operating load, and annual operating hours. The generator was modeled with a load factor of 0.73 and 200 operating hours per year, consistent with the permitted maximum annual operating hours. Under SCAQMD Rule 1470, up to 50 hours per year are allowed for maintenance and testing, with a permit allowing up to 200 total operating hours per year. DPM emissions from the emergency generator were evaluated to estimate potential health risks at nearby sensitive receptors over the applicable exposure duration. Mobile-source emissions from routine vehicle trips were not included in the operational HRA.

Figure 4, *Locations of Project's Operational DPM Emission Source,* provides the location of the proposed emergency generator evaluated in the operational HRA.

Figure 4: Locations of the Project's Operational DPM Emission Sources

2.4 Atmospheric Dispersion Methodology

Atmospheric dispersion modeling is the mathematical simulation of how air pollutants disperse in the ambient atmosphere. The modeling is performed with computer programs that solve algorithms simulating the movement and dispersion of air pollutants. The air dispersion model uses emissions from various emission sources and meteorological data such as wind speed and direction, air temperature, and atmospheric mixing rates to estimate the air pollutant impacts at various geographic locations (referred to as receptor locations).

Table 6, *General Modeling Assumptions*, and Table 7, *Summary of Construction and Operational Emissions Source Configuration,* provide the general assumptions applied in the AERMOD model (Version 26135). The AERMOD output sheets can be found in Appendix B.1.

Table 6: General Modeling Assumptions

Feature	Assumption
Terrain Processing	Complex terrain. Elevations were obtained for the Project site using the USGS NED 1/3 terrain data (USA, 10m). Data set: USGS_NED_13_n34w117.tif.
Land Use	Rural based on land use patterns surrounding the Project site.
Meteorological Data	Perris Meteorological Station (PERI) for the years 2010-2016
Receptor Locations	A uniform receptor grid network was used to include all existing residences and worker locations surrounding the Project site, off-site extensions, and along central off-site truck routes. Discrete receptors were placed at nearby residences, schools, and workplaces. No health care centers were observed in the immediate area. Discrete receptors are placed at ground level.
Population	Riverside County Population: ~2,492,442
Building Profile Heights	The heights of the existing and proposed buildings on the Project site were based on the provided building plans. The SNF was modeled at 16 feet 7 inches, the PHF at 14 feet, and the office building at 14 feet 6 inches.

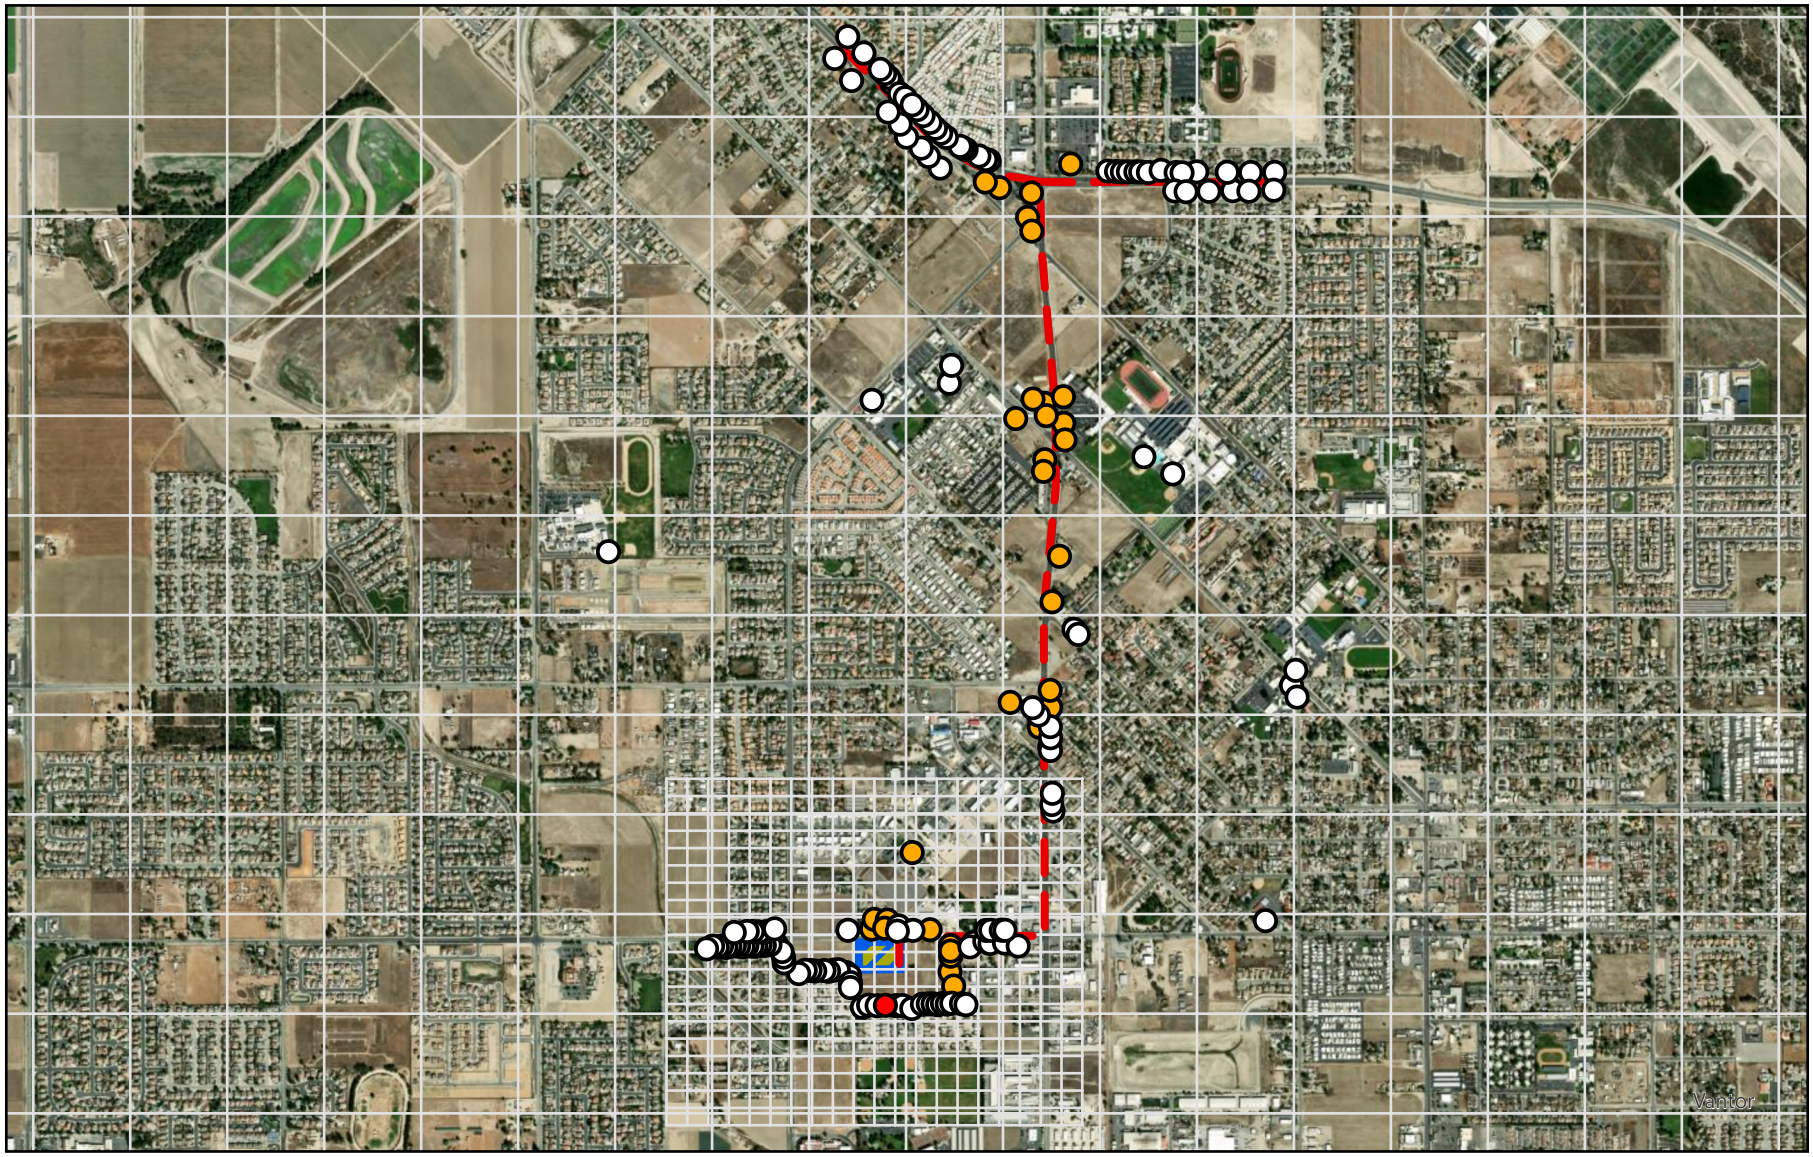
Source: See Data Attachment in Appendix B.1, B.2 (Table A: County Population to Use in AERMOD, SCAQMD, 2006).

Table 7: Summary of Construction and Operational Emissions Source Configuration

Emission Source Type	Geometric Configuration	Relevant Assumptions
Construction Sources	Polygon Area Source	• Size of the construction area source was the size of the Project area (approximately 2.98 acres) • Construction equipment emission source release height – 5 meters (16.4 feet). • Emissions generated from the Project's CalEEMod model. See Appendix A attachments. • Construction operations: 5 days per week, 8 hours per day.
Construction Diesel Vehicle Traffic	Line Area Source	• Line source: height – 3.11 meters (10.2 feet) and plume height 5.29 meters (17.4 feet) (EPA Haul Roads Calculator); • Construction Travel Routes (Two-way): ○ Route 1: Project Site West *to/from* 7th St *to/from* South and North State Street (100%). ○ Route 2: North State Street *to/from* Ramona Expressway eastbound (50%). ○ Route 3: North State Street *to/from* Ramona Expressway westbound (50%). • All heavy-duty trucks (LHDT1&LHDT2, MHDT, and HHDT) are assumed to be diesel engines. • Construction operations: 5 days per week, 8 hours per day.
Emergency Generator	Point Source	• 236 horsepower (hp). • 73% load factor. • Emissions were estimated assuming 200 hours per year of generator operation, consistent with the permitted maximum annual operating hours under SCAQMD Rule 1470, which allows up to 50 hours per year for maintenance and testing and up to 200 hours per year of total operation. • DPM emission rate: 0.15 g/hp-hr from the CalEEMod model.

Source: See Data Attachment in Appendix B.1, B.2

2.5 Receptors



The SCAQMD defines a sensitive receptor as any residence, including private homes, condominiums, apartments, and living quarters, schools, preschools, daycare centers, and health facilities such as hospitals or retirement and nursing homes. A sensitive receptor also includes long-term care hospitals, hospices, prisons, and dormitories, or similar live-in housing (South Coast Air Quality Management District, 2021b). For the purpose of this HRA, sensitive receptors were placed within the air dispersion model at the locations of the closest existing residences and other establishments or residences nearest to the Project site that qualify as sensitive receptors. Receptor points were placed on existing residences and schools along the Project's travel routes, as well as the closest worker receptors to the Project's boundary.

The closest sensitive receptors to the Project site and the Project's on-site and off-site sources were evaluated to identify locations potentially exposed to the highest DPM emissions from Project construction and operational emissions along with the associated cancer risks.

The nearest sensitive receptor is the residence located at 943 W 7th Street, approximately 90 feet (27 meters) north of the Project site boundary. However, the most impacted sensitive receptor is the residence located at 868 W. 9th Street, approximately 377 feet (115 meters) south of the Project site boundary. The nearest worker receptor is located at Talley Metal Fabrication, 989 W. 7th Street, approximately 104 feet (32 meters) north of the Project site boundary.

Figure 5, *Locations of Air Dispersion Model Receptors*, shows the receptor locations included for the construction health risk estimation.

Figure 5: Locations of Air Dispersion Model Receptors

3 RESULTS OF THE HEALTH RISK ASSESSMENT

3.1 Project-Level Risk Results

Tables 8, 9, and 10 present a summary of the cancer risks resulting from the Project's construction, operation, and combined DPM emissions, respectively, along with the SCAQMD health risk significance thresholds. As shown in Table 8, *Summary of Project Construction Health Risk,* and Table 9, *Summary of Project Operational Health Risk,* the estimated maximum cancer risks for construction and operation are 4.76 and 2.21 in one million, respectively, for the maximally impacted sensitive/residential receptors. As shown in Table 10, *Summary of Combined Project Construction and Operational Health Risk,* the combined construction and operational cancer risk is 2.37 in one million, below the SCAQMD cancer risk threshold of 10 in one million. The estimated maximum cancer risks for worker receptors during construction and operation are 0.13 and 0.24 in one million, respectively, also below the 10 in one million threshold. The combined worker cancer risk for combined construction and operation is 0.36 in one million. Therefore, health risk impacts related to cancer would be less than significant.

The Project's estimated non-cancer health risks are 0.01 for the maximally impacted sensitive receptor and 0.01 for the maximally impacted worker receptor during construction, and less than 0.01 for the maximally impacted sensitive receptor and 0.05 for the maximally impacted worker receptor during operation. All results are below the significance threshold of 1.0. As shown in Tables 8 through 10, there are no Project-level health risks during construction and operation that would exceed the SCAQMD significance thresholds; therefore, impacts would be less than significant.

Figure 6, *Construction Model Output,* and Figure 7, *Operational Model Output,* present the respective model outputs.

Table 8 : Summary of Project Construction Health Risk

Receptor	Cancer Risk (per million)		Exceeds Significance Threshold?
	Maximum Lifetime Proposed Project Risk	Significance Threshold	
Maximum Impacted Sensitive Receptor Prebirth to 0.99 years	4.76	10	No
Maximum Impacted Sensitive Receptor Adult (0.99 years)	0.18	10	No
Maximum Impacted Worker Receptor (0.99 years)	0.13	10	No
Receptor	**Chronic Non-Cancer Hazard Index**		**Exceeds Significance Threshold?**
	Maximum Lifetime Proposed Project Risk	**Significance Threshold**	
Maximum Impacted Sensitive Receptor	0.01	1.0	No
Maximum Impacted Worker Receptor	0.01	1.0	No

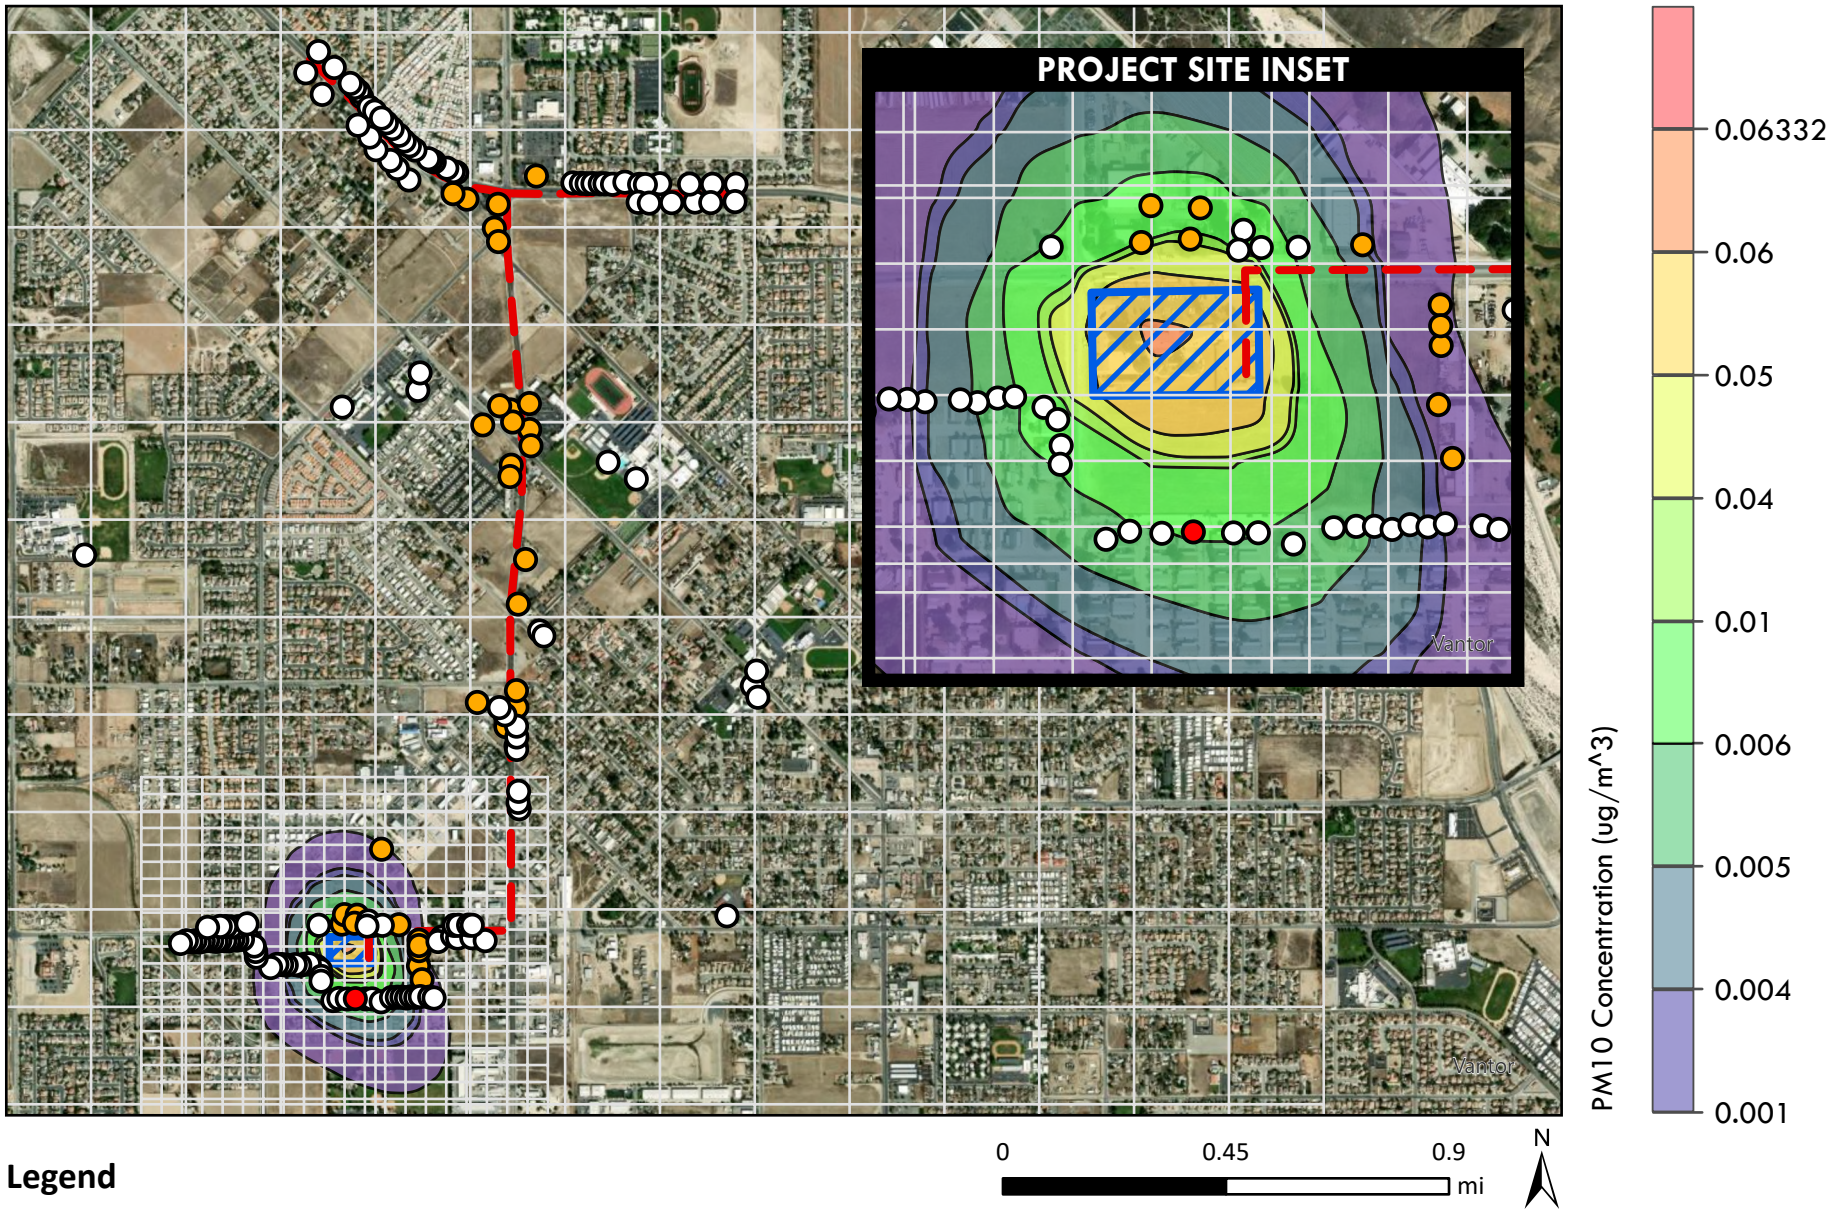
Figure 6: Construction Model Output



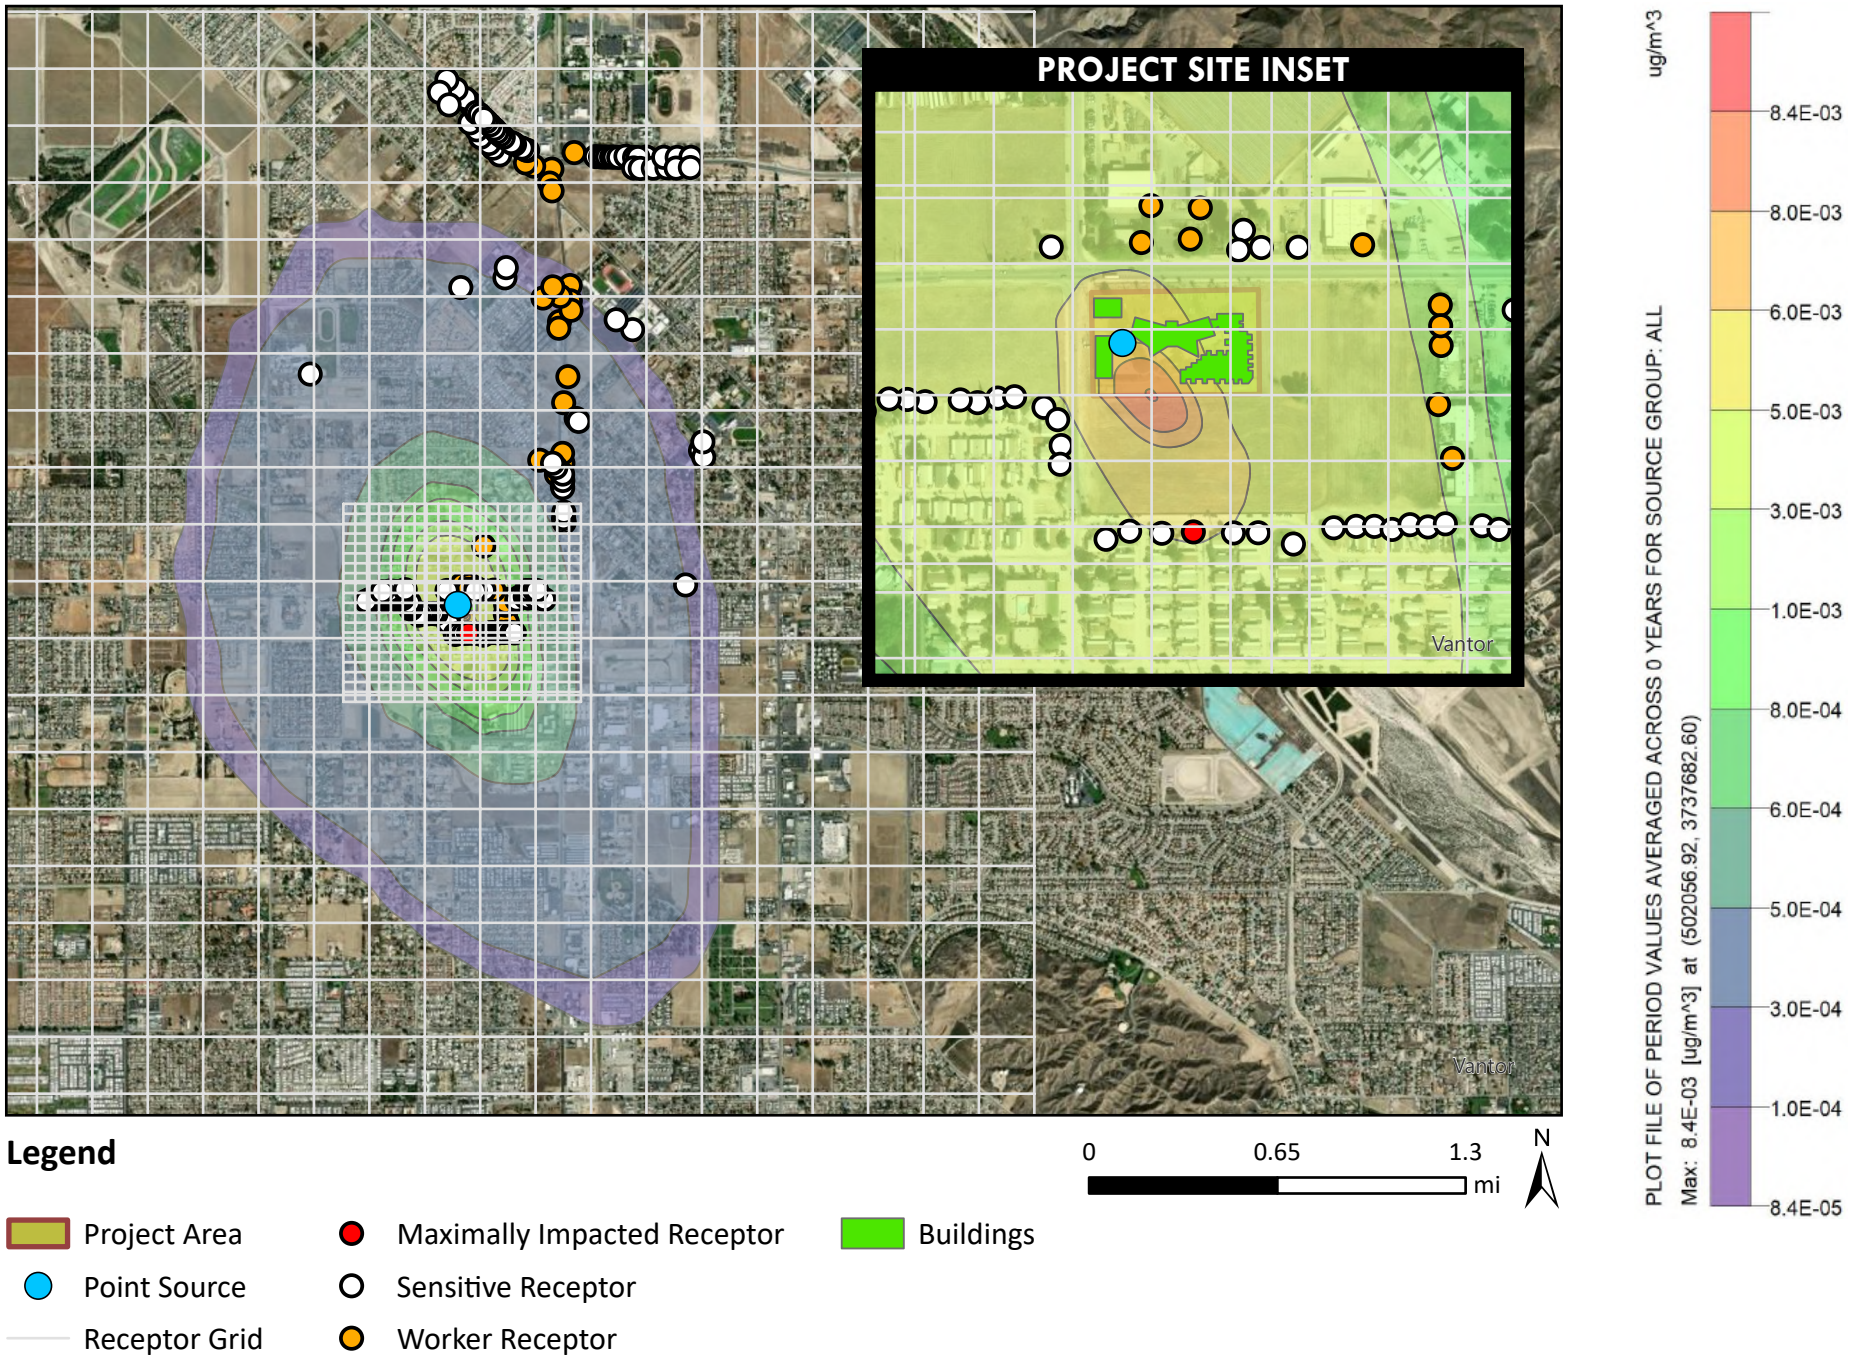


Figure 7: Operational Model Output

3.2 Cumulative Analysis

The SCAQMD has applied a 1,000-foot distance from a proposed project to identify other development projects that could contribute to cumulative impacts. The search radius for this Project was extended to 0.25 miles (1,320 feet) to identify potential cumulative sources. The proposed Project is within an urban area with existing residential and commercial-source emissions, and no significant sources in development were identified in the 0.25-mile radius. As described in Section 2.1, *SCAQMD Significance Thresholds*, project-specific thresholds were established at levels intended to reduce cumulative health risk impacts. Therefore, project-specific thresholds are the same as cumulative thresholds. The Project's maximum cancer risk is less than the 10 in one million project-level SCAQMD threshold. In addition, the Project's maximum non-cancer risk is less than the 1 in one million threshold. Since the Project would not exceed the project-level thresholds, the Project would also have a less-than-significant cumulative impact on cancer and non-cancer risks.

4 CONCLUSION

The emissions from Project construction and operation, including emissions from the emergency generator during operation, would not result in cancer health risk results that exceed the lifetime cancer risk threshold of 10 in one million at the maximum impacted sensitive receptor. The Project's emissions for construction and operation impacts would also not result in a non-cancer risk greater than the 1.0 non-cancer hazard index threshold. The Project's maximum construction, operational, and combined health risk impacts would result in the following:

Maximum Project Construction Health Risk Results:

- Sensitive/residential receptor: 4.76 in one million
- Worker receptor: 0.13 in one million
- Sensitive receptor chronic non-cancer HI: 0.01
- Worker receptor chronic non-cancer HI: 0.01

Maximum Project Operational Health Risk Results:

- Sensitive/residential receptor for the 30-year lifetime exposure duration: 2.21 in one million
- Worker receptor: 0.24 in one million
- Sensitive receptor chronic non-cancer HI: <0.01
- Worker receptor chronic non-cancer HI: 0.05

Combined Project Construction and Operational Cancer Risk Results:

- Sensitive/residential receptor for the 30-year exposure duration: 2.37 in one million
- Worker receptor: 0.36 in one million

The Project construction and operational health risk results, including emissions from the emergency generator in the operational analysis, would not exceed the SCAQMD significance threshold of 10 in one million or the HI threshold of 1.0. Therefore, the construction and operation of the proposed Project would result in a less-than-significant project-level and cumulative impact for cancer and non-cancer health risk.

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	26-017 Bradley Gardens San Jacinto-Proposed Project -10-19
Construction Start Date	12/1/2026
Operational Year	2028
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50000
Precipitation (days)	22.4000
Location	980 W 7th St, San Jacinto, CA 92582, USA
County	Riverside-South Coast
City	San Jacinto
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5571
EDFZ	11
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas

Data Field	Value
App Version	2022.1.1.46

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Congregate Care (Assisted Living)	103.000	Dwelling Unit	0.75000	32,741.0	40,362.0	—	333.000	Congregate Facility Units
Other Non-Asphalt Surfaces	1.70000	Acre	1.70000	0.02000	0.00000	—	1,040.00	—
Parking Lot	52.0000	Space	0.47000	0.00000	0.00000	—	—	Parking Space
General Office Building	2.60900	1000sqft	0.06000	2,609.00	0.00000	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	23.2500	annual days of extreme heat
Extreme Precipitation	3.30000	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.49000	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

Indicator	Result for Project Census Tract
AQ-Ozone	93.6279
AQ-PM	39.6017
AQ-DPM	17.7100

2016 Voting	12.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	59.0000
Healthy Places Index Score for Project Location (b)	7.00000
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

8.1. Justifications

Screen	Justification
Land Use	Adjusted based on information provided on the Site Plan.
Construction: Construction Phases	The construction start date and operational date were provided by the client, along with the number of days for each construction phase. The paving phase was set to begin concurrently with the building construction phase, and would be completed after the default amount of days. Architectural coating was set to begin approximately 2 weeks before building construction was completed, and would span the CalEEMod default amount of days.
Construction: Off-Road Equipment	Assumed all construction will be utilized 8 hours per work day. Replaced Tractors/Loaders/Backhoes with Crawler Tractors in the Site Preparation and Grading Phases.
Construction: Dust From Material Movement	Adjusted per the client's grading information to balance the site.
Operations: Vehicle Data	Adjusted rates for Weekday Trips (based on ITE 12th Edition), Saturday Trips, and Sunday Trips to match ITE trip rates for 620 – Nursing Home.
Operations: Hearths	Fireplaces and Wood Stoves are removed in accordance with SCAQMD Rule 445.

8.3. Land Use

Model Parameter	Units	Default Value	New Value
Lot Area	acre	6.43750	0.75000
Building Area	sq. ft	109,180	32,741.0
Landscape Area	sq. ft	—	40,362.0
Building Area	sq. ft	0.00000	0.02000
Landscape Area	sq. ft	—	0.00000
Lot Area	acre	0.46800	0.47000
Landscape Area	sq. ft	—	0.00000
Lot Area	acre	0.05989	0.06000

                                             ***     MODEL SETUP OPTIONS SUMMARY
 ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
```

```
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for    35 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   2492442.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:     35 Source(s);       1 Source Group(s); and    1051
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:     35 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   442.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
```

Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.7 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: 26-017 Bradley Gardens San Jacinto.err

**File for Summary of Results: 26-017 Bradley Gardens San Jacinto.sum

- - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for     1 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   2492442.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:      1 Source(s);       1 Source Group(s); and    1051
Receptor(s)

                with:      1 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)
```

```
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and
Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   442.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.6 MB of RAM.

APPENDIX C.1 – ESTIMATION OF PROJECT CONSTRUCTION DPM EMISSIONS

Basic Construction HRA Setup

Information Needed to Generate Emissions

Site Plan showing onsite trip distribution for trucks and cars
Trip generation Table with offsite trip distribution for trucks and cars
Operational Year
Land Use - refrigerated vs non-refrigerated
TRU usage (number of trucks and TRU size using TRUs and number of hours in opertion while at loading docks)
Use of fire pumps, standby emergency generator, forklifts, and yard trucks (number, size, and hours of operation)
Emission factors: EMFAC2021, OFFROAD2021 (2017), CalEEMod
Idle time assumed to be 15 minutes

AERMOD Setup to Generate Ground-level Concentrations

Use site plan to delineate the locations of the onsite truck routes, offsite truck routesm fire pump, generators, fork lifts, and yard trucks
Obtain the necessary meteorological data
Overlay site plan onto Google Earth and screen capture the site plan noting the Google x and y corners of the screen capture bottom left and upper right coordinates
Import the Google site plan into AERMOD
Layout the onsite and offsite truck routes on the imported site plan as line area sources
Locate the truck idling locations at the loading docks and define as a series of point sources to extend over the entire length of the loading docks
Locate the fire pumps and generators as point sources
Locate the forklifts and yard trucks as area or volume sources
Set the AERMOD averaging times as 1-hour and Period
Enter the annual average DPM emissions for each source
Deploy a gridded network of receptors to cover the receptor locations that could be impacted by the project along the offsite travel routes, locations of nearest sensitive receptors, locations of the nearest worker receptors

Area Sources:			
Project Site:			
	Release:	5 meters	16.4042
	Release Heights:		
Line Sources		3.11 meters	10.2034
	Vehicle Height	3.11 meters	10.2034
	Vehicle Width	3.5? meters	
	Emission Rate:

Landfill Lamb Canyon Landfill, 16411 Lamb Canyon Rd, Beaumont, CA 92223

APPENDIX C.2 – ESTIMATION OF PROJECT OPERATIONAL DPM EMISSIONS

Basic Operational HRA Setup

Information Needed to Generate Emissions

Site Plan showing onsite trip distribution for trucks and cars
Trip generation Table with offsite trip distribution for trucks and cars
Operational Year
Land Use - refrigerated vs non-refrigerated
TRU usage (number of trucks and TRU size using TRUs and number of hours in opertion while at loading docks)
Use of fire pumps, standby emergency generator, forklifts, and yard trucks (number, size, and hours of operation)
Emission factors: EMFAC2021, OFFROAD2021 (2017), CalEEMod
Idle time assumed to be 15 minutes

AERMOD Setup to Generate Ground-level Concentrations

Use site plan to delineate the locations of the onsite truck routes, offsite truck routesm fire pump, generators, fork lifts, and yard trucks
Obtain the necessary meteorological data
Overlay site plan onto Google Earth and screen capture the site plan noting the Google x and y corners of the screen capture bottom left and upper right coordinates
Import the Google site plan into AERMOD
Layout the onsite and offsite truck routes on the imported site plan as line area sources
Locate the truck idling locations at the loading docks and define as a series of point sources to extend over the entire length of the loading docks
Locate the fire pumps and generators as point sources
Locate the forklifts and yard trucks as area or volume sources
Set the AERMOD averaging times as 1-hour and Period
Enter the annual average DPM emissions for each source
Deploy a gridded network of receptors to cover the receptor locations that could be impacted by the project along the offsite travel routes, locations of nearest sensitive receptors, locations of the nearest worker receptors

Area Sources:
Project Site:
Release: 5 meters 16.4042

Release Heights: Idling Source
Line Sources 3.11 meters 10.2034
Vehicle Height 3.11 meters 10.2034
Vehicle Width 3.5? meters
Emission Rate:
Idling Truck Source

FirePump/Generator 2.256 meters 7.40157
Emission Rate: 1.64E-04
Gas Exit Temp 789
Stack Diam 0.104
Gas Exit Velocity 43.273
Flow Rate 0.3676

Vehicle Height 3.11 meters
choose single or two lanes

for single I usually do 5 meters,=
for two lanes (like on main roads) I do 10 meters, two lanes on site can be 7.5 meter

26-017

SUBJECT: **Habitat Assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Consistency Analysis for the Proposed Bradley Gardens Project Located Within Assessor Parcel Number (APN) 435-330-003 in the City of San Jacinto, Riverside County, California**

Introduction

This report contains the findings of ELMT Consulting's (ELMT) habitat assessment and Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) consistency analysis for the proposed Bradley Gardens Project located within APN 435-330-003 in the City of San Jacinto, Riverside County, California. The habitat assessment was conducted by ELMT biologist Andrew N. Mestas on February 6, 2026, to document baseline conditions and assess the potential for special-status[1] plant and wildlife species to occur within the proposed Project site that could pose a constraint to implementation of the proposed Project. Special attention was given to the suitability of the onsite habitat to support special-status species identified by the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB) and other electronic databases as potentially occurring on or within the general vicinity of the Project site.

The Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map was queried to determine if the MSHCP identifies any potential survey requirements for the Project. Further, the Project site was reviewed against the MSHCP to determine if the site is located within any MSHCP areas including Criteria Cells (core habitat and wildlife movement corridors) or areas proposed for conservation. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the Project site is located within the San Jacinto Valley Area Plan of the MSHCP but is not located within any Criteria Cells or MSHCP Conservation Areas. Further, it was determined that the Project site is not located within any designated survey areas.

Project Location

The Project site is generally located east of Interstate 215, north of State Route 74, and south and west of State Route 79 in the City of San Jacinto, Riverside County, California. The Project site is depicted on the San Jacinto quadrangle of the of the United States Geological Survey's (USGS) 7.5-minute topographic

1 As used in this report, "special-status" refers to plant and wildlife species that are federally, State, and MSHCP listed, proposed, or candidates; plant species that have been designated with a California Native Plant Society Rare Plant Rank; wildlife species that are designated by the CDFW as fully protected, species of special concern, or watch list species; and specially protected natural vegetation communities as designated by the CDFW.

map within an unsectioned region of Township 4 South, and Range 1 West. Specifically, the Project site is bordered to the north by West 7th Street and to the west by South Grand Avenue within Assessor's Parcel Number (APN) 435-330-003. Refer to Exhibits 1-3 in Attachment A.

Project Description

The Project proposes the expansion of the existing Bradley Gardens facility on the 2.98-acre site. The Project includes demolition of the existing 1,074 SF maintenance and storage building located in the southeastern corner of the site for construction of an expansion to the existing 44-bed SNF building. The proposed building addition would total approximately 17,372 SF and would provide 43 additional SNF and STP beds, resulting in a total capacity of 87 beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building located in the northwestern corner of the site into a 16-bed PHF. The Project would not modify the existing 2,609 SF administrative office building along the western boundary of the site. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, parking lot, and driveways.

Methodology

Literature Review

The first step in determining if a Project is consistent with the above listed sections of the MSHCP is to conduct a literature review and records search for special-status biological resources potentially occurring on or within the vicinity of the Project site. Previously recorded occurrences of special-status plant and wildlife species and their proximity to the Project were determined through a query of the CDFW's CNDDB Rarefind 5, the California Native Plant Society (CNPS) Electronic Inventory of Rare and Endangered Vascular Plants of California, Calflora Database, compendia of special-status species published by CDFW, United States Fish and Wildlife Service (USFWS) species listings, and species covered within the MSHCP and associated technical documents.

All available reports, survey results, and literature detailing the biological resources previously observed on or within the vicinity of the Project site were reviewed to understand existing site conditions and note the extent of any disturbances that have occurred on the Project site that would otherwise limit the distribution of special-status biological resources. Standard field guides and texts were reviewed for specific habitat requirements of special-status and non-special-status biological resources, as well as the following resources:

- Environmental Protection Agency (EPA) Water Program "My Waters" data layers
- Google Earth Pro historic aerial imagery (1994-2026);
- United States Department of Agriculture (USDA) Natural Resource Conservation Service (NRCS), Soil Survey[2];
- USFWS Critical Habitat designations for Threatened and Endangered Species;
- USFWS National Wetlands Inventory (NWI);
- Stephen's Kangaroo Rat Habitat Conservation Plan;

2 A soil series is defined as a group of soils with similar profiles developed from similar parent materials under comparable climatic and vegetation conditions. These profiles include major horizons with similar thickness, arrangement, and other important characteristics, which may promote favorable conditions for certain biological resources.

- Western Riverside County Regional Conservation Authority (RCA) MSHCP Information Map; and
- 2006 Burrowing Owl Survey Instructions for the Western Riverside Multiple Species Habitat Conservation Plan Area.

The literature review provided a baseline from which to inventory the biological resources potentially occurring on the Project site. The CNDDB database was used, in conjunction with ArcGIS software, to locate the nearest recorded occurrences of special-status species and determine the distance from the Project.

Field Investigation

Following the literature review, biologist Andrew N. Mestas inventoried and evaluated the condition of the habitat within the Project site on February 6, 2026. Plant communities identified on aerial photographs during the literature review were verified by walking meandering transects through the plant communities and along boundaries between plant communities. In addition, aerial photography was reviewed prior to the site investigation to locate potential natural corridors and linkages that may support the movement of wildlife through the area. These areas identified via aerial photography were then walked during the field survey.

All plant and wildlife species observed, as well as dominant plant species within each plant community, were recorded. Plant species observed during the field survey were identified by visual characteristics and morphology in the field. Unusual and less familiar plant species were photographed during the field survey and identified in the laboratory using taxonomical guides. Wildlife detections were made through observation of scat, trails, tracks, burrows, nests, and/or visual and aural observation. In addition, site characteristics such as soil condition, topography, hydrology, anthropogenic disturbances, indicator species, condition of onsite plant communities, and presence of potential jurisdictional drainage and/or wetland features were noted.

Soil Series Assessment

Onsite and adjoining soils were researched prior to the field survey using the USDA NRCS Soil Survey for the Western Riverside area. In addition, a review of the local geological conditions and historical aerial photographs was conducted to assess the ecological changes that the Project site has undergone.

Plant Communities

Plant communities were mapped using 7.5-minute USGS topographic base maps and aerial photography. The plant communities were delineated on an aerial photograph, classified in accordance with those described in the MSHCP, and then digitized into GIS Arcview. The Arcview application was used to compute the area of each plant community in acres.

Plants

Common plant species observed during the field survey were identified by visual characteristics and morphology in the field and recorded in a field notebook. Unusual and less-familiar plants were photographed in the field and identified in the laboratory using taxonomic guides. Taxonomic nomenclature

used in this study follows the 2012 Jepson Manual (Hickman 2012). In this report, scientific names are provided immediately following common names of plant species (first reference only).

Wildlife

Wildlife species detected during field surveys by sight, calls, tracks, scat, or other sign were recorded during surveys in a field notebook. Field guides were used to assist with identification of wildlife species during the survey included The Sibley Field Guide to the Birds of Western North America (Sibley 2003), A Field Guide to Western Reptiles and Amphibians (Stebbins 2003), and A Field Guide to Mammals of North America (Reid 2006). Although common names of wildlife species are fairly well standardized, scientific names are provided immediately following common names in this report (first reference only).

Jurisdictional Drainages and Wetlands

Aerial photography was reviewed prior to conducting a field investigation in order to locate and inspect any potential natural drainage features, ponded areas, or water bodies that may fall under the jurisdiction of the United States Army Corps of Engineers (Corps), Regional Water Quality Control Board (Regional Board), or CDFW. In general, surface drainage features indicated as blue-line streams on USGS maps that are observed or expected to exhibit evidence of flow are considered potential riparian/riverine habitat and are also subject to state and federal regulatory jurisdiction. In addition, ELMT reviewed jurisdictional waters information through examining historical aerial photographs to gain an understanding of the impact of land-use on natural drainage patterns in the area. The USFWS National Wetland Inventory (NWI) and Environmental Protection Agency (EPA) Water Program "My Waters" data layers were also reviewed to determine whether any hydrologic features and wetland areas have been documented on or within the vicinity of the Project site.

Topography and Soils

The Project site ranges in elevation from approximately 1,525 to 1,529 feet above mean sea level. Onsite topography is generally flat. Based on the NRCS USDA Web Soil Survey, the Project site is underlain by the following soil units: Grangeville sandy loam (sandy substratum, drained, 0 to 5 percent slopes) and Grangeville fine sandy loam (saline-alkali, 0 to 5 percent slopes). Onsite soils have been heavily disturbed and compacted as a result of historic and ongoing land uses, including grading, weed abatement, vehicular use, and both onsite and surrounding development activities.

Existing Site Condition

The Project site supports entirely developed land that has been subject to a variety of anthropogenic disturbances associated with on-site development, and routine weed abatement activities. Natural plant communities that historically occurred on the Project site have been eliminated.

The Project site is bounded to the east, south, and west by vacant land and residential development; to the north by West 7th Street and commercial development. Historical aerial imagery indicates that development has existed within the site since at least 1966.

Vegetation

The Project site does not support any natural plant communities. In addition, the site supports one (1) land

cover types that would be classified as developed (refer to Exhibit 4, *Vegetation*, in Attachment A). Refer to Attachment B, *Site Photographs*, for representative site photographs.

Developed

Developed land cover is present throughout the entirety of the project site. Developed areas generally encompass all buildings/structures, parks, and paved, impervious surfaces. These areas are largely devoid of natural vegetation and may support ornamental vegetation that may be maintained in association with or without artificial irrigation.

Vegetation observed within the project site included common ornamental species such as: Mexican fan palm (*Washingtonia robusta*), rose (*Rosa spp.*), creeping thyme (*Thymus serpyllum*), bougainvillea (*Bougainvillea glabra*), magnolia (*Magnolia grandiflora*). Other species observed included: Matilija poppy (*Romneya coulterii*), London rocket (*Sisymbrium irio*), common dandelion (*Taraxacum officinale*), stinknet (*Oncosiphon piluliferum*), and red-stemmed filaree (*Erodium cicutarium*).

Wildlife

Plant communities provide foraging habitat, nesting/denning sites, and shelter from adverse weather or predation. This section provides a discussion of those wildlife species that were observed or are expected to occur within the Project site. The discussion is to be used as a general reference and is limited by the season, time of day, and weather conditions in which the field survey was conducted. Wildlife detections were based on calls, songs, scat, tracks, burrows, and direct observation.

Fish

The MSHCP does not identify any covered or special-status fish species as potentially occurring within the Project site. Further, no fish or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for fish were observed on or within the vicinity of the site. Therefore, no fish are expected to occur and are presumed absent.

Amphibians

The MSHCP does not identify any covered or special-status amphibian species as potentially occurring within the Project site. The Project site does not support hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for amphibian species. Further, no amphibians were observed, and all are presumed to be absent from the Project site.

Reptiles

The MSHCP does not identify any covered or special-status reptilian species as potentially occurring within the Project site. The site and surrounding area provide suitable foraging and cover habitat for reptile species adapted to routine anthropogenic disturbance. The only reptilian species observed during the field investigation was common side-blotched lizard (*Uta stansburiana*). Additional reptile species that may be expected to occur onsite include the Great Basin fence lizard (*Sceloporus occidentalis longipes*) and Southern alligator lizard (*Elgaria multicarinata webbii*).

Birds

The Project site and surrounding area provides suitable foraging and nesting habitat for local avian species, especially those adapted to routine anthropogenic disturbance. Bird species detected during the field survey included black phoebe (*Sayornis nigricans*), house sparrow (*Passer domesticus*), American crow (*Corvus branchyrhynchos*), yellow-rumped warbler (*Setophaga coronata*), house finch (*Haemorhous mexicanus*), and common raven (*Corvus corax*).

Mammals

The MSHCP does not identify any covered or special-status mammalian species as potentially occurring within the Project site. The site provides minimal suitable foraging and cover habitat for mammalian species adapted to degraded conditions and routine anthropogenic disturbance. Mammalian species detected included Botta's pocket gopher (*Thomomys bottae*) and domestic goat (*Capra hircus*). Other common mammalian species that could be expected to occur include possum (*Didelphis virginiana*) and raccoon (*Procyon lotor*).

Nesting Birds and Raptors

No active nests or birds displaying nesting behavior were observed during the field survey, which was conducted outside of the breeding season. Although subjected to routine disturbance, the plant communities and land cover types supported onsite have the potential to provide suitable nesting habitat for year-round and seasonal avian residents, as well as migrating songbirds that may occur in the area that are adapted to urban environments. Ornamental tree species occur within the project site and have the potential to support nesting birds tolerant to urban conditions.

Nesting birds are protected pursuant to the federal Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests, or eggs). If construction occurs between February 1st and August 31st, a pre-construction clearance survey for nesting birds should be conducted prior to the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction.

Migratory Corridors and Linkages

Habitat linkages provide connections between larger habitat areas that are separated by development. Wildlife corridors are similar to linkages but provide specific opportunities for animals to disperse or migrate between areas. A corridor can be defined as a linear landscape feature of sufficient width to allow animal movement between two comparatively undisturbed habitat fragments. Adequate cover is essential for a corridor to function as a wildlife movement area. It is possible for a habitat corridor to be adequate for one species yet still inadequate for others. Wildlife corridors are features that allow for the dispersal, seasonal migration, breeding, and foraging of a variety of wildlife species. Additionally, open space can provide a buffer against both human disturbance and natural fluctuations in resources.

The Project site has not been identified as supporting a wildlife migratory corridor or linkage. The nearest RCA-conserved lands are located approximately 2.5 miles east of the Project site, within the San Jacinto River Soboba area, which provides opportunities for wildlife movement through the region. However, the Project site is separated from the RCA conserved lands by existing development and highly trafficked roads. Additionally, areas within the RCA conserved lands are covered under the MSHCP plans for conservation. Further, the project site support existing developed land, and as such, implementation of the proposed

Project is not expected to have any impact to wildlife movement opportunities or prevent local wildlife movement through the area.

Jurisdictional Areas

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates discharge of dredge or fill materials into "waters of the United States" pursuant to Section 404 of the Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFW regulates alterations to streambed and bank under Fish and Wildlife Code Sections 1600 et seq., and the Regional Board regulates discharges into surface waters pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

No jurisdictional drainages and/or wetland features were observed within site boundaries during the field investigation. A roadside ditch is present along the northern boundary of the site, on the southern shoulder of W 7th Street. The roadside ditched receives stormwater runoff from the road. Since this feature is considered a roadside ditch, and was constructed to convey some flows off of the road, it will not be considered jurisdictional. herefore, development of the project will not result in impacts to Corps, Regional Board, or CDFW jurisdiction and regulatory approvals will not be required.

Special-Status Biological Resources

The CNDDB was queried for reported locations of special-status plant and wildlife species as well as natural communities of special concern in the San Jacinto USGS 7.5-minute quadrangle. Only one quadrangle was queried due to the proximity of the Project site to quadrangle boundaries. A search of published records within these quadrangles was conducted using the CNDDB Rarefind 5 online software and the CDFW BIOS database and the CNPS Inventory of Rare and Endangered Plants of California that supplied information regarding the distribution and habitats of vascular plants in the vicinity of the Project site. The habitat assessment evaluated the conditions of the habitat(s) within the boundaries of the Project site to determine if the existing plant communities, at the time of the survey, have the potential to provide suitable habitat(s) for special-status plant and wildlife species.

The literature search identified twelve (12) special-status plant species, sixty-nine (69) special-status wildlife species, and four (4) special-status plant communities as having potential to occur within the San Jacinto quadrangle. Special-status plant and wildlife species were evaluated for their potential to occur within the Project site based on habitat requirements, availability, and quality of suitable habitat, and known distributions. Species determined to have the potential to occur within the general vicinity are presented in *Table C-1: Potentially Occurring Special-Status Biological Resources*, provided in Attachment C. Refer to Table C-1 for a determination regarding the potential occurrence of special-status plant and wildlife species within the Project site.

Special-Status Plants

According to the CNDDB and CNPS, twelve (12) special-status plant species have been recorded in the San Jacinto quadrangle (refer to Attachment C). No special-status plant species were observed onsite during the field investigation. The majority of the Project site has been subject to a variety of anthropogenic disturbances associated with the existing development. These disturbances have diminished the natural plant communities that once occurred which have diminished the ability of the habitat in these areas to

provide suitable habitat for special-status plant species known to occur in the general vicinity. Based on habitat requirements for specific special-status plant species and the availability and quality of habitats, the Project site was determined not to provide suitable habitat for any of the special-status plant species known to occur in the area and all are presumed to be absent. No focused surveys are recommended.

Special-Status Wildlife

According to the CNDDB, sixty-nine (69) special-status wildlife species have been reported in the San Jacinto quadrangle (refer to Attachment C). No special-status wildlife species were observed onsite during the habitat assessment. Based on habitat requirements for specific species and the availability and quality of on-site habitats, it was determined that the project site has a moderate potential to support Cooper's hawk (*Astur cooperii*) All remaining special-status wildlife species were presumed to be absent from the project site due to existing development.

To ensure impacts to the aforementioned special-status avian species do not occur from implementation of the proposed project, a pre-construction nesting bird clearance survey shall be conducted prior to ground disturbance. With implementation of the pre-construction nesting bird clearance survey, impacts to these species will be less than significant and no mitigation will be required.

Special-Status Plant Communities

According to the CNDDB, four (4) special-status plant communities have been reported in the San Jacinto quadrangle (refer to Attachment C). No special-status plant communities occur onsite.

Critical Habitat

Under the federal Endangered Species Act, "Critical Habitat" is designated at the time of listing of a species or within one year of listing. Critical Habitat refers to specific areas within the geographical range of a species at the time it is listed that include the physical or biological features that are essential to the survival and eventual recovery of that species. Maintenance of these physical and biological features requires special management considerations or protection, regardless of whether individuals or the species are present or not. All federal agencies are required to consult with the United States Fish and Wildlife Service (USFWS) regarding activities they authorize, fund, or permit which may affect a federally listed species or its designated Critical Habitat. The purpose of the consultation is to ensure that Projects will not jeopardize the continued existence of the listed species or adversely modify or destroy its designated Critical Habitat. The designation of Critical Habitat does not affect private landowners, unless a Project they are proposing is on federal lands, uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highways Administration or a CWA Permit from the Corps). If there is a federal nexus, then the federal agency that is responsible for providing the funding or permit would consult with the USFWS.

The Project site is not located with federally designated Critical Habitat (refer to Exhibit 5, *Critical Habitat*, in Attachment A). The nearest designated Critical Habitat to the site is located approximately 2.5 miles to the east for San Bernardino Merriam's kangaroo rat (*Dipodomys merriami parvus*) and is separated from the Project site by existing development. Therefore, the loss or adverse modification of Critical Habitat will not occur as a result of the proposed Project and consultation with the USFWS will not be required for impacts to Critical Habitat.

Western Riverside County MSHCP

The Project site is located in the San Jacinto Valley Area Plan of the MSHCP but is not located within any Criteria Cells or designated conservation areas (Exhibit 6, *MSHCP Conservation Areas*). Additionally, the Project site is not located within any MSHCP designated survey areas.

Since the City of San Jacinto and Riverside County are permittees under the MSHCP and, while the Project is not specifically identified as a Covered Activity under Section 7.1, *Covered Activities Outside Criteria Area and PQP Lands*, of the MSHCP, public and private development that are outside of Criteria Areas and Public/Quasi-Public (PQP) Lands are permitted under the MSHCP, subject to consistency with MSHCP policies that apply to area outside of Criteria Areas. As such, to achieve coverage, the Project must be consistent with the following policies of the MSHCP:

- The policies for the protection of species associated with Riparian/Riverine areas and vernal pools as set forth in Section 6.1.2 of the MSHCP;
- The policies for the protection of Narrow Endemic Plant Species as set forth in Section 6.1.3;
- The Urban/Wildlands Interface Guidelines as set forth in Section 6.1.4; and
- The requirements for conducting additional surveys as set forth in Section 6.3.2

Riparian/Riverine Areas

As identified in Section 6.1.2 of the MSHCP, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools,* riparian/riverine areas are defined as areas dominated by trees, shrubs, persistent emergent plants, or emergent mosses and lichens which occur close to or are dependent upon nearby freshwater, or areas with freshwater flowing during all or a portion of the year. Conservation of these areas is intended to protect habitat that is essential to a number of listed or special-status water-dependent fish, amphibian, avian, and plant species. If impacts to riparian/riverine habitat cannot be avoided, a Determination of Biologically Equivalent or Superior Preservation (DBESP) must be developed to address the replacement of lost functions of habitats in regard to the listed species. This assessment is independent from considerations given to "waters of the U.S." and "waters of the State" under the CWA and the California Fish and Game Code.

No jurisdictional drainages, riparian/riverine and/or wetland features were observed within the project site during the field investigation. Development of the proposed project will not result in impacts to riparian/riverine habitats and a DBESP will not be required for the loss of riparian/riverine habitat from development of the proposed project. Therefore, the project is consistent with Section 6.1.2 of the MSHCP.

Vernal Pools and Fairy Shrimp Habitat

One of the factors for determining the suitability of the habitat for fairy shrimp would be demonstrable evidence of seasonal ponding in an area of topographic depression that is not subject to flowing waters. These astatic pools are typically characterized as vernal pools. More specifically, vernal pools are seasonal wetlands that occur in depression areas without a continual source of water. They have wetland indicators of all 3 parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indicators of hydrology and/or vegetation during the drier portion of the growing season. Obligate hydrophytes and facultative wetlands plant species are normally dominant during the

wetter portion of the growing season. The determination that an area exhibits vernal pool characteristics and the definition of the watershed supporting vernal pool hydrology is made on a case-by-case basis. Such determinations should be considered the length of time the areas exhibit upland and wetland characteristics and the manner in which the area fits into the overall ecological system as a wetland. The seasonal hydrology of vernal pools provides for a unique environment, which supports plants and invertebrates specifically adapted to a regime of winter inundation, followed by an extended period when the pool soils are dry.

Vernal pools are seasonally inundated, ponded areas that only form in regions where specialized soil and climatic conditions exist. During fall and winter rains typical of Mediterranean climates, water collects in shallow depressions where downward percolation of water is prevented by the presence of a hard pan or clay pan layer (duripan) below the soil surface. Later in the spring when rains decrease and the weather warms, the water evaporates and the pools generally disappear by May. The shallow depressions remain relatively dry until late fall and early winter with the advent of greater precipitation and cooler temperatures. Vernal pools provide unusual "flood and drought" habitat conditions to which certain plant and wildlife species have specifically adapted as well as invertebrate species such as fairy shrimp.

The MSHCP lists two general classes of soils known to be associated with listed and special-status plant species; clay soils and Traver-Domino Willow association soils. The specific clay soils known to be associated with listed and special-status species within the MSHCP plan area include Bosanko, Auld, Altamont, and Porterville series soils, whereas Traver-Domino Willows association includes saline-alkali soils largely located along floodplain areas of the San Jacinto River and Salt Creek. Without the appropriate soils to create the impermeable restrictive layer, none of the special-status plant or wildlife species associated with vernal pools can occur on the Project site. None of these soils have been documented within the Project site.

A review of recent and historic aerial photographs (1994–2026) of the Project site did not identify visual evidence of astatic or vernal pool conditions. These observations support the conclusion that the project site does not support the hydrologic regimes necessary to support vernal pool conditions.

Based on the analysis of historical aerial photography and findings from recent field surveys, there is no evidence of vernal pools or habitat conditions suitable for fairy shrimp within the boundaries of the proposed Project site. As such, the Project is consistent with the requirements outlined in Section 6.1.2 of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP).

Narrow Endemic Plant Species

Section 6.1.3 of the MSHCP, *Protection of Narrow Endemic Plant Species*, states that the MSHCP database does not provide sufficient detail to determine the extent of the presence/distribution of Narrow Endemic Plant Species within the MSHCP Plan Area. Additional surveys may be needed to gather information to determine the presence/absence of these species to ensure that appropriate conservation of these species occurs. Based on the RCA MSHCP Information Map query and review of the MSHCP, it was determined that the Project site is not located within a Narrow Endemic Plant Species Survey Area. The project site supports existing development and heavily disturbed land that does not provide suitable habitat for Narrow Endemic Plant Species. As such, the Project is consistent with the requirements outlined in Section 6.1.3 of the MSHCP.

Additional Survey Needs and Procedures

In accordance with Section 6.3.2 of the MSHCP, *Additional Survey Needs and Procedures*, additional surveys may be needed for certain species in order to achieve coverage for these species. The query of the RCA MSHCP Information Map and review of the MSHCP determined that the Project site is not located within the any designated species survey area. The project site supports existing development and heavily disturbed land that does not provide suitable habitat for and MSHCP listed species. As such, are result, the Project is consistent with the requirements outlined in Section 6.2.3 of the MSHCP.

Urban/Wildlands Interface Guidelines

Section 6.1.4 of the MSHCP, *Guidelines Pertaining to Urban/Wildlands Interface,* is intended to address indirect effects associated with development in proximity to MSHCP Conservation Areas. The Urban/Wildlife Interface Guidelines are intended to ensure that indirect Project-related impacts to the MSHCP Conservation Area, including drainage, toxics, lighting, noise, invasive plant species, barriers, and grading/land development, are avoided or minimized. The Project site is not located within or immediately adjacent to any Criteria Cells, corridors, or linkages. The urban/Wildlands Interface Guidelines do not apply to this Project, and, therefore, the Project is consistent with Section 6.1.4 of the MSHCP.

Stephen's Kangaroo Rat Habitat Conservation Plan

Separate from the consistency review against the policies of the MSHCP, Riverside County established a boundary in 1996 for protecting the Stephens' kangaroo rat (*Dipodomys stephensi*), a federally endangered and state threatened species. The Stephens' kangaroo rat is protected under the Stephens' Kangaroo Rat Habitat Conservation Plan (County Ordinance No. 663.10; SKR HCP). As described in the MSHCP Implementation Agreement, a Section 10(a) Permit, and California Fish and Game Code Section 2081 Management Authorization were issued to the Riverside County Habitat Conservation Agency (RCHCA) for the Long-Term SKR HCP and was approved by the USFWS and CDFW in August 1990 (RCHCA 1996). Relevant terms of the SKR HCP have been incorporated into the MSHCP and its Implementation Agreement. The SKR HCP will continue to be implemented as a separate HCP; however, to provide the greatest conservation for the largest number of Covered Species, the Core Reserves established by the SKR HCP are managed as part of the MSHCP Conservation Area consistent with the SKR HCP. Actions shall not be taken as part of the implementation of the SKR HCP that will significantly affect other Covered Species. Take of Stephens' kangaroo rat outside of the boundaries but within the MSHCP area is authorized under the MSHCP and the associated permits.

The Project site is not located within the Mitigation Fee Area of the SKR HCP. Therefore, the applicant will not be required to pay the SKR HCP Mitigation Fee.

Conclusion

Based on the literature review and field survey, implementation of the Project will have no significant impacts on federally, State, or MSHCP listed species known to occur in the general vicinity of the Project site. The Project site was determined not to have suitable conditions to support any special-status species known to occur in the vicinity. With completion of the recommendations provided below, no impacts to year-round, seasonal, or special-status avian residents will occur from implementation of the proposed Project.

Additionally, the project will have no effect on designated Critical Habitat, since there is no federal nexus, or regional wildlife corridors/linkage. No riverine/riparian features were identified within the project site, therefore, the proposed project is consistent with Section 6.1.2 of the MSHCP. With implementation of the recommended measures and payment of the MSHCP Local Development Mitigation Fee, development of the Project site would be fully consistent with the MSHCP.

Recommendations

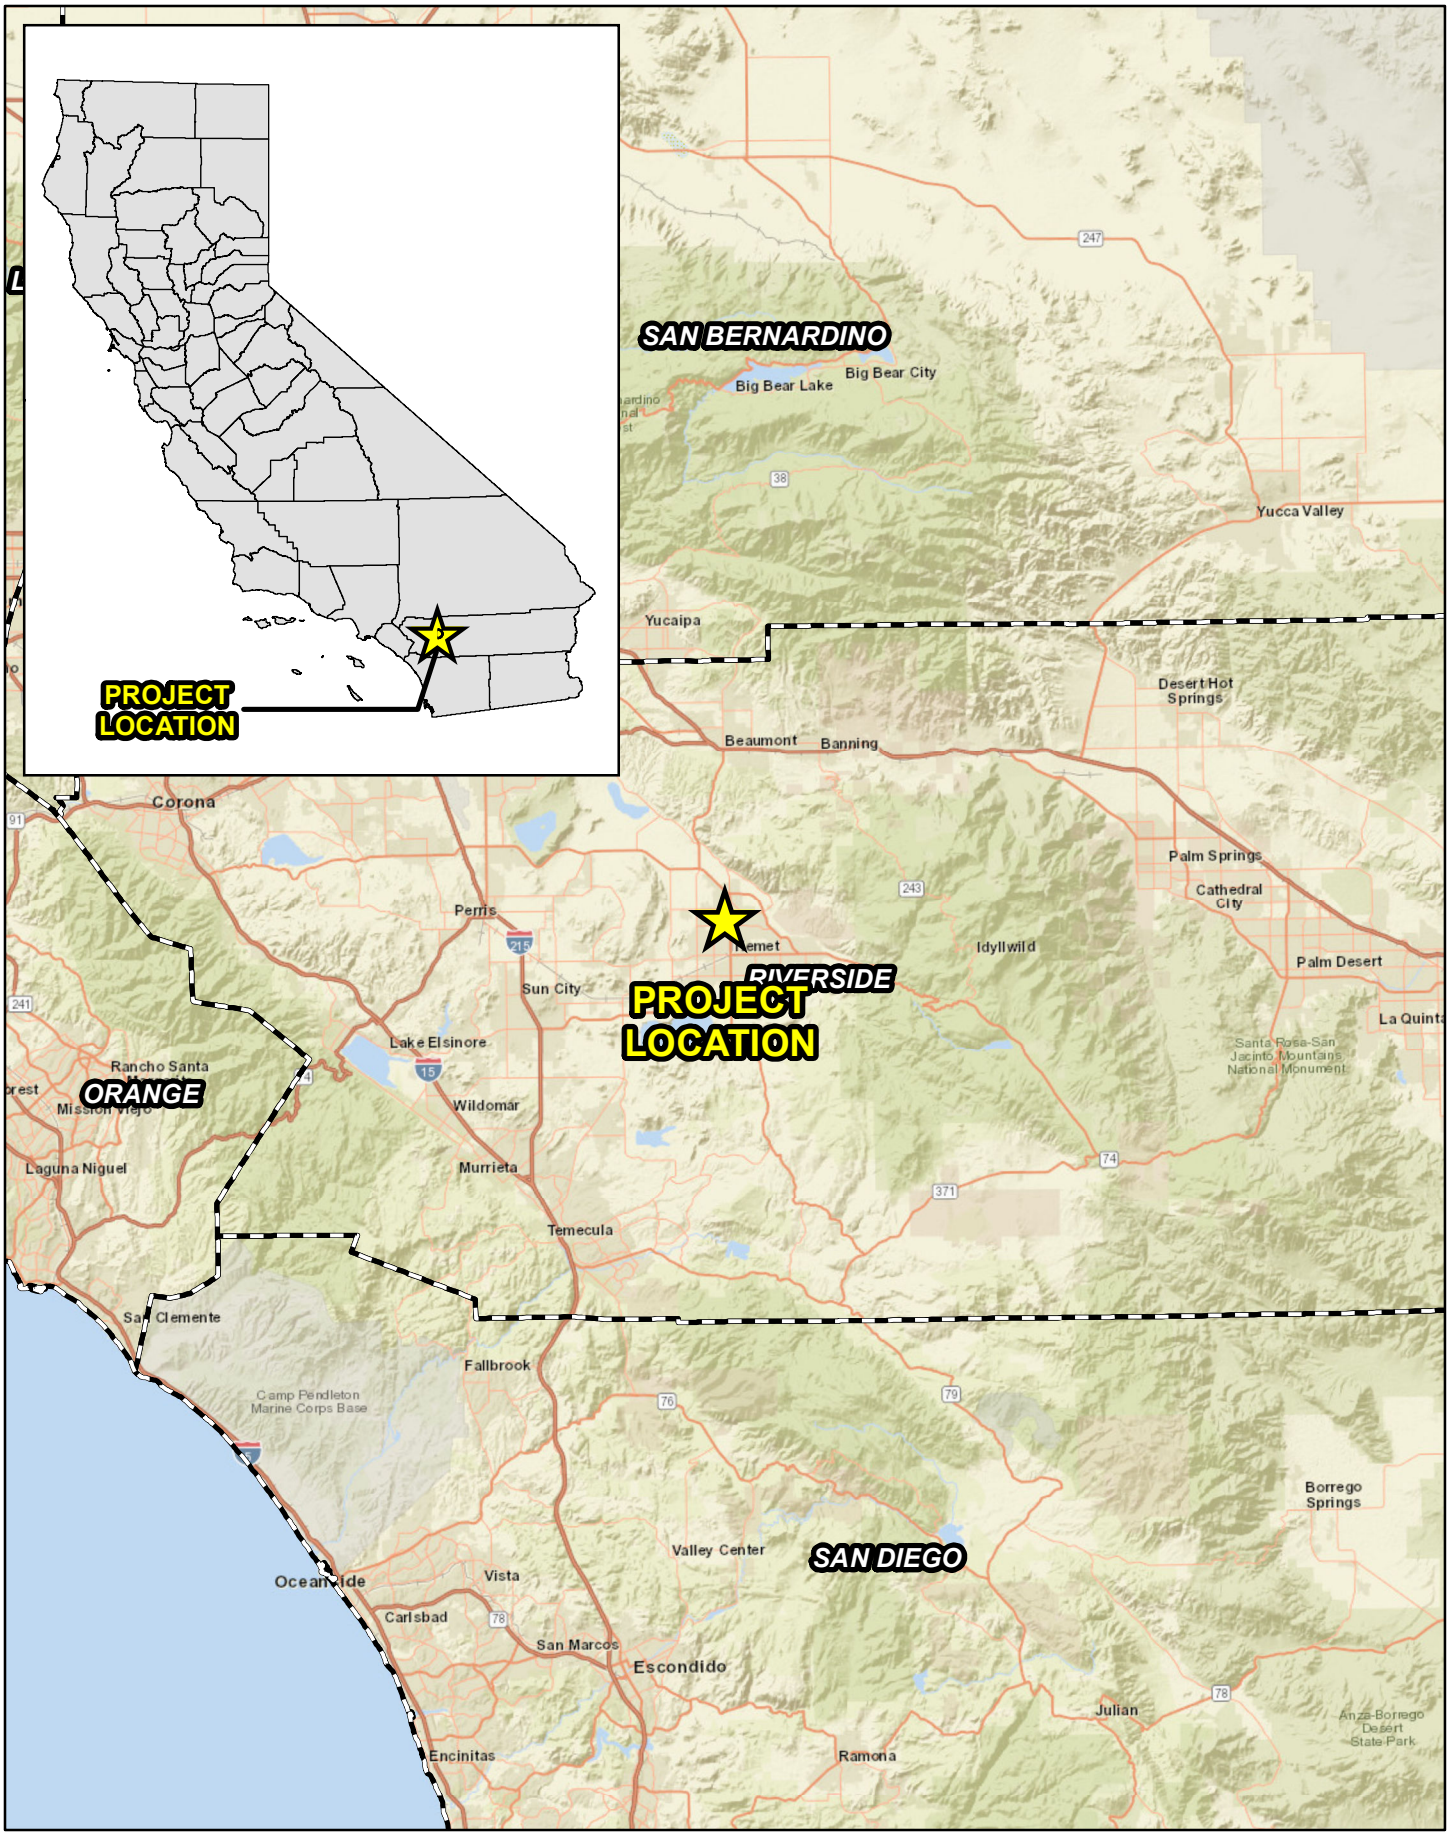
Migratory Bird Treaty Act and Fish and Game Code Compliance

Vegetation within and surrounding the Project site has the potential to provide refuge cover from predators, perching sites and favorable conditions for avian nesting that could be impacted by construction activities associated with the Project. Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.3, 3511, and 3513 of the California Fish and Game Code prohibit the take, possession, or destruction of birds, their nests or eggs). In order to protect migratory bird species, a nesting bird clearance survey should be conducted prior to any ground disturbance or vegetation removal activities that may disrupt the birds during the nesting season. Consequently, if avian nesting behaviors are disrupted, such as nest abandonment and/or loss of reproductive effort, it is considered "take" and is potentially punishable by fines and/or imprisonment.

If construction occurs between February 1st and August 31st, a pre-construction clearance survey for nesting birds should be conducted within three (3) days of the start of any vegetation removal or ground disturbing activities to ensure that no nesting birds will be disturbed during construction. The biologist conducting the clearance survey should document a negative survey with a brief letter report indicating that no impacts to active avian nests will occur. If an active avian nest is discovered during the pre-construction clearance survey, construction activities should stay outside of a no-disturbance buffer. The size of the no-disturbance buffer will be determined by the wildlife biologist and will depend on the level of noise and/or surrounding anthropogenic disturbances, line of sight between the nest and the construction activity, type and duration of construction activity, ambient noise, species habituation, and topographical barriers. These factors will be evaluated on a case-by-case basis when developing buffer distances. Limits of construction to avoid an active nest will be established in the field with flagging, fencing, or other appropriate barriers; and construction personnel will be instructed on the sensitivity of nest areas. A biological monitor should be present to delineate the boundaries of the buffer area and to monitor the active nest to ensure that nesting behavior is not adversely affected by the construction activity. Once the young have fledged and left the nest, or the nest otherwise becomes inactive under natural conditions, construction activities within the buffer area can occur.

Please do not hesitate to contact Travis McGill at (909) 816-1646 or travismcgill@elmtconsulting.com should you have any questions regarding this report.

Sincerely,



Travis J. McGill
Director

Potentially Occurring Special-Status Biological Resources

Table C-1: Potentially Occurring Special-Status Biological Resources

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
WILDLIFE SPECIES					
Accipiter striatus sharp-shinned hawk	**Fed:** None **CA:** WL	Generally found in cismontane woodland, lower montane coniferous forest, riparian forest, and riparian woodland. Associated with ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine habitats, with a preference for riparian areas.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Agelaius tricolor tricolored blackbird	**Fed:** None **CA: THR** | SSC	Range is limited to the coastal areas of the Pacific coast of North America, from Northern California to upper Baja California. Can be found in a wide variety of habitat including annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields, cattle feedlots, and dairies. Occasionally forage in riparian scrub habitats along marsh borders. Basic habitat requirements for breeding include open accessible water, protected nesting substrate (freshwater marsh dominated by cattails, willows, and bulrushes), and either flooded or thorny or spiny vegetation and suitable foraging space providing adequate insect prey.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	**Fed:** None **CA:** WL	Typically found between 3,000 and 6,000 feet in elevation. Breeds in sparsely vegetated scrubland on hillsides and canyons. Prefers coastal sage scrub dominated by California sagebrush (Artemisia californica), but they can also be found breeding in coastal bluff scrub, low-growing serpentine chaparral, and along the edges of tall chaparral habitats.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Ammodramus savannarum grasshopper sparrow	**Fed:** None **CA:** SSC	Occurs in grassland, upland meadow, pasture, hayfield, and old field habitats. Optimal habitat contains short- to medium-height bunch grasses interspersed with patches of bare ground, a shallow litter layer, scattered forbs, and few shrubs. May inhabit thickets, weedy lawns, vegetated landfills, fence rows, open fields, or grasslands.	Yes (e)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Anniella stebbinsi Southern California legless lizard	**Fed:** None **CA:** SSC	Occurs in sparsely vegetated habitat types including coastal sand dunes, chaparral, pine-oak woodland, desert scrub, open grassland, and riparian areas. Requires sandy or loose loamy substrates conducive to burrowing.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Antrozous pallidus pallid bat	**Fed:** None **CA:** SSC	Locally common species of low elevation in California. Mostly found in desert habitats, but also occur in oak and pine forested areas and open farmland. Prefers rocky outcrops for roosting, but also roost in caves, rock crevices, mines, hollow trees, and buildings. roosts with depth gradients are preferred.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Aquila chrysaetos golden eagle	**Fed:** None **CA:** FP | WL	Occurs in rolling foothill, sage-juniper flats, desert, and mountainous habitats. Requires open terrain for hunting including grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats. Nests on cliffs and escarpments in rugged canyons and in large trees in open areas. Prefers rolling foothills, mountain terrain, cliffs, rock outcrops, and wide arid plateaus deeply cut by streams and canyons.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Ardea alba great egret	**Fed:** None **CA:** None	Generally found in brackish marsh estuary freshwater marsh & swamp riparian forest wetland. Rookery sites located near marshes, tide-flats, irrigated pastures, and margins of rivers and lakes.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Ardea herodias great blue heron	**Fed:** None **CA:** None	Generally found in brackish marsh estuary freshwater marsh & swamp riparian forest wetland. Colonial nester in tall trees, cliffsides, and sequestered spots on marshes. Rookery sites in close proximity to foraging areas: marshes, lake margins, tide-flats, rivers and streams, wet meadows.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Arizona elegans occidentalis California glossy snake	**Fed:** None **CA:** SSC	Inhabits arid scrub, rocky washes, grassland, and chaparral. Appears in microhabitats of open areas and areas with soil loose enough for easy burrowing.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Artemisiospiza belli belli Bells sparrow	**Fed:** None **CA:** WL	Generally prefers semi-open habitats with evenly spaced shrubs 1 – 2 meters in height. Dry chaparral dominated by chamise and/or California sagebrush, coastal sage scrub. Less common in tall, dense, old chaparral.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Asio flammeus short-eared owl	**Fed:** None **CA:** SSC	Generally found in Great Basin grassland, meadow and seep, marsh and swamp, and valley and foothill grassland wetlands. Occurs in lowland meadows.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Aspidoscelis hyperythra orange-throated whiptail	**Fed:** None **CA:** WL	Inhabits low-elevations coastal scrub, chamise-redshank chaparral, mixed chaparral, and valley-foothill hardwood habitats. Semi-arid brushy areas typically with loose soil and rocks, including washes, stream sides, rocky hillsides, and coastal chaparral.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Aspidoscelis tigris stejnegeri coastal whiptail	**Fed:** None **CA:** SSC	Found in deserts and semi-arid areas with sparse vegetation and open areas. Also found in woodland and riparian areas. Ground may be firm soil, sandy, or rocky.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Astur cooperii Coopers hawk	**Fed:** None **CA:** WL	Generally found in cismontane woodland riparian forest riparian woodland upper montane coniferous forest. Woodland, chiefly of open, interrupted or marginal type. Nests sites mainly in riparian growths of deciduous trees, as in canyon bottoms on river flood-plains. Also, live oaks.	No	No	**Low** Marginal foraging and habitat is present within and adjacent to the project site.
Athene cunicularia burrowing owl	**Fed:** None **CA:** Candidate Endangered | SSC	Prefers habitat with short, sparse vegetation with few shrubs and well-drained soils in grassland, shrub steppe, and desert habitats. Primarily a grassland species, but it persists and even thrives in some landscapes highly altered by human activity. Occurs in open, annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. The overriding characteristics of suitable habitat appear to be burrows for roosting and nesting and relatively short vegetation with only sparse shrubs and taller vegetation.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Aythya americana redhead	**Fed:** None **CA:** SSC	Occurs year round in California, though status varies regionally. Nests in freshwater emergent wetlands where dense stands of cattails and tules are interspersed with areas of deep, open water.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Bombus crotchii Crotchs bumble bee	**Fed:** None **CA:** Candidate Endangered	Colonial species that lives almost exclusively from coastal California east towards the Sierra-Cascade Crest and can be found uncommonly in western Nevada and south through Baja California. Inhabits grassland and scrub habitats in hotter and drier climates than most other bumblebee species and is only capable of tolerating a narrow range of climatic conditions. This species usually nests underground, often in abandoned rodent dens.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Bombus pensylvanicus American bumble bee	**Fed:** None **CA:** None	Generally found in coastal prairie Great Basin grassland valley & foothill grassland.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Botaurus exilis least bittern	**Fed:** None **CA:** SSC	Generally found in marsh & swamp wetland. Colonial nester in marshlands and borders of ponds and reservoirs which provide ample cover.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Botaurus lentiginosus American bittern	**Fed:** None **CA:** None	Generally found in brackish marsh freshwater marsh salt marsh. Freshwater and slightly brackish marshes. Also in coastal saltmarshes.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Buteo regalis ferruginous hawk	**Fed:** None **CA:** WL	Common winter resident of grasslands and agricultural areas in southwestern California. Frequents open grasslands, sagebrush flats, desert scrub, low foothills surrounding valleys, and fringes of pinyon-juniper habitats. Does not breed in California.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Buteo swainsoni Swainsons hawk	**Fed:** None **CA: THR**	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Calypte costae Costas hummingbird	**Fed:** None **CA:** None	Typical habitat is open desert, grassland, or cropland containing scattered, large trees or small groves. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grassland or suitable grain or alfalfa fields or livestock pastures.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Chaetodipus californicus femoralis Dulzura pocket mouse	**Fed:** None **CA:** None	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 1,400 meters. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Chaetodipus fallax fallax northwestern San Diego pocket mouse	**Fed:** None **CA:** None	Occurs in desert and coastal habitats in southern California, Mexico, and northern Baja California, from sea level to at least 4,600 feet in elevation. Found in a variety of temperate habitats ranging from chaparral and grasslands to scrub forests and deserts. Requires low growing vegetation or rocky outcroppings, as well as sandy soils for burrowing.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Chlidonias niger black tern	**Fed:** None **CA:** SSC	Found at freshwater marshes and lakes and found along coastal waters in migration. For nesting favors fresh waters with extensive marsh vegetation and open water, also sometimes in smaller marshes and wet meadows. In migration found on larger lakes and along coast. Winters in tropical coastal regions, mostly just offshore or around salt lagoons and estuaries.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Circus hudsonius northern harrier	**Fed:** None **CA:** SSC	Most common in large, undisturbed tracts of wetlands and grasslands with low, thick vegetation. They breed in freshwater and brackish marshes, lightly grazed meadows, old fields, tundra, dry upland prairies, drained marshlands, high-desert shrubsteppe, and riverside woodlands. During winter they use a range of habitats with low vegetation, including deserts, coastal sand dunes, pasturelands, croplands, dry plains, grasslands, old fields, estuaries, open floodplains, and marshes.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Coccyzus americanus occidentalis western yellow-billed cuckoo	**Fed: THR** **CA: END**	In California, the breeding distribution is now thought to be restricted to isolated sites in Sacramento, Amargosa, Kern, Santa Ana, and Colorado River valleys. Obligate riparian species with a primary habitat association of willow-cottonwood riparian forest.	Yes (a)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Coleonyx variegatus abbotti San Diego banded gecko	**Fed:** None **CA:** SSC	Found in southwestern California just inland from the Pacific coast, from Ventura County south into northwestern and central Baja California. It is found in coastal scrub chaparral and desert scrub habitats, preferring granite or rocky outcrops.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Corynorhinus townsendii Townsends big-eared bat	**Fed:** None **CA:** SSC	Occupies a variety of habitats including desert scrub, chaparral, oak woodland, and coniferous forest. Roosts in caves, mines, rock crevices, and abandoned buildings, typically selecting sites with minimal disturbance and stable temperatures. Forages in open habitats and along forest edges, relying on a high degree of roost site fidelity.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Crotalus ruber red-diamond rattlesnake	**Fed:** None **CA:** SSC	Found from desert dense chaparral communities in the foothills (it avoids the mountains above around 4,000 feet), to warm inland mesas and valleys, all the way to the cool ocean shore. Most commonly associated with heavy brush and large rocks or boulders. Dense chaparral in the foothills, cactus or boulder associated coastal sage scrub, oak and pine woodlands, and desert slope scrub associations are known to carry populations of the northern red-diamond rattlesnake. however, chamise and red shank associations may offer better structural habitat for refuges and food resources for this species than other habitats.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Dendrocygna bicolor fulvous whistling-duck	**Fed:** None **CA:** SSC	Generally found in freshwater marsh and swamp habitats, including freshwater and tule/cattail marshes.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Dipodomys merriami parvus San Bernardino kangaroo rat	**Fed: END** **CA: END** | SSC	Primarily found in Riversidean alluvial fan sage scrub (RAFSS) and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May also occur at lower densities in Riversidean upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to RAFSS habitat. Tends to avoid rocky substrates.	Yes (c)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Dipodomys simulans Dulzura kangaroo rat	**Fed:** None **CA:** None	Relatively common in chaparral, coastal sage scrub, Riversidean alluvial fan sage scrub, and peninsular juniper woodland habitats with sandy and gravelly soils. Sometimes found in forests of pine, oak and fir.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Dipodomys stephensi Stephens kangaroo rat	**Fed: THR** **CA: THR**	Generally found in coastal scrub valley & foothill grassland. Primarily annual and perennial grasslands, but also occurs in coastal scrub and sagebrush with sparse canopy cover. Will burrow into firm soil.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Elanus leucurus white-tailed kite	**Fed:** None **CA:** FP	Common in savannahs, open woodlands, marshes, desert grasslands, partially cleared areas, and cultivated fields. Avoids heavily grazed areas. Breeds in lowland grasslands, agricultural wetlands, oak-woodland and savannah habitats, and riparian areas.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Empidonax traillii willow flycatcher	**Fed:** None **CA: END**	A rare to locally uncommon, summer resident in wet meadow and montane riparian habitats (2,000 to 8,000 ft) in the Sierra Nevada and Cascade Range. Most often occurs in broad, open river valleys or large mountain meadows with lush growth of shrubby willows.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Empidonax traillii extimus southwestern willow flycatcher	**Fed: END** **CA: END**	Uncommon summer resident of southern California. Occurs in riparian woodlands in southern California. Typically requires large areas of willow thickets in broad valleys, canyon bottoms, or around ponds and lakes. These areas typically have standing or running water, or are at least moist.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Eremophila alpestris actia California horned lark	**Fed:** None **CA:** WL	Occurs in meadows, grasslands, open fields, prairie, and alkali flats. This subspecies is typically found in coastal regions.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Euphydryas editha quino quino checkerspot butterfly	**Fed: END** **CA:** Candidate Endangered	Can be found in meadows and upland sage scrub/chaparral habitat.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Falco columbarius merlin	**Fed:** None **CA:** WL	Found in treetops, low perches at forest edges, grasslands, and saltmarshes. Also found in fairly open country such as willow or birch scrub, shrubland, taiga forests, parks, grasslands, steppes, and prairies. Winters in open forests, grasslands, and coastal areas.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Falco mexicanus prairie falcon	**Fed:** None **CA:** WL	Distributed from annual grasslands to alpine meadows, but primarily associated with grasslands, savannahs, rangeland, agricultural fields, and desert scrub areas. Requires open terrains for foraging and nests on cliffs, escarpments, and rock outcrops.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Falco peregrinus anatum American peregrine falcon	**Fed:** Delisted **CA:** Delisted	Uncommon winter resident of the inland region of southern California. Active nesting sites are known along the coast north of Santa Barbara, in Orange County, in the Sierra Nevada, and in other mountains of northern California. Breeds mostly in woodland, forest, and coastal habitats. Riparian areas and coastal and inland wetlands are important habitats yearlong, especially in nonbreeding seasons.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Gila orcuttii arroyo chub	**Fed:** None **CA:** SSC	Generally found in aquatic habitats of the south coast's flowing waters. Native to streams from Malibu Creek to the San Luis Rey River basin. Introduced into streams in the Santa Clara, Ventura, Santa Ynez, Mojave, and San Diego River basins. Occurs in slow-moving stream sections with mud or sand bottoms.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Haliaeetus leucocephalus bald eagle	**Fed:** Delisted **CA: END** | FP	Generally found in lower montane coniferous forest Oldgrowth. Ocean shore, lake margins, and rivers for both nesting and wintering. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Icteria virens yellow-breasted chat	**Fed:** None **CA:** SSC	Lives in thickets and along other dense, regrowing areas such as bramble bushes, clearcut areas, powerline corridors, and shrubs along streams. Can sometimes be found in overgrown pastures and in margins of woodlands. Winters in open scrub and woodland edges in lowland areas.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Lanius ludovicianus loggerhead shrike	**Fed:** None **CA:** SSC	Prefers open habitats with bare ground, scattered shrubs, and areas with low or sparse herbaceous cover including open-canopied valley foothill hardwood, riparian, pinyon-juniper, desert riparian, creosote bush scrub, and Joshua tree woodland. Requires suitable perches including trees, posts, fences, utility lines, or other perches.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Lasiurus xanthinus western yellow bat	**Fed:** None **CA:** SSC	Most commonly found in riparian woodland habitats consisting of sycamore, cottonwood and oak. Can also be found in desert environments and are closely associated with palms.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Lepus californicus bennettii San Diego black-tailed jackrabbit	**Fed:** None **CA:** None	Found in diverse habitats, but primarily is found in arid regions supporting shortgrass habitats. Openness of open scrub habitat is preferred over dense chaparral. Known to occur on the coastal side of mountain ranges westward from Los Padres National forest into Baja California.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Melanerpes lewis Lewis woodpecker	**Fed:** None **CA:** None	Breeds in open forest and woodland with an open canopy and brushy understory.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Nannopterum auritum double-crested cormorant	**Fed:** None **CA:** WL	Fairly common, yearlong resident in lowlands and foothills throughout most of California, including the Salton Sea and Colorado River areas, and very common locally in large nesting colonies. Feeds along the margins of lacustrine, large riverine, and fresh and saline emergent habitats and rarely, on kelp beds in marine sub tidal habitats. Nests and roosts in dense-foliaged trees and dense emergent wetlands.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Neotoma lepida intermedia San Diego desert woodrat	**Fed:** None **CA:** SSC	Found in a variety of shrub and desert habitats. Prefers large cactus patches and rock outcroppings. Common in sagebrush scrub areas, chaparral, desert, and within rocky sloped areas. Occurs at elevations up to 9,500 feet.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Nycticorax nycticorax black-crowned night heron	**Fed:** None **CA:** None	Fairly common, yearlong resident in lowlands and foothills throughout most of California, including the Salton Sea and Colorado River areas, and very common locally in large nesting colonies. Feeds along the margins of lacustrine, large riverine, and fresh and saline emergent habitats and rarely, on kelp beds in marine sub tidal habitats. Nests and roosts in dense-foliaged trees and dense emergent wetlands.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Onychomys torridus ramona southern grasshopper mouse	**Fed:** None **CA:** SSC	Inhabits alkali desert scrub and other desert scrub habitats, and to a lesser extent succulent shrubs, desert washes, desert riparian, coastal scrub, mixed chaparral, and sagebrush habitats. Generally rare in valley foothill and montane riparian habitats. Prefers low to moderate shrub cover and requires friable soils. In California, range extends from Los Angeles southward to the Mexican border, generally west of the desert.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Perognathus longimembris brevinasus Los Angeles pocket mouse	**Fed:** None **CA:** SSC	Generally found in coastal scrub. Lower elevation grasslands and coastal sage communities in and around the Los Angeles basin. Open ground with fine, sandy soils.	Yes (c)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Phrynosoma blainvillii coast horned lizard	**Fed:** None **CA:** SSC	Found in a wide variety of vegetation types including coastal sage scrub, annual grassland, chaparral, oak woodland, riparian woodland and coniferous forest. The key elements of such habitats are loose, fine soils with a high sand fraction. an abundance of native ants or other insects. and open areas with limited overstory for basking and low, but relatively dense shrubs for refuge.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Plegadis chihi white-faced ibis	**Fed:** None **CA:** WL	Prefers to feed in fresh emergent wetland, shallow lacustrine waters, muddy ground of wet meadows, and irrigated or flooded pastures and croplands. Roosts amidst dense, freshwater emergent vegetation such as bulrushes, cattails, reeds or low shrubs over water.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Polioptila californica californica coastal California gnatcatcher	**Fed: THR** **CA:** SSC	Common yearlong resident of southern California in sage scrub habitats that are dominated by California sagebrush (Artemisia californica). Prefers scrub habitat with more low-growing vegetation. Species generally occurs below 750 feet above mean sea level (msl) along the coast and below 1,500 feet above msl within inland regions.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Pyrocephalus rubinus vermilion flycatcher	**Fed:** None **CA:** SSC	Found in any open country in the Southwest, including arid scrublands, farmlands, deserts, parks, and canyon mouths. Sometimes winters along the coastlines. Reliant on stream corridors within scrub ecosystems, in areas where willow, sycamore, cottonwood, mesquite, and other bottomland trees grow. Nests along stream corridors.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Salvadora hexalepis virgultea coast patch-nosed snake	**Fed:** None **CA:** SSC	Found in desert scrub, grassland chaparral, sagebrush plains, and pinyon-juniper woodlands in the southwestern United States south into Baja California and Mexico. Occurs from below sea level to 7,000 feet in elevation.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Setophaga petechia yellow warbler	**Fed:** None **CA:** SSC	Nests over all of California except the Central Valley, the Mojave Desert region, and high altitudes and the eastern side of the Sierra Nevada. Winters along the Colorado River and in parts of Imperial and Riverside Counties. Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral. May also use oaks, conifers, and urban areas near stream courses.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Spea hammondii western spadefoot	**Fed: PTHR** **CA:** SSC	Prefers open areas with sandy or gravelly soils in a variety of habitats, including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rain pools that do not contain bullfrogs, fish, or crayfish are necessary for breeding.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Spinus lawrencei Lawrences goldfinch	**Fed:** None **CA:** None	Typical habitats include valley foothill hardwood, valley foothill hardwood-conifer, and, in southern California, desert riparian, palm oasis, pinyon-juniper, and lower montane habitats. Open woodlands, chaparral, and weedy fields. Closely associated with oaks. Nests in open oak or other arid woodland and chaparral near water.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Spizella breweri Brewers sparrow	**Fed:** None **CA:** None	Live in shrublands year-round. Most often found in sagebrush shrublands with short vegetation in spring and summer. May also occur in openings in pinyon-juniper woodlands or in other mountain shrub communities. Typically nest in taller, denser shrubs with less bare ground. Common in desert shrublands dominated by saltbush shrubs and creosote.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Taxidea taxus American badger	**Fed:** None **CA:** SSC	Primarily occupy grasslands, parklands, farms, tallgrass and shortgrass prairies, meadows, shrub-steppe communities and other treeless areas with sandy loam soils where it can dig more easily for its prey. Occasionally found in open chaparral (with less than 50% plant cover) and riparian zones.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Thamnophis hammondii two-striped gartersnake	**Fed:** None **CA:** SSC	Inhabits streams and ponds in chaparral, oak woodland, and forest habitats up to 8,000 feet elevation. Semi-aquatic in nature, but can occur in a variety of habitats-including urban areas-where there is water present.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Vireo bellii pusillus least Bells vireo	**Fed: END** **CA: END**	Primarily occupy Riverine riparian habitat that typically feature dense cover within 1 -2 meters of the ground and a dense, stratified canopy. Typically it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodlands, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses, 2,000 feet elevation in the interior.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Xanthocephalus xanthocephalus yellow-headed blackbird	**Fed:** None **CA:** SSC	Summers in the west-central United States and Canada and winters throughout the western United States. Nests primarily in large wetlands, but also in mountain meadows and along pond and river edges. Breeds in freshwater sloughs, marshy lake borders, and tall cattails.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
PLANT SPECIES					

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Abronia villosa var. aurita chaparral sand-verbena	**Fed:** None **CA:** None **CNPS:** 1B.1	Found on the coastal side of the southern California mountains in chaparral, coastal sage scrub, and desert dune plant communities in areas of full sun and sandy soils. Found at elevations ranging from 262 to 5,249 feet. Blooming period is from January to September.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Allium marvinii Yucaipa onion	**Fed:** None **CA:** None **CNPS:** 1B.2	Found in chaparral, cismontane woodland, coastal scrub, pinyon and juniper woodland, valley and foothill grassland. Found at elevations ranging from 974 to 3,510 feet. Blooming period is from March to May.	Yes (b)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Astragalus pachypus var. jaegeri Jaegers milk-vetch	**Fed:** None **CA:** None **CNPS:** 1B.1	Found in only a few places in Riverside County and within the Cleveland and San Bernadino National Forests. Grows in rocky (sometimes), sandy (sometimes) areas within chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland habitats. Found at elevations ranging from 1,200 to 3,200 feet. Blooming period is from December to June.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Calochortus plummerae Plummers mariposa-lily	**Fed:** None **CA:** None **CNPS:** 4.2	Found along the coast and inland hills in chaparral, coastal sage scrub, yellow pine forest, foothill woodland, and valley grassland plant communities. Prefers dry, rocky soils. Grows at elevations of up to 5,580 feet. Blooms from May to July.	Yes (e)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Caulanthus simulans Paysons jewelflower	**Fed:** None **CA:** None **CNPS:** 4.2	Occurs in pinyon-juniper woodland, chaparral, and coastal sage scrub, typically on north-facing slopes and ridgelines on sandy-granitic soils. Grows in elevations ranging from 295 to 7,220 feet above msl. Blooming period is from March to May.	Yes	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Centromadia pungens ssp. laevis smooth tarplant	**Fed:** None **CA:** None **CNPS:** 1B.1	Occurs in alkaline soils within chenopod scrub, meadows and seeps, playas, riparian woodland, and valley and foothill grassland habitats. Grows in elevation ranging from 0 to 2,100 feet. Blooming period ranges from April to September.	Yes (d)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Chorizanthe leptotheca Peninsular spineflower	**Fed:** None **CA:** None **CNPS:** 4.2	Endemic to southern California, primarily in the Peninsular Ranges including parts of San Bernardino, Riverside, and San Diego counties. Found in chaparral, cismontane woodland, and coastal scrub habitats, typically on granitic or sandy soils. Elevation range is approximately 1,000 to 6,200 feet. Blooms from May to August.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Chorizanthe parryi var. parryi Parrys spineflower	**Fed:** None **CA:** None **CNPS:** 1B.1	Openings within alluvial washes and margins on sandy (sometimes), rocky (sometimes) soils within chaparral, cismontane woodland, coastal scrub, and valley and foothill grasslands. Found at elevations ranging from 951 to 3,773 feet. Blooming period is from April to June.	Yes (e)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Deinandra mohavensis Mojave tarplant	**Fed:** None **CA: END** **CNPS:** 1B.3	Found in the southernmost areas of the Sierra Nevada Mountains, the Mojave Desert, the Peninsular Ranges, and the San Bernadino Mountains. Grows in mesic areas in chaparral, coastal scrub, and riparian scrub habitats. Found at elevations ranging from 2,100 to 5,250 feet. Blooms from June to October.	Yes (e)	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Imperata brevifolia California satintail	**Fed:** None **CA:** None **CNPS:** 2B.1	Grows in mesic soils within coastal scrub, Mojavean desert scrub, meadows and seeps (often alkali), and riparian scrub habitats. found at elevations ranging from 0 to 3,986 feet. Blooming period is from September to May.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Pseudognaphalium leucocephalum white rabbit-tobacco	**Fed:** None **CA:** None **CNPS:** 2B.2	Grows in sandy, gravelly soils within chaparral, cismontane woodland, coastal scrub, and riparian woodland habitats. Found at elevations ranging from 0 to 6,890 feet. Blooming period is from July to December.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
Quercus engelmannii Engelmann oak	**Fed:** None **CA:** None **CNPS:** 4.2	Occurs in chaparral, cismontane woodland, riparian woodland, and valley and foothill grassland. Found at elevations ranging from 164 to 4,265 feet. Blooming period is from March to June.	No	No	**Presumed Absent** There is no suitable habitat present within or adjacent to the project site.
CDFW SENSITIVE HABITATS					
Desert Fan Palm Oasis Woodland	CDFW Sensitive Habitat	Occurs in riparian woodland.	No	No	**Absent**
Southern Coast Live Oak Riparian Forest	CDFW Sensitive Habitat	Open-to-dense canopy woodland dominated by coast live oak (Quercus agrifolia), as well as western sycamore (Platanus racemosa) and willow (Salix spp.). This habitat is found in flood-prone areas near waterways like rivers and creeks. Understory is comprised of moisture-loving plants.	No	No	**Absent**

Scientific Name Common Name	**Status**	**Habitat**	**Covered by MSHCP**	**Observed On-site**	**Potential to Occur**
Southern Cottonwood Willow Riparian Forest	CDFW Sensitive Habitat	Dominated by winter-deciduous trees, specifically Fremont cottonwood (Populus fremontii) and several species of willow (Salix sp.). These forests are characterized by a tall, multi-layered canopy and often have a dense understory of shrubs and herbaceous plants. They are found along rivers, streams, and other bodies of water, typically in areas with moist, bare mineral soil.	No	No	**Absent**
Southern Mixed Riparian Forest	CDFW Sensitive Habitat	Typically a younger successional stage of riparian forest, due to disturbance or more frequent flooding. Plant species include willow (Salix sp.) species, elderberry (Sambucus sp.), oak species, sycamore (Platanus racemosa), cottonwood (Populus sp.), and smaller shrubs.	No	No	**Absent**

U.S. Fish and Wildlife Service (Fed) - Federal

Yes (c)- May require surveys under MSHCP Section 6.3.2
Yes (d)- May require surveys under MSHCP Section 6.3.2
Yes (e)- Conditionally covered pending the achievement of species-specific conservation measures

Attachment D

Regulations

Special status species are native species that have been afforded special legal or management protection because of concern for their continued existence. There are several categories of protection at both federal and state levels, depending on the magnitude of threat to continued existence and existing knowledge of population levels.

Federal Regulations

Endangered Species Act of 1973

Federally listed threatened and endangered species and their habitats are protected under provisions of the Federal Endangered Species Act (ESA). Section 9 of the ESA prohibits "take" of threatened or endangered species. "Take" under the ESA is defined as to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any of the specifically enumerated conduct." The presence of any federally threatened or endangered species that are in a project area generally imposes severe constraints on development, particularly if development would result in "take" of the species or its habitat. Under the regulations of the ESA, the United States Fish and Wildlife Service (USFWS) may authorize "take" when it is incidental to, but not the purpose of, an otherwise lawful act.

Critical Habitat is designated for the survival and recovery of species listed as threatened or endangered under the ESA. Critical Habitat includes those areas occupied by the species, in which are found physical and biological features that are essential to the conservation of an ESA listed species and which may require special management considerations or protection. Critical Habitat may also include unoccupied habitat if it is determined that the unoccupied habitat is essential for the conservation of the species.

Whenever federal agencies authorize, fund, or carry out actions that may adversely modify or destroy Critical Habitat, they must consult with USFWS under Section 7 of the ESA. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highway Administration or a permit from the U.S. Army Corps of Engineers (Corps)).

If USFWS determines that Critical Habitat will be adversely modified or destroyed from a proposed action, the USFWS will develop reasonable and prudent alternatives in cooperation with the federal institution to ensure the purpose of the proposed action can be achieved without loss of Critical Habitat. If the action is not likely to adversely modify or destroy Critical Habitat, USFWS will include a statement in its biological opinion concerning any incidental take that may be authorized and specify terms and conditions to ensure the agency is in compliance with the opinion.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) (16 U.S. Government Code [USC] 703) makes it unlawful to pursue, capture, kill, possess, or attempt to do the same to any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union, and authorizes the U.S. Secretary of the Interior to protect and regulate the taking of migratory birds. It establishes seasons and bag limits for hunted species and protects migratory birds, their occupied nests, and their eggs (16 USC 703; 50 CFR 10, 21).

The MBTA covers the taking of any nests or eggs of migratory birds, except as allowed by permit pursuant to 50 CFR, Part 21. Disturbances causing nest abandonment and/or loss of reproductive effort (i.e., killing or abandonment of eggs or young) may also be considered "take." This regulation seeks to protect migratory birds and active nests.

In 1972, the MBTA was amended to include protection for migratory birds of prey (e.g., raptors). Six families of raptors occurring in North America were included in the amendment: Accipitridae (kites, hawks, and eagles); Cathartidae (New World vultures); Falconidae (falcons and caracaras); Pandionidae (ospreys); Strigidae (typical owls); and Tytonidae (barn owls). The provisions of the 1972 amendment to the MBTA protects all species and subspecies of the families listed above. The MBTA protects over 800 species including geese, ducks, shorebirds, raptors, songbirds and many relatively common species.

State Regulations

California Environmental Quality Act (CEQA)

The California Environmental Quality Act (CEQA) provides for the protection of the environment within the State of California by establishing State policy to prevent significant, avoidable damage to the environment through the use of alternatives or mitigation measures for projects. It applies to actions directly undertaken, financed, or permitted by State lead agencies. If a project is determined to be subject to CEQA, the lead agency will be required to conduct an Initial Study (IS); if the IS determines that the project may have significant impacts on the environment, the lead agency will subsequently be required to write an Environmental Impact Report (EIR). A finding of non-significant effects will require either a Negative Declaration or a Mitigated Negative Declaration instead of an EIR. Section 15380 of the CEQA Guidelines independently defines "endangered" and "rare" species separately from the definitions of the California Endangered Species Act (CESA). Under CEQA, "endangered" species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while "rare" species are defined as those who are in such low numbers that they could become endangered if their environment worsens.

California Endangered Species Act (CESA)

In addition to federal laws, the state of California implements the CESA which is enforced by CDFW. The CESA program maintains a separate listing of species beyond the FESA, although the provisions of each act are similar.

State-listed threatened and endangered species are protected under provisions of the CESA. Activities that may result in "take" of individuals (defined in CESA as; "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill") are regulated by CDFW. Habitat degradation or modification is not included in the definition of "take" under CESA. Nonetheless, CDFW has interpreted "take" to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

The State of California considers an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is considered as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the

absence of special protection or management. A rare species is one that is considered present in such small numbers throughout its range that it may become endangered if its present environment worsens. State threatened and endangered species are fully protected against take, as defined above.

The CDFW has also produced a species of special concern list to serve as a species watch list. Species on this list are either of limited distribution or their habitats have been reduced substantially, such that a threat to their populations may be imminent. Species of special concern may receive special attention during environmental review, but they do not have formal statutory protection. At the federal level, USFWS also uses the label species of concern, as an informal term that refers to species which might be in need of concentrated conservation actions. As the Species of Concern designated by USFWS do not receive formal legal protection, the use of the term does not necessarily ensure that the species will be proposed for listing as a threatened or endangered species.

Fish and Game Code

Fish and Game Code Sections 3503, 3503.5, 3511, and 3513 are applicable to natural resource management. For example, Section 3503 of the Code makes it unlawful to destroy any birds' nest or any birds' eggs that are protected under the MBTA. Further, any birds in the orders Falconiformes or Strigiformes (Birds of Prey, such as hawks, eagles, and owls) are protected under Section 3503.5 of the Fish and Game Code which makes it unlawful to take, possess, or destroy their nest or eggs. A consultation with CDFW may be required prior to the removal of any bird of prey nest that may occur on a project site. Section 3511 of the Fish and Game Code lists fully protected bird species, where the CDFW is unable to authorize the issuance of permits or licenses to take these species. Pertinent species that are State fully protected by the State include golden eagle (*Aquila chrysaetos*) and white-tailed kite (*Elanus leucurus*). Section 3513 of the Fish and Game Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

Native Plant Protection Act

Sections 1900–1913 of the Fish and Game Code were developed to preserve, protect, and enhance Rare and Endangered plants in the state of California. The act requires all state agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least ten days in advance of any change in land use which would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

California Native Plant Society Rare and Endangered Plant Species

Vascular plants listed as rare or endangered by the CNPS, but which have no designated status under FESA or CESA are defined as follows:

California Rare Plant Rank

1A- Plants Presumed Extirpated in California and either Rare or Extinct Elsewhere

1B- Plants Rare, Threatened, or Endangered in California and Elsewhere

2A- Plants Presumed Extirpated in California, But More Common Elsewhere

2B- Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere

3- Plants about Which More Information is Needed - A Review List

4- Plants of Limited Distribution - A Watch List

Threat Ranks

.1- Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)

.2- Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)

.3- Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known).

Local Policies

Western Riverside County MSHCP

The MSHCP is a comprehensive, multi-jurisdictional HCP focusing on conservation of species and their associated habitats in western Riverside County. The goal of the MSHCP is to maintain biological and ecological diversity within a rapidly urbanizing region.

The approval of the MSHCP and execution of the Implementing Agreement (IA) by the wildlife agencies allows signatories of the IA to issue "take" authorizations for all species covered by the MSHCP, including state- and federal-listed species as well as other identified sensitive species and/or their habitats. Each city or local jurisdiction will impose a Development Mitigation Fee for projects within their jurisdiction. With payment of the mitigation fee to the County and compliance with the survey requirements of the MSHCP where required, full mitigation in compliance with the California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), CESA, and FESA will be granted. The Development Mitigation Fee varies according to project size and project description. The fee for industrial development is $7,382 per acre (County Ordinance 810.2). Payment of the mitigation fee and compliance with the requirements of Section 6.0 of the MSHCP are intended to provide full mitigation under CEQA, NEPA, CESA, and FESA for impacts to the species and habitats covered by the MSHCP pursuant to agreements with the USFWS, the CDFW, and/or any other appropriate participating regulatory agencies and as set forth in the IA for the MSHCP.

There are three key agencies that regulate activities within inland streams, wetlands, and riparian areas in California. The Corps Regulatory Branch regulates activities pursuant to Section 404 of the Federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the CDFG regulates activities under the Fish and Game Code Section 1600-1616, and the Regional Board regulates activities pursuant to Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act.

Federal Regulations

Section 404 of the Clean Water Act

In accordance with the Revised Definition of "Waters of the United States"; Conforming (September 8, 2023), "waters of the United Sates" are defined as follows:

(a) ***Waters of the United States*** means:

(1) Waters which are:
(i) Currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
(ii) The territorial seas; or
(iii) Interstate waters;

(2) Impoundments of waters otherwise defined as waters of the United States under this definition, other than impoundments of waters identified under paragraph (a)(5) of this section;

(3) Tributaries of waters identified in paragraph (a)(1) or (2) of this section that are relatively permanent, standing or continuously flowing bodies of water;

(4) Wetlands adjacent to the following waters:
(i) Waters identified in paragraph (a)(1) of this section; or
(ii) Relatively permanent, standing or continuously flowing bodies of water identified in paragraph (a)(2) or (a)(3) of this section and with a continuous surface connection to those waters;

(5) Intrastate lakes and ponds not identified in paragraphs (a)(1) through (4) of this section that are relatively permanent, standing or continuously flowing bodies of water with a continuous surface connection to the waters identified in paragraph (a)(1) or (a)(3) of this section

(b) The following are not "waters of the United States" even where they otherwise meet the terms of paragraphs (a)(2) through (5) of this section:

(1) Waste treatment systems, including treatment ponds or lagoons, designed to meet the requirements of the Clean Water Act;

(2) Prior converted cropland designated by the Secretary of Agriculture. The exclusion would cease upon a change of use, which means that the area is no longer available for the production of agricultural commodities. Notwithstanding the determination of an area's status as prior converted

cropland by any other Federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA;

(3) Ditches (including roadside ditches) excavated wholly in and draining only dry land and that do not carry a relatively permanent flow of water;

(4) Artificially irrigated areas that would revert to dry land if the irrigation ceased;
(5) Artificial lakes or ponds created by excavating or diking dry land to collect and retain water and which are used exclusively for such purposes as stock watering, irrigation, settling basins, or rice growing;
(6) Artificial reflecting or swimming pools or other small ornamental bodies of water created by excavating or diking dry land to retain water for primarily aesthetic reasons;

(7) Waterfilled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and until the construction or excavation operation is abandoned and the resulting body of water meets the definition of waters of the United States; and

(8) Swales and erosional features (*e.g.,* gullies, small washes) characterized by low volume, infrequent, or short duration flow.

(c) In this section, the following definitions apply:

(1) ***Wetlands*** means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.

(2) ***Adjacent*** means having a continuous surface connection

(3) ***High tide line*** means the line of intersection of the land with the water's surface at the maximum height reached by a rising tide. The high tide line may be determined, in the absence of actual data, by a line of oil or scum along shore objects, a more or less continuous deposit of fine shell or debris on the foreshore or berm, other physical markings or characteristics, vegetation lines, tidal gages, or other suitable means that delineate the general height reached by a rising tide. The line encompasses spring high tides and other high tides that occur with periodic frequency but does not include storm surges in which there is a departure from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds such as those accompanying a hurricane or other intense storm.

(4) ***Ordinary high water mark*** means that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

(5) ***Tidal waters*** means those waters that rise and fall in a predictable and measurable rhythm or cycle due to the gravitational pulls of the moon and sun. Tidal waters end where the rise and fall of the water surface can no longer be practically measured in a predictable rhythm due to masking by hydrologic, wind, or other effects.

Section 401 of the Clean Water Act

Pursuant to Section 401 of the CWA, any applicant for a federal license or permit to conduct any activity which may result in any discharge to waters of the United States must provide certification from the State or Indian tribe in which the discharge originates. This certification provides for the protection of the physical, chemical, and biological integrity of waters, addresses impacts to water quality that may result from issuance of federal permits, and helps insure that federal actions will not violate water quality standards of the State or Indian tribe. In California, there are nine Regional Water Quality Control Boards (Regional Board) that issue or deny certification for discharges to waters of the United States and waters of the State, including wetlands, within their geographical jurisdiction. The State Water Resources Control Board assumed this responsibility when a project has the potential to result in the discharge to waters within multiple Regional Boards.

State Regulations

Fish and Game Code

Fish and Game Code Sections 1600 et. seq. establishes a fee-based process to ensure that projects conducted in and around lakes, rivers, or streams do not adversely impact fish and wildlife resources, or, when adverse impacts cannot be avoided, ensures that adequate mitigation and/or compensation is provided.

Fish and Game Code Section 1602 requires any person, state, or local governmental agency or public utility to notify the CDFW before beginning any activity that will do one or more of the following:

(1) substantially obstruct or divert the natural flow of a river, stream, or lake;
(2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or
(3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake.

Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the State. CDFW's regulatory authority extends to include riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, the CDFW takes jurisdiction to the top of bank of the stream or to the outer limit of the adjacent riparian vegetation (outer drip line), whichever is greater. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation. A Section 1602 Streambed Alteration Agreement would be required if impacts to identified CDFW jurisdictional areas occur.

Porter Cologne Act

The California *Porter-Cologne Water Quality Control Act* gives the State very broad authority to regulate waters of the State, which are defined as any surface water or groundwater, including saline waters. The Porter-Cologne Act has become an important tool in the post SWANCC and Rapanos regulatory environment, with respect to the state's authority over isolated and insignificant waters. Generally, any person proposing to discharge waste into a water body that could affect its water quality must file a Report of Waste Discharge in the event that there is no Section 404/401 nexus. Although "waste" is partially defined as any waste substance associated with human habitation, the Regional Board also interprets this to include fill discharged into water bodies.

Site Plan

SITE INFORMATION:

APN(S):	435-330-003
PARCEL GROSS AREA:	±164,000 S.F. (3.765 ACRES)
PARCEL NET AREA:	±127,846 S.F. (2.935 ACRES)
ZONING:	INDUSTRIAL LIGHT (IL)
SITE ADDRESS:	980 W. 7TH STREET SAN JACINTO, CA 92582
FAR:	±34,518 S.F. = 27% (MAX FAR - 50%)
LANDSCAPED AREA:	±30,683 S.F. = 24%
IMPERVIOUS SURFACE AREA:	±97,163 S.F. = 76% (MAX AREA - 80%)

EXISTING BUILDING A - SNF DATA:

EXISTING USE:	SKILLED NURSING FACILITY
OCCUPANCY:	I-2 (W/ CONTROLLED EGRESS)
CONSTRUCTION TYPE:	V-A
FIRE SPRINKLERED:	YES
STORIES:	1
AREA:	±12,132 S.F.
EXISTING LICENSED BEDS:	44 BEDS

PROPOSED BUILDING A1 (ADDITION) - 43-BED SNF-STP DATA:

PROPOSED USE:	SKILLED NURSING FACILITY
OCCUPANCY:	I-2 (W/ CONTROLLED EGRESS)
CONSTRUCTION TYPE:	V-A
FIRE SPRINKLERED:	YES
STORIES:	1
AREA:	±17,372 S.F.
PROPOSED LICENSED BEDS:	43 BEDS (TOTAL OF 87 BEDS)

EXISTING OFFICE BUILDING B DATA:

EXISTING USE:	AUXILLARY TO SKILLED NURSING FACILITY
OCCUPANCY:	B
CONSTRUCTION TYPE:	V-B
FIRE SPRINKLERED:	NO
STORIES:	1
AREA:	±2,609 S.F.

PROPOSED BUILDING C - 16-BED PHF DATA :

EXISTING USE:	MEDICAL OFFICE
PROPOSED USE:	PSYCHIATRIC HEALTH FACILITY (PHF)
OCCUPANCY:	I-2 (W/ CONTROLLED EGRESS)
CONSTRUCTION TYPE:	V-A
FIRE SPRINKLERED:	YES
STORIES:	1
TOTAL AREA:	±2,596 S.F.
PROPOSED LICENSED BEDS:	16 BEDS

PARKING TABULATION:

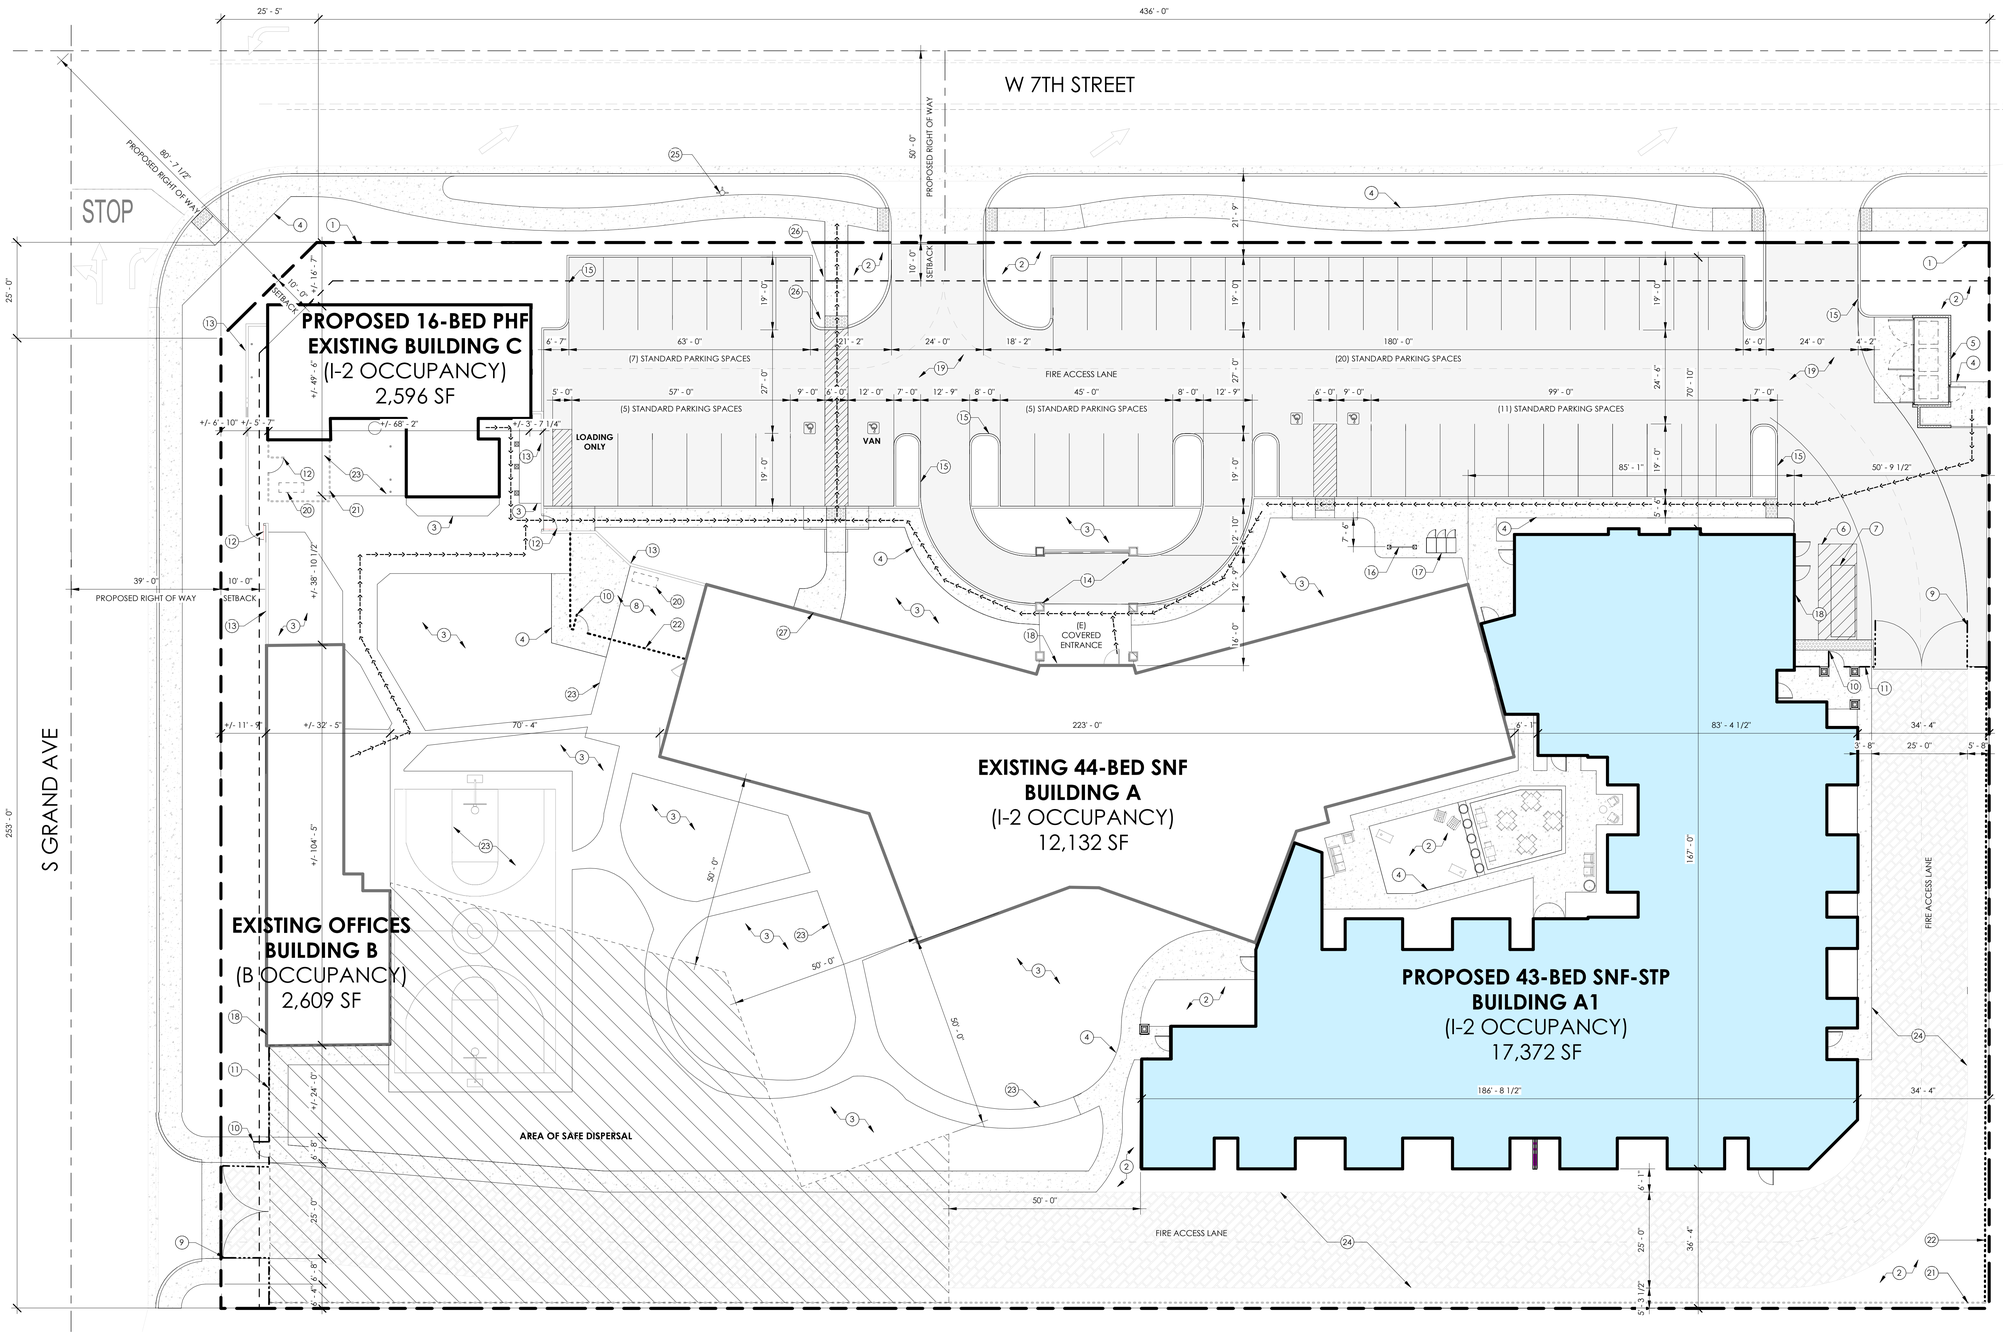
REQUIRED PARKING FOR "CONGREGATE CARE FACILITY (15 OR MORE)":

1 SPACE FOR EACH ON DUTY EMPLOYEE AND 1 SPACE FOR EACH 10 BEDS

REQUIRED PARKING:

PROPOSED 87-BED SNF - (87/10)	9
PROPOSED 16-BED PHF - (16/10)	2
PROPOSED TOTAL STAFF (1 PER STAFF)	41
TOTAL PARKING REQUIRED:	**52**

PROPOSED PARKING:



PROPOSED STANDARD SPACES	48
PROPOSED HANDICAP SPACES	4
TOTAL PARKING PROPOSED	**52**

REQUIRED BICYCLE PARKING:

5% OF REQUIRED MOTOR VEHICLE SPACES

PROPOSED BICYCLE PARKING:

PROPOSED SHORT-TERM SPACES	3
PROPOSED LONG-TERM SPACES	3
TOTAL BICYCLE SPACES	**6**

PROJECT DESCRIPTION

PROJECT #: PROJ25-0178

1. NEW FREESTANDING SKILLED NURSING FACILITY BUILDING ADDITION WITH 43 BEDS - 23 ROOMS WHEREIN MENTAL HEALTH PATIENTS ARE RESTRAINED AND DESIGNED WITH CONTROLLED EGRESS AT BUILDING EXITS AND DELAYED EGRESS AT EXTERIOR GATES.
2. INTERIOR REMODEL TO EXISTING SKILLED NURSING FACILITY
3. INTERIOR REMODEL TO EXISTING BUILDING FOR NEW 16-BED PSYCHIATRIC HEALTH FACILITY

→→→→→→→→→→ ACCESSIBLE PATH OF TRAVEL

KEYNOTES

1	PROPERTY LINE
2	LANDSCAPING
3	EXISTING LANDSCAPING TO REMAIN
4	CONCRETE WALKWAY, TYP.
5	TRASH ENCLOSURE PER 17.305.130 WITH ADJACENT CAN WASH AREA
6	10' X 25' LOADING SPACE
7	GREASE INTERCEPTOR
8	ELECTRICAL SERVICE YARD
9	12'-0" W, X 7'-0" H. MANUAL VEHICULAR GATES WITH HEAVY DUTY HINGES, FOR FIRE LANE ACCESS ONLY
10	4'-0" W, GATE TO MATCH EXISTING GATES, WITH PANIC HARDWARE AND CONTROLLED EGRESS
11	EXISTING 7'-0" H. VINYL FENCE WITH STEEL FRAMES AT VEHICULAR GATES
12	EXISTING 4'-0" W. GATE TO REMAIN
13	EXISTING 7'-0" H. CMU WALL TO REMAIN
14	EXISTING PORTE COCHERE WITH 5'-0" X 20'-0" MINIMUM PASSENGER DROP OFF AND LOADING ZONE
15	6" CONCRETE CURB
16	3 SPACE BICYCLE RACK PARKING
17	3 BAY BICYCLE LOCKERS
18	KNOX BOX
19	ASPHALT CONCRETE PAVING
20	EMERGENCY GENERATOR ON 8" CONCRETE PAD
21	EXISTING 7'-0" H. CHAINLINK FENCE WITH VINYL SLATS TO REMAIN
22	7'-0" H. CHAINLINK FENCE
23	EXISTING CONCRETE FLATWORK TO REMAIN
24	PERVIOUS SURFACE FIRE ACCESS LANE TO BE DESIGNED AND CONSTRUCTED TO MEET OFM-01A REQUIREMENTS
25	FIRE HYDRANT
26	FIRE P.I.V. AND DCDA (BACKFLOW PREVENTOR)
27	EXISTING RISER

Resumes

Travis J. McGill

Biologist/Regulatory Specialist

Years of Experience: 18

Education

B.S., 2006, Biology, University of California at San Diego

Certifications

Certificate, 2012, Field Ornithology, University of California at Riverside, University Extension

Certificate, 2012, Wetland Delineation, Wetland Training Institute

Certificate, 2014, Certified California Rapid Assessment Method (CRAM) Practitioner, Riverine and Depressional Wetlands

Certificate, 2014, GIS and Spatial Analyst, California State University at Fullerton

Certificate Botany, 2015, University of California at Riverside, University Extension

Additional Training

Southwestern Willow Flycatcher Survey Training Workshop, Southern Sierra Research Station, 2014

Learning California Bird Sounds, Sea and Sage Audubon Society – Sylvia Gallagher, 2012

Introduction to Desert Tortoise Surveying, Monitoring, and Handling Techniques Workshop, Desert Tortoise Council, 2011

Skills and Specialties

General and Focused Habitat Assessments
Focused Sensitive Plant and Wildlife Surveys
Avian Surveys and Monitoring
Wetland and Stream Delineations
Regulatory Permit Processing
Mitigation Implementation
Endangered Species Permits

Mr. Travis McGill specializes in conducting due diligence surveys, habitat assessments, preparing biological technical reports, botanical surveys, protocol listed species surveys, and assisting with environmental permitting and compliance for both public and private sector clients. He assists clients in compliance with a range of environmental regulations, including the California Environmental Quality, National Environmental Policy Act, and State and Federal Endangered Species Acts. He also has experience preparing and processing federal and State Incidental Take Permits through the United States Fish and Wildlife Service (Section 7 and Section 10 of the Federal Endangered Species Act) and California Department of Fish and Game (Section 2080.1, 2081, subds. (b}{c) of the Fish and Game Code).

Mr. McGill conducts delineations of state and federal jurisdictional waters and helps clients through the regulatory permit process pursuant to Sections 404 and 401 of the Clean Water Act, the California Porter-Cologne Water Quality Control Act, and Section 1602 et. seq. of the California Fish and Game Code. Mr. McGill has effectively drafted and processed numerous state and federal regulatory applications for residential, restoration, commercial, flood control, institutional, and transportation projects. Mr. McGill also performs California Rapid Assessment Method analyses on riverine and depressioanl areas to identify the functionality of a drainage system.

Mr. McGill also prepares and conducts Worker Education Training programs, biological monitoring, and nesting bird and burrowing owl clearance surveys in compliance with the federal Migratory Bird Treaty Act and California Fish and Game Code Section 3503, 3503.5, and 3513.

Project Experience

Salt Creek Trail Project, Cities of Menifee and Hemet, California. *County of Riverside Transportation Department.* Biologist/ Regulatory Specialist. The County proposes to construct and operate two (2) segments of the Salt Creek Trail, which will contribute to the County's ultimate goal for an approximately 16-mile-long multi-use trail connecting the cities of Hemet and Menifee. The Project offers an alternative to gasoline-powered vehicle trips, which is key to achieving state and local air quality objectives. Mr. McGill prepared the Caltrans

Natural Environment Study, jurisdictional delineation, sensitive plant survey, Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) consistency analysis, Determination of Biologically Equivalent or Superior Preservation (DBESP), and regulatory permits for the project. In addition, Mr. McGill attended several of the Western Riverside County Regional Conservation Authority (RCA) pre-application meetings to ensure project consistency with the MSHCP and negotiate the mitigation requirements for impacts to jurisdictional waters. Based on negotiations with the RCA and regulatory agencies, Mr. McGill prepared a Habitat Mitigation Monitoring and Reporting Plan to satisfy the mitigation requirements for the project.

Interstate 10/Avenue 50 Interchange Project, City Coachella, California. *City of Coachella*. Biologist/Regulatory Specialist. The project includes the construction of a new interchange at Interstate 10 (I-10) and Avenue 50, from PM R62.3 to R63.7, within the limits of the City of Coachella (City) in the County of Riverside. The proposed interchange is located approximately 3.4 miles east of the existing I-10/Dillon Road interchange (PM 58.9) and approximately 12.7 miles west of the existing I-10/Aqueduct Wash interchange (PM 75.0). Within the limits of the project, I-10 is a four-lane freeway with a median running down the center and no High Occupancy Vehicle (HOV) facilities. Mr. McGill conducted and prepared the delineation of State and federal jurisdictional waters report and tow Caltrans Natural Environment Study-Minimal Impact (NES-MI) reports for the Aerially Deposited Lead and Geotechnical Borings portions of the project. The NES-MI reports included a Coachella Valley MSHCP Consistency Analysis to demonstrate the projects consistency with the Coachella Valley MSHCP. Mr. McGill successfully delineated the jurisdictional boundaries of the drainage features on-site and documented the biological resources occurring within the Biological Study Area. As part of the NES-MI report, Mr. McGill helped prepare a project impact analysis that included quantifying project impacts and outlining a permitting strategy for impacts to jurisdictional waters. Mr. McGill successfully processed and obtained the Approved Jurisdictional Determination through the U.S. Army Corps of Engineers documenting that the drainage features on-site did not qualify as "Waters of the U.S".

Date Palm Drive Bridge over Whitewater River Cathedral City, California. *City of Cathedral City*. Biologist/Regulatory Specialist. The project included the widening of Date Palm Drive from four to six lanes adding sidewalks, bicycle lanes, and a central median. Mr. McGill conducted and helped prepare the delineation of State and federal jurisdictional waters report and Caltrans Natural Environment Study-Minimal Impact (NES-MI) for the project, which included a Coachella Valley MSHCP Consistency Analysis. Mr. McGill successfully delineated the jurisdictional boundaries of the Whitewater River and documented the biological resources occurring within the Biological Study Area. As part of the NES-MI report, Mr. McGill helped prepare a project impact analysis that included quantifying project impacts and outlining a permitting strategy for impacts to jurisdictional waters. Mr. McGill helped draft the resource agency permits through the California Department of Fish and Wildlife (Section 1602 Streambed Alteration Agreement), the Regional Water Quality Control Board (Section 401 Water Quality Certification), and the U.S. Army Corps of Engineers (Section 404 Nationwide Permit) for impacts occurring within the Whitewater River.

Sycamore Canyon Business Park Project, City of Riverside, California. *Hillwood Investment Properties.* Biologist/ Regulatory Specialist. The project would include the construction of two commercial warehouse buildings and associated infrastructure. In addition, multiple detention basins would be construction along the perimeter of the project site to treat surface runoff prior to being discharges off-site. Mr. McGill helped prepare the Delineation of State and Federal Jurisdictional Waters Report and Least Bell's Vireo focused survey reports for the project and assisted with the negotiation efforts with the U.S. Army Corps of Engineers, Regional Water Quality Control Board, and California Department of Fish and Wildlife for impacts to on-site jurisdictional features.

Bautista Recharge Basin Expansion Project, Riverside County, California. *Riverside County Flood Control and Water Conservation District*. Biologist/Regulatory Specialist. The District, in partnership with the Lake

Hemet Municipal Water District (LHMWD), proposed to design, construct, operate and maintain the Bautista Recharge Basin Expansion Project as part of an effort to fulfill the District's ongoing goal to promote water conservation and recharge. The recharge project was designed to promote infiltration and increase recharge in the Hemet-San Jacinto Valley groundwater basin areas. Mr. McGill prepared the habitat assessment, jurisdictional delineation, Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) consistency analysis, and Public/Quasi-Public Land Equivalency Analysis for the project.

Renaissance Specific Plan Burrowing Owl Relocation Plan, Rialto, California. *Lewis-Hillwood Rialto Company.* Biologist. The Renaissance Specific Plan was adopted by the City of Rialto in 1997 to provide a long-term strategy for the development of the Rialto Municipal Airport and surrounding area. Currently, Lewis – Hillwood Rialto Company, LLC owns or has an option to buy several of the properties within Renaissance Specific Plan Area. The proposed project included the development of a Town Center, residential housing ranging from low density to high density, a school, public park, a business center, and corporate center. Mr. McGill lead the biological studies for the project which include a general habitat assessment, focused burrowing owl survey, special-status plant suitability assessment, jurisdictional delineation and regulatory permitting. Several burrowing owl were found on the project site during the focused surveys, and Mr. McGill helped prepare a relocation plan that outlined the recommended methods proposed to relocate burrowing owls from the project site and provided measures that would be implemented for the maintenance, monitoring, and reporting of the relocated burrowing owls to increase chances of survivorship and ensure compliance with CDFW guidelines. Once the plan was approved by CDFW, Mr. McGill assisted the San Diego Zoo in the active relocation of the burrowing owls from the project site. The burrowing owls found within the project site were captured and actively relocated to a conservation site within the boundaries of the Western Riverside County MSHCP.

Date Palm Drive Bridge over Whitewater River, Cathedral City, California. *City of Cathedral City*. Biologist/Regulatory Specialist. The project included the widening of Date Palm Drive from four to six lanes adding sidewalks, bicycle lanes, and a central median. Mr. McGill conducted and helped prepare the delineation of State and federal jurisdictional waters report and Caltrans Natural Environment Study-Minimal Impact (NES-MI) for the project, which included a Coachella Valley MSHCP Consistency Analysis. Mr. McGill successfully delineated the jurisdictional boundaries of the Whitewater River and documented the biological resources occurring within the Biological Study Area. As part of the NES-MI report, Mr. McGill helped prepare a project impact analysis that included quantifying project impacts and outlining a permitting strategy for impacts to jurisdictional waters. Mr. McGill helped draft the resource agency permits through the California Department of Fish and Wildlife (Section 1602 Streambed Alteration Agreement), the Regional Water Quality Control Board (Section 401 Water Quality Certification), and the U.S. Army Corps of Engineers (Section 404 Nationwide Permit) for impacts occurring within the Whitewater River.

Andrew Mestas

Associated Biologist

Years of Experience: 3

Education

B.S., 2024, Biological Science, California State University, Fullerton

Research Assistant

Assisted in identifying Washington vascular and non-vascular plants, including special-status species such as the Wenatchee Mountains Checker-mallow (*Sidalcea oregana var. calva*), a federally endangered species.

Assisted in a field survey in the Gifford Pinchot National Forest, focusing on the Indian Heaven Wilderness area which included bryophyte collection of approximately 2000 specimens, herbarium preparation, and use of GPS and digital data collection tools

Additional Training

Introduction to Desert Tortoise Surveying, Monitoring, and Handling Techniques Workshop, Desert Tortoise Council, 2025

Skills and Specialties

General and Focused Habitat Assessments
Focused Sensitive Plant Surveys
Avian Surveys and Monitoring

Mr. Andrew Mestas is a biologist with three years of experience conducting habitat assessments, jurisdictional delineations, and protocol-level surveys for special-status species across southern California. His field experience includes Burrowing Owl focused surveys, Desert Tortoise surveys, and participation in Western Joshua Tree Incidental Take Permit census and processing efforts. Mr. Mestas has prepared and contributed to technical biological reports, Restoration Monitoring Plans, and MSHCP Consistency Analyses for projects subject to Habitat Conservation Plans such as the Western Riverside County MSHCP. He is proficient in the use of BIOS and CNDDB for species occurrence data review and analysis. Mr. Mestas is skilled in identifying regional flora, fauna, and plant communities, and has practical experience in plant cultivation in an academic setting.

Project Experience

Cook Street Hospital District Specific Plan, Palm Desert, Riverside County – Meridian Consultants, LLC. The project involves development of a core hospital and medical center complemented by supporting facilities, including a hotel to accommodate patient families, senior and assisted living residences, and high-density workforce housing for medical, hospitality, and retail employees. Mr. Mestas conducted focused surveys for Burrowing Owl and participated in field investigations to assess potential biological resources within the project area.

Palm Villas, Jurupa Valley, Riverside County – Mckenna Lanier Group. The project involves construction of the Palm Villas at Rancho Jurupa, an affordable housing community totaling 182 dwelling units on approximately 8.3 acres. Mr. Mestas conducted focused surveys for Burrowing Owl and prepared the report documenting survey results and existing site conditions.

Skyline Village, City of Corona, Riverside County – KWC Engineers. The project involves the development of 39 one-bedroom condominiums, 39 three-bedroom townhomes, and a 25,900-square-foot commercial space with restaurant, retail, and office uses. Mr. Mestas conducted the habitat assessment, MSHCP consistency analysis, and jurisdictional delineation and contributed to the preparation of the project's technical reports.

Baxter Iron Mine Desert Native Plant Survey, San Bernardino County – CalPortland. The project involves expanding existing mining operations—occurring on 49 acres—onto an additional 69 acres (increasing the mined footprint to 118 acres) within an approximately 280-acre site immediately south and

east of the current quarry. Mr. Mestas performed a Desert Native Plant Survey to identify cacti and other plant species protected by the San Bernardino County Desert Native Plant Ordinance, precisely GPS-tagging and georeferencing each individual and assembling relocation maps and supporting documentation to enable timely, compliant transplanting prior to project implementation.

Cajon Creek Conservation Area SBKR Study, San Bernardino County – Vulcan Materials Company. Mr. Mestas assisted in the collection of field data for the San Bernardino Kangaroo Rat (SBKR) Habitat Suitability Assessments within 23 designated plots of the Cajon Creek Conservation Area. Data collection included evaluating soil texture and compaction using penetrometers, characterizing surface soil composition, classifying vegetation communities, estimating percent cover for multiple vegetation and substrate categories, identifying dominant plant species, and recording evidence of disturbance, road types, and rodent activity levels. Collected data were used to assess habitat conditions influencing SBKR occupancy and to support long-term monitoring and management efforts conducted in coordination with USFWS, CDFW, and USGS.

10th St Palmdale, Palmdale, Los Angeles County. The project involves construction of an 823,516-square-foot warehouse and distribution facility on approximately 40 acres. Mr. Mestas conducted field investigations, a Western Joshua Tree inventory (census), and contributed to the Incidental Take Permit (ITP) processing and preparation of technical biological reports. He is scheduled to conduct protocol-level focused surveys for Burrowing Owl and presence/absence surveys for Desert Tortoise during the upcoming survey season.

Mission College Athletic Field, Sylmar, City of Los Angeles – Meridian Consultants. The project involves the development of new athletic facilities at Los Angeles Mission College, including a multi-purpose field with track, a new softball field, six tennis courts, restroom and concession buildings, associated parking areas, and renovation of an existing baseball field. Mr. Mestas participated in field investigations to assess biological resources within the project site, mapped jurisdictional aquatic features, and documented the presence of the special-status species Least Bell's Vireo. He also contributed to the preparation of technical biological reports and evaluated applicable city ordinances relevant to the project.

Johnson Road Warehouse Project, Palmdale, Los Angeles County – Palmdale Industrial Partners, LLC. The project involves construction of a new 823,516-square-foot warehouse and distribution facility on approximately 40.18 acres. Mr. Mestas conducted the field investigation, Western Joshua tree Inventory (census), and contributed to the ITP processing and technical reports. Mr. Mestas will conduct protocol-level focused surveys for burrowing owl as well as a presence/absence desert tortoise survey for this project in the upcoming appropriate season.

Central Basin MWD Prop 1, Los Angeles County – Tom Dodson & Associates. The project proposed installation of new recycled water pipelines to connect seven public sites in disadvantaged communities to the Central Basin Municipal Water District's existing recycled water transmission system. The Proposition 1 Recycled Water Customer Conversion Project aims to conserve potable water by converting irrigation systems at these sites to recycled water use. Mr. Mestas conducted field investigations for each of the seven subareas and prepared the Biological Resources Report documenting existing habitat conditions, potential impacts, and applicable regulatory considerations for the project.

Table 4.1–1 Cultural Resources Recorded Within One Mile of the Project 4.0–1

1.0 MANAGEMENT SUMMARY/ABSTRACT

The following report describes the results of the cultural resources survey conducted by BFSA Environmental Services, a Perennial Company (BFSA), for the Bradley Gardens Project. The study includes 2.98 acres (Assessor's Parcel Number [APN] 435-330-003) and is located at 980 West Seventh Street, southeast of the intersection of West Seventh Street and South Grand Avenue, in the city of San Jacinto, Riverside County, California. The project is situated within the unsectioned former San Jacinto Viejo Land Grant, Township 4 South, Range 1 West (projected), of the San Bernardino Base and Meridian, as shown on the United States Geological Survey (USGS) *San Jacinto, California* (7.5-minute) quadrangle map. The applicant proposes removal and/or modifications to the existing buildings within the parcel and the construction of a new care building with associated hardscape, landscape, and infrastructure. BFSA conducted this assessment to determine if any cultural resources would be affected by the proposed land development.

1.1 Purpose of Investigation

The purpose of this investigation was to locate and record any cultural resources present within the project and subsequently evaluate those resources as part of the City of San Jacinto's environmental review process conducted in compliance with the California Environmental Quality Act (CEQA). The archaeological investigation of the project included the review of an archaeological records search from the South Coastal Information Center (SCIC) at San Diego State University (SDSU) in order to assess previous archaeological studies and identify any previously recorded archaeological sites within the project boundaries or in the immediate vicinity. A review of the records search results indicates that 59 resources have been recorded within one mile of the property, none of which are recorded within the project. The records search also indicates that 40 previous studies have been conducted within one mile of the property, none of which include the subject property. BFSA also requested a Sacred Lands File (SLF) review by the Native American Heritage Commission (NAHC), which was returned with positive results.

1.2 Major Findings

A review of historic maps and aerial photographs indicates the project was utilized for agricultural purposes by 1953. In 1964, a main care center building and a storage building were constructed as part of the Colonial Nursing Home (Colonial Convalescent Hospital) (now the Bradley Gardens care facility), and in 1971, two medical office buildings were constructed. Various improvements were made to the property from the mid-1960s to 2026, including building expansions, the construction and infilling of a pool, landscaping, and paved parking.

The archaeological survey of the Bradley Gardens Project was conducted on February 6, 2026. During the survey, ground visibility was characterized as poor given the current built environment. No historic or prehistoric archaeological resources were identified anywhere within the project. However, the four buildings that characterize the project's built environment were

reviewed and determined to meet the minimum age threshold to be considered historic according to CEQA criteria. As the buildings reflect the same use of and period of development, they were recorded collectively as Site Temp-1. Given the presence of Site Temp-1 within the project, a historic structure assessment was conducted. The assessment, which included a review of archival records and in-depth analysis of Site Temp-1, found that none of the buildings associated with the site are eligible for the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR).

1.3 Recommendation Summary

The cultural resources assessment for the Bradley Gardens Project resulted in the identification of one historic resource, Site Temp-1. The resource is comprised of four buildings constructed between 1964 and 1971. No prehistoric or historic archaeological resourses were identified during the survey. Given the age of the buildings identified, a historic structure assessment was conducted to evaluate the potential impacts of the proposed project upon significant resources within the property. The assessment revealed that Site Temp-1 is not considered a significant resources according to NRHP or CEQA criteria and, as such, no impacts to significant resources are associated with the proposed development.

Although Site Temp-1 was evaluated as not significant, the potential exists that unidentified significant historic deposits may be present that are related to the occupation of this location since the 1960s. Further, the current built environment masked the existing ground surface, limiting the ability to identify archaeological resources. Because of the potential to encounter buried cultural deposits, monitoring of grading by a qualified archaeologist is recommended. Should potentially significant cultural deposits be discovered, mitigation measures will be implemented to reduce the effects of the grading impacts. As part of this study, a copy of this report will be submitted to the SCIC at SDSU.

2.0 INTRODUCTION

BFSA was retained by the applicant to conduct a cultural resources survey for the Bradley Gardens Project, which proposes to develop 2.98 acres at 980 West Seventh Street, southeast of the intersection of West Seventh Street and South Grand Avenue, in the city of San Jacinto, Riverside County, California (Figure 2.0–1). The project (APN 435-330-003) is situated within the unsectioned former San Jacinto Viejo Land Grant, Township 4 South, Range 1 West (projected), of the San Bernardino Base and Meridian, as shown on the USGS *San Jacinto, California* quadrangle map (Figure 2.0–2). Currently, four historic-age buildings associated with the Bradley Gardens care facility are present on the property. These buildings include the main care center building, one storage building, and two medical office buildings. As designed, the proposed project includes removal and/or modifications to the existing buildings within the parcel for the construction of a new care building along with associated hardscape, and infrastructure (Figure 2.0–3).

Principal Investigator Tracy A. Stropes, M.A., RPA, directed the cultural resources study for the project with assistance from BFSA archaeologist Reina Inlow. The pedestrian survey of the project was conducted on February 6, 2026. The survey was completed by traversing the property in transects spaced at approximately 15-meter intervals when not hindered by the present development. During the survey, it was noted that the entire project has been previously developed for the current Bradley Gardens care facility beginning in the 1960s. Kathleen A. Krogh, M.A., RPA, Alec M. Whitson, M.A., and Tracy A. Stropes, M.A., RPA, prepared the report. Jillian Conroy created the report graphics and Elena Goralogia conducted technical editing and report production. Qualifications of key personnel are provided in Appendix A.

2.1 Previous Work

The archaeological records search for the property identified 59 cultural resources within one mile of the project, none of which are within the subject property. The records search also identified 40 previous cultural resource studies that have been conducted within one mile of the subject property, none of which include the subject property.

2.2 Project Setting

Riverside County lies in the Peninsular Ranges Geologic Province of southern California. The mountain range, which lies in a northwest to southeast trend through the county, extends around 1,000 miles from the Raymond-Malibu Fault Zone in western Los Angeles County to the southern tip of Baja California. Regionally, the project lies within the San Jacinto Valley, east of the Lakeview Mountains. The surficial geology at the project is mapped as Holocene- and late Pleistocene-aged young alluvial valley deposits (Lancaster et al. 2012). These deposits are characterized as clay, silt, sand, and gravel along stream valleys and alluvial flats of larger rivers (Wirths 2026). The specific soils found on the property consist of Grangeville sandy loam, sandy substratum, drained, 0 to 5 percent slopes (GrB), and Grangeville fine sandy loam, saline-alkali, 0 to 5 percent slopes (GvB) (NRCS 2019). The subject property is relatively flat with an average elevation of approximately 1,526 feet above mean sea level (AMSL). The closest major natural source of water is the San Jacinto River approximately 2.3 miles to the northeast.

The majority of the subject property is currently developed with four buildings associated with the Bradley Gardens care facility and associated hardscape, landscape, and infrastructure. Vegetation within the property primarily consists of grass lawns and commercial landscaping. Historically, the region surrounding the property has been utilized for agriculture and rural residential neighborhoods until transitioning into a medium-density residential community. However, the project vicinity would have originally contained sage and chapparal plant communities. During the prehistoric period, vegetation in the area provided sufficient food resources to support prehistoric human occupants.

Animals that inhabited the project during prehistoric times included mammals such as rabbits, squirrels, gophers, mice, rats, deer, and coyotes, in addition to a variety of reptiles and amphibians. The natural setting of the project during the prehistoric occupation offered a rich nutritional resource base. Fresh water could have been obtained from the San Jacinto River. Historically, the project was utilized for agriculture and the property contained similar plant and animal species as are present today.

2.3 Cultural Setting – Archaeological Perspectives

The archaeological perspective seeks to reconstruct past cultures based upon the material remains left behind. This is done using a range of scientific methodologies, almost all of which draw from evolutionary theory as the base framework. Archaeology provides a deeper look into history or prehistory to see where the beginnings of ideas manifest via analysis of material culture, which in turn allows for the understanding of outside forces that shape social change. Thus, the archaeological perspective allows for a better understanding of the consequences of the history of a given culture upon modern cultures. Archaeologists seek to understand the effects of past contexts of a given culture on this moment in time, not culture in context *in* the moment.

Despite this, a distinction exists between "emic" and "etic" ways of understanding material culture, prehistoric lifeways, and cultural phenomena in general (Harris 1991). While "emic" perspectives serve the subjective ways in which things are perceived and interpreted by the participants within a culture, "etic" perspectives are those of an outsider looking in in the hopes of attaining a more scientific or "objective" understanding of the given phenomena. Archaeologists, by definition, will almost always serve an etic perspective as a result of the very nature of their work. As indicated by Laylander et al. (2014), it has sometimes been suggested that etic understanding, and therefore an archaeological understanding, is an imperfect and potentially ethnocentric attempt to arrive at emic understanding. In contrast to this, however, an etic understanding of material culture, cultural phenomena, and prehistoric lifeways can address significant dimensions of culture that lie entirely beyond the understanding or interest of those solely utilizing an emic perspective. As Harris (1991:20) appropriately points out, "Etic studies often involve the measurement and juxtaposition of activities and events that native informants find inappropriate or meaningless." This is also likely true of archaeological comparisons and juxtapositions of material culture. However, culture as a whole does not occur in a vacuum and is the result of several millennia of choices and consequences influencing everything from technology, to religions, to institutions. Archaeology allows for the ability to not only see what came before, but to see how those choices, changes, and consequences affect the present. Where possible, archaeology should seek to address both emic and etic understandings to the extent that they may be recoverable from the archaeological record as manifestations of patterned human behavior (Laylander et al. 2014).

To that point, the culture history offered herein is primarily based upon archaeological (etic) and ethnographic (partially emic and partially etic) information. It is understood that the ethnographic record and early archaeological records were incompletely and imperfectly collected. In addition, in most cases, more than a century of intensive cultural change and cultural evolution had elapsed since the terminus of the prehistoric period. Coupled with the centuries and millennia of prehistoric change separating the "ethnographic present" from the prehistoric past, this has affected the emic and etic understandings of prehistoric cultural settings. Regardless, there remains a need to present the changing cultural setting within the region under investigation. As a result, both archaeological and Native American perspectives are offered when possible.

2.3.1 Introduction

Paleo Indian, Archaic Period Milling Stone Horizon, and the Late Prehistoric Takic groups are the three general cultural periods represented in Riverside County. The following discussion of the cultural history of Riverside County references the San Dieguito Complex, Encinitas Tradition, Milling Stone Horizon, La Jolla Complex, Pauma Complex, and San Luis Rey Complex, since these culture sequences have been used to describe archaeological manifestations in the region. The Late Prehistoric component present in the Riverside County area was primarily represented by the Cahuilla, Gabrielino, and Luiseño Indians.

Absolute chronological information, where possible, will be incorporated into this archaeological discussion to examine the effectiveness of continuing to interchangeably use these terms. Reference will be made to the geological framework that divides the archaeologically-based culture chronology of the area into four segments: the late Pleistocene (20,000 to 10,000 years before the present [YBP]), the early Holocene (10,000 to 6,650 YBP), the middle Holocene (6,650 to 3,350 YBP), and the late Holocene (3,350 to 200 YBP).

2.3.2 Paleo Indian Period (Late Pleistocene: 11,500 to circa 9,000 YBP)

Archaeologically, the Paleo Indian Period is associated with the terminus of the late Pleistocene (12,000 to 10,000 YBP). The environment during the late Pleistocene was cool and moist, which allowed for glaciation in the mountains and the formation of deep, pluvial lakes in the deserts and basin lands (Moratto 1984). By the terminus of the late Pleistocene, the climate became warmer, which caused the glaciers to melt, sea levels to rise, greater coastal erosion, large lakes to recede and evaporate, extinction of Pleistocene megafauna, and major vegetation changes (Moratto 1984; Martin 1967, 1973; Fagan 1991). The coastal shoreline at 10,000 YBP, depending upon the particular area of the coast, was near the 30-meter isobath, or two to six kilometers further west than its present location (Masters 1983).

Paleo Indians were likely attracted to multiple habitat types, including mountains, marshlands, estuaries, and lakeshores. These people likely subsisted using a more generalized hunting, gathering, and collecting adaptation utilizing a variety of resources including birds, mollusks, and both large and small mammals (Erlandson and Colten 1991; Moratto 1984; Moss and Erlandson 1995).

2.3.3 Archaic Period (Early and Middle Holocene: circa 9,000 to 1,300 YBP)

Archaeological data indicates that between 9,000 and 8,000 YBP, a widespread complex was established in the southern California region, primarily along the coast (Warren and True 1961). This complex is locally known as the La Jolla Complex (Rogers 1939; Moriarty 1966), which is regionally associated with the Encinitas Tradition (Warren 1968) and shares cultural components with the widespread Milling Stone Horizon (Wallace 1955). The coastal expression of this complex appeared in southern California coastal areas and focused upon coastal resources and the development of deeply stratified shell middens that were primarily located around bays and lagoons. The older sites associated with this expression are located at Topanga Canyon, Newport Bay, Agua Hedionda Lagoon, and some of the Channel Islands. Radiocarbon dates from sites attributed to this complex span a period of over 7,000 years in this region, beginning over 9,000 YBP.

The Encinitas Tradition is best recognized for its pattern of large coastal sites characterized by shell middens, grinding tools that are closely associated with the marine resources of the area, cobble-based tools, and flexed human burials (Shumway et al. 1961; Smith and Moriarty 1985). While ground stone tools and scrapers are the most recognized tool types, coastal Encinitas Tradition sites also contain numerous utilized flakes, which may have been used to pry open

shellfish. Artifact assemblages at coastal sites indicate a subsistence pattern focused upon shellfish collection and nearshore fishing. This suggests an incipient maritime adaptation with regional similarities to more northern sites of the same period (Koerper et al. 1986). Other artifacts associated with Encinitas Tradition sites include stone bowls, doughnut stones, discoidals, stone balls, and beads made from stone, bone, and shell.

The coastal lagoons in southern California supported large Milling Stone Horizon populations circa 6,000 YBP, as shown by numerous radiocarbon dates from the many sites adjacent to the lagoons. The ensuing millennia were not stable environmentally and, by 3,000 YBP, many of the coastal sites in central San Diego County had been abandoned (Gallegos 1987, 1992). The abandonment of the area is usually attributed to the sedimentation of coastal lagoons and the resulting deterioration of fish and mollusk habitat. This is a well-documented situation at Batiquitos Lagoon, where over a 2,000-year period, dominant mollusk species occurring in archaeological middens shift from deep-water mollusks (*Argopecten* sp.) to species tolerant of tidal flat conditions (*Chione* sp.), indicating changes in both water depth and temperature (Miller 1966; Gallegos 1987).

This situation likely occurred for other small drainages (Buena Vista, Agua Hedionda, San Marcos, and Escondido creeks) along the central San Diego coast where low flow rates did not produce sufficient discharge to flush the lagoons they fed (Buena Vista, Agua Hedionda, Batiquitos, and San Elijo lagoons) (Byrd 1998). Drainages along the northern and southern San Diego coastline were larger and flushed the coastal hydrological features they fed, keeping them open to the ocean and allowing for continued human exploitation (Byrd 1998). Peñasquitos Lagoon exhibits dates as late as 2,355 YBP (Smith and Moriarty 1985) and San Diego Bay showed continuous occupation until the close of the Milling Stone Horizon (Gallegos and Kyle 1988). Additionally, data from several drainages in Marine Corps Base Camp Pendleton indicates a continued occupation of shell midden sites until the close of the period, which shows that coastal sites were not entirely abandoned during this time (Byrd 1998).

By 5,000 YBP, an inland expression of the La Jolla Complex is evident in the archaeological record, exhibiting influences from the Campbell Tradition from the north. These inland Milling Stone Horizon sites have been termed "Pauma Complex" (True 1958; Warren et al. 1961; Meighan 1954). Pauma Complex sites share a predominance of grinding implements (manos and metates), lack mollusk remains, have greater tool variety (including atlatl dart points, quarry-based tools, and crescentics), and seem to express a more sedentary lifestyle with a subsistence economy based upon the use of a broad variety of terrestrial resources. Although originally viewed as a separate culture from the coastal La Jolla Complex (True 1980), it appears that these inland sites may be part of a subsistence and settlement system utilized by the coastal peoples. Evidence from the 4S Ranch Project in inland San Diego County suggests that these inland sites may represent seasonal components within an annual subsistence round by La Jolla Complex populations (Raven-Jennings et al. 1996). Including both coastal and inland sites of this period in discussions of the Encinitas Tradition, therefore, provides a more complete appraisal of the settlement and subsistence system exhibited by this cultural complex.

More recent work by Sutton has identified a more localized complex known as the Greven Knoll Complex. The Greven Knoll Complex is a redefined northern inland expression of the Encinitas Tradition first put forth by Mark Sutton and Jill Gardner (2010). Sutton and Gardner (2010:25) state that "[t]he early millingstone archaeological record in the northern portion of the interior southern California was not formally named but was often referred to as 'Inland Millingstone,' 'Encinitas,' or even 'Topanga.'" Therefore, they proposed that all expressions of the inland Milling Stone in southern California north of San Diego County be grouped together in the Greven Knoll Complex.

The Greven Knoll Complex, as postulated by Sutton and Gardner (2010), is broken into three phases and obtained its name from the type-site Greven Knoll located in Yucaipa, California. Presently, the Greven Knoll Site is part of the Yukaipa't Site (SBR-1000) and was combined with the adjacent Simpson Site. Excavations at Greven Knoll recovered manos, metates, projectile points, discoidal cogged stones, and a flexed inhumation with a possible cremation (Kowta 1969:39). It is believed that the Greven Knoll Site was occupied between 5,000 and 3,500 YBP. The Simpson Site contained mortars, pestles, side-notched points, and stone and shell beads. Based upon the data recovered at these sites, Kowta (1969:39) suggested that "coastal Milling Stone Complexes extended to and interdigitated with the desert Pinto Basin Complex in the vicinity of the Cajon Pass."

Phase I of the Greven Knoll Complex is generally dominated by the presence of manos and metates, core tools, hammerstones, large dart points, flexed inhumations, and occasional cremations. Mortars and pestles are absent from this early phase, and the subsistence economy emphasized hunting. Sutton and Gardner (2010:26) propose that the similarity of the material culture of Greven Knoll Phase I and that found in the Mojave Desert at Pinto Period sites indicates that the Greven Knoll Complex was influenced by neighbors to the north at that time. Accordingly, Sutton and Gardner (2010) believe that Greven Knoll Phase I may have appeared as early as 9,400 YBP and lasted until about 4,000 YBP.

Greven Knoll Phase II is associated with a period between 4,000 and 3,000 YBP. Artifacts common to Greven Knoll Phase II include manos and metates, Elko points, core tools, and discoidals. Pestles and mortars are present; however, they are only represented in small numbers. Finally, there is an emphasis upon hunting and gathering for subsistence (Sutton and Gardner 2010:8).

Greven Knoll Phase III includes manos, metates, Elko points, scraper planes, choppers, hammerstones, and discoidals. Again, small numbers of mortars and pestles are present. Greven Knoll Phase III spans from approximately 3,000 to 1,000 YBP and shows a reliance upon seeds and yucca. Hunting is still important, but bones seem to have been processed to obtain bone grease more often in this later phase (Sutton and Gardner 2010:8).

The shifts in food processing technologies during each of these phases indicate a change in subsistence strategies; although people were still hunting for large game, plant-based foods eventually became the primary dietary resource (Sutton 2011a). Sutton's (2011b) argument posits that the development of mortars and pestles during the middle Holocene can be attributed to the

year-round exploitation of acorns as a main dietary provision. Additionally, the warmer and drier climate may have been responsible for groups from the east moving toward coastal populations, which is archaeologically represented by the interchange of coastal and eastern cultural traits (Sutton 2011a).

2.3.4 Late Prehistoric Period (Late Holocene: 1,300 YBP to 1790)

Many Luiseño hold the world view that, as a population, they were created in southern California. Archaeological and anthropological data, however, proposes a scientific archaeological perspective, suggesting that at approximately 1,350 YBP, Takic-speaking groups from the Great Basin region moved into Riverside County, marking the transition to the Late Prehistoric Period. An analysis of the Takic expansion by Sutton (2009) indicates that inland southern California was occupied by "proto-Yuman" populations before 1,000 YBP. The comprehensive, multiphase model offered by Sutton (2009) employs linguistic, ethnographic, archaeological, and biological data to solidify a reasonable argument for population replacement of Takic groups to the north by Penutians (Laylander 1985). As a result, it is believed that Takic expansion occurred starting around 3,500 YBP moving toward southern California, with the Gabrielino language diffusing south into neighboring Yuman (Hokan) groups around 1,500 to 1,000 YBP, possibly resulting in the Luiseño dialect.

Based upon Sutton's model, the final Takic expansion would not have occurred until about 1,000 YBP, resulting in the Vanyume, Serrano, Cahuilla, and Cupeño dialects. The model suggests that the Luiseño did not simply replace Hokan speakers, but were rather a northern San Diego County/southern Riverside County Yuman population who adopted the Takic language. This period is characterized by higher population densities and elaborations in social, political, and technological systems. Economic systems diversified and intensified during this period with the continued elaboration of trade networks, the use of shell-bead currency, and the appearance of more labor-intensive, yet effective, technological innovations. Technological developments during this period included the introduction of the bow and arrow between A.D. 400 and 600 and the introduction of ceramics. Atlatl dart points were replaced by smaller arrow darts, including Cottonwood series points. Other hallmarks of the Late Prehistoric Period include extensive trade networks as far-reaching as the Colorado River Basin, as well as the cremation of the dead.

2.3.5 Protohistoric Period (Late Holocene: 1790 to Present)

Ethnohistoric and ethnographic evidence indicates that portions of Riverside County were occupied by three Takic-speaking groups: the Cahuilla, the Gabrielino, and the Luiseño. The geographic boundaries between these groups in pre- and proto-historic times are difficult to place, but the project is located well within the borders of ethnographic Luiseño territory. This group was a seasonal hunting and gathering people with cultural elements that were very distinct from Archaic Period peoples. These distinctions include cremation of the dead, the use of the bow and arrow, and exploitation of the acorn as a main food staple (Moratto 1984). Along the coast, the Luiseño made use of available marine resources by fishing and collecting mollusks for food.

Seasonally available terrestrial resources, including acorns and game, were also sources of nourishment for Luiseño groups. Elaborate kinship and clan systems between the Luiseño and other groups facilitated a wide-reaching trade network that included trade of Obsidian Butte obsidian and other resources from the eastern deserts, as well as steatite from the Channel Islands.

According to Charles Handley (1967), the primary settlements of Late Prehistoric Luiseño Indians in the San Jacinto Plain were represented by Ivah and Soboba near Soboba Springs, Jusipah near the town of San Jacinto, Ararah in Webster's Canyon en route to Idyllwild, Pahsitha near Big Springs Ranch southeast of Hemet, and Corova in Castillo Canyon. These locations share features such as the availability of food and water resources. Features of this land use include petroglyphs and pictographs, as well as widespread milling, which is evident in both the bedrock and portable implements. Groups in the vicinity of the project, neighboring the Luiseño, include the Cahuilla and the Gabrielino. Ethnographic data for the three groups is presented below.

Luiseño: An Archaeological and Ethnographic Perspective

When contacted by the Spanish in the sixteenth century, the Luiseño occupied a territory bounded on the west by the Pacific Ocean, on the east by the Peninsular Ranges mountains at San Jacinto (including Palomar Mountain to the south and Santiago Peak to the north), on the south by Agua Hedionda Lagoon, and on the north by Aliso Creek in present-day San Juan Capistrano. The Luiseño were a Takic-speaking people more closely related linguistically and ethnographically to the Cahuilla, Gabrielino, and Cupeño to the north and east rather than the Kumeyaay who occupied territory to the south. The Luiseño differed from their neighboring Takic speakers in having an extensive proliferation of social statuses, a system of ruling families that provided ethnic cohesion within the territory, a distinct worldview that stemmed from the use of datura (a hallucinogen), and an elaborate religion that included the creation of sacred sand paintings depicting the deity Chingichngish (Bean and Shipek 1978; Kroeber 1976).

Subsistence and Settlement

The Luiseño occupied sedentary villages, most often located in sheltered areas in valley bottoms, along streams, or along coastal strands near mountain ranges. Villages were located near water sources to facilitate acorn leaching, as well as in areas that offered both thermal and defensive protection. Villages were comprised of areas that were both publicly and privately (by family) owned. Publicly owned areas included trails, temporary campsites, hunting areas, and quarry sites. Inland groups had fishing and gathering sites along the coast that were intensively used from January to March when inland food resources were scarce. During October and November, most of the village would relocate to mountain oak groves to harvest acorns. The Luiseño remained at village sites for the remainder of the year, where food resources were within a day's travel (Bean and Shipek 1978; Kroeber 1976).

The most important food source for the Luiseño was the acorn, six different species of which were used (*Quercus californica, Quercus agrifolia, Quercus chrysolepis, Quercus dumosa, Quercus engelmannii,* and *Quercus wislizenii*). Seeds, particularly those of grasses, flowering

plants, and mints, were also heavily exploited. Seed-bearing species were encouraged through controlled burns, which were conducted at least every third year. A variety of other stems, leaves, shoots, bulbs, roots, and fruits were also collected. Hunting augmented this vegetal diet. Animal species taken included deer, rabbit, hare, woodrat, ground squirrel, antelope, quail, duck, freshwater fish from mountain streams, marine mammals, and other sea creatures such as fish, crustaceans, and mollusks (particularly abalone, or *Haliotis* sp.). In addition, a variety of snakes, small birds, and rodents were also eaten (Bean and Shipek 1978; Kroeber 1976).

Social Organization

Social groups within the Luiseño nation consisted of patrilineal families or clans, which were politically and economically autonomous. Several clans comprised a religious party, or nota, which was headed by a chief who organized ceremonies and controlled economics and warfare. The chief had assistants who specialized in particular aspects of ceremonial or environmental knowledge and who, with the chief, were part of a religion-based social group with special access to supernatural power, particularly that of Chingichngish. The positions of chief and assistants were hereditary, and the complexity and multiplicity of these specialists' roles likely increased in the coastal and larger inland villages (Bean and Shipek 1978; Kroeber 1976; Strong 1929).

Marriages were arranged by the parents, often made to forge alliances between lineages. Useful alliances included those between groups of differing ecological niches and those that resulted in territorial expansion. Residence was patrilocal (Bean and Shipek 1978; Kroeber 1976). Women were primarily responsible for plant gathering and men principally hunted, but at times, particularly during acorn and marine mollusk harvests, there was no division of labor. Elderly women cared for children and elderly men participated in rituals, ceremonies, and political affairs. They were also responsible for manufacturing hunting and ritual implements. Children were taught subsistence skills at the earliest age possible (Bean and Shipek 1978; Kroeber 1976).

Material Culture

House structures were conical, partially subterranean, and thatched with reeds, brush, or bark. Ramadas were rectangular, protected workplaces for domestic chores such as cooking. Ceremonial sweathouses were important in purification rituals; these were round and partially subterranean thatched structures covered with a layer of mud. Another ceremonial structure was the wámkis (located in the center of the village, serving as the place of rituals), where sand paintings and other rituals associated with the Chingichngish religious group were performed (Bean and Shipek 1978; Kroeber 1976).

Clothing was minimal; women wore a cedar-bark and netted twine double apron and men wore a waist cord. In cold weather, cloaks or robes of rabbit fur, deerskin, or sea otter fur were worn by both sexes. Footwear included deerskin moccasins and sandals fashioned from yucca fibers. Adornments included bead necklaces and pendants made of bone, clay, stone, shell, bear claw, mica, deer hooves, and abalone shell. Men wore ear and nose piercings made from cane or bone, which were sometimes decorated with beads. Other adornments were commonly decorated

with semiprecious stones including quartz, topaz, garnet, opal, opalite, agate, and jasper (Bean and Shipek 1978; Kroeber 1976).

Hunting implements included the bow and arrow. Arrows were tipped with either a carved, fire-hardened wood tip or a lithic point, usually fashioned from locally available metavolcanic material or quartz. Throwing sticks fashioned from wood were used in hunting small game, while deer head decoys were used during deer hunts. Coastal groups fashioned dugout canoes for nearshore fishing and harvested fish with seines, nets, traps, and hooks made of bone or abalone shell (Bean and Shipek 1978; Kroeber 1976).

The Luiseño had a well-developed basket industry. Baskets were used in resource gathering, food preparation, storage, and food serving. Ceramic containers were shaped by paddle and anvil and fired in shallow, open pits to be used for food storage, cooking, and serving. Other utensils included wood implements, steatite bowls, and ground stone manos, metates, mortars, and pestles (Bean and Shipek 1978; Kroeber 1976). Additional tools such as knives, scrapers, choppers, awls, and drills were also used. Shamanistic items include soapstone or clay smoking pipes and crystals made of quartz or tourmaline (Bean and Shipek 1978; Kroeber 1976).

Cahuilla: An Archaeological and Ethnographic Perspective

At the time of Spanish contact in the sixteenth century, the Cahuilla occupied territory that included the San Bernardino Mountains, Orocopia Mountain, and the Chocolate Mountains to the west, Salton Sea and Borrego Springs to the south, Palomar Mountain and Lake Mathews to the east, and the Santa Ana River to the north. The Cahuilla are a Takic-speaking people closely related to their Gabrielino and Luiseño neighbors, although relations with the Gabrielino were more intense than those with the Luiseño. The Cahuilla differ from the Luiseño and Gabrielino in that their religion is more similar to the Mohave tribes of the eastern deserts than the Chingichngish religious group of the Luiseño and Gabrielino. The following is a summary of the ethnographic data regarding this group (Bean 1978; Kroeber 1976).

Subsistence and Settlement

Cahuilla villages were typically permanent and located on low terraces within canyons in proximity to water sources. These locations proved to be rich in food resources and also afforded protection from prevailing winds. Villages had areas that were publicly owned and areas that were privately owned by clans, families, or individuals. Each village was associated with a particular lineage and series of sacred sites that included unique petroglyphs and pictographs. Villages were occupied throughout the year; however, during a several-week period in the fall, most of the village members relocated to mountain oak groves to take part in acorn harvesting (Bean 1978; Kroeber 1976).

The Cahuilla's use of plant resources is well documented. Plant foods harvested by the Cahuilla included valley oak acorns and single-leaf pinyon pine nuts. Other important plant species included bean and screw mesquite, agave, Mojave yucca, cacti, palm, chia, quail brush, yellowray goldfield, goosefoot, manzanita, catsclaw, desert lily, mariposa lily, and other species

such as grass seed. A number of agricultural domesticates were acquired from the Colorado River tribes including corn, bean, squash, and melon grown in limited amounts. Animal species taken included deer, bighorn sheep, pronghorn antelope, rabbit, hare, rat, quail, dove, duck, roadrunner, and a variety of rodents, reptiles, fish, and insects (Bean 1978; Kroeber 1976).

Social Organization

The Cahuilla were not a political nation, but rather a cultural nationality with a common language. Two non-political, non-territorial patrimoieties were recognized: the Wildcats (túktem) and the Coyotes (?ístam). Lineage and kinship were memorized at a young age among the Cahuilla, providing a backdrop for political relationships. Clans were comprised of three to 10 lineages; each lineage owned a village site and specific resource areas. Lineages within a clan cooperated in subsistence activities, defense, and rituals (Bean 1978; Kroeber 1976).

A system of ceremonial hierarchy operated within each lineage. The hierarchy included the lineage leader, who was responsible for leading subsistence activities, guarding the sacred bundle, and negotiating with other lineage leaders in matters concerning land use, boundary disputes, marriage arrangements, trade, warfare, and ceremonies. The ceremonial assistant to the lineage leader was responsible for organizing ceremonies. A ceremonial singer possessed and performed songs at rituals and trained assistant singers. The shaman cured illnesses through supernatural powers, controlled natural phenomena, and was the guardian of ceremonies, meant to keep evil spirits away. The diviner was responsible for finding lost objects, telling future events, and locating game and other food resources. Doctors were usually older women who cured various ailments and illnesses with their knowledge of medicinal herbs. Finally, certain Cahuilla specialized as traders, who ranged as far west as Santa Catalina and as far east as the Gila River (Bean 1978; Kroeber 1976).

Marriages were arranged by parents from opposite moieties. When a child was born, an alliance formed between the families, which included frequent reciprocal exchanges. The Cahuilla kinship system extended to relatives within five generations. Important economic decisions, primarily the distribution of goods, operated within this kinship system (Bean 1978; Kroeber 1976).

Material Culture

Cahuilla houses were dome-shaped or rectangular, thatched structures. The home of the lineage leader was the largest, located near the ceremonial house with the best access to water. Other structures within the village included the men's sweathouse and granaries (Bean 1978; Kroeber 1976).

Cahuilla clothing, like other groups in the area, was minimal. Men typically wore a loincloth and sandals; women wore skirts made from mesquite bark, animal skin, or tules. Babies wore mesquite bark diapers. Rabbit skin cloaks were worn in cold weather (Bean 1978; Kroeber 1976).

Hunting implements included the bow and arrow, throwing sticks, and clubs. Grinding tools used in food processing included manos, metates, and wood mortars. The Cahuilla were known to use long grinding implements made from wood to process mesquite beans; the mortar was typically a hollowed log buried in the ground. Other tools included steatite arrow shaft straighteners (Bean 1978; Kroeber 1976).

Baskets were made from rush, deer grass, and skunkbush. Different species and leaves were chosen for different colors in the basket design. Coiled-ware baskets were either flat (for plates, trays, or winnowing), bowl-shaped (for food serving), deep, inverted, and cone-shaped (for transporting), or rounded and flat-bottomed for storing utensils and personal items (Bean 1978; Kroeber 1976).

Cahuilla pottery was made from thin, red-colored ceramic ware that was often painted and incised. Four basic vessel types are known for the Cahuilla: small-mouthed jars, cooking pots, bowls, and dishes. Additionally, smoking pipes and flutes were fashioned from ceramic (Bean 1978; Kroeber 1976).

Gabrielino: An Archaeological and Ethnographic Perspective

The territory of the Gabrielino at the time of Spanish contact covers much of present-day Los Angeles and Orange counties. The southern extent of this cultural area is bounded by Aliso Creek, the eastern extent is located east of present-day San Bernardino along the Santa Ana River, the northern extent includes the San Fernando Valley, and the western extent includes portions of the Santa Monica Mountains. The Gabrielino also occupied several Channel Islands including Santa Barbara Island, Santa Catalina Island, San Nicholas Island, and San Clemente Island. Due to their access to certain resources, including a steatite source from Santa Catalina Island, this group was among the wealthiest and most populous aboriginal groups in all of southern California. Trade of materials and resources controlled by the Gabrielino extended as far north as the San Joaquin Valley, as far east as the Colorado River, and as far south as Baja California (Bean and Smith 1978; Kroeber 1976).

Subsistence and Settlement

The Gabrielino lived in permanent villages and occupied smaller resource-gathering camps at various times of the year depending upon the seasonality of the resource. Larger villages were comprised of several families or clans, while smaller, seasonal camps typically housed smaller family units. The coastal area between San Pedro and Topanga Canyon was the location of primary subsistence villages, while secondary sites were located near inland sage stands, oak groves, and pine forests. Permanent villages were located along rivers and streams and in sheltered areas along the coast. As previously mentioned, the Channel Islands were also the locations of relatively large settlements (Bean and Smith 1978; Kroeber 1976).

Resources procured along the coast and on the islands were primarily marine in nature and included tuna, swordfish, ray and shark, California sea lion, Stellar sea lion, harbor seal, northern elephant seal, sea otter, dolphin and porpoise, various waterfowl species, numerous fish species,

purple sea urchin, and mollusks such as rock scallop, California mussel, and limpet. Inland resources included oak acorn, pine nut, Mojave yucca, cacti, sage, grass nut, deer, rabbit, hare, rodent, quail, duck, and a variety of reptiles such as western pond turtle and numerous snake species (Bean and Smith 1978; Kroeber 1976).

Social Organization

Little is known about the social structure of the Gabrielino; however, there appears to have been at least three social classes: 1) the elite, which included the rich, chiefs, and their immediate family; 2) a middle class, which included people of relatively high economic status or long-established lineages; and 3) a class of people that included most other individuals in the society. Villages were politically autonomous units comprised of several lineages. During times of the year when certain seasonal resources were available, the village would divide into lineage groups and move out to exploit them, returning to the village between forays (Bean and Smith 1978; Kroeber 1976).

Each lineage had its own leader, with the village chief coming from the dominant lineage. Several villages might be allied under a paramount chief. Chiefly positions were of an ascribed status, most often passed to the eldest son. Chiefly duties included providing village cohesion, leading warfare, and peace negotiations with other groups, collecting tribute from the village(s) under his jurisdiction, and arbitrating disputes within the village(s). The status of the chief was legitimized by his safekeeping of the sacred bundle, a representation of the link between the material and spiritual realms and the embodiment of power (Bean and Smith 1978; Kroeber 1976).

Shamans were leaders in the spirit realm and their duties included conducting healing and curing ceremonies, guarding the sacred bundle, locating lost items, identifying and collecting poisons for arrows, and making rain (Bean and Smith 1978; Kroeber 1976).

Marriages were made between individuals of equal social status, and in the case of powerful lineages, marriages were arranged to establish political ties between the lineages (Bean and Smith 1978; Kroeber 1976).

Men conducted the majority of the heavy labor, hunting, fishing, and trading with other groups. Women's duties included gathering and preparing plant and animal resources, as well as making baskets, pots, and clothing (Bean and Smith 1978; Kroeber 1976).

Material Culture

Gabrielino houses were domed, circular structures made of thatched vegetation. Houses varied in size and could house anywhere from one to several families. Sweathouses (semicircular, earth-covered buildings) were public structures used in male social ceremonies. Other structures included menstrual huts and a ceremonial structure called a yuvar which was an open-air structure built near the chief's house (Bean and Smith 1978; Kroeber 1976).

Clothing was minimal; men and children most often went naked, while women wore deerskin or bark aprons. In cold weather, deerskin, rabbit fur, or bird skin (with feathers intact) cloaks were worn. Island and coastal groups used sea otter fur for cloaks. In areas of rough terrain,

yucca fiber sandals were worn. Women often used red ochre on their faces and skin for adornment or protection from the sun. Adornment items included feathers, fur, shells, and beads (Bean and Smith 1978; Kroeber 1976).

Hunting implements included wood clubs, sinew-backed bows, slings, and throwing clubs. Maritime implements included rafts, harpoons, spears, hook and line, and nets. A variety of other tools included deer scapulae saws, bone and shell needles, bone awls, scrapers, bone or shell flakers, wedges, stone knives and drills, metates, mullers, manos, shell spoons, bark platters, and wood paddles and bowls. Baskets were made from rush, deer grass, and skunkbush. Baskets were fashioned for hoppers, plates, trays, and winnowers for leaching, straining, and gathering. Baskets were also used for storing, preparing, and serving food, and for keeping both personal and ceremonial items (Bean and Smith 1978; Kroeber 1976).

The Gabrielino had exclusive access to soapstone, or steatite, procured from Santa Catalina Island quarries. This highly prized material was used for making pipes, animal carvings, ritual objects, ornaments, and cooking utensils. The Gabrielino profited well from trading steatite since it was valued so much by groups throughout southern California (Bean and Smith 1978; Kroeber 1976).

2.3.6 Ethnohistoric Period (1769 to Present)

Traditionally, the history of the state of California has been divided into three general periods: the Spanish Period (1769 to 1821), the Mexican Period (1822 to 1846), and the American Period (1848 to present) (Caughey 1970). The American Period is often further subdivided into additional phases: the nineteenth century (1848 to 1900), the early twentieth century (1900 to 1950), and the Modern Period (1950 to present). From an archaeological standpoint, all of these phases can be referred to together as the Ethnohistoric Period. This provides a valuable tool for archaeologists, as ethnohistory is directly concerned with the study of indigenous or non-Western peoples from a combined historical/anthropological viewpoint, which employs written documents, oral narrative, material culture, and ethnographic data for analysis.

European exploration along the California coast began in 1542 with the landing of Juan Rodríguez Cabrillo and his men at San Diego Bay. Sixty years after the Cabrillo expeditions, an expedition under Sebastián Vizcaíno made an extensive and thorough exploration of the Pacific coast. Although the voyage did not extend beyond the northern limits of the Cabrillo track, Vizcaíno had the most lasting effect upon the nomenclature of the coast. Many of his place names have survived, whereas practically every one of the names created by Cabrillo have faded from use. For instance, Cabrillo named the first (now) United States port he stopped at “San Miguel”; 60 years later, Vizcaíno changed it to “San Diego” (Rolle 1969). The early European voyages observed Native Americans living in villages along the coast but did not make any substantial, long-lasting impact. At the time of contact, the Luiseño population was estimated to have ranged from 4,000 to as many as 10,000 individuals (Bean and Shipek 1978; Kroeber 1976).

The historic background of the project area began with the Spanish colonization of Alta California. The first Spanish colonizing expedition reached southern California in 1769 with the intention of converting and civilizing the indigenous populations, as well as expanding the knowledge of and access to new resources in the region (Brigandi 1998). As a result, by the late eighteenth century, a large portion of southern California was overseen by Mission San Luis Rey (San Diego County), Mission San Juan Capistrano (Orange County), and Mission San Gabriel (Los Angeles County), who began colonization in the region and surrounding areas (Chapman 1921).

Up until this time, the only known way to feasibly travel from Sonora to Alta California was by sea. In 1774, Juan Bautista de Anza, an army captain at Tubac, requested and was given permission by the governor of the Mexican State of Sonora to establish an overland route from Sonora to Monterey (Chapman 1921). In doing so, Juan Bautista de Anza passed through Riverside County and described the area in writing for the first time (Caughey 1970; Chapman 1921). In 1797, Father Fermín de Lasuén (of Mission San Diego de Alcalá), Father Norberto de Santiago, and Corporal Pedro Lisalde (of Mission San Juan Capistrano) led an expedition through southwestern Riverside County in search of a new mission site to establish a presence between San Diego and San Juan Capistrano (Engelhardt 1921). Their efforts ultimately resulted in the establishment of Mission San Luis Rey in Oceanside, California.

Each mission gained power through the support of a large, subjugated Native American workforce. As the missions grew, livestock holdings increased and became increasingly vulnerable to theft. In order to protect their interests, the southern California missions began to expand inland to try and provide additional security (Beattie and Beattie 1939; Caughey 1970). In order to meet their needs, the Spaniards embarked on a formal expedition in 1806 to find potential locations within what is now the San Bernardino Valley. As a result, by 1810, Father Francisco Dumetz of Mission San Gabriel had succeeded in establishing a religious site, or capilla, at a Cahuilla rancheria called Guachama (Beattie and Beattie 1939). San Bernardino Valley received its name from this site, which was dedicated to San Bernardino de Siena by Father Dumetz. The Guachama rancheria was located in present-day Bryn Mawr in San Bernardino County.

These early colonization efforts were followed by the establishment of estancias at Puente (circa 1816) and San Bernardino (circa 1819) near Guachama (Beattie and Beattie 1939). These efforts were soon mirrored by the Spaniards from Mission San Luis Rey, who in turn established a presence in what is now Lake Elsinore, Temecula, and Murrieta (Chapman 1921). The indigenous groups who occupied these lands were recruited by missionaries, converted, and put to work in the missions (Pourade 1961). Throughout this period, the Native American populations were decimated by introduced diseases, a drastic shift in diet resulting in poor nutrition, and social conflicts due to the introduction of an entirely new social order (Cook 1976).

Mexico achieved independence from Spain in 1822 and became a federal republic in 1824. As a result, both Baja and Alta California became classified as territories (Rolle 1969). Shortly thereafter, the Mexican Republic sought to grant large tracts of private land to its citizens to begin to encourage immigration to California and to establish its presence in the region. Part of the

establishment of power and control included the desecularization of the missions circa 1832. These same missions were also located on some of the most fertile land in California and, as a result, were considered highly valuable. The resulting land grants, known as "ranchos," covered expansive portions of California and, by 1846, more than 600 land grants had been issued by the Mexican government. Rancho Jurupa was the first rancho to be established and was issued to Juan Bandini in 1838. Although Bandini primarily resided in San Diego, Rancho Jurupa was located in what is now Riverside County (Pourade 1963). A review of Riverside County place names quickly illustrates that many of the ranchos in Riverside County lent their names to present-day locations, including Jurupa, El Rincon, La Sierra, El Sobrante de San Jacinto, La Laguna (Lake Elsinore), Santa Rosa, Temecula, Pauba, San Jacinto Nuevo y Potrero, and San Jacinto Viejo (Gunther 1984). As was typical of many ranchos, these were all located in the valley environments within western Riverside County.

The treatment of Native Americans grew worse during the Rancho Period. Most of the Native Americans were forced off their land or put to work on the now privately-owned ranchos, often as slave labor. The degree to which Native Americans had become dependent upon the mission system due to the brutal ranchos is evident when, in 1838, a group of Native Americans from Mission San Luis Rey petitioned government officials in San Diego to relieve suffering at the hands of the rancheros:

> We have suffered incalculable losses, for some of which we are in part to be blamed for because many of us have abandoned the Mission … We plead and beseech you … to grant us a Rev. Father for this place. We have been accustomed to the Rev. Fathers and to their manner of managing the duties. We labored under their intelligent directions, and we were obedient to the Fathers according to the regulations, because we considered it as good for us. (Brigandi 1998:21)

Native American culture had been disrupted to the point where they could no longer rely upon their prehistoric subsistence and social patterns. Not only does this illustrate how dependent the Native Americans had become upon the missionaries, but it also indicates a marked contrast in the way the Spanish treated the Native Americans compared to the Mexican and United States ranchers. Spanish colonialism (missions) is based upon utilizing human resources while integrating them into their society. The Mexican and American ranchers did not accept Native Americans into their social order and used them specifically for the extraction of labor, resources, and profit. Rather than being incorporated, they were either subjugated or exterminated (Cook 1976).

By 1846, tensions between the United States and Mexico had escalated to the point of war (Rolle 1969). In order to reach a peaceful agreement, the Treaty of Guadalupe Hidalgo was put into effect in 1848, which resulted in the annexation of California to the United States. Once California opened to the United States, waves of settlers moved in searching for gold mines, business opportunities, political opportunities, religious freedom, and adventure (Rolle 1969;

Caughey 1970). By 1850, California had become a state and was eventually divided into 27 separate counties. While a much larger population was now settling in California, this was primarily in the central valley, San Francisco, and the Gold Rush region of the Sierra Nevada mountain range (Rolle 1969; Caughey 1970). During this time, southern California grew at a much slower pace than northern California and was still dominated by the cattle industry that was established during the earlier rancho period. However, by 1859, the first United States Post Office in what would eventually become Riverside County was set up at John Magee's store on the Temecula Rancho (Gunther 1984).

During the same decade, circa 1852, the Native Americans of southern Riverside County, including the Luiseño and the Cahuilla, thought they had signed a treaty resulting in their ownership of all lands from Temecula to Aguanga east to the desert, including the San Jacinto Valley and the San Gorgonio Pass. The Temecula Treaty also included food and clothing provisions for the Native Americans. However, Congress never ratified these treaties, and the promise of one large reservation was rescinded (Brigandi 1998).

With the completion of the Southern Pacific Railroad in 1869, southern California saw its first major population expansion. The population boom continued circa 1874 with the completion of connections between the Southern Pacific Railroad in Sacramento to the transcontinental Central Pacific Railroad in Los Angeles (Rolle 1969; Caughey 1970). The population influx brought farmers, land speculators, and prospective developers to the region. As the Jurupa area became more and more populated, circa 1870, Judge John Wesley North and a group of associates founded the city of Riverside on part of the former rancho.

Although the first orange trees were planted in Riverside County circa 1871, it was not until a few years later when a small number of Brazilian navel orange trees were established that the citrus industry truly began in the region (Patterson 1971). The Brazilian navel orange was well suited to the climate of Riverside County and thrived with assistance from several extensive irrigation projects. At the close of 1882, an estimated half a million citrus trees were present in California. It is estimated that nearly half of that citrus tree population was in Riverside County. Population growth and 1880s tax revenue from the booming citrus industry prompted the official formation of Riverside County in 1893 out of portions of what was once San Bernardino and San Diego counties (Patterson 1971).

Shortly thereafter, with the start of World War I, the United States began to develop a military presence in Riverside County with the construction of March Air Reserve Base. During World War II, Camp Anza and Camp Haan were constructed, with the former located in the western part of the city of Riverside and the latter in what is now the current location of the National Veteran's Cemetery. In the decades that followed, populations spread throughout the county into Lake Elsinore, Corona, Norco, Murrieta, and Wildomar. A significant portion of the county, however, remained largely agricultural well into the 1970s. Following the 1970s, Riverside saw a period of dramatic population increase as the result of new development, more than doubling the population of the county to a population of over 1.3 million residents (Patterson 1971).

History of the City of San Jacinto and the Surrounding Area

Settlement in the San Jacinto Valley began with a 35,500-acre land grant given to José Antonio Estudillo in 1842, known as the Rancho San Jacinto Viejo Land Grant. Estudillo's children began developing the ranch in the 1880s by constructing two, two-story brick mansions, one of which is still located at South Dillon Avenue and Main Street in San Jacinto (Plate 2.3−1). In 1889, 15,000 acres of the Rancho San Jacinto Viejo Land Grant were sold to a group of Los Angeles investors known as the San Jacinto Land Association. Prior to the secession of the acreage, these investors developed a rival town in 1883 just two miles away from San Jacinto.

Plate 2.3−1: The Estudillo Mansion circa 1890.
(*Photograph courtesy of the City of San Jacinto Archives)*

Plate 2.3−2: Old San Jacinto circa 1890.
(Photograph courtesy of the City of San Jacinto Archives)

The town, which called itself New San Jacinto, competed for dominance with Old San Jacinto (Plate 2.3−2). However, the battle was ultimately decided when the Santa Fe Railroad built a branch line that terminated in New San Jacinto. Old San Jacinto faded from existence by the twentieth century (City of San Jacinto 2020). According to one source:

> The San Jacinto Land Association originally wanted the region to be a Methodist temperance colony and had even gone as far as to state that deeds to land sold by the Association would contain a clause prohibiting the manufacture or sale of alcoholic beverages upon land sold by the company. Nevertheless, it appeared as though such clauses were never initiated into the deeds. (Wiley 2018)

The valley land was divided into large farm lots, usually made up of one quarter of the sectioned land. Portions of the San Jacinto Land Association land were irrigated with water obtained in the San Jacinto Mountains to the east. However, the region still lacked a sufficient water supply to support large scale agriculture, until:

> Edward Mayberry, William Whitter, Albert H.H. Judson, Hancock M. Johnston, and Peter Potts formed the Lake Hemet Water Company and the Hemet Land Company after acquiring portions of Rancho San Jacinto. By 1895, the Lake Hemet Water Company had constructed a dam (Lake Hemet) that they planned to use to irrigate the holdings of the Hemet Land Company. The formation of the Lake Hemet Dam led to the incorporation of the city of Hemet in 1910. (Wiley 2018)

With the expanded irrigation capabilities, farmers began to thrive in the San Jacinto Valley throughout the early twentieth century as settlements increased, giving rise to small family-owned agricultural businesses while large-scale cattle ranching declined in popularity (City of San Jacinto 2020). Instead, "small-scale horticulture increased," with many different crops grown throughout the San Jacinto Valley due to its relatively high water table (10 to 15 feet below the surface) and warm climate (Wiley 2018; Pitman 1976). In fact, "Citrus, alfalfa, corn, potatoes, oat hay, and walnut orchards all prospered in the early twentieth century" (Wiley 2018).

Tourism also played an important role to the development of the San Jacinto Valley. In the 1880s, Helen Hunt Jackson visited the San Jacinto Valley to conduct research for her upcoming book, *Ramona*. Although *Ramona* is a fictional dramatization of Native American mistreatment, the book sparked an increase in tourism within the San Jacinto Valley, eventually leading to the creation of the California Historic Landmark Ramona Bowl (CHL No. 1009), where the annual Ramona Pageant, a dramatization of the events depicted in the novel, was first performed in 1923 (Office of Historic Preservation [OHP] 1993).

In 1909, Edwin Cawston, an English businessman, established a second location of his extremely popular ostrich farm from Pasadena just southwest of the subject property at Cawston and Cottonwood avenues. Cawston raised the birds primarily for their feathers, which were used in women's decorative clothing and accessories, such as ostrich feather fans and feather boas. The farm was considered a tourist attraction, where guests could view, feed, and ride the birds and purchase goods made from the feathers. Although Cawston's San Jacinto farm was short lived, his influence on the region is clear, as Cawston Avenue is named after him.

On July 14, 1937, in a dairy pasture located in the northern portion of the city:

> … pilot Mikhail Gromov, co-pilot Andrei Yumashev and navigator Sergei Danilin piloted their brakeless, single-engine ANT-25 plane – with a wingspan of 125 feet – to a landing in what is now near the Riverside County city of San Jacinto.
>
> Although the fliers had charted San Diego as their destination, fog forced them to find an alternative landing site. After flying the 6,305 miles from Moscow in 62 hours and 17 minutes, the crew climbed wearily out of the red-winged, silver-bodied craft, walked up to a farmer who had watched them land and handed him first a pre-printed note asking him to call the Soviet Embassy, and then three cards that read: "Bath," "Eat," and "Sleep." (Rasmussen 2001)

The flight was one of three different Soviet attempts to establish the feasibility of flying from Russia to the United States by way of the North Pole (Wiley 2019). However, fog forced the plane to make a landing in the cow pasture owned by Earl Smith, near the corner of Cottonwood and Sanderson avenues (Plate 2.3–3; Rasmussen 2001). At the time, the 62 hour and 17 minute flight established a new world record for the longest nonstop distance flown of 6,305 miles (OHP 1989). As crowds gathered to look at the plane and Russian crew, Smith began charging admission to the onlookers (Rasmussen 2001; Schultz 2017). Before long, a plane from the nearby March Air Reserve Base landed and men were enlisted to set up a perimeter around the plane. Eventually, the plane was dismantled to be sent back to Russia while the crew was escorted throughout California before also returning to Russia (Rasmussen 2001).

Plate 2.3–3: 1937 photograph of the ANT-25 plane at the Russian Transpolar Landing Site.
(Photograph courtesy of the UCLA Library Archives)

Tourism garnered by the draw of natural hot springs located on the north side of the valley also stimulated the growth of the area by ushering in the development of resorts and hotels. Notably, the Gilman and Soboba Hot Springs, which were developed in the late nineteenth century, drew increased tourism in the early twentieth century (City of San Jacinto 2020). As the population of the valley grew, the demand for dairy products increased, and dairy farming became more prevalent in the San Jacinto Valley. By 1922, dairy farmers in the San Jacinto Valley were producing more than 500,000 gallons of milk yearly (Law 1922). The wide-open acreage and thorough irrigation allowed dairy cows in the San Jacinto Valley to free forage on ample fresh alfalfa, producing healthier cows and a better milk product, which could then be shipped to Los Angeles daily on the railroad lines (City of San Jacinto 2020). Turkey ranching and lime kilns also added to the economy. These industries are still important to the economy of the San Jacinto Valley today.

2.4 Research Goals

The primary goal of the research design is to attempt to understand the way in which humans have used the land and resources within the project through time, as well as to aid in the determination of resource significance. For the current project, the study area under investigation is the central-western portion of Riverside County. The scope of work for the archaeological program conducted for the Bradley Gardens Project included an intensive pedestrian survey of the entire 2.98-acre property and the assessment of four historic buildings. Given the area involved, the research design for this project was focused upon realistic study options. Since the main objective of the investigation was to identify the presence of and potential impacts to cultural

resources, the goal is not necessarily to answer wide-reaching theories regarding the development of early southern California, but to investigate the role and importance of the identified resources. Nevertheless, the assessment of the significance of a resource must take into consideration a variety of characteristics, as well as the ability of the resource to address regional research topics and issues.

Although survey programs are limited in terms of the amount of information available, several specific research questions were developed that could be used to guide the initial investigations of any observed cultural resources:

- Can located cultural resources be associated with a specific time period, population, or individual?
- Do the types of located cultural resources allow a site activity/function to be determined from a preliminary investigation? What are the site activities? What is the site function? What resources were exploited?
- How do the located sites compare to others reported from different surveys conducted in the area?
- How do the located sites fit existing models of settlement and subsistence for the region?

For the historic buildings located within the project, the potential for historic deposits is considered remote, and therefore, the research process was focused upon the built environment and those individuals associated with the ownership, design, and construction of the buildings within the project footprint. Although historic structure evaluations are limited in terms of the amount of information available, several specific research questions were developed that could be used to guide the initial investigations of any observed historic resources:

- Can the building be associated with any significant individuals or events?
- Is the building representative of a specific type, style, or method of construction?
- Is the building associated with any nearby structures? Does the building, when studied with the nearby structures, qualify as a contributor to a potential historic district?
- Was the building designed or constructed by a significant architect, designer, builder, or contractor?

Data Needs

At the survey level, the principal research objective is a generalized investigation of changing settlement patterns in both the prehistoric and historic periods within the study area. The overall goal is to understand settlement and resource procurement patterns of the project area occupants. Further, the overall goal of the historic structure assessment is to understand the construction and use of the buildings within their associated historic context. Therefore, adequate information on site function, context, and chronology from both an archaeological and historical

perspective is essential for the investigation. The fieldwork and archival research were undertaken with the following primary research goals in mind:

1) To identify cultural and historic resources occurring within the project;
2) To determine, if possible, site type and function, context of the deposit, and chronological placement of each cultural resource identified, and the type, style, and method of construction for any buildings;
3) To place each cultural resource identified within a regional perspective;
4) To identify persons or events associated with any buildings and their construction; and
5) To provide recommendations for the treatment of each cultural and historic resource identified.

3.0 METHODOLOGY

The cultural resources study of the project consisted of an institutional records search, an intensive cultural resource survey of the entire 2.98-acre project, and the detailed recordation of all identified cultural resources. This study was conducted in conformance with City of San Jacinto environmental guidelines, Section 21083.2 of the California Public Resources Code (PRC), and CEQA. Statutory requirements of CEQA (Section 15064.5) were followed for the identification and evaluation of resources. Specific definitions for archaeological resource type(s) used in this report are those established by the State Historic Preservation Office (SHPO 1995).

3.1 Methods

3.1.1 Archival Research

Records relating to the ownership and developmental history of this project were sought to identify any associated historic persons, historic events, or architectural significance. Records and lot book research was conducted at the BFSA research library, the SCIC, and the Riverside County Archives held at the County of Riverside Assessor-County Clerk-Recorder Office. Sanborn Fire Insurance maps were searched for at the San Diego Public Library. Appendix E contains maps of the property, including historic USGS maps from 1901, 1943, 1954, 1973, and 1999, the 1887 Estudillo Land and Water Addition to San Jacinto map, and the current Assessor's parcel map. No Sanborn maps are available as the property is outside the San Jacinto coverage areas.

3.1.2 Survey Methods

The survey methodology employed during the current investigation followed standard archaeological field procedures and was sufficient to accomplish a thorough assessment of the project. The field methodology employed for the project included walking evenly spaced survey transects set approximately 15 meters apart while visually inspecting the ground surface, including all potentially sensitive areas where cultural resources might be located. Photographs documenting survey discoveries and overall survey conditions were taken frequently. All cultural resources were recorded as necessary according to the OHP's manual, *Instructions for Recording Historical Resources,* using Department of Parks and Recreation (DPR) forms.

3.1.3 Historic Structure Assessment

Methods for evaluating the integrity and significance of the historic buildings within APN 435-330-003 included photographic documentation and review of available archival documents. During the survey, photographs were taken of all building elevations. The photographs were used to complete architectural descriptions of the buildings. The original core structures and all modifications made to the buildings since their initial construction were also recorded. The current setting of the buildings was compared to the historical setting of the property. This information was combined with the archival research in order to evaluate the buildings' seven aspects of integrity, as well as their potential significance under CEQA guidelines.

3.2 Applicable Regulations

Resource importance is assigned to districts, sites, buildings, structures, and objects that possess exceptional value or quality illustrating or interpreting the heritage of Riverside County in history, architecture, archaeology, engineering, and culture. A number of criteria are used in demonstrating resource importance. Specifically, criteria outlined in CEQA provide the guidance for making such a determination. Below is the CEQA criteria that a resource must meet in order to be determined important.

3.2.1 California Environmental Quality Act

According to CEQA (§15064.5a), the term "historical resource" includes the following:

1) A resource listed in or determined to be eligible by the State Historical Resources Commission for listing in the CRHR (PRC SS5024.1, Title 14 CCR. Section 4850 et seq.).
2) A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the PRC or identified as significant in a historical resource survey meeting the requirements of Section 5024.1(g) of the PRC, shall be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
3) Any object, building, structure, site, area, place, record, or manuscript, which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the CRHR (PRC SS5024.1, Title 14, Section 4852) including the following:

    a) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
    b) Is associated with the lives of persons important in our past;
    c) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
    d) Has yielded, or may be likely to yield, information important in prehistory or history.

4) The fact that a resource is not listed in, or determined eligible for listing in the CRHR, not included in a local register of historical resources (pursuant to Section 5020.1[k] of

the PRC), or identified in a historical resources survey (meeting the criteria in Section 5024.1[g] of the PRC) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Section 5020.1(j) or 5024.1.

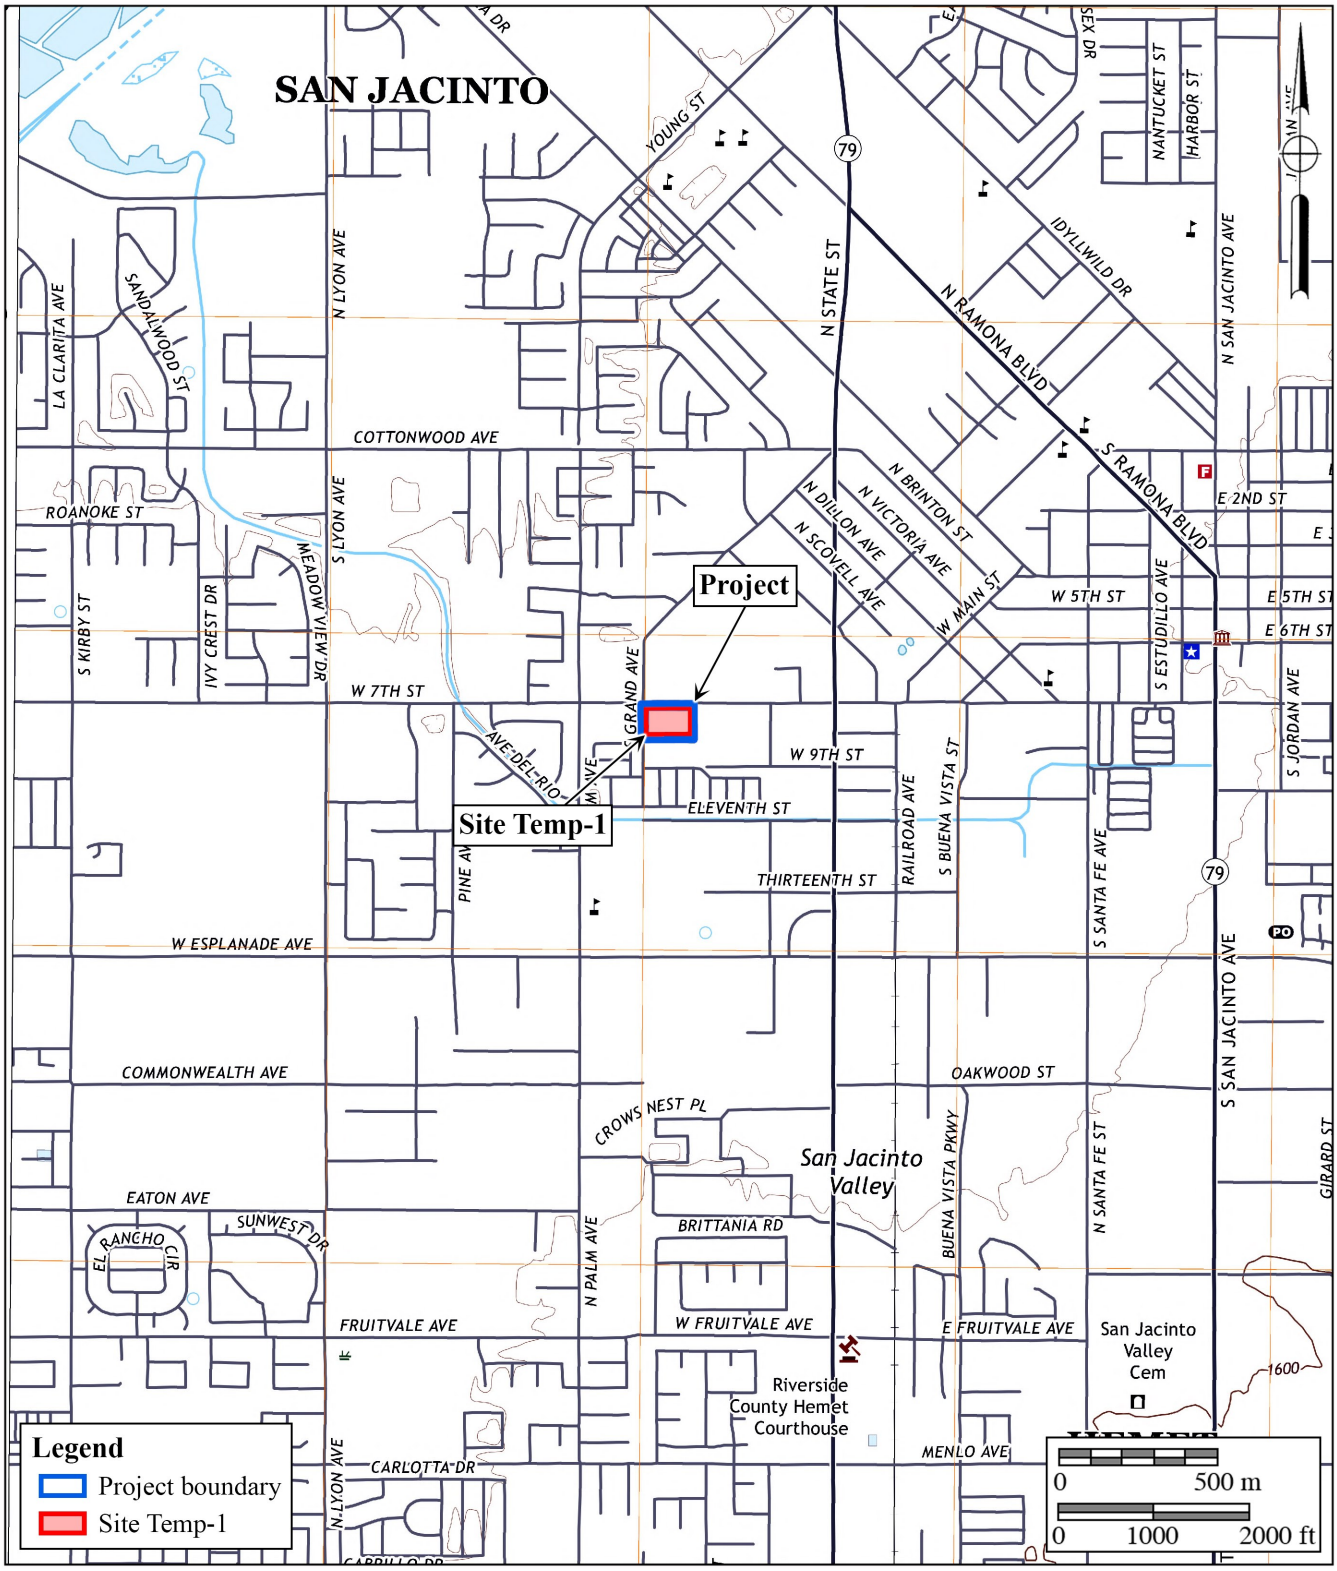
According to CEQA (§15064.5b), a project with an effect that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect upon the environment. CEQA defines a substantial adverse change as:

1) Substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired.
2) The significance of a historical resource is materially impaired when a project:

    a) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for inclusion in the CRHR; or
    b) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to Section 5020.1(k) of the PRC or its identification in a historical resources survey meeting the requirements of Section 5024.1(g) of the PRC, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or,
    c) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the CRHR as determined by a lead agency for purposes of CEQA.

Section 15064.5(c) of CEQA applies to effects upon archaeological sites and contains the following additional provisions regarding archaeological sites:

1. When a project will impact an archaeological site, a lead agency shall first determine whether the site is a historical resource, as defined in subsection (a).
2. If a lead agency determines that the archaeological site is a historical resource, it shall refer to the provisions of Section 21084.1 of the PRC, Section 15126.4 of the guidelines, and the limits contained in Section 21083.2 of the PRC do not apply.
3. If an archaeological site does not meet the criteria defined in subsection (a), but does meet the definition of a unique archaeological resource in Section 21083.2 of the PRC, the site shall be treated in accordance with the provisions of Section 21083.2. The time



and cost limitations described in PRC Section 21083.2(c-f) do not apply to surveys and site evaluation activities intended to determine whether the project location contains unique archaeological resources.

4. If an archaeological resource is neither a unique archaeological nor historical resource, the effects of the project upon those resources shall not be considered a significant effect upon the environment. It shall be sufficient that both the resource and the effect upon it are noted in the Initial Study or Environmental Impact Report, if one is prepared to address impacts on other resources, but they need not be considered further in the CEQA process.

Section 15064.5(d) and (e) contain additional provisions regarding human remains. Regarding Native American human remains, paragraph (d) provides:

(d) When an Initial Study identifies the existence of, or the probable likelihood of, Native American human remains within the project, a lead agency shall work with the appropriate Native Americans as identified by the NAHC, as provided in PRC SS5097.98. The applicant may develop an agreement for treating or disposing of, with appropriate dignity, the human remains and any items associated with Native American burials with the appropriate Native Americans as identified by the NAHC. Action implementing such an agreement is exempt from:

1) The general prohibition on disinterring, disturbing, or removing human remains from any location other than a dedicated cemetery (Health and Safety Code Section 7050.5).
2) The requirements of CEQA and the Coastal Act.

The Bradley Gardens Project

USGS *San Jacinto* Quadrangle (7.5-minute series)

Site(s)	Description
RIV-10,093	Historic Kuhn compound
RIV-10,094	Historic adobe and trash scatter
RIV-10,911	Historic ranch complex with associated brick and wood debris

The results of the SCIC records search also identified 40 studies that have been conducted within one mile of the project, none of which overlap the project.

BFSA reviewed the following sources to help facilitate a better assessment of the potential for cultural resources within the property:

- The NRHP index
- The OHP Built Environment Resources Directory
- Historic 1942 and 1956 *Banning, California* (15-minute) USGS topographic maps
- Historic 1953 and 1996 *San Jacinto, California* (7.5-minute) USGS topographic maps
- BLM GLO records
- Aerial photographs (1939 to 2025)

Between 1939 and 1953, the subject property transitioned from a vacant field to agricultural use. The 1962 aerial photograph illustrates that the majority of the subject property consisted of an agricultural field and that a small structure had been constructed directly east of the project. By 1966, the entire subject property appears to have been cleared for the construction of two buildings, a small parking lot, and several driveways that served as the Colonial Nursing Home. Between the 1967 and 1972 aerial photographs, two more buildings had been constructed along the western project boundary and the parking lot on the northern half of the property was expanded. According to Riverside County Assessor's records, these buildings were constructed in 1971. By 1997, there had been several additions to the hardscape and a pool was constructed in the southwest portion of the property. The pool was filled by 2003 and paved over by 2026. The subject property currently includes four buildings associated with what is now the Bradley Garden care facility: a main residential building, a storage building, and two office buildings.

BFSA also requested a records search of the SLF of the NAHC to identify if any known sacred sites or locations of religious or ceremonial importance are within the search radius. The SLF results have been returned with positive results for cultural resources. All correspondence is provided in Appendix C.

4.2 Results of the Field Survey

The cultural resources survey was conducted on February 6, 2026. Principal Investigator Tracy A. Stropes, M.A., RPA, directed the cultural resources study for the project with assistance from BFSA archaeologist Reina Inlow. The intensive reconnaissance consisted of a series of parallel survey transects spaced at approximately 15-meter intervals when not hindered by the present development. All exposed ground surfaces were carefully inspected, including rodent burrows and disturbed areas. A survey form, field notes, and photographs documented the survey work. During the survey, visibility of the natural ground surface was limited to a grass lawn behind the large central building, commercial landscaping, and cleared areas surrounding the southeastern building. Vegetation on the property consisted of commercial landscaping surrounding the development and non-native weeds and grasses on the southern half (Plates 4.2–1 to 4.2–3).

The survey identified four extant buildings and a parking lot associated with the Bradley Gardens care facility (a large main care center building, one storage building in the southeast corner, and two medical office buildings in the northwest and southwest corners) that were constructed between 1964 and 1971 (Plate 4.2–4). No prehistoric resources were identified within the project. As the four Bradley Gardens care facility buildings are historic in age, they have been recorded as Site Temp-1 (Figure 4.2–1) and evaluated for significance below.

4.3 Historic Structure Analysis

Methods for evaluating the integrity and significance of the historic buildings recorded collectively as Site Temp-1 included photographic documentation and review of available archival documents. During the survey, photographs were taken of building elevations. The photographs were used to complete architectural descriptions of the buildings. The original core structures and all modifications made to the buildings since their initial construction were also recorded. The current setting of the buildings was compared to the historical setting of the property. This information was combined with archival research to evaluate the buildings' seven aspects of integrity, as well as their potential significance under CEQA and NRHP guidelines.

Within the boundaries of the subject property, four historic buildings associated with the Bradley Gradens care facility were identified (Figure 4.3–1). The applicable DPR forms have been prepared for submittal to the SCIC along with this report. Once processed, the SCIC will assign the resource a permanent site number. The following section provides the pertinent field results for the significance evaluation for the historic buildings located within the project boundaries, which was conducted in accordance with City of San Jacinto guidelines and site evaluation protocols.

The main care center building and storage building were constructed in 1964, according to Riverside County Assessor's records and a review of aerial photography. The two medical office buildings were constructed in 1971. Descriptions and significance evaluations of the Site Temp-1 buildings are provided below.

Plate 4.2–1: Overview from the southwest corner of the project, facing northeast.

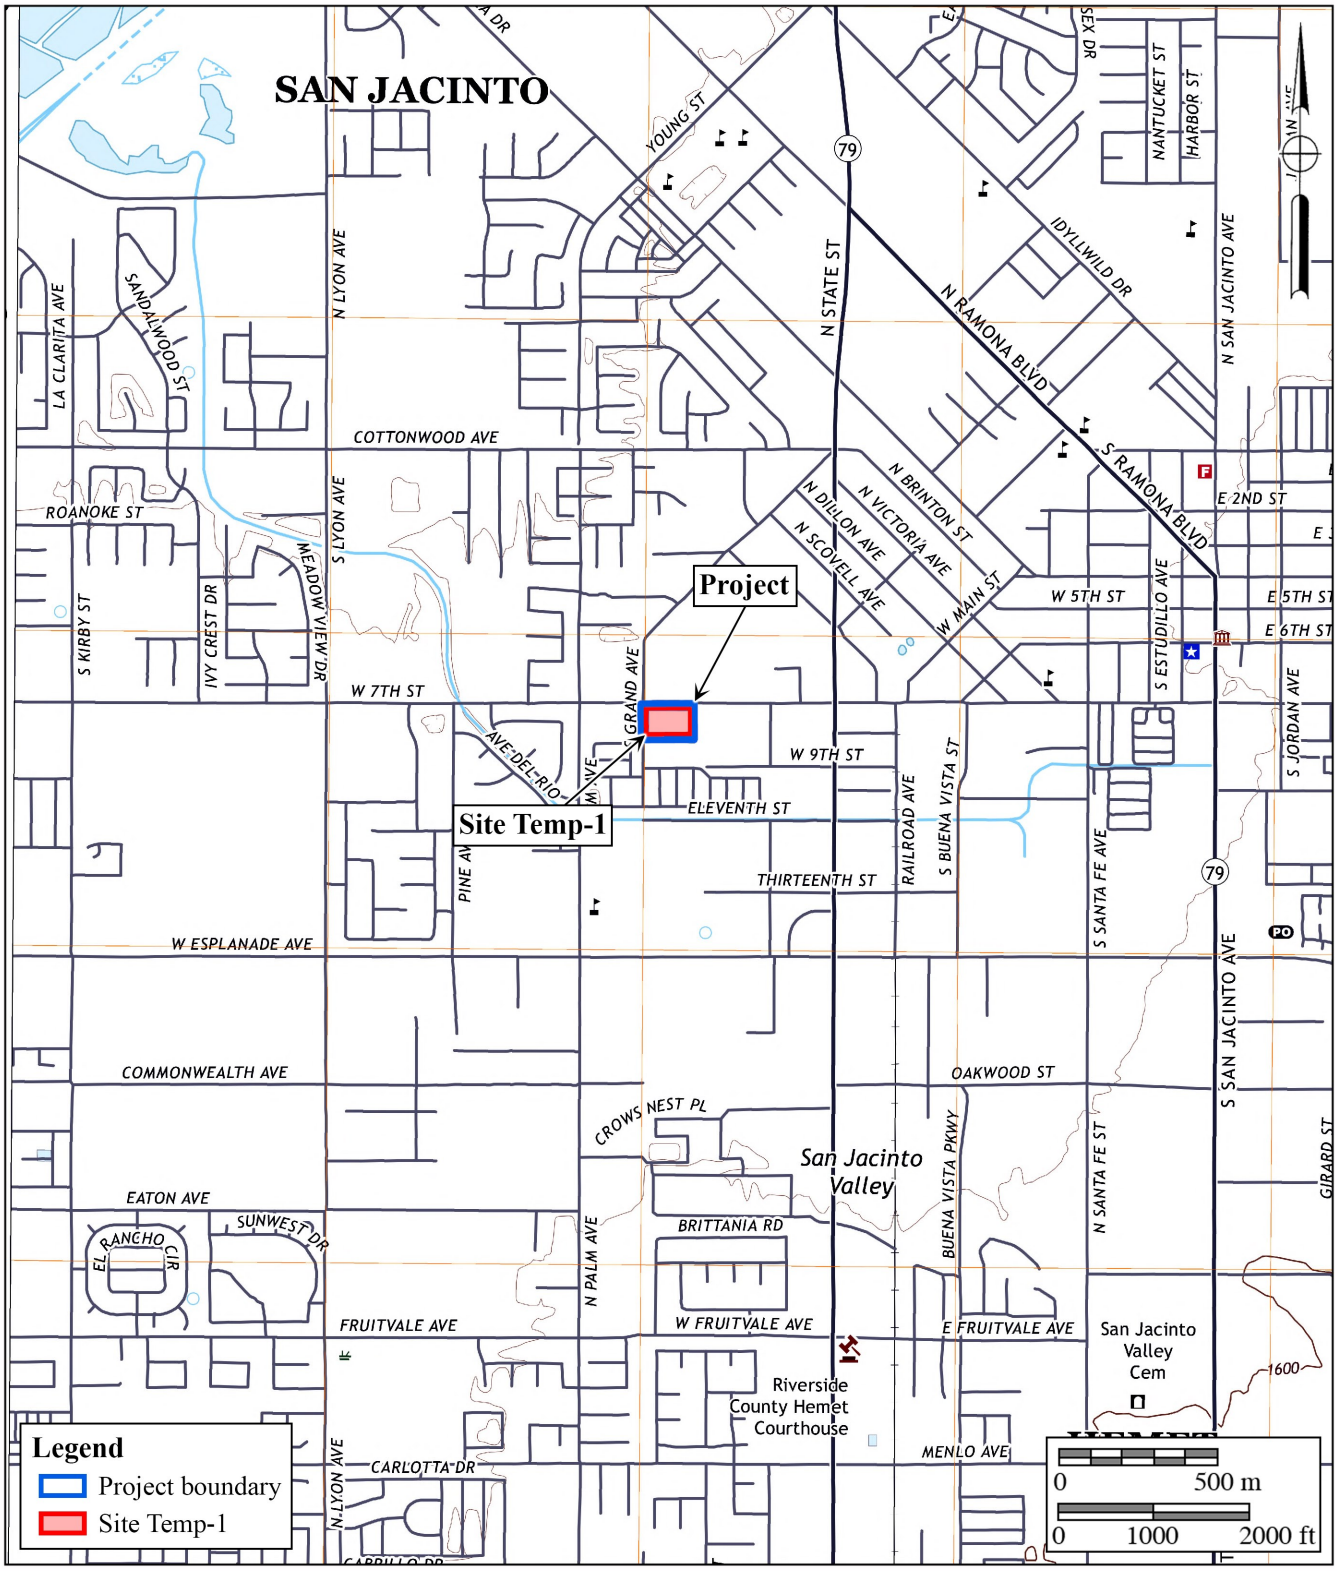

Plate 4.2–2: Overview from the northeast corner of the project, facing southwest.

Plate 4.2–3: Overview from the southeast corner of the project, facing northwest.

Plate 4.2–4: Overview of the main care center building, facing south.

4.3.1 History of the Project Area

According to lot book records, the subject property is located on Lot 14 and a portion of Lot 13 in the Estudillo Land and Water Co. Subdivision of San Jacinto, California. The first building improvements on these lots (listed together in the records) are recorded in 1945. However, a review of aerial imagery from 1962 and 1966 (Plates 4.3–1 and 4.3–2) confirms that any existing building improvements within the current property boundaries were removed by 1966.

According to lot book and building permit records, Howard Patterson and his niece Irene Yokes (Plate 4.3–3) purchased the property in 1961 with the intention of building a nursing home. They were granted a building permit to begin construction in 1963. Patterson was born in Pittsburgh, Pennsylvania, in 1880. In 1911, he married Anna E. Patterson (born circa 1879, maiden name unknown), who died in 1948. Irene Yokes "kept house for her uncle since his wife, Anna, died" and they lived in Hemet, California (*Hemet News* 1976; Ancestry.com 2006). Yokes (née Patterson) was born in Titusville, Pennsylvania, in 1898. In 1916, she married Delos Yokes (born 1895), who died in 1943 (*News Herald* 1916; Ancestry.com 2012).

99 AND GOING STRONG—A large crowd of well-wishers joined Howard H. Patterson Friday night at the Colonial Country Club Estates in the celebration of his 99th birthday. Shown with Mr. Patterson is his niece Irene Yokes. (Hemet News photo)

Plate 4.3–3: Irene Yokes and Howard Patterson at Howard's 99th Birthday Celebration. ***(Photograph courtesy of Hemet News 1979)***

Archival records, building permits, and aerial photographs indicate that Patterson and Yokes had the Colonial Nursing Home (also referred to as Colonial Convalescent Home in archival records) constructed on the property in April 1964, which included the main care center building and the storage building, which are both visible in the 1966 aerial photograph, which also shows a shed-roofed addition on the main care center building southeast wing (see Plate 4.3–2). The facility, listed at 3941 West Seventh Street at that time, was advertised as a 24-hour care facility for elderly, ill, or convalescent patients with a full staff of nurses, aids, and housekeepers (*Hemet News* 1964).

Building permit records and the 1967 aerial photograph (Plate 4.3–4) indicate that a cross-gabled addition to the storage building and additions to the northwest and northeast wings of the main center care building were constructed in 1967. Building records further indicate that a porte cochere was installed on the north façade of the main care center building in 1970, two medical office buildings were constructed along the western property boundary in 1971, and a swimming pool was constructed off the east façade of the southern medical office building likely in 1972, as a building permit was issued in that year but it is not visible in available aerial imagery from 1972 (Plates 4.3–5 and 4.3–6). Between 1980 and 1988, a shed-roofed garage addition was constructed on the east façade of the storage building (Plates 4.3–6 and 4.3–7) and between 1988 and 1996, the swimming pool was infilled (Plate 4.3–8). By the time of the current survey, the swimming pool had been paved for use as a basketball court.

Howard Patterson died in 1982, and Irene Yokes died in 1991 (*Riverside Independent Enterprise* 1982; Ancestry.com 2012). It is unknown how long the two managed the operations at the Colonial Nursing Home, but building permit and chain of title records from the 1960s to the 1990s list Colonial Convalescent Hospital, Inc. as the property owner and lot book records list them as the owner beginning in 1971.

At an unknown date, the property and surrounding area were annexed into the city of San Jacinto, and by 1985, the subject property was listed under its current address at 980 West Seventh Street (*Hemet News* 1985). Chain of title records show that in 1988, the facility was sold to Care Net, Inc. (later referred to as Care Net Ltd.), but *Hemet News* (1996) still refers to the facility as Colonial Convalescent Hospital.

Healthcare Management Systems, Inc. purchased the property in 1997, when the facility was renamed Bradley Gardens Convalescent Center (also listed as the Bradley Gardens) (*Riverside Press Enterprise* 1997). Bradley Gardens has been in continuous operation from 1997 until the present. In 2024, Healthcare Management Systems sold the property to San Jacinto Real Estate LLC.

4.3.2 Description of Surveyed Resources

The Bradley Gardens care facility at 980 West Seventh Street includes a main care center building, a storage building, and two medical office buildings constructed between 1964 and 1971 in the Ranch architectural style. Each building features a broad, single-story layout, low-pitched, cross-gabled roofs with composite tiles, closed eaves with moderate overhangs, and sheltered entryways with simple wood post porch supports. The buildings feature painted stucco cladding and horizontal massing. Some solid wood or multipanel wood doors are featured, though most have been replaced by sliding aluminum doors or simple, swinging metal doors. Fenestration on each building consists of aluminum-framed windows, with the main care center building and southern medical office building featuring painted wood exterior trim surrounds.

Main Care Center Building

The 12,132-square-foot main care center building was constructed in 1964 with an irregular "X"-shaped floor plan created by two larger northwest and northeast wings and two smaller southwest and southeast wings. The northwest and northeast wings were extended in 1967 (see Plate 4.3–4). A central porte cochere protrudes from the north façade of the building that was added in 1970 (Plate 4.3–10). The front-gabled roof of the porte cochere is supported by fluted, doric-style columns on concrete plinths and projects north toward West Seventh Street. A circular driveway passes beneath and allows for vehicular access to the front entrance (Plates 4.3–11 and 4.3–12). This entrance consists of an automatic, aluminum-framed sliding door (see Plate 4.3–10). Fenestration on the north façade consists of aluminum-framed windows with painted wood exterior trim surrounds (see Plates 4.3–10 to 4.3–13).

Plate 4.3–13

East End of the North Façade of the Main Care Center Building, Facing Southwest

The Bradley Gardens Project

The northwest wing gable end features a painted metal door with a sheltered entryway supported by simple wood post porch supports (Plate 4.3–14), while the south façade of this wing contains one aluminum-framed sliding window and a painted metal door (Plate 4.3–15). The gable end of the northeast wing features two metal doors and an aluminum-framed sliding window (Plate 4.3–16). Two matching aluminum-framed window sets and a sliding aluminum-framed door are present on the south façade of the northeast wing (Plate 4.3–17).

The southwest and southeast wings form a shallow arc at the south façade of the building (see Figure 4.3–1). The wings each feature a recessed entrance in the gable ends with metal access doors (Plates 4.3–18 and 4.3–19). A shed-roof addition protrudes to the southeast from the southeast wing with vertical tongue-and-groove siding on the south and east façades (see Plate 4.3–19). Wood lattice paneling surrounds a metal screen door on the north façade of the southeast wing and wraps around to overlap the siding boards on the east façade (see Plate 4.3–19)

Storage Building

A square, front-gabled storage building was constructed in the southeastern corner of the property in 1964 (Plate 4.3–20). A cross-gabled addition was constructed on the west façade of the building in 1967 (Plates 4.3–21 and 4.3–22). Between 1980 and 1988, a shed-roofed garage addition was constructed on the east façade of the building (Plate 4.3–23). The garage addition features corrugated sheet metal cladding, a roll-up metal garage door, and a wide overhanging eave on the east façade with exposed rafters.

The primary (north) façade of the building features painted stucco cladding, a composite shingle roof with a low pitch and moderate overhang, and a shaded entryway over the primary entrance supported by simple wood posts (see Plate 4.3–20). Small aluminum-framed sliding windows are present on the north and south façades of the cross-gabled addition, along with larger aluminum sliding windows on the south façade of the original building and shed room extension. Two simple metal doors are present on the primary (north) façade (see Plate 4.3–20) and a multipaneled wood door is present on the west corner of the south façade (see Plate 4.3–22).

Medical Office Buildings

Two medical office buildings were constructed in 1971 along the western property boundary. The southern medical office building is a single story and side-gabled with an irregular, north-to-south, "L"-shaped floor plan. The building features a low-pitched roof with composite shingles and a moderate overhang, with painted stucco cladding. The south façade of the southern medical office building features a sheltered entryway with wood post porch supports over a glass, aluminum-framed door (Plate 4.3–24). Fenestration on the west (Plates 4.3–25 and 4.3–26) and east façades (Plate 4.3–27) consist of aluminum-framed sliding windows with painted wood exterior trim.

Plate 4.3–27

East Façade of the Southern Medical Office Building, Facing Northwest

The Bradley Gardens Project

The east façade of the building features an aluminum-framed sliding glass door, three painted wood doors, and square pilasters that divide the east façade into bays. The east façade of the southern medical office building opens up into a paved courtyard area, which featured a pool likely built in 1972 and infilled by 1996, and paved for a basketball court by 2026 (Plate 4.3–28). The north façade does not exhibit any features except for a circular vent under the gable end (Plate 4.3–29).

The northern medical office building features a "L"-shaped floor plan with a small, projecting, south-facing gable on the western end of the south façade. The roof is cross gabled with a hipped roof extension at the southeast corner of the building, and features a low pitch, composite shingles, and a moderate overhang. A recessed entryway is present on the west façade of the hipped roof extension and is covered by a roof extension supported by simple wood posts (Plate 4.3–30). The primary entrance to the building is on the east façade underneath a broad entry porch supported by square, Tuscan-style columns (Plate 4.3–31). Similar square, Tuscan-style pilasters divide the east and north façades into equal bays (Plates 4.3–32 and 4.3–33). Each bay (excluding one on the east façade) features aluminum-framed sliding windows (see Plate 4.3–32). The gable end on the east façade also features a grooved embellishment within the stucco, highlighting the shape of the gable above the prominent bays and pilasters situated below. Views of the south façade are provided in Plates 4.3–34 and 4.3–35.

4.3.3 Significance Evaluation

CEQA guidelines (Section 15064.5) address archaeological and historic resources, noting that physical changes that would demolish or materially alter in an adverse manner those characteristics that convey the historic significance of the resource and justify its listing on inventories of historic resources are typically considered significant impacts. Because demolition and/or expansion of the buildings within the project would require approval from the City of San Jacinto, as part of the proposed project criteria for listing on the CRHR and the NRHP were used to measure the significance of the resources.

Integrity Evaluation

When evaluating a historic resource, integrity is the authenticity of the resource's physical identity clearly indicated by the retention of characteristics that existed during its period of construction. It is important to note that integrity is not the same as condition. Integrity directly relates to the presence or absence of historic materials and character-defining features, while condition relates to the relative state of physical deterioration of the resource. In most instances, integrity is more relevant to the significance of a resource than condition; however, if a resource is in such poor condition that original materials and features may no longer be salvageable, then the resource's integrity may be adversely impacted.

In order to determine whether or not the buildings are eligible for listing, CRHR and NRHP eligibility criteria were used. Furthermore, BFSA based the review upon the recommended criteria listed in the *National Register Bulletin: How to Apply the National Register Criteria for Evaluation* (Andrus and Shrimpton 2002). This review is based upon the evaluation of integrity of the buildings followed by the assessment of distinctive characteristics:

1. **Integrity of Location** *[refers to] the place where the historic property was constructed or the place where the historic event occurred* (Andrus and Shrimpton 2002). Integrity of location was assessed by reviewing historical records and historic aerial photographs in order to determine if the buildings had always existed at their present locations or if they had been moved, rebuilt, or their footprints significantly altered. Historical research revealed that the Bradley Gardens care facility buildings were constructed in their current locations between 1964 and 1971. Therefore, the buildings retain integrity of location.

2. **Integrity of Design** *[refers to] the combination of elements that create the form, plan, space, structure, and style of a property* (Andrus and Shrimpton 2002). Integrity of design was assessed by evaluating the spatial arrangement of the buildings and any architectural features present. The Bradley Gardens care facility buildings were constructed between 1964 and 1971 in the Ranch architectural style.

   The main care center building southeast wing had a shed-roofed addition constructed off it between 1964 and 1966 and its northwest and northeast wings were extended in 1967. A porte cochere with fluted, doric-style columns on concrete plinths was constructed on its north façade in 1970. These additions represent modifications to the form, plan, space, style, and structure of the original building. Therefore, the main care center building does not retain integrity of design.

   A cross-gabled addition was constructed on the west façade of the storage building in 1967 and a shed-roofed garage addition was constructed on the east façade of the storage building between 1980 and 1988. These additions represent modifications to the form, plan, space, style, and structure of the original building. Therefore, the storage building does not retain integrity of design.

   No known modifications have been made to the medical office buildings since their original date of construction in 1971 and, therefore, they retain integrity of design.

3. **Integrity of Setting** *[refers to] the physical environment of a historic property. Setting includes elements such as topographic features, open space, viewshed, landscape, vegetation, and artificial features* (Andrus and Shrimpton 2002). Integrity of setting was assessed by inspecting the elements of the property, which include topographic features, open space, views, landscape, vegetation, man-made features, and relationships between buildings and other features. The Bradley Gardens care facility buildings were constructed between 1964 and 1971. At the time of the facility's construction, the surrounding area consisted of limited agricultural and industrial development to the north and open farmland to the east, west, and south. Historic aerial photographs indicate that much of the surrounding land began to be replaced with residential development and small industrial parks between 1980 and 1988. Between 1988 and 2003, the land across Seventh Street to the north and northeast was being used for agricultural purposes and industrial development. Between the medical office buildings and main care center building, a pool was built in 1972 that was infilled by 1996 and paved for a basketball court by 2026. Currently, only the parcels immediately adjacent to the property to the east, west, and south remain vacant, with modern residences and agricultural or industrial buildings taking up most of the land in the surrounding area. Residential and industrial lots are also present to the north of the property across Seventh Street. Development of the surrounding area has altered the open space, viewshed, landscape, vegetation, and general built environment around the care facility property. Therefore, the property does not retain integrity of setting.

4. **Integrity of Materials** *[refers to] the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property* (Andrus and Shrimpton 2002). Integrity of materials was assessed by determining the presence or absence of original building materials, as well as the possible introduction of materials that may have altered the architectural design of the buildings. The Bradley Gardens care facility buildings were constructed between 1964 and 1971 in the Ranch architectural style.

   The main care center building southeast wing had a shed-roofed addition constructed off it between 1964 and 1966 and its northwest and northeast wings were extended in 1967. The original walls were removed from the gable ends of these wings and new materials were added when the extensions were built. A porte cochere was constructed on the north façade in 1970, altering the original primary façade and introducing new materials. Therefore, the main care center building does not retain integrity of materials.

A cross-gabled addition was constructed on the west façade of the storage building in 1967 and a shed-roofed garage addition was constructed on the east façade of the storage building between 1980 and 1988. The original walls on the east and west façades of the building were removed for these additions and new materials were added. Therefore, the storage building does not retain integrity of materials.

No known modifications have been made to the medical office buildings since their original date of construction in 1971 and, therefore, they retain integrity of materials.

5. **Integrity of Workmanship** *[refers to] the physical evidence of the labor and skill of a particular culture or people during any given period in history* (Andrus and Shrimpton 2002). Integrity of workmanship was assessed by evaluating the quality of the architectural features present in the buildings. The original workmanship demonstrated by the construction of the Bradley Gardens care facility appears to have been average. Although the buildings have not been significantly modified since their initial construction, with the exception of the storage building, they are not representative of the labor or skill of a particular culture or people. Therefore, none of the buildings ever possessed integrity of workmanship.

6. **Integrity of Feeling** *[refers to] a property's expression of the aesthetic or historic sense of a particular period of time* (Andrus and Shrimpton 2002). Integrity of feeling was assessed by evaluating whether or not the resources' features, in combination with their setting, conveyed a historic sense of the property during the period of construction. As noted previously, the integrity of setting for the property was affected by nearby development and the reduction of farmland. The original aesthetic environment has been significantly altered since the construction of the care facility and no longer conveys a historic sense of the property during its period of construction. Therefore, the buildings do not retain integrity of feeling.

7. **Integrity of Association** *[refers to] the direct link between an important historic event or person and a historic property* (Andrus and Shrimpton 2002). Integrity of association was assessed by evaluating the resources' data or information and their ability to answer any research questions relevant to the history of the San Jacinto area or the state of California. Historical research indicates that the Bradley Gardens care facility is associated with Howard Patterson and Irene Yokes, the first owners who built and operated the original facility as the Colonial Convalescent Hospital. The property was sold in 1985 to Care Net Ltd., and sold again in 1997 to Healthcare Management Systems, Inc., at which time the facility was renamed the Bradley Gardens Convalescent Center. None of these individuals or corporations were found to be historically significant or associated with any historically significant events.

Furthermore, the Bradley Gardens care facility was not found to be a unique example of a convalescent care facility in the surrounding area, nor was it associated with any unique advancements in convalescent or in-patient care. Therefore, the buildings have never possessed integrity of association.

The Bradley Gardens care facility buildings were all determined to retain integrity of location. The two medical offices also retain integrity of design and materials. None of the buildings retain integrity of setting, workmanship, feeling, or association.

CRHR and NRHP Evaluation

For a historic resource to be eligible for listing on the CRHR or the NRHP, the resource must be found significant at the local, state, or national level, under one or more of the following criteria:

- **CRHR Criterion 1/NRHP Criterion A:**
  It is associated with events that have made a significant contribution to the broad patterns of our/California's history and cultural heritage.

  It was discovered through historical research that no significant events could be associated with the Bradley Gardens care facility buildings. Because the property could not be associated with any specific historic event, the buildings are not eligible for designation under CRHR Criterion 1/NRHP Criterion A.

- **CRHR Criterion 2/NRHP Criterion B:**
  It is associated with the lives of persons significant/important in our past.

  Historical research revealed that the Bradley Gardens care facility buildings are not historically significant or associated with any historically significant events. Furthermore, the Bradley Gardens care facility was not found to be a unique example of a convalescent care facility in the surrounding area, nor was it associated with any unique advancements in convalescent or in-patient care. Therefore, the buildings are not eligible for designation under CRHR Criterion 2/NRHP Criterion B.

- **CRHR Criterion 3/NRHP Criterion C:**
  It embodies the distinctive characteristics of a type, period, region, or method of construction, or that represents the work of an important creative individual/master, or that possesses high artistic values, or that represents a significant and distinguishable entity whose components may lack individual distinction.

The Bradley Gardens care facility buildings were constructed between 1964 and 1971 in the Ranch architectural style, during the circa 1935 to 1975 period during which the Ranch style was most popular:

> The Ranch style originated in southern California in the mid-1930s, after a few earlier precursors … During the decades of the 1950s and 1960s it became by far the most popular house style built throughout the country. Often located in large subdivisions, post-World War II Ranch-house suburbs form a dominant part of many American cities – particularly those that grew in the postwar Sunbelt Boom of the 1950s and 1960s, such as Dallas, Houston, Phoenix, Los Angeles, and Atlanta. (McAlester 2015)

Identifying features of the Ranch style, as provided by McAlester (2015) include:

> Broad one-story shape; usually built low to ground; low-pitched roof without dormers; commonly with moderate-to-wide roof overhang; front entry usually located off-center and sheltered under main roof of house; garage typically attached to main façade (faces front, side, or rear); large picture window generally present; asymmetrical façade. (McAlester 2015:597)

None of the buildings were constructed as residential buildings and, as such, the attached garage feature does not apply. Of the remaining seven features listed above, the main care center building, storage building, and medical office buildings each possess five: broad one-story shape, built low to the ground; low-pitched roof without dormers; moderate eave overhangs; and asymmetrical façades. Additionally, the storage building and medical office buildings possess sheltered, off-center front entries. The main care center building features a covered porte cochere entrance that does not meet the criteria of the front entrance feature listed above.

In addition to the identifying features listed above, McAlester (2015) also distinguishes between four principal subtypes of the Ranch architectural style, including hipped roof, cross-hipped roof, side-gabled roof, and cross-gabled roof. The main care center and storage buildings fit in the cross-gabled roof subtype, the southern medical office building fits in the side-gabled roof subtype, and the northern medical office building fits in the cross-hipped roof subtype.

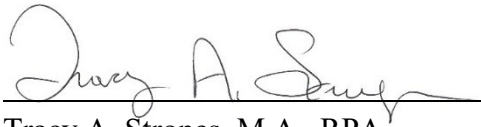
Although the Bradley Gardens care facility buildings were constructed within the circa 1935 to 1975 period of significance for Ranch-style buildings and possess several of the identifying features listed by McAlester (2015), the main care center building and storage building currently only retain one out of seven aspects of integrity, and the medical office buildings only maintain three out of seven aspects of integrity. According to the San Diego Modernism Historic Context Statement, due to the commonality of Ranch-style buildings in southern California, representative examples of the Ranch style eligible for designation on the CRHR or the NRHP should retain the majority of their character-defining features in order to be eligible for designation (City of San Diego 2007:71–74). The buildings do not retain integrity of setting and feeling and are not known to have been designed or built by an important creative individual. Therefore, the buildings are not eligible for designation under CRHR Criterion 3/NRHP Criterion C.

- **CRHR Criterion 4/NRHP Criterion D:**
  It has yielded, or may be likely to yield, information important in prehistory or history.

  The research conducted for this study revealed that because the buildings are not associated with any significant persons or events and were not constructed using unique or innovative methods of construction, they likely cannot yield any additional information about the history of San Jacinto or the state of California. Therefore, the buildings are not eligible for designation under CRHR Criterion 4/NRHP Criterion D.

4.4 Discussion/Summary

During the field survey, four historic buildings constructed as part of the Bradley Gardens care facility were identified and subsequently evaluated for significance. No additional cultural resources were observed during the survey. The buildings are evaluated as not historically or architecturally significant under any CEQA or federal significance criteria due to a lack of association with any significant persons or events and not being representative examples of any specific architectural style, period, or region. Therefore, the buildings are not eligible for the CRHR or the NRHP. Because none of the buildings are eligible for listing on the CRHR or NRHP, no mitigation measures are required for any future alterations or planned demolition of the buildings.



5.0 RECOMMENDATIONS

The archaeological study for the Bradley Gardens Project was completed in accordance with the City of San Jacinto environmental policies and CEQA significance criteria. The current study identified one resource within the project (Site Temp-1), which reflects the built environment of the parcel, consisting of four buildings constructed between 1964 and 1971. No historic or prehistoric archaeological resources were identified during the survey. The current assessment concludes that Site Temp-1 is not eligible for listing on the NRHP or the CRHR and, therefore, is not considered a significant resource. The resource has been thoroughly recorded, and no additional information can be derived from further analysis.

The proposed development of the Bradley Gardens Project will include the removal/modification of the buildings and infrastructure recorded as Site Temp-1, which will not constitute an adverse impact because the resource has been evaluated as not significant and not eligible for listing on the NRHP or CRHR. The potential does still exist, however, that historic deposits may be present that are related to the occupation of this location since the 1960s. To mitigate any potential impacts to unrecorded historic features or deposits inadvertently discovered during the development process, archaeological monitoring of project-related ground disturbances is recommended as a condition of approval.

6.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this archaeological report, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

March 13, 2026

APPENDIX A

Resumes of Key Personnel

Tracy A. Stropes, MA, RPA

Vice President of Cultural Resources/ Principal Archaeologist
BFSA Environmental Services, a Perennial Company
14010 Poway Road • Suite A •
Phone: (858) 484-0915 • Email: tstropes@bfsa.perennialenv.com

Education

Master of Arts, Anthropology, San Diego State University, California **2007**

Bachelor of Science, Anthropology, University of California, Riverside **2000**

Professional Memberships

Register of Professional Archaeologists
Society for California Archaeology
Archaeological Institute of America
Association of Oregon Archaeologists

Experience

Vice President of Cultural Resources/Principal Archaeologist **March 2009–Present**
BFSA Environmental Services, a Perennial Company
Poway, California

Tracy A. Stropes has over 33 years of experience in cultural resource management, with experience in project management, report authorship, lithic analysis, laboratory management, Native American consultation, and technical report editing for numerous projects throughout the western United States. Mr. Stropes has conducted cultural resource surveys, archaeological site testing and evaluations for National Register eligibility and CEQA compliance, mitigation of resources through data recovery for archaeological sites, budget and report preparation, and direction of crews of all sizes for projects ranging in duration from a single-day site visit to multiple years. Mr. Stropes is a Registered Professional Archaeologist (RPA) and is on the list of archaeological consultants qualified to conduct archaeological investigations in the city and county of San Diego, county of Riverside, State of Oregon, State of Arizona, and on Arizona and California BLM lands. He has served as project archaeologist for hundreds of projects and composed data recovery and preservation programs for sites throughout the western United States for both CEQA- and NEPA-level compliance.

Archaeological Principal Investigator **June 2008–February 2009**
TRC Solutions **Irvine, California**

Cultural resource segment of Natural Sciences and Permitting Division; management of archaeological investigations for private companies and local, state, and federal agencies, personnel management, field and laboratory supervision, lithic analysis, Native American consultation and reporting, NRHP and CEQA site evaluations, and authoring/coauthoring cultural resource management reports.

Principal Investigator and Project Archaeologist **June 2006–May 2008**
Archaeological Resource Analysts **Oceanside, California**

As a sub consultant, served as Principal Investigator and Project Archaeologist for several projects for SRS Inc., including field direction, project and personnel management, lab analysis, and authorship of company reports.

Project Archaeologist **September 1996–June 2006**
Gallegos & Associates **Carlsbad, California**

Project management, laboratory management, lithic analysis, field direction, Native American consultation, report authorship/technical editing, and composition of several data recovery/preservation programs for both CEQA and NEPA level compliance.

Project Archaeologist **September 1993–September 1996**
Macko Inc. **Santa Ana, California**

Project management, laboratory management, lithic analysis, field supervision, and report authorship/technical editing.

Archaeological Field Technician **January 1993–September 1993**
Chambers Group Inc. **Irvine, California**

Archaeological excavation, surveying, monitoring, wet screen facilities management, and project logistics.

Archaeological Field Technician **May 1992–September 1992**
John Minch and Associates **San Juan Capistrano, California**

Archaeological excavation, surveying, monitoring, wet screen facilities management, and project logistics.

The Honorable Board of Supervisors
Court House
Riverside, California

SUBJECT: Variance Case No. 496
Everett H. Pettengill and Irene Tobin
Convalescent Hospital
Zone A-1-5
Hemet-San Jacinto District

Fifth Supervisorial District

Gentlemen:

Pursuant to the request of your honorable Board dated February 26, 1963, the Planning Commission respectfully recommends the following conditions for the operation and maintenance of a convalescent hospital in the A-1-5 Zone of Hemet-San Jacinto:

1. That development of the premises conform substantially with that shown on plot plan marked Exhibit "A" (2 pages) on file with Variance Case No. 496 in the office of the Riverside County Planning Commission.

2. That curb and gutter be installed at a grade and alignment approved by the Riverside County Road Commissioner along the 7th Street frontage of the property, and that the existing road paving be extended to the into said curb and gutter, and further that said improvements be done at no cost to any government agency.

3. That a 6-foot concrete block wall be erected around the perimeter of the property with consideration with the exception that a 12-inch concrete block wall may be erected along the 7th Street frontage. OR CHAIN LINK BY BERGER

4. That all open areas shown on Exhibit "A" be established in lawn and be planentably landscaped and maintained at all times.

5. That all driveways and parking areas be paved with not less than two (2) inches of asphaltic material.

105018

[redacted]

6. [redacted] with all State requirements as well as requirements of the Health Department and the Department of Building and Safety of the County of Riverside.

7. [redacted] within 6 months of the effective date of approval, otherwise it shall be null and void and of no effect whatsoever.

RE: REPORT AND RECOMMENDATION OF HEARING BOARD

DATE: JANUARY 9, 1963

SUBJECT: VARIANCE CASE NO. 496
Howard H. Patterson and Irene Yokes
Convalescent Hospital
Zone A-1-5
Hemet-San Jacinto District
Fifth Supervisorial District

FACTUAL DATA: Nine (9) notices of this hearing were mailed to those persons whose names and addresses appeared on the latest available assessment roll of the County Assessor as property owners of record within a 300-foot radius of the boundaries of the property under consideration. Thirteen (13) additional notices were mailed to other interested persons and organizations and to other government agencies.

PLOT PLAN: The plan, consisting of two pages, indicates a 76 bed hospital with parking area adjacent to 7th Avenue with four entries.

STAFF REPORT: The request for variance covers 2.6 acres in an A-1-5 Zone for a convalescent hospital.

SUMMARY

PROPONENTS: Howard H. Patterson, P. O. Box 124, Hemet (applicant)
Irene Yokes, P. O. Box 124, Hemet (applicant)
John Longrin, Contractor

OPPONENTS: None

ADVISORY: Ray C. Smith, Land Use Administrator

Mr. Patterson and Irene Yokes, applicants, appeared and stated that they were ready to go ahead with the project, had owned the property for two years, intended a 76-bed hospital, and stated that no farm water was available but domestic water was available for the hospital. Their reason for hardship was stated to be that the land was too small to farm (less than 5 acres) and that no water was available. The matter of the cattle feed yard and chicken ranch was discussed. Mr. Longrin, contractor for the hospital, stated that there was fire protection and water and requested a continuance to establish a hardship.

FINDINGS: 1) That the evidence submitted by the staff is correct. 2) Since the applicant had previously been advised to be prepared to establish a legal hardship, the Board felt that the matter should be decided upon. 3) No legal hardship was established by the applicants.

RECOMMENDATION: That the permit be denied.

HEARING BOARD MEMBERS CONCURRING: Commissioners Perry and Katzenstein, and R. C. Lober.

Case No. 496

APPLICATION FOR VARIANCE

As Provided by Article XIX of Zoning Ordinance
ORDINANCE NO. 348

COUNTY OF RIVERSIDE, CALIFORNIA

TO: THE RIVERSIDE COUNTY PLANNING COMMISSION:

I. NAME OF APPLICANT Howard M. Patterson & Irene Yokes

~~XXXXA~~. Only the following persons may file. Applicant must indicate under what capacity he is filing by placing (x) in block provided.

XXX 1. The record owner of the land. (If in escrow, give Escrow No. _____.)

2. The purchaser thereof under a contract in writing duly acknowledged by both the buyer and the seller. (COPY OF CONTRACT MUST BE ATTACHED.)

3. The lessee in possession of the property, with the written consent of the record owner. (WRITTEN AUTHORIZATION MUST BE ATTACHED.)

4. The agent of any of the foregoing, duly authorized thereto in writing. (WRITTEN AUTHORIZATION MUST BE ATTACHED.)

II. PROPERTY IN QUESTION

A. Street address of property 39151 Seventh Ave, San Jacinto, Calif.
Situated on the South side of said street between
Gilbert and Grand

B. Legal description of real property located in the County of Riverside must be accurately described as per Riverside County records.
Estedulla Land And Water Co. Add. MB. 9 410 SD.
Lot 14 And West 160 Feet of Lot 13. 2.87 A.

(If more space is needed for above description, please attach supplementary sheet.)

C. Date of acquisition of property. June 1, 1961

D. Outline deed restrictions pertinent to this application. (Any permit granted pursuant to this petition shall not affect deed restrictions of record.) None

E. Land use of property. Idle

III. APPLICANT'S REQUEST

A. Outline in space below in clear and concise wording what you are requesting for the property in question. Before this application is accepted, there must be attached a plot plan drawn to scale showing boundaries and dimensions of the property, width of boundary streets, all existing improvements on property, and plans and elevations of all proposed new improvements. Applicant must file with this application evidence of his ability and intention to proceed with the actual construction work in accordance with said plans within six (6) months from date of filing this application.

B. Legal description of real property located in the County of Riverside must be accurately described as per Riverside County records.
Estedulla Land And Water Co. Add. MB. 9 410 SD.
Lot 14 And West 160 Feet of Lot 13. 2.87 A.

(If more space is needed for above description, please attach supplementary sheet.)

C. Date of acquisition of property. June 1, 1961

D. Outline deed restrictions pertinent to this application. (Any permit granted pursuant to this petition shall not affect deed restrictions of record.) None

E. Land use of property. Idle

III. APPLICANT'S REQUEST

A. Outline in space below in clear and concise wording what you are requesting for the property in question. Before this application is accepted, there must be attached a plot plan drawn to scale showing boundaries and dimensions of the property, width of boundary streets, all existing improvements on property, and plans and elevations of all proposed new improvements. Applicant must file with this application evidence of his ability and intention to proceed with the actual construction work in accordance with said plans within six (6) months from date of filing this application.
A Seventy Six Bed Convalescent Hospital

B. State what exceptional or extraordinary circumstances or conditions there are applicable to the property involved, or to the intended use of the property, and explain why these conditions do not apply generally to other property adjacent to your property and in the neighborhood.

The proposed use requires a large portion of land which is satisfied by the size and shape of the parcel involved. Many of the neighboring parcels are too small for similar use. Adjacent property, presenty not developed and not need, would not be affected by granting of the requested variance.
Also, this parcel has existing adequate utilities (water, gas, and electric) at the parcel frontage. Many parcels looked at by the applicants did not have the necessary utilities, which would have ~~located~~ great expense to have such utilites made available.

C. State why the granting of this Variance as requested is necessary to do substantial justice to the applicant and to avoid practical difficulty, unnecessary hardship and results inconsistent with the general purpose of the Zoning Ordinance.

Applicant has the necessary experience, abilities and backing for the construction and operation of the proposed convalescent hospital. Granting of this variance will permit construction of a substantial improvement ~~involving a considerable investment and adding greatly~~ to neighboring property values.

D. State why the granting of this variance as requested will not result in material damage to other property in the neighborhood, nor be detrimental to the public safety or welfare.

The proposed use will in no way bring about any material damage or create any hazards for other property in the area. On the contrary, the improvement will benefit the entire community through improved and expanded facitities for the proposed use (such as road improvement, curbs and gutters, power and water facilities, etc.).

NOTE: It is desirable but not mandatory to have the signature of owners of adjacent property certifying that they have no objection to the establishment of the use as applied for in this application.

We, the undersigned owners of property in the vicinity of the property legally described in this APPLICATION FOR VARIANCE, hereby certify that we do not object to the granting of this application.

SUMMARY

PROPONENTS: Howard H. Patterson, P. O. Box 124, Hemet (applicant)
Irene Yokes, P. O. Box 124, Hemet (applicant)
John Longrin, Contractor

OPPONENTS: None

ADVISORY: Ray C. Smith, Land Use Administrator

Mr. Patterson and Irene Yokes, applicants, appeared and stated that they were ready to go ahead with the project, had owned the property for two years, intended a 76-bed hospital, and stated that no farm water was available but domestic water was available for the hospital. Their reason for hardship was stated to be that the land was too small to farm (less than 5 acres) and that no water was available. The matter of the cattle feed yard and chicken ranch was discussed. Mr. Longrin, contractor for the hospital, stated that there was fire protection and water and requested a continuance to establish a hardship.

FINDINGS: 1) That the evidence submitted by the staff is correct. 2) 2) Since the applicant had previously been advised to prepared to establish a legal hardship, the Board felt that the matter should be decided upon. 3) No legal hardship was established by the applicants.

RECOMMENDATION: That the permit be denied.

HEARING BOARD MEMBERS CONCURRING: Commissioners Perry and Katzenstein, and R. C. Lober.

HEARING BOARD

WORK SHEET
NOTICE OF PUBLIC HEARING

VARIANCE CASE NO. 496

NOTICE IS HEREBY GIVEN that a public hearing will be held before the Riverside County Planning Commission Hearing Board on the application of Hazel Estes (name of applicant or commission initiative) made pursuant to Article XIX and Article XXa, Ordinance No. 348, Riverside County Zoning Ordinance for a variance to said Ordinance permitting the establishment of Convalescent Hospital

in zone A-1-5 (Light Farming Cattle) on property located at the SE corner of 7th St and Grand Ave

in the Hemet San Jacinto District

and more particularly described as follows:

Lot 12 and the west 160 feet of Lot 13 of Estudillo Land & Water Co as shown by map on file in Book 9 Page 410, SD Co. R.

Said public hearing will be held on Wed (day of week), Jan. (month), 9 (day of month), 1963 (year), at 9:50 o'clock A.M., ~~P.M.~~ in the Board of Supervisors Room, Court House, Riverside, California, at which time and place pertinent testimony will be heard.

FORM 418

OFFICE OF THE CLERK OF THE BOARD OF SUPERVISORS

County of Riverside, State of California

1:30 P.M. being the time heretofore set for hearing the appeal of Patterson and Yokes from the denial of a zoning variance in Case No. 496, for establishment of a convalescent hospital in the Hemet-San Jacinto District, the Chairman called the matter for hearing.

The recommendation of the Planning Commission was presented and was explained by the Planning Director.

Irene Yokes spoke in support of the appeal.

It appearing that no one else present desired to be heard on the matter, the Chairman declared the hearing closed.

On motion of Supervisor McCall, seconded by Supervisor Cook and duly carried by unanimous vote, IT WAS ORDERED that this matter be referred back to the Planning Commission for its recommendation on conditions to be attached to the variance if granted. Said recommendation to be returned to the Board not later than March 11, 1963.

RJS:21399 (1963)

Gentlemen:

An on site inspection was made this date regarding subject case.

The Convalescent Hospital is nearing completion. Workmen were working on the building which is approximately 90% complete.

A chain link fence was erected around the property, which was an exception granted by the Board of Supervisors.

No curb and gutter or parking area was installed.

A follow up report on this case will be made in June 1964.

Yours very truly,

Gentlemen:

A recent on site inspection was made concerning subject Variance Case No. 496. All Items have been complied with, except Items 2 and 6.

A Memo is on file from the Road Department stating that Item 2 requiring curb and gutter is not feasible at this time.

Regarding Item 6 a Memo has been sent to the Riverside County Health Department requesting they advise your office as to compliance with the Health Department requirements.

If there are no objections from the Health Department, recommend this case be closed.

Very truly yours,

PLANNING COMMISSION

This will acknowledge receipt of three sets of Revised Final Plans, Sheets 0 through 13. These plans may be identified by our date stamp of September 13, 1963. Copies have been sent to the Office of the State Fire Marshal. The Fire Marshal's report will be forwarded to you separately.

Review of your plans by the Architectural and Licensing Sections of the Bureau of Hospitals with respect to the requirements of Title 17, California Administrative Code, discloses substantial compliance with the Code, with one exception. The letter which was submitted with regard to compliance to local zoning requirements appears to be a recommendation approving the variance submitted by the Riverside County Planning Commission to the Riverside County Board of Supervisors. Final approval by the Riverside County Board of Supervisors is not indicated. It is also pointed out that the variance permit must be used within six months of the effective date of approval. It is assumed that this effective date of approval is the date on which the approval of the Board of Supervisors was issued.

Approval of your plans is issued contingent upon your providing this Department with a current approved variance permit as issued by the Riverside County Board of Supervisors, or by the Riverside County Planning Commission, indicating approval by the Board of Supervisors.

Approval of your plans is further contingent upon concurrence by the State Fire Marshal and upon compliance with all local codes and ordinances.

COPY

It should be understood that final approval and acceptance for licensure is subject to field inspection and determination that the facility, as completed, is in accordance with the requirements of Title 17, California Administrative Code.

Very truly yours,

John R. Derry, Acting Chief

SUBJECT: Variance Case No. 496
Howard H. Patterson and Irene Yokes
Convalescent Hospital
Zone A-1-5
Hemet-San Jacinto District

Fifth Supervisorial District

Gentlemen:

Pursuant to the request of your honorable Board dated February 26, 1963, the Planning Commission respectfully recommends the following conditions for the operation and maintenance of a convalescent hospital in the A-1-5 Zone of Hemet-San Jacinto:

1. That development of the premises conform substantially with that shown on plot plan marked Exhibit "A" (2 pages) on file with Variance Case No. 496 in the office of the Riverside County Planning Commission.

2. That curb and gutter be installed at a grade and alignment approved by the Riverside County Road Commissioner along the 7th Street frontage of the property, and that the existing road paving be extended to tie into said curb and gutter, and further that said improvements be done at no cost to any government agency.

3. That a 6-foot concrete block wall be erected around the perimeter of the property under consideration with the exception that a 42-inch concrete block wall may be erected along the 7th Street frontage.

4. That all open areas shown on Exhibit "A" be established in lawn and be pleasantly landscaped and maintained at all times.

5. That all driveways and parking areas be paved with not less than two (2) inches of asphaltic material.

6. That the use contemplated meet all State requirements as well as requirements of the Health Department and the Department of Building and Safety of the County of Riverside.

7. That this permit shall be used within 6 months of the effective date of approval, otherwise it shall be null and void and of no effect whatsoever.

Respectfully submitted,

Fifth Supervisorial District

Gentlemen:

The Planning Commission respectfully reports denial of the attached application of Howard H. Patterson and Irene Yahne, P. O. Box 184, Hemet, California for a variance to establish, operate, and maintain a convalescent hospital in Zone A-1-5 (Light Agriculture - 5 acre minimum lot size) on property located at the northwest corner of 7th Street and Grand Avenue in the Hemet-San Jacinto District.

Pursuant to Ordinance 348, a public hearing was held on this matter before the Planning Commission Hearing Board on January 9, 1963. A summary of evidence presented and the findings and recommendations of the Hearing Board are attached hereto. The Commission, at its regular meeting on January 29, 1963 approved and adopted the findings and recommendations of the Hearing Board.

No further action is required by your Board unless an appeal is filed by the applicant or some property owner within 300 feet of the exterior boundaries of the property under consideration within seven days of the date this report first appears on your Board Agenda, or the Board on its own motion orders the application transferred to it for further proceedings.

To whom it May Concern:

In the latter part of May 1961, acting as Broker, I sold to Mr. Patterson - a parcel of land on Seventh St in San Jacinto. After looking over this Community for several Weeks, this plot of ground was the only place suitable for Mr. Patterson's intended use: which was a location, meeting all specifications, to build a Nursing or rest home.

Sincerely,

Marvin Tipler

December 5, 1962

Mr. Howard H. Patterson
P. O. Box 124
Hemet, California

SUBJECT: Variance Case No. 496

Dear Mr. Patterson:

Your application for variance has been brought to my attention for processing and I find numerous changes that should be made on your plot plan which I have indicated on the returned map. Kindly furnish us with two revised plot plans showing these corrections.

I hope that you are fully aware of the fact that you must establish a legal hardship at the time you present your matter to the Hearing Board. My first impression of a convalescent hospital in the A-1-5 Zone strikes me as being a matter which would be difficult to prove hardship.

Very truly yours,

RIVERSIDE COUNTY PLANNING COMMISSION

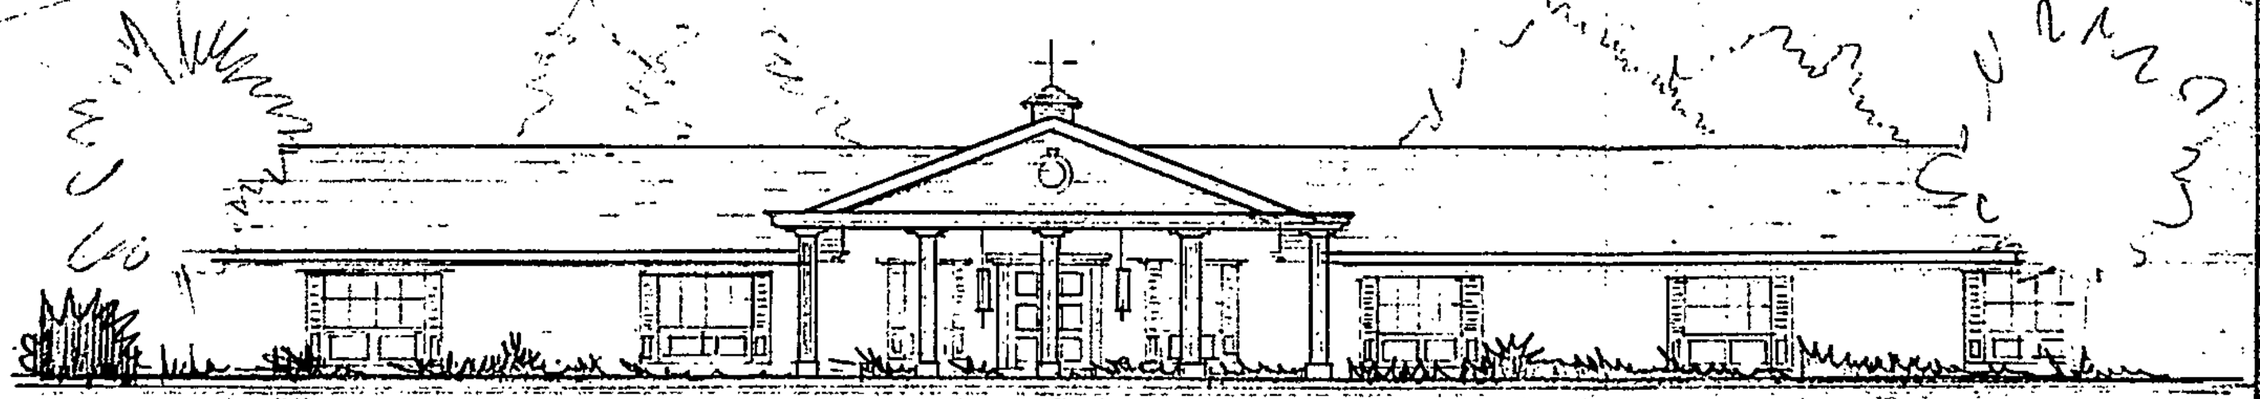
NOTICE OF PUBLIC HEARING VARIANCE CASE NO. 496



NOTICE IS HEREBY GIVEN that a public hearing will be held before the Riverside County Planning Commission Hearing Board on the application of Howard Patterson and Irene Yokes made pursuant to Article XIX and Article XXa, Ordinance No. 348, Riverside County Zoning Ordinance for a variance to said Ordinance permitting the establishment of a convalescent hospital in Zone A-1-5 (Light Agriculture - 5 Acre Minimum Lot Size) on property located at the southeast corner of 7th Street and Grand Avenue in the Hemet-San Jacinto District and more particularly described as follows:

Lot 14 and the W 160 ft. of Lot 13 of Estudillo Land & Water Co. as shown by Map on file in Book 9 Page 410, San Diego County records.

Said public hearing will be held on Wednesday, January 9, 1963, at 9:50 o'clock A.M., in the Board of Supervisors Room, Court House, Riverside, California, at which time and place pertinent testimony will be heard.

RIVERSIDE COUNTY DEPARTMENT OF BUILDING AND SAFETY
CORRECTION NOTICE

To: _____ Permit No. 212643

Address: 39241 Jay Date: 9-5-72

FINAL STRUCTURAL INSPECTION—U.B.C., 1970 EDITION

1. Slope Finish grade away from building ½" per foot for 3' from building. (Ord 457).
2. Finish grade to be 6 inches below wood (2905).
3. Counterflash chimney. (3208).
4. Firewall: door to be solid core 1⅜" and self-closing (503).
5. Back wall on planter shall be 6" above outside wall of planter (Sec 2517)
6. Glass not fixed. Door not self-closing. (Sec. 1412).
7. Hand rail or guard rail. Intermediate rails 9" max. apart. (1714).

FINAL ELECTRICAL INSPECTION

* National Electrical Code, 1968 Edit.
x Uniform Wiring Code, 1968 Edit.

1. Install missing blanks in main service or sub panel dead front. (230-62 *).
2. Place circuit identification on panel board (170 21 x).
3. Electric service ground clamp shall be accessible at all times and securely fastened. (111.5 x).
4. Receptacles shall be installed in _____ room. (210-22(b)* 170.13x).
5. Fixtures or plates shall be installed in _____ room. (410-12 *).
6. Cord connection has not been installed on disposal unit. (170.9 x).
7. Properly connect hood fan over range. (250-57 (a)(b) * 400-4 * 150.12x).
8. Make provision for heating unit or air handler to be connected to electrical supply.
9. Weatherproof covers on exterior outlets. (370-5 *).
10. Exterior wiring to be in weatherproof raceways or approved open wiring. (50.8 x).
11. Provide the space for the minimum of 20 overcurrent devices. (140.3x).
12. Provide disconnect for A.C. and/or air handlers (170.22x).
13. Provide correct wire sizes for appliances (310, 430*).

FINAL PLUMBING INSPECTION—U.P.C., 1970 EDITION

1. Permanent water supply to be connected to building before final (1001).
2. Hot and cold are cross-connected. (1003).
3. Trap leaks _____ (318).
4. No slip joint on outlet side of trap. (703).
5. Clean breather holes on vent buckets. (1315).
6. Shower enclosure not watertight at walls. (909).
7. Water heater burners or heating elements shall be 18" from floor. (1310).
8. Water heater shall have protective barrier in front. (1310).
9. Separate combustion air and return air intakes by 10' min. (706 Vol. II U.B.C.).
10. Mastic around pipes extending through flashing. (506).
11. Gas gauge down; must hold 10 lb. pressure for 15 min. (1206).
12. Gas gauge defective; replace. (1206).
13. Seal floor and door of furnace room. (706 Vol. II U.B.C.).
14. Water service line shall be of same material as house lines. (1004).
15. Full way gate valve to be accessible on service line and at water heater. (1005).
16. Support conductor vent pipe on water heater _____, furnace _____ (1315).
17. Toilets to be sealed water tight at floors. (907).
18. Anti-syphon Ball cock required on toilet. (1003).
19. No appliance or equipment permitted in lot setback. (Ord. 348).
20. More combustion air required for water heater ( ), furnace ( ), top ( ), bottom ( ), (1307).
21. Furnace compartment too small. (704 Vol. II U.B.C.).

1. The development of the premises shall conform substantially with that as shown on plot plan marked Exhibit "A" on file with Public Use Case No. 225 in the office of the Riverside County Planning Commission unless otherwise amended by the following conditions.

   a. Use shall be limited to a 107 bed convalescent hospital.

2. Prior to the issuance of a building permit or any use contemplated by this permit, a bond for the cost of curb and gutter and tie-in paving shall be deposited with the Road Commissioner By January 1, 1972 said curb and gutter and tie-in paving shall be installed at no cost to any government agency, at a grade and alignment approved by the Riverside County Road Commissioner on 7th Street.

3. Prior to the issuance of a building permit for construction of any use contemplated by this approval, the applicant shall first obtain permits and/or clearance from the following public agencies:

   Department of Public Health
   State Division of Forestry

   Road Department

   Written evidence of said permit or clearance from the above agencies shall be presented to the Land Use Division of the Department of Building and Safety at the time of the issuance of a building permit for the use contemplated herewith.

4. This approval shall be used within 2 years, after final proceedings before the Board of Supervisors, otherwise it shall become null and void and of no effect whatsoever. By "use" is meant beginning of construction of the hospital addition.

AGREEMENT

I accept and agree, prior to use of this permit ro approval, to comply with all of the conditions set forth, and understand that the Office of Building and Safety will not issue a Building Permit, or allow occupancy on the use permitted until this signed confirmation, in quadruplicate, has been received by the Planning Commission.

(558-728)
1:45 P.M. PUBLIC HEARING
PUBLIC USE CASE NO. 225
Colonial Convalescent Hospital, Inc.
Expansion of Convalescent Hospital
Zone A-1-5
Hemet-San Jacinto District
Fifth Supervisorial District

Property located at the rear of southwesterly corner of Seventh and Gilbert Street

(Hearing opened 1:45 p.m., closed 2:10 p.m.)

PRESENTATION: Mr. Stokes presented the subject application together with all maps pertinent thereto, surrounding property owners having previously been notified according to the provisions of Ordinance No. 348. The applicant plans and expansion of existing facilities because there is a need for long-term care and care for the mentally ill. The Land Use Map would indicate a few single-family dwellings and scattered agricultural uses across 7th Street from the facility. The area south of 7th Street, for the most part, is vacant. The existing facility has 45 beds. It is the applicant's intent to add 62 beds, making a total of 107 beds. The staff recommends approval. No

report has been received from the Hospital Planning Association as to need.

(Mr. Broiles administered oath to all persons wishing to present testimony.)

PROPONENTS: Jean E. Reed, 39410 West Seventh Street, West San Jacinto
(representing applicant)
Sam Kalfayan, City Manager, City of San Jacinto

OPPONENTS: None

Mrs. Reed, Administrator, Colonial Convalescent Hospital, Inc., said that she had a report from the State Department of Public Health as to need of the type of facilities for psychiatric, alcoholic, and long-term patients which they expected to offer. The estimated bed need for 1973 is 121; 15 beds are under construction , leaving future needed balance of 106. Of the 62 beds which they intended to add, 52 would be for mental and alcoholic patients; the other ten beds would be for extended care patients. They now had a turn-over of 45 beds each month. They had gone into rehabilitation and the high rate of turn-over made Social Security very happy in that it showed that they were doing a good job. She stated that they expected to work closely with Hemet Psychiatric which took patients for only a few days or weeks and then treated such persons on an out-patient basis. They could assist Hemet Psychiatric by releasing the patient load so that that facility might concentrate its attentions on the acutely ill. Last summer her hospital had had to turn down two or three patients each day. The mental hygiene section would be separated from the rest of the facility by a locked door. They employed between 30 and 40 people. She explained that Extended Care Facilities as required by Social Security, required that a registered nurse be the only one of its kind in San Jacinto. They cared for both Medical and Medicare patients. Seven letters and a petition with fifteen signatures were filed in favor of the use.

Mr. Kalfayan said that although the hospital was outside the formal boundaries of the City of San Jacinto, it was still within the City's area of influence. Last year the City had 250 arrests involving intoxicated persons. 160 of these were known alcoholics that invariably came back; these people were booked for 24 hours and then released. At the present time there was no institution of this type within driving distance of San Jacinto. He felt that the facility would be of great help to the City in dealing with this particular problem.

Mrs. Reed stated that the proposed conditions were satisfactory.

There being no further testimony, the Chairman declared the public hearing closed at 2:10 o'clock p.m.

FINDINGS: 1) The evidence presented by the Staff was correct. 2) The use was found to be necessary at this location. 3) With the conditions attached, the use will not be detrimental to the public welfare.

MOTION: It was regularly moved by Commissioner Katzenstein, seconded by Commissioner Miller and unanimously carried that the Hearing Board recommend that the Planning Commission approve Public Use Case No. 225 subject to the conditions as proposed.

- - - - - -

STAFF REPORT

October 23, 1969

TO: Riverside County Planning Commission

RE: PUBLIC USE CASE NO. 225
Colonial Convalescent Hospital, Inc.
Expand a Convalescent Hospital
Zone A-1-5
Hemet-San Jacinto District

STAFF RECOMMENDATION: The staff recommends APPROVAL of the expansion of the convalescent hospital to increase the number of beds from 45 to 62 providing the Riverside Hospital Planning Association finds there is a need for the additional beds.

APPLICANT'S REQUEST: The applicant is requesting expansion of the convalescent hospital, stating in his application that there is a need for long term patient care and care for the mentally ill. The applicant further states that the expansion will not damage or prejudice other property in the vicinity.

DESCRIPTION OF PROPERTY AND SURROUNDING AREA: The property on the south side of Seventh Street and the properties to the east and west are for the most part vacant with the exception of the convalescent hospital and several dwellings to the east. There are numerous lemon on the north side of Seventh Street having agricultural uses to the rear of the homes. The zone is A-1-5.

PLOT PLAN: The plot plan proposes the addition of 62 beds, bringing the total to 107 with 35 parking spaces. The new addition will be to the rear of the existing convalescent hospital. There is sufficient right of way on Seventh and, therefore, there will be no need to alter the present landscaping and parking adjacent to the present right of way.

CORRESPONDENCE: The City of San Jacinto has commented on the matter and generally have no objection to it.

Mr. Elmer Katzenstein, Chairman
Riverside County Planning Commission
4080 Lemon Street
Riverside, California

Dear Mr. Katzenstein:

It has come to my attention that the owner-operators of the Colonial Convalescent Hospital on the outskirts of San Jacinto have applied for the Riverside County Planning Commission's approval to expand their present facilities.

The City of San Jacinto has neither an hospital or a convalescent home within its corporate limits. In housing elderly and ill citizens the Colonial Convalescent Hospital is our community's one local salvation. In addition to our normal need for such an institution there is a dire need for medical care of alcoholics and mental hygiene patients.

The applicants in this case are asking the permission of your august body to construct a building that will house 109 additional beds. On Thursday, October 23, the Hemet Valley Hospital Board of Directors proudly opened the doors to its Mental Health Center. Dr. Thomas, Director of the Center, took pains to explain that their institution will be geared to handle only acute mental cases - patients who may be assisted as much as possible during short periods of stay. Due to lack of quarters the Center must "farm out" long-term care patients to foster homes, nursing homes and half-way houses. The availability of additional 109 beds in the proposed expansion of our Colonial Convalescent Hosptial can become, in reality, an adjunct to the needs and pruposes of the Hemet Valley Community Mental Health Center. The Colonial Convalescent Hospital already has a psychiatrist, Dr. Phillip Lawlar, on its staff who will undoubtedly work in harmony with Dr. Thomas of the Hemet Mental Health Center. Enclosed is the informational literature the Center is distributing for the layman's knowledge.

As the Mayor of the City of San Jacinto, I implore the Commission's serious consideration of this community's medical and convalescent home needs. I am certain your study of our needs will convince you to approve the application as requested by the Colonial Convalescent Hospital, Inc. Thank you for your decisions.

Sincerely,

Ray A. Brooks

WHAT IS THE HEMET VALLEY COMMUNITY MENTAL HEALTH CENTER?

It is a public, non-profit psychiatric facility which provides a comprehensive coordinated program of mental health services located in a recent addition to the Hemet Valley District Hospital.

WHAT PURPOSE DOES IT SERVE?

1. The Center intends to provide a varied range of accessible and coordinated psychiatric services designed to help prevent mental illnesses and to diagnose and treat mental disorders.
2. Through the Center's service program provided within a specific geographic area, any person can find the type of care he needs, when he needs it, as close to his home as possible.
3. By evaluation and research, improved programs will evolve.

WHAT ARE THE ESSENTIAL ELEMENTS OF SERVICE TO BE PROVIDED?

As soon as sufficient staff can be recruited the following "essential" services will be developed:

1. Outpatient care which offers patients individual group or family therapy while permitting them to live at home and go about their daily work and social activities.
2. Partial hospitalization which offers either care for patients able to return home evenings or night care for patients able to work days but are in need of further therapy and are usually without suitable home arrangements. Week-end care may be developed later for patients with special problems.
3. Inpatient care will include provision of fifteen beds for patients who require 24-hour hospitalization. All modalities of treatment will be available.
4. Emergency "crisis-oriented" care which offers psychiatric services at any hour around-the-clock on a walk-in basis at first only in the Center, but subsequently through mobile teams it is planned to serve agencies, facilities and homes in communities within the "catchment service area".
5. Mental Health Consultation and Education services also will be made available by Center staff to community agencies and professional personnel, such as Family Service.
6. For a full and comprehensive program in the future, it is planned to develop the following additional services as staffing and funds permit: Evaluation and research to determine program effectiveness and to analyze needs of the area to be served; Diagnostic and screening services, plus pre-care and after care including patient follow-up in foster homes, nursing homes and half-way houses; Rehabilitation services of both social and vocational types; and University affiliated training for all types of mental health personnel who serve the Center's patients.
7. Special services - will ultimately be provided for children, the elderly, alcoholics, drug users, and potential suicides.
8. Continuity of care for patients in coordinating the above ten services represents the most advanced psychiatric thinking concerning the modern treatment of the mentally ill. It is probably the key concept of the Hemet Valley Community Mental Health Center's program. These coordinated services enable the patient to move easily from one type of treatment to another as his needs dictate. Treatment, therefore, at any time is appropriate to the course of his illness.

WHO IS ELIGIBLE FOR THESE SERVICES?

These services must be available and accessible to all persons in the Center's "catchment area" without regard to age, sex, race, creed, national origin, diagnosis or ability to pay for care.

A "Catchment area" is defined as a geographic area containing census tracts with a total population "not less than 75,000 nor more than 200,000 persons".

HOW MUCH DOES THE SERVICE COST?

In no event will the fee exceed the actual cost of providing the specific service required.

WHAT IS THE ORGANIZATIONAL STRUCTURE OF THE CENTER?

The Mental Health Center is administered by the Board of Directors of the Hemet Valley Hospital District. The Board consists of five members elected for four year term by public ballot of the registered voters of the geographical district which was determined by the Riverside County Board of Supervisors in 1946.

HOW WILL THE COMMUNITY PARTICIPATE?

1. In order to develop a Community Mental Health Center which will have a stable base in the community and be responsible to the needs for solving those problems which the community identifies as most urgent, the Hemet Valley Hospital District Board of Directors proposes to develop a Mental Health Advisory Council of twelve members to serve in an advisory capacity to both the Board and the Center Director. The Council will consist of a rotating membership which will be representing both the geographical locations within the catchment area and individual interests within these locations.

2. It is further proposed that a nine member Professional Advisory Council be appointed by the Board to advise on the technicial aspects of mental health program planning.

3. Finally, plans currently are being made to expand the opportunities for interested citizens to participate directly through the Hospital Auxiliary and other volunteer activities related to the Mental Health Center Program. For information call the Hospital. The number is (714) 658-9471.

WHAT IS THE APPLICATION PROCEDURE?

1. Requests for psychiatric services may be made initially from 8:30 to 5:00 P. M. daily through the Hemet Valley Hospital at 1116 East Latham Street in Hemet, California by calling (714) 658-9471.

2. Depending upon the staff available and the rate of inacituting the various essential service elements, appointments will be set up initially for both direct patient care and indirect patient care and indirect mental health consultation and education services according to priorities developed by the advisory council.

3. Emergency crisis-oriented psychiatric treatment and referral can be provided through the Hospital Emergency Room on a very limited basis from 8:30A.M. to 11:30P.M.

4. General information regarding community psychiatric researches including the HOT LINE can be obtained on a 24-hour basis by calling the Hospital (714) 658-9471.

October 27, 1969

Gentlemen:

It has come to my attention that the only convalescent hospital in our community, the "Colonial" has made plans for the expansion of its facilities.

We understand that this expansion will add 52 beds to the present 44 bed facility and make available accomodations and services to patients who to some degree are mentally deficient.

As a businessman in this community of retired people, I am well aware of the need for this addition. It should do much to serve our community and we respectfully ask that your department give favorable consideration to any requests which the Colonial people might make concerning this community improvement.

I am also familiar with the area surrounding the hospital property. You will no doubt observe that most of the property has appreciated in value to the extent that it is no longer practical to make agricultural use of the land. We, therefore, suggest that the hospital and its planned expansion will not only serve a need but also assist our community in making an orderly and desireable transition from the present zoning to a more desireable usage.

We, therefore, again respectfully ask and recommend approval of any request which the Colonial people may make in order that this expansion can be effected.

Sincerely,

Hale Leonard

Attention: Mr. Katzenstein, Chairman

Gentlemen:

The County Planning Department's routine form letter requesting this City's point of view on Public Use Case No. 225 re: the application of Colonial Convalescent Hospital, Inc. for expansion passed over my desk recently. Although our Planning Commission conveyed its views through the office of the City Planning Director, I consider this particular case of sufficient importance to our community to express the position of this Office for your consideration.

The applicants of Case No. 225 had discussed with me on previous occasions our common problem of housing and caring for alcoholics and mental hygiene patients. I am sure you know that no medical institution rendering such specialized service exists within reasonable travelling distance from here. During 1968 our Police Department logged 212 drunk bookings. Of these there were 86 local residents apprehended and 88 out-of-towners who needed special care. In the absence of an institution geared for such alcoholics we had to release and allow them to fend for themselves. As the figures show the added problem of out-of-towners equalled our own alcoholic residents.

The need for housing and caring for alcoholics and mental hygiene patients in this area, for as many as 100 (and over) beds was verified early this calendar year through a letter by the State Department of Public Health. The Colonial Convalescent Hospital's present 44 beds present a very inadequate housing problem for our community's convalescent patients' needs. The June 1969 county-wide special census figures showed that 41% of San Jacinto's population is over 50 years of age. As the City Manager of the City of San Jacinto, I am in daily contact with the relationship between this abnormal age factor in our community and the inadequacy of beds for convalescing patients and emergency callers. In addition to our normal municipal services our police and fire departments render resuscitator and emergency call aid. The lack of housing facilities for such patients in our area is a matter-of-fact common knowledge to us.

Further substantiation of this acute problem is verified by the statement taken in toto from the Hemet-San Jacinto Area General Plan (adopted by the governments of Hemet, San Jacinto and Riverside County), Public Facilities chapter (page 74):

> "Long-term care hospital needs for the Valley by 1980 may be as many as 400 beds based on California State Department of Public Health standards because of the expected high per cent of population aged 65 and over. The 170 conforming beds available in 1967 do not meet current needs and,

therefore, expansion of these facilities is recommended. The General Plan recommends that new convalescent and long-term hospitals be located in quiet areas protected from heavy highway traffic and industrial or other possible noise generators."

With the above-noted facts brought to your attention we hope your decision will favor the needs of our community, namely, the expansion of the Colonial Convalescent Hospital.

Thank you in advance for your cooperation.

Respectfully,

Sam Kalfayan

Asst. Administrator
Colonial Nursing Home
39241 Seventh Street
San Jacinto, California

Dear Miss Reed:

PSYCHIATRIC LONG-TERM CARE

In reply to your request for estimates of long-term psychiatric care bed need, we are providing you with the following information taken from the 1968-69 California State Plan for Hospitals.

San Jacinto is in Catchment Area 139 as defined in the California State Plan for Community Mental Health Centers, 1968-69. Estimated need for long-term psychiatric care facilities and existing beds in this area are summarized below:

Estimated Bed Need - 1973	121
Total Existing Beds and Beds Under Construction - 12/31/67	15
Conforming	15
Nonconforming	0
ADDITIONAL BEDS NEEDED	106
Beds to be Modernized	0

The criteria for estimated need and the methods of inventory as to conforming or nonconforming are contained in the California State Plan for Hospitals, 1968-69.

This letter is not a Certificate of Need (FHA Form No. 2576) as required by the Federal Housing Administration as a prerequisite to application for mortgage insurance.

A Certificate of Need may be sent by this office directly to your local FHA office if you so desire. The Certificate would contain the same information shown above and would be sent in your name to FHA upon your written request.

For further information or assistance, please contact us and we will do whatever we can to be of service.

Dear Miss Yokes and Mr. Patterson:

Several days ago I met with the State Department of Health and reviewed the plans for the Hospital expansion. We received an exceptionally fine reception for the plan as designed with the exception that we over-looked a central supply which is required. Therefore, we have assigned general storage room 64 for this purpose.

Consequently, I plan to submit the preliminary plans some time next week to the State Department of Health and the State Fire Marshall for their approvals.

Very truly yours,

Reference: Proposed addition to:
Colonial Convalescent Hospital, Inc.
San Jacinto, California

Dear Miss Yokes and Mr. Patterson:

Several days ago, we received approval of the preliminary plans from the State Fire Marshal's office with an exception of a few minor changes that they requested. However, we had no word from the State Department of Health and I telephoned them and learned that they had written to you on July 14 requesting the completion of the license application, which they sent to you, that is now required before they will review the plans. Therefore, I wish to urge you to send the completed application to them as soon as possible.

I do not anticipate any difficulties in getting the Department's approval since I had a preliminary personal meeting with Mr. John Evans, who will be reviewing the plans, after they have been corrected.

I have been waiting for the financial information that you were going to send me prepared by your Accountant, giving the balance sheet and profit and loss for your Hospital operation for 1968, as well as an operational projection for the expanded Hospital. As I told you when we talked recently by phone, I have one lender that I would like to contact regarding financing for your project, however, I would need all the financial information to complete the loan package.

Just as soon as I hear from you, we will be able to move forward.

Very truly yours,

The Public hearing on this matter will be held on October 29, 1969 [illegible]

you wish to be present.

COMMENTS: The General Plan designates low medium density uses itemized for this particular area. Therefore, our interpretation of the Multiple Family Areas reads as follows: "The General Plan allocates low density multiple family uses in certain areas for the development of mobile homes, apartments and cluster housing. The General Plan indicates certain areas for multiple family use in order to stimulate apartment development with up to forty (40) units to the acre near the central business districts and shopping centers". The last paragraph on Page 45 reads as follows: "Additional multiple family zoning will be desirable within, and near, the City of Hemet and to a lesser extent in the City of San Jacinto. The large increase in single retired persons in the next decade will offer a continued market for small apartment developments in and near the cities".

Checking the smaller General Plan maps the low medium density covers a larger portion of the area while the large General Plan document shows low medium density in the particular area involved.

After due consideration by the Planning and the staff, they were [illegible] to the interpretation that the Convalescent Hospital use complies to standards and regulations as approved and adopted by the City of San Jacinto, City of Hemet and County of Riverside.

Thanking you for your consideration for the increased facilities for the Colonial Convalescent Hospital, Inc.

Date: October 14, 1969 Signed: Henry C. Kalbfleisch

Re: Public Use Case No. 225
Convalescent Hospital
Hemet-San Jacinto Area

Gentlemen:

The Department of Public Health of Riverside County has reviewed the application filed by Colonial Convalescent Hospital, Incorporated to expand a convalescent hospital on property located between Grand Avenue and Gilbert Street south of 7th Street in the Hemet San Jacinto area in the unincorporated territory of Riverside County.

If the occupancy contemplated is installed according to Exhibit A on file in the Planning Commission, and is maintained in accordance with all laws, rules, regulations and policies of this and other jurisdictions, it would not have any detrimental effect on the health, safety and general welfare of the persons residing in the nearby area.

This Department requests that information indicating that sewage and waste disposal are feasible in accordance with existing regulations of the State and County and that water is obtainable from an approved source, be furnished this Department prior to any construction.

Very truly yours,

HAROLD M. ERICKSON, M.D.

Addition to Convalescent Hospital

Gentlemen:

Enclosed please find a copy of legal notification in connection with your application.

It is suggested that you be present or represented at this hearing. Failure to do so may be construed as a waiver of your right to present additional evidence.

In the event you appoint someone to represent you at the hearing, a letter signed by yourself giving such authorization must be on file with the Planning Commission at the time of the hearing. Your attention is directed to the enclosed "Posting of Notice" and "Affidavit of Posting" instructions.

Very truly yours,

RIVERSIDE COUNTY PLANNING COMMISSION
Wm. R. Livingstone - Planning Director

Richard J. Stokes - Associate Planner

PUBLIC USE CASE NO. 225
Colonial Convalescent Hospital, Inc.
Expand a convalescent hospital
Zone A-1-5
Hemet-San Jacinto District
Fifth Supervisorial District

HEARING BOARD CONDITIONS (PROPOSED)
October 29, 1969

Approved

1. The development of the premises shall conform substantially with that as shown on plot plan marked Exhibit "A" on file with Public Use Case No. 225 in the office of the Riverside County Planning Commission unless otherwise amended by the following conditions.

   a. Use shall be limited to a 107 bed convalescent hospital.

2. Prior to the issuance of a building permit or any use contemplated by this permit, a bond for the cost of curb and gutter and tie-in paving shall be deposited with the Road Commissioner By January 1, 1972 said curb and gutter and tie-in paving shall be installed at no cost to any government agency, at a grade and alignment approved by the Riverside County Road Commissioner on 7th Street.

3. Prior to the issuance of a building permit for construction of any use contemplated by this approval, the applicant shall first obtain permits and/or clearance from the following public agencies:

   Department of Public Health
   State Division of Forestry
   Road Department

   Written evidence of said permit or clearance from the above agencies shall be presented to the Land Use Division of the Department of Building and Safety at the time of the issuance of a building permit for the use contemplated herewith.

4. This approval shall be used within 2 years, after final proceedings before the Board of Supervisors, otherwise it shall become null and void and of no effect whatsoever. By "use" is meant beginning of construction of the hospital addition.

Bill

Bill: PU Case #225

This attached article from the Enterprise of April 8th tells about how "Colonial Convalescent Hospital" is branching into other fields — "weight reduction, massage, physical therapy, dancing and exercise plus beauty care including new face."

Condition "1a" of PU #225 says use shall be limited to a 107 bed convalescent hospital.

I have a feeling that the new use does not fit the intention of the Commission + BS of S at time of approval of the PU case nor of the applicants as judging by their testimony before the Hearing Board.

It doesn't appear to me that the uses themselves would be permitted per-se in the A-1 zone nor would qualify for a Public Use Permit — or would be an accessory use for a convalescent hospital.

Harold

PU 225

The program's purpose is to give beauty

By JOANNE NORRIS

SAN JACINTO — Eve bit into the apple and woman began the quest for youth and beauty.

The search often has led her to charlatans. But her desire for health, beauty and youth has been so compelling that she is often easy to deceive.

Today plastic surgery and facial rejuvenation remain controversial, although the stigma once attached to them is being lifted by operators with proper medical credentials.

Jean Reed, former school teacher and licensed vocational nurse, is including face lifts and exfoliation (face peels) in a program she has initiated at a new health and beauty complex near San Jacinto.

She and her partner, Dr. Howard L. Holt, a Hemet physician, are transforming a convalescent hospital at 39241 Seventh St. into a place to keep people healthy and beautiful as well as alive.

The Colonial Convalescent Hospital, started by Mrs. Reed's mother, Mrs. Irene Yokes, in 1964 will still accept geriatric patients.

But it's branching into other fields — weight reduction with help from shots, massage, physical therapy, dancing and exercise, plus beauty care including new faces.

Face peeling and lifts will be done by a Lancaster general surgeon who says medical ethics prevent his agreeing to the use of his name.

He's on call by the hospital, which has changed its name to San Jacinto Medical Center. Mrs. Reed arranges appointments for consultations with the doctor at the center.

Only about 10 per cent of plastic surgery must be performed in a hospital, the Lancaster doctor said. The rest can be done in a doctor's office under local anesthetic.

Face lifting and face peeling are separate procedures. The lifts, where tucks are taken in the loose skin of the face and neck, should be done first because the exfoliation can erase any tiny scars left over from the lift, explained the physician.

Incisions can be made behind the hairline, ears, near the eyebrows and in the folds under the chin, depending on where the wrinkles are. The skin is pulled as taut as possible.

that procedure requires about nine days of bed rest.

Chemical face peeling, he explained, was done by Cleopatra but despite its early origin has become popular only in about the past 10 or 15 years.

The chemical peeling was done in Europe after World War II and is performed principally in Heidelberg and Rome.

The physician became interested in chemosurgery in the early 1950s when a Hollywood actress was brought into a hospital emergency room where he was on duty.

"Her face looked wonderful, so I asked her where she had had it done.

"At that time a woman in Hollywood had done Gary Cooper and other stars.

"I went there to try to find out her technique, but when I said I was a doctor I wasn't admitted.

"She's in Mexico now and still doing the peeling, I guess. Her work was marvelous."

In 1956 a British physician outlined the exfoliation proc-

(See THE SEARCH, Page H-3)

Face peeling: what it's like

Face peeling begins when the patient checks into a hospital.

He or she takes a shower, washes his hair and cleans his skin thoroughly with an antiseptic soap. Male patients shave as closely as

eyes. A weaker solution is used on the eyelids.

The phenol application phase lasts 20 to 30 minutes. After it's completed, the face is taped to maintain a warm, liquid environment for two to three days.

MRS. JEAN REED, left, has converted a convalescent hospital in San Jacinto to a facility which will concentrate on health and beauty. She's putting James V. Reed, her brother-in-law, and LeVey Alexander through an exercise routine.

People

creaky is free to go about his business.

The doctor, who ghost wrote a chapter on exfoliation or chemosurgery in a recent paperback book, "Facial Rejuvenation" by Robert W. Prehoda (Three Penny, Inc.), said

The surgery is outlined in a book, "Facial Rejuvenation," by Robert W. Prehoda. A Lancaster general surgeon, who does face peeling and lifts at San Jacinto Medical Center, ghost wrote the chapter on face peeling (exfoliation or chemosurgery).

He says medical ethics prevent the use of his name.

A sedative is administered to keep the patient calm while the surgical team — doctor, nurse and trained cosmetologist — go to work.

Liquid phenol (carbolic acid) preparations have been prepared beforehand. The formulas are not secret, the doctor explained in the book. They are available to any qualified physician who seeks them, he said.

The phenol solution is applied to the skin with great care. An ointment is placed between the eyelids to assure that no phenol reaches the

[illegible] of tape are laid on like shingles on a roof in a 20- to 30-minute process.

The greatest amount of tissue rejuvenation will occur during the next 30 hours, according to the doctor.

After the taping is done, the patient is returned to his room where he must stay in bed.

Talking and facial movement are restricted because excessive moving of face muscles can cause the procedure to be less effective, the doctor points out.

No visitors are allowed and patients must communicate by pencil and paper. The diet is liquids and pureed foods.

The patient is plied with large amounts of hot tea and hot lemonade to maintain a flow of the plasma-like fluid under the tape mask.

After about 48 hours the mask becomes uncomforta-

Guest list problem

DEAR ABBY: My daughter is 18. She is marrying the boy she went steady with all through high school. He is 19. We are managing the wedding but must limit the number of guests to 125 because my husband has been out of work and we are not in very good shape financially.

I told the groom's mother that she could invite 63 people and we were inviting 62. She said that wasn't nearly enough for her as she is presently separated from her husband and she wants to invite her boyfriend and his family, which is very large. I told her in a nice way that she could invite whomever she wanted but not more than 63 people as we had to hold down the expense.

Guess what she said? "Either I have as many people as I want or I'll refuse to sign for my son!"

Abby, he is only 19 and he can't get married unless she signs for him. So what do I do now? — SAD MOM

DEAR MOM: Don't let her blackmail you. In some states the signature of only one parent (or guardian) is sufficient. Look into it. Also tell the lady (?) that if she wants to pay for her own guests she may have as many as she wants.

DEAR ABBY: A few weeks ago my husband died, and right after the funeral my children insisted that I go visit my sister in another town to get away for a while.

Today I came home to an immaculate, but very empty house. I have two wonderful daughters and I love them dearly, but sometimes I wish they wouldn't be so helpful.

They came in and cleaned my house from top to bottom. Every closet, every cupboard, every shelf had been scrubbed. My house shines from one end to another.

But what bothers me most is that they disposed of all their father's belongings! There is not a trace of him in this house. It's as though he never lived here. There are no socks to darn, no buttons to sew. My sons-in-law even divided up his tools. I suppose they did this so I wouldn't feel so bad sorting through his things and doing it myself.

I could say something, but the deed is done, however well-meaning it was. But now I have nothing to do except dust and wash my own few dishes.

Thanks for listening, Abby. I feel a little better now. — LOST AND LONELY

DEAR LOST: I understand your feeling of uselessness, but I assure you your daughters meant well. They spared you what is usually the most painfully heart-breaking task a widow must face.

The search for beauty

(Continued from Page H-1)

ess in Lancet, a British medical journal. It provided the doctor with information about the chemical formulas used.

Then in 1964, on a trip around the world, he saw the procedure performed in Japan and Hong Kong.

A few years later, he studied the process at the University of Heidelberg.

A general surgeon, he continues his regular practice, devoting about 35 per cent of his time to facial rejuvenation.

"I think this should be available to everyone," he said. He hopes eventually to do it fulltime.

"Doctors are strange about the whole subject," he continued. "Plastic surgeons are an elite group and they want to keep it that way."

Chemosurgery simply is the removal of the aging epidermis or outer skin layer by the use of chemicals instead of scalpel or abrasives, the doctor explained in "Facial Rejuvenation."

Skin aging is more apparent in the face and neck than in other parts of the body because, scientists say, those areas get more ultra violet sun rays.

When the wrinkled exterior skin layer is peeled away, new skin is possible again.

The doctor said that plastic surgeons tend to shy away from chemosurgery because it did not stem from a clinical discovery by a famous physician. Instead it was introduced in this country by lay operators with little or no training. And results were mixed.

Cases of scarring in the 1930s and 1940s caused many physicians to criticize the technique.

The scarring can be attributed to the lack of medical knowledge of the lay operators, the doctor said. He claims it's now as safe as any other form of cosmetic surgery.

Dr. Holt's part in the rejuvenation process is overseeing weight reduction based on the use of daily injections of chorionic gonadotrophin (HCG), derived from the urine of pregnant women.

According to the Lancet, HCG can be administered to the average patient for 40 days without harmful effects. It reduces the appetite so patients can exist on 500 calories a day without hunger or loss of energy.

After 40 days, as the body becomes immune to the HCG, a normal appetite returns. The HCG can be started again in about six weeks if further weight loss is desirable.

During the 40 days, most patients lose 20 to 30 pounds, Lancet said.

HCG acts on abnormal fat so if a patient is just five to 10 pounds overweight, results are not as dramatic

Lancet points out other effects.

"There was a great increase in libido in its broadest sense, and the frequency with which pregnancy took place during or soon after treatment was such, even in women who had hitherto considered themselves sterile, that it became an ethical obligation to warn women of childbearing age about this before treatment was started."

Lancet also claims HCG stops abnormal loss of head hair and improves brittle fingernails. Singers reported improvement in their voice quality, the journal reported.

The HCG shots are available at the San Jacinto Medical Center at a cost of $150 for a 40-day series, Mrs. Reed said. The fee includes a physical examination given before the shots are begun.

Cost for the chemosurgery is about $1,500 including the nine days of bed rest at the center, she added. Face lifts start at $750 and go up to several thousand dollars.

The center also has a beauty salon with two cosmetologists, a dance studio, massage parlor plus equipment for exercise and physical therapy.

Working women can stay at the center from Friday to Sunday for $59. This includes figure analysis, advice on diet, exercise and games, entertainment and room and board.

For $119, the weekend also will include massage and hairstyle among other things.

The staff of 38 includes three registered nurses and three vocational nurses. The director of nurses is Mrs. Ellen Hitzka, Mrs. Reed's daughter.

Mrs. Reed's husband Don, who has retired from the U.S. Air Force, does the cooking. His brother, Jim, works there too.

A former housewife and bank employe, Mrs. Reed, 51, went to college while her daughter was in high school. She taught in Ohio and San Diego before moving to the San Jacinto area.

She's had a face peel and a face lift.

"You can't believe how different I look. I had this awful neck, jowly, full of wrinkles. It was a real chicken neck. I rushed out and bought a low-cut gown first thing."

Eye for eye

BOSTON, Mass (AP) — Mrs. Angelia Hermenet, a social worker with the Springfield Child and Family Service, opened her testimony before the Joint Committee on Social Welfare in Spanish.

She told the committee she did this to let them "experience for an instance what 100,000 Spanish - Americans have experienced in Massachusetts."

She was testifying in support of a measure for a special commission study on the availability of Spanish-speaking medical personnel and social workers in mental health and retardation institutions.

REC AUG 2 1965

Case No. 225

APPLICATION FOR PUBLIC USE PERMIT

In Accordance with Article XVII of Ordinance No. 348,
Zoning Ordinance for the

COUNTY OF RIVERSIDE, CALIFORNIA

TO: THE RIVERSIDE COUNTY PLANNING COMMISSION

NAME OF APPLICANT JOLONI L CONVALESCENT HOSPITALS, INC.

Only the following persons may file. Applicant must indicate under what capacity he is filing by placing (x) in block provided.

1. The record owner of the property.

2. The purchaser of the property under a contract in writing duly acknowledged by both the buyer and the seller.

3. The lessee in possession of the property, with the written consent of the record owner to make this application.

4. The agent of any of the foregoing, duly authorized thereto in writing.

(If the application is filed by lessee or agent, evidence of written authorization must be submitted with this application.)

A map showing said real property and adjacent properties is attached hereto and made a part of this application.

The street address of this property is 39241 W. 7th St., San Jacinto, Cal 92383
Situated on the south side of said street between Gilbert and Grand

Legal description of real property located in the County of Riverside, must be accurately described as per Riverside County Records. Lot 14 and that portion of Lot 13 of Estudillo Land and Water Companys Addition to San Jacinto as shown by Map on file in Book 9 page 410 of Maps, San Diego County Records, lying Westerly of a line drawn parallel with and distant Easterly 500 feet from the center line of Grand Avenue. Farm Lots 15 and 16 of the Estudillo Land and Water Company's Addition to San Jacinto, as shown by Map on file in Book 9 page 410 of Maps, San Diego County Records.

Said property was acquired on or about the Original Escrow June 1, 1961 / Escrow March 17, 1966 day of March 21 1967 19____ and is now located in Zone _____ in the _____ District.

APPLICANT DESIRES A PUBLIC USE PERMIT OF THE FOLLOWING CHARACTER:

For the construction of an addition to an existing convalescent hospital, for the mentally ill.

If this Permit is granted, it shall be subject to the time limits set forth in the Riverside County Zoning Ordinance. Any permit granted pursuant to this application shall not affect deed restrictions of record.

133-7

1. **The following deed restrictions are in effect on the above property:**

NONE ARE KNOWN

2. **Describe briefly the type of use and improvement proposed:**

Long term patient care and the care of the mentally ill.

3. **State fully how the use requested is necessary at the location herein requested:**

In view of the existing facility which is located on the subject property and the indicated need for additional patient care for both convalescent and the mentally ill. The need for the additional beds is supported by the Medical Profession in the area.

4. **State fully how the granting of this Public Use Permit, as requested, will not result in material damage or prejudice to other property in the vicinity, nor be detrimental to the public safety or welfare.**

The existing facility has been in existence on the subject property for a number of years, it's presents has not created any damage or prejudice to other property in the vicinity.

5. Furnish plot plan showing boundaries and dimension of property, width of boundary streets, location and size of buildings on the site, roadways, walks, off-street parking and loading space, landscaping and the like, Architect's sketch showing elevation of any proposed building and complete plans for such building are also desirable, and, if available, should be filed with the application.

6. The undersigned, owners of property in the immediate vicinity of the above proposed use do not object to the granting of this permit as applied for:

APPLICATION CERTIFICATE
PERMIT #

Effective July 1, 1980, Chapter 1301, Section 19825 of the Health and Safety Code requires the execution of the following applicable declarations prior to the issuance of a building permit. Please print or type and sign below.

[X] LICENSED CONTRACTORS DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code and my license is in full force and effect.

License Class C-10 License No. 325779

Date Sept. 10, 1980 Contractor Valley Electric Co., Inc.

[ ] OWNER-BUILDER DECLARATION

Swede Nordlof

I hereby affirm that I am exempt from the Contractor's License Law for the following reasons:

[ ] I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale. If I sell within one year of completion, I understand I will have the burden of proving I did not build or improve for the purpose of sale (Sec. 7044.5, B.&P.C.).

[ ] I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B.&P.C.).

[ ] I am exempt under Section _____, B.&P.C. for this reason:

Date _____ Owner _____

[ ] WORKERS' COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure, or a Certificate of Workers' Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. Code).

Policy No. WC14-5857-79 Insurance Unigard Insurance Co.

[ ] Certified copy is hereby furnished.

[X] Certified copy is filed with the County of Riverside, Department of Building and Safety.

Date 9/10/80 Applicant Swede Nordlof

[ ] CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

(This section need not be completed if permit valuation is for $100.00 or less.)

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation laws of California. I further understand that if after making this Certificate of Exemption, I should become subject to the Workers' Compensation provisions of the labor code, I must forthwith comply with such provisions or this permit shall be deemed revoked.

Date _____ Applicant _____

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. Code).

Lender's Name _____

Lender's Address _____

DIVISION OF INDUSTRIAL SAFETY PERMIT CERTIFICATION

[X] I hereby certify that no excavation five (5) or more feet in depth into which a person is required to descend, will be made in connection with work authorized by this permit, and that no building, structure, scaffolding, falsework, or demolition or dismantling thereof, will be more than thirty-six (36) feet high. (Chap 3.2, Grp 2, Art 2, Sec 341, Title 8, C.A.C.)

[ ] As owner-builder, I will not employ anyone to do work which would require a permit from the Division of Industrial Safety, as noted above, unless such person has a permit to do such work from that division.

[ ] Division of Industrial Safety Permit No.

Date 9/10/80 Applicant Swede Nordlof

CERTIFICATE OF COMPLIANCE AND AUTHORIZATION OF ENTRY

I certify I have read this application and state that the information given is correct. I agree to comply with all state laws and county ordinances relating to building construction, and authorize a representative of the County of Riverside, Department of Building and Safety to enter upon the property for which I have applied for this permit for the purpose of making inspections.

DEPARTMENT OF BUILDING AND SAFETY
COUNTY OF RIVERSIDE

APPLICATION CERTIFICATE
PERMIT # 405225

Effective July 1, 1980, Chapter 1301, Section 19825 of the Health and Safety Code requires the execution of the following applicable declarations prior to the issuance of a building permit. Please print or type and sign below.

☐ LICENSED CONTRACTORS DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code and my license is in full force and effect.

License Class C-10 License No. 325779
Date 9/23/1980 Contractor VALLEY ELECTRIC

☐ OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reasons:

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work, and the structure is not intended or offered for sale. If I sell within one year of completion, I understand I will have the burden of proving I did not build or improve for the purpose of sale (Sec. 7044.5, B.&P.C.).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Sec. 7044, B.&P.C.).

☐ I am exempt under Section _____, B.&P.C. for this reason:

Date _____ Owner _____

☒ WORKERS' COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self-insure, or a Certificate of Workers' Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. Code).

Policy No. WC14-5857-79 Insurance UNIGARD INSURANCE

☐ Certified copy is hereby furnished.

☒ Certified copy is filed with the County of Riverside, Department of Building and Safety.

Date 9/23/80 Applicant VALLEY ELECTRIC INC

☐ CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

(This section need not be completed if permit valuation is for $100.00 or less.)

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation laws of California. I further understand that if after making this Certificate of Exemption, I should become subject to the Workers' Compensation provisions of the labor code, I must forthwith comply with such provisions or this permit shall be deemed revoked.

Date 9/23/80 Applicant John Luchuck

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. Code).

Lender's Name _____
Lender's Address _____

DIVISION OF INDUSTRIAL SAFETY PERMIT CERTIFICATION

☒ I hereby certify that no excavation five (5) or more feet in depth into which a person is required to descend, will be made in connection with work authorized by this permit, and that no building, structure, scaffolding, falsework, or demolition or dismantling thereof, will be more than thirty-six (36) feet high. (Chap 3.2, Grp 2, Art 2, Sec 341, Title 8, C.A.C.)

☐ As owner-builder, I will not employ anyone to do work which would require a permit from the Division of Industrial Safety, as noted above, unless such person has a permit to do such work from that division.

☐ Division of Industrial Safety Permit No. _____

Date 9/23/80 Applicant John Luchuck

CERTIFICATE OF COMPLIANCE AND AUTHORIZATION OF ENTRY

I certify I have read this application and state that the information given is correct. I agree to comply with all state laws and county ordinances relating to building construction, and authorize a representative of the County of Riverside, Department of Building and Safety to enter upon the property for which I have applied for this permit for the purpose of making inspections.

Attention: Ms. Kim Corcoran

Subject: Supplemental Infiltration Feasibility Testing, Proposed Bradley Gardens Skilled Nursing Facility Building Addition, 980 W. 7th Street, City of San Jacinto, Riverside County, California 92582 (APN 435-330-003)

Dear Ms. Corcoran:

In accordance with the City of San Jacinto review comments received, and your request and authorization, GeoSoils, Inc. (GSI) is presenting the results of our supplemental infiltration feasibility testing for the proposed Bradley Gardens skilled nursing facility in the City of San Jacinto, Riverside County, California. The purpose of this study was to further evaluate the onsite soils and geologic conditions and conduct feasibility infiltration testing within the areas of the proposed pervious paver access driveway onsite, for use in water quality Best Management Practice (BMP) design by the water quality engineer of record for the project.

The scope of our services has included a review of the referenced reports and documents (see Appendix A), the advancement of four (4) hand-excavated exploratory borings onsite, which were excavated to a depth of 2 feet below the existing surface (bgs), geologic logging (Appendix B), field infiltration testing (Appendix C), analysis of field test data obtained, and preparation of this summary infiltration feasibility testing report.

SITE DESCRIPTION AND CURRENT SITE CONDITIONS

The overall site consists of an approximately 2.98-acre, rectangular-shaped area of developed land. The site is located on the southeast corner of the intersection of W 7th Street and S. Grand Avenue, in the City of San Jacinto, Riverside County, California. The property is bounded by undeveloped land on the south, east and west, by residential development to the southwest, and commercial development to the north, across W 7th Street. In general, the site is flat-lying to very gently sloping in a southeasterly direction. According to Google Earth Pro (GEP, 2026), site elevations vary between approximately 1,527 and 1,525 feet Mean Sea Level (MSL), for an overall relief of about 2 feet. The site is sparsely vegetated and has localized shrubs and trees within and surrounding the existing facility.

PROPOSED DEVELOPMENT

Based on our review of the overall site plan, dated September 18, 2025, prepared by Gregg Maedo & Associates (GMA, 2025), we understand that continued development of the property would consist of the construction of a 43-bed skilled nursing facility (Building A1), as well as the installation of underground utility and roadway infrastructure. The newly provided storm water quality control plan by Guide Engineering (GE, 2026) indicates the development of a pervious paver access roadway on the east and south side of the project site. It is our understanding the pervious paver access roadway will be used as a relatively shallow water quality Best Management Practice (BMP) feature onsite.

SITE GEOLOGY

Based on our previous onsite preliminary geotechnical investigation (GSI, 2025) and published geologic mapping by Dibblee (2003), the site is underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas (Qa), although no significant clay layers were encountered during this, or our previous subsurface investigation (GSI, 2025). As encountered during our previous subsurface investigation the site soils were mostly sandy (e.g., silty sands) with minor silt layers encountered at depth. The observed alluvial deposits extend to depths beyond 60 feet, and are estimated to be hundreds of feet in thickness based on the data reviewed (GSI, 2025).

The near surface alluvial deposits encountered during this study generally consist of light brown silty sands that were generally loose to medium dense with depth, with the exception of hand auger P-4, near the dumpster area, which was medium dense to very dense with depth. The near surface soils were also found to be dry to damp, very fine to coarse grained sands, and somewhat to locally friable near the surface.

GROUNDWATER

Regional or perched groundwater was not encountered during this study or within the subsurface excavations (Borings and Cone Penetration Testing [CPT]), up to approximately 60 feet in depth, advanced during our previous field work (GSI, 2025). Likewise, seeps, springs, or other indications of a high groundwater level were not noted on the subject property during the time of this or our previous field investigation (GSI, 2025).

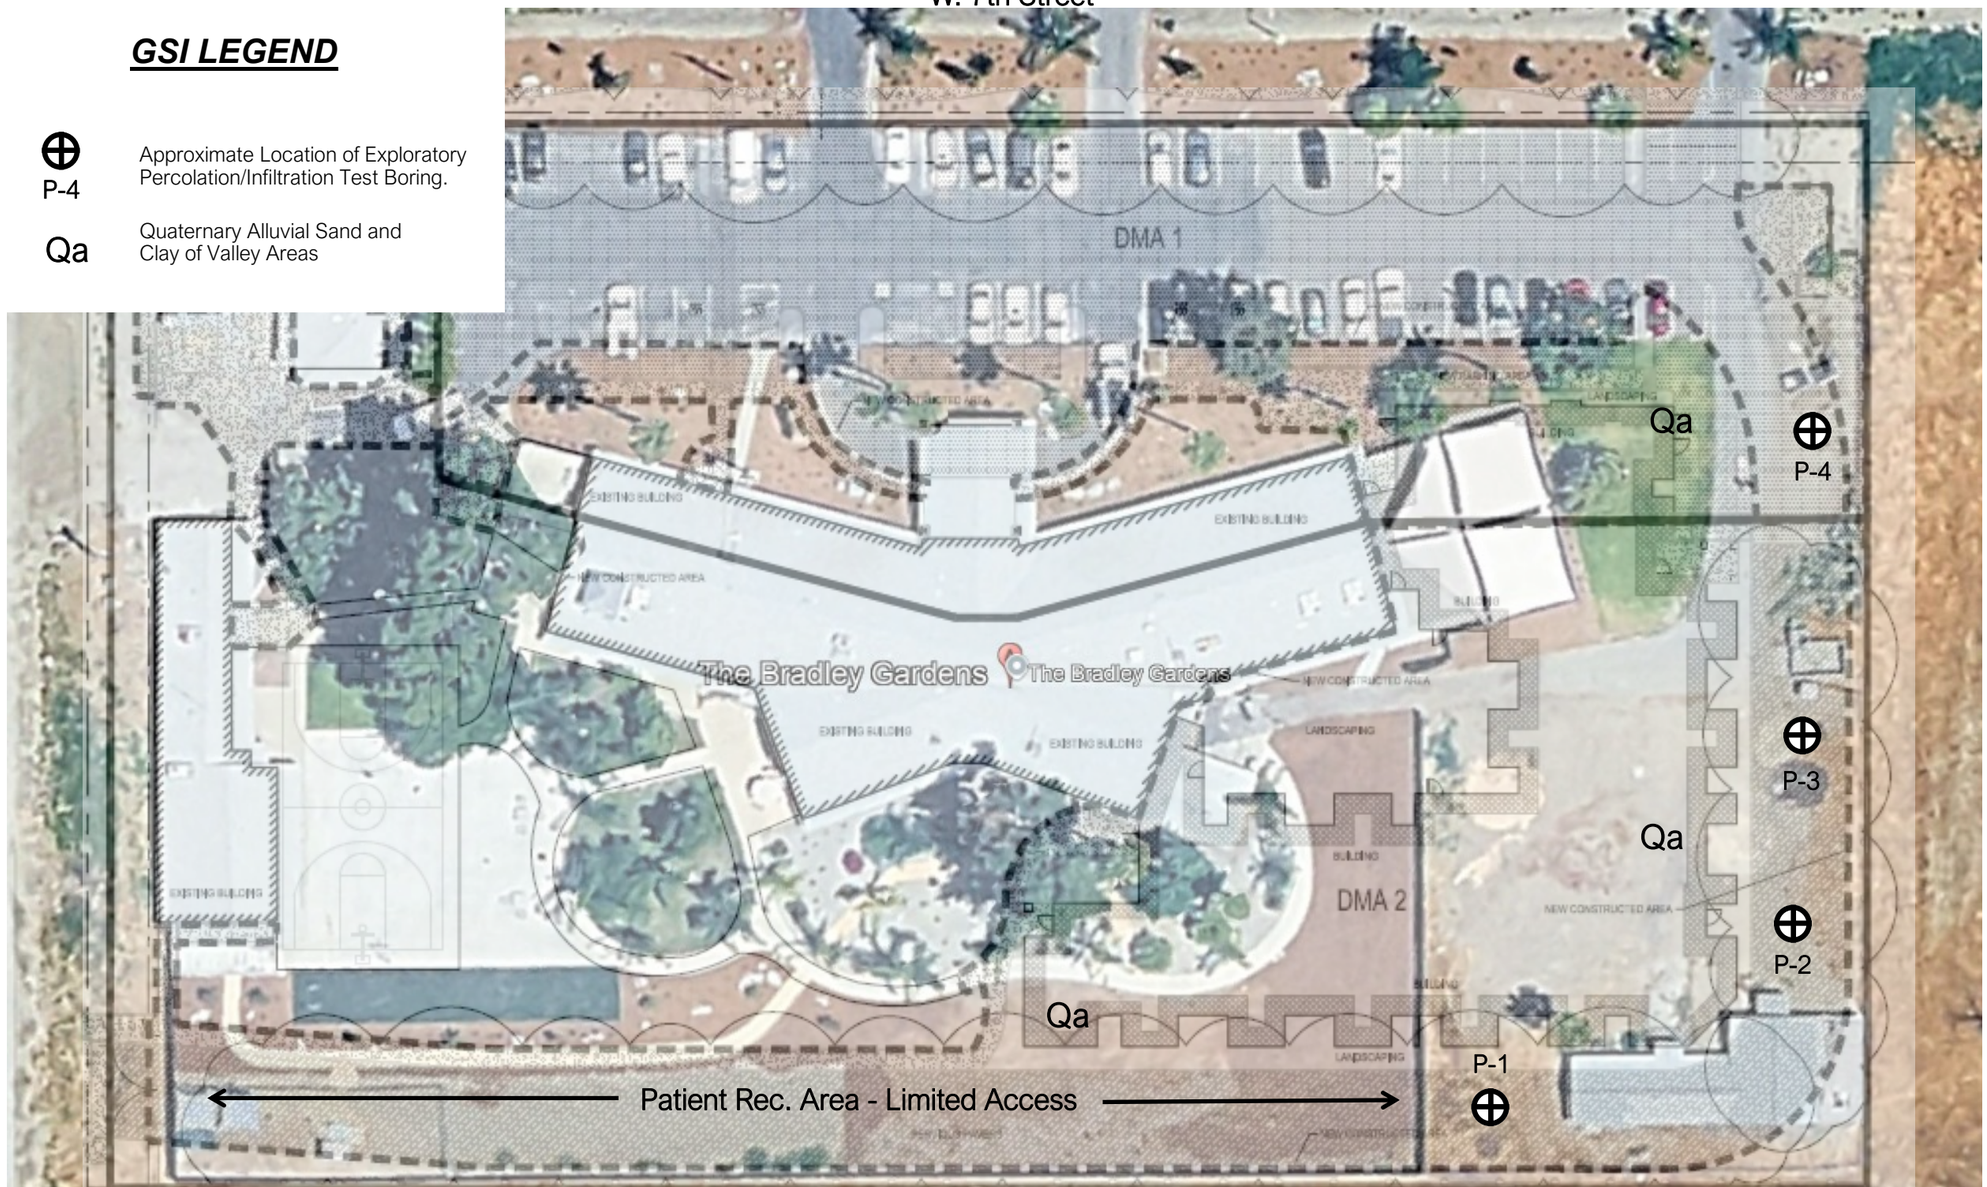
Based on our review of the California Department of Water Resources (CDWR) Water Data Library (2026), nearby well measurements reviewed appear to be regional groundwater measurements at depths of approximately 170 and 155 feet (State Well No. 04S01W27P005S [March 7, 1991], and Site Code No. 337748N1169760W001 [December 6, 2011], respectively) at sites with similar ground surface elevations. However,

our review of historic groundwater measurements in the San Jacinto and Temecula basins (U.S. Geological Survey, 1919, Water Supply Paper 429) indicates groundwater near the center of the basin may have been as shallow as 40 feet bgs. However, in California, the legislature passed the Sustainable Groundwater Management Act (SGMA), creating a statewide framework for groundwater regulation. The Eastern Municipal Water District (EMWD), and several other water purveyors, have been actively managing the San Jacinto basin as part of a voluntary Assembly Bill 3030 effort passed in 1992. As such, it is unlikely the groundwater will reach historic levels as the basin is now adjudicated. These observations reflect site conditions at the time of our field work and do not prevent future changes in local groundwater conditions from excessive irrigation, precipitation, or that were not evident at the time of this, or our original preliminary investigation (GSI, 2025).

INFILTRATION FEASIBILITY TESTING

In accordance with Riverside County Flood Control - Low Impact Development (LID) BMP Design Handbook (RCFC, 2011) guidelines for infiltration testing, four (4) tests were conducted within the proposed location of the pervious paver access driveway, as requested by the design engineer. The approximate locations of the infiltration tests for this study are provided on Figure 1 (Percolation-Infiltration Test Location Map). The infiltration testing was performed to further evaluate site conditions with respect to the proposed pervious paver BMP system that would retain and filter onsite storm water. The infiltration testing was performed in conformance with the RCFC (2011) design handbook for such testing. The infiltration testing was performed by a senior field technician under the direct supervision of a principal geologist from GSI. Logs of the borings advanced for this study are presented in Appendix B, and the Field Infiltration Data Sheets are presented in Appendix C. Procedures for testing are outlined briefly below:

Percolation Test Procedures



Test Borings:

1. Hand excavated to a depth of approximately 2 feet
2. Diameter - 8 inches.
3. After the removal of loose materials, 2 inches of gravel was placed on the bottom of each test boring.
4. A perforated pipe was then installed within each test boring to facilitate accurate field measurements and prevent caving during the pre-soak period and infiltration testing.

Figure 1

PERCOLATION/INFILTRATION TEST LOCATION MAP

W.O. 9071-A1-IE	DATE: 08/26	SCALE: NTS

Pre-Soaking: After the installation of the perforated pipes, the boring was filled with a minimum of 5-gallons of clear water. The test period for the percolation testing commenced immediately, as all the water seeped away while the tester was present and sandy soils were known to exist onsite.

Sandy Soil Test: Following the pre-soak period, sandy soil criteria testing was conducted. Two (2) consecutive measurements were made at each test location at intervals of approximately 25 minutes. Greater than 6 inches of water seeped away during each of the two (2) test measurements at each location, therefore the testing began using the criteria for "sandy soils" testing at all locations.

Testing: After required pre-soak period and sandy soil test periods, infiltration testing started at all locations. A column of clear water was re-established within each of the test locations. The drop in water level was measured from a fixed reference point, refilling after each test measurement. Within the test locations, a series of test measurements were taken for an additional hour, at time intervals of 10 minutes.

Precision: All test measurements were read to the nearest ¼-inch.

Test Results: Calculations from our field testing indicate percolation rates between approximately 0.97 and 0.42 minutes/inch. Per the RCFC (2011) guidelines, the percolation rates obtained were then converted to infiltration rates using the "Porchet Method," to be used by the design engineer for appropriate sizing of the BMP systems (RCFC, 2011). The converted infiltration rates obtained varied between approximately 5.9 inches/hour and 11.1 inches/hour. Typically, the lowest infiltration rate obtained is applied to the design; therefore, an unfactored (no factor of safety applied) infiltration rate (UIR) of 5.9 inches/hour was obtained. Using an appropriate Factor of Safety (FOS) of 3, per the RCFC (2011) guidelines, a Design Infiltration Rate of 1.97 inches/hour may be used for design. The converted infiltration rates, along with the formulas used are presented in Figure 2 (Percolation Rate to Infiltration Rate Conversion).

USDA Site Soil Group, Soil Units, and Ksat Values

Our review of the United States Department of Agriculture (USDA, 2026) Web Soil Survey (https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm), indicates that two (2) major soil units underlie the site. The Grangeville sandy loam, 0 to 5 percent slopes (GrB) and the Grangeville fine sandy loam, 0 to 5 percent slopes (GvB) are mapped onsite (USDA, 2026). The USDA (2026) indicates that the capacity of the most limiting layer to transmit water

Percolation Rate to Infiltration Rate Conversion

* $$\text{Infiltration Rate } (I_t) = \frac{\Delta H\ \pi r^2\ 60}{t(\pi r^2 + 2\pi r H_{av}} = \frac{\Delta H\ 60\ r}{\Delta t(r+2H_{avg})}$$

Where:
- I_t = tested infiltration rate, inches/hour
- ΔH = change in head over the time interval, inches
- Δt = time interval, minutes
- r = effective radius of test hole
- H_{avg} = average head over the time interval, inches

		Δt	Init Level	Fnl Level	ΔH	H_{avg}	I_t	
Infiltration Test Numbers	P-1	10	24	24	24	24	11.08	
	P-2	10	24	9	15	16 1/2	9.73	High = 12.70
	P-3	10	24	6	18	15	12.71	Low = 5.90
	P-4	10	24	13 3/4	10 1/4	18 7/8	5.89	Average = 9.85
								**UIR = 5.90

* Conversion per the "Porchet Method" (RCFC, 2011)

**UIR = Unfactored Infiltration Rate (Inches/Hour)

Factor of Safety (FOS) = 3.0 = 5.9/3.0 = **1.97** = DIR**

**DIR = Design Infiltration Rate (Inches/Hour)

W.O. 9071-A1-IE

Figure 2

(Ksat) within the Grangeville sandy loam, is high (1.98 to 5.95 inches per hour [in/hr]) and falls into hydrologic soil groups (HSGs) "A/D." The USDA (2026) also indicates that capacity of most limiting layer to transmit water (Ksat) within the Grangeville fine sandy loam is moderately high to high (0.57 to 1.98 in/hr) and falls into hydrologic soil groups (HSGs) "B/D." Based on our review, the results of our onsite infiltration feasibility testing appear to correlate well with the USDA (2026) Ksat values for the major soil units mapped onsite.

Infiltration Siting Requirements

Our review of the general infiltration siting requirements and limitations provided by the California Stormwater Quality Association (CASQA, 2003), indicates sites characterized as belonging to Hydrologic Soil Group "A," "B," and "C" may be suitable for infiltration, requiring a minimum soil infiltration rate of 0.5 inches/hour. However, the County of Riverside water pollution prevention Water Quality Management Plan (WQMP, 2012), guidance document for the Santa Ana Region states: "the minimum long-term post-development infiltration rate must be at least 0.83 inches per hour." Furthermore, based on our review of historic regional groundwater levels and our previous onsite subsurface investigation (GSI, 2025), a minimum 10-foot vertical separation from the bottom of the BMP systems to the top of historic high groundwater levels will be maintained.

The design engineer will need to review BMP requirements by the RCFC (2011) and the converted infiltration rates obtained during this study with respect to the proposed water quality BMP systems. An appropriate factor of safety (FOS), per the RCFC (2011) technical guidance document, has been applied herein. The design infiltration rates, general BMP design parameters, and recommendations provided herein are based on our experience with earth materials within the City of San Jacinto, RCFC (2011) and State criteria (CASQA, 2003), and our experience on adjacent sites with similar geologic conditions. Based on our review of the USDA data and our subsurface explorations, similar soil conditions prevail throughout the site, including sandy fine-grained surficial soils.

CONCLUSIONS AND RECOMMENDATIONS

Based on the onsite infiltration testing conducted, it is our opinion that the proposed commercial development and BMP development onsite is feasible from a geologic and geotechnical viewpoint, provided the recommendations presented herein, and within the previous report by GSI (2025) are properly implemented during project planning, design, and construction, as warranted. General recommendations for storm water quality BMP systems are presented in GSI (2025); however, for convenience are reiterated below.

Onsite Storm Water Quality Best Management Practice (BMP) Systems

Should onsite infiltration-systems be planned for Best Management Practices (BMP's) or Low Impact Development (LID) principles for the project, certain guidelines must be followed in the planning, design, and construction of such systems. Such systems, if improperly designed or implemented without consideration of the geotechnical aspects of site conditions, can contribute to flooding, saturation of bearing materials beneath site improvements, slope instability, and possible concentration and contribution of pollutants into the groundwater or storm drain or utility trench systems.

A key factor in these systems is the infiltration rate (often referred to as the percolation rate) which can be ascribed to, or determined for, the earth materials within which these systems are installed. Additionally, the infiltration rate of the designed system (which may include gravel, sand, mulch and topsoil, or other amendments) will need to be considered. Locally, relatively impermeable formations include: clayey surficial soils, igneous and metamorphic bedrock, as well as future fine grained fill soils.

Some of the methods which are used for onsite infiltration include percolation basins, dry wells, bio-swale or bio-retention, permeable pavers and pavement, infiltration trenches, filter boxes and subsurface infiltration galleries or chambers. Some of these systems are constructed using native and import soils, perforated piping, and filter fabrics while others employ structural components such as stormwater infiltration chambers and filters or separators. Every site will have characteristics which should lend themselves to one or more of these methods, but not every site is suitable for BMPs. In practice, BMPs are usually initially designed by the project design civil engineer. Applicable governing agency requirements should be reviewed and included in design considerations.

The following geotechnical guidelines should be considered when designing onsite BMP systems:

- It is not good engineering practice to allow water to saturate soils, especially near slopes or improvements; however, the controlling agency may now require the use of stormwater BMPs.

- Areas adjacent to, or within, the BMP that are subject to inundation should be properly protected against scouring, undermining, and erosion, in accordance with the recommendations of the design engineer.

- Where infiltration BMP systems are located near buildings or improvements, impermeable liners and subdrains should be used along the bottom or sides of bioretention swales or basins located within the influence of structures. Impermeable liners used in conjunction with BMP basins should consist of a 30-mil polyvinyl chloride (PVC) membrane that is covered by a minimum of 12 inches of clean soil, free from rocks and debris, with a maximum 4:1 (h:v) slope inclination, or flatter, and meets the following minimum specifications:

Solid Soils Specific Gravity (ASTM D792): 1.2 (g/cc, min.); Tensile (ASTM D 882): 73 (lb/in-width, min); Elongation at Break (ASTM D882): 380 (%, min); Modulus (ASTM D882): 32 (lb/in-width, min.); and Tear Strength (ASTM D1004): 8 (lb/in, min); Seam Shear Strength (ASTM D882) 58.4 (lb/in, min); Seam Peel Strength (ASTM D882) 15 (lb/in, min).

- Subdrains should consist of at least 4-inch diameter Schedule 40 or SDR 35 drain pipe with perforations oriented down. The drain pipe should be sleeved with a filter sock.

- Storm drain, standpipes, and utilities that cross BMPs should be slurried with a 3-sack slurry mix, to 5 feet outside the structure.

- Infiltrations systems should not be installed within approximately 8 feet of building foundations utility trenches, and walls, or a 1:1 (horizontal to vertical [h:v]) slope (down and away) from the bottom elements of these improvements. Alternatively, deepened foundations may be used.

- Infiltration systems should not be installed adjacent to rigid pavements or hardscape improvements. Alternatively, deepened or thickened edges and curbs or impermeable liners may be used in areas adjoining the BMP.

- As with any infiltration BMP, localized ponding and groundwater seepage should be anticipated. The potential for seepage or perched groundwater to occur after site development should be disclosed to all interested or affected parties.

- Installation of infiltration BMP systems should avoid expansive soils (Expansion Index [E.I.] ≥51) or soils with a relatively high plasticity index (P.I. > 20).

- Infiltration BMP systems should not be installed where the vertical separation of the groundwater level is less than approximately 10 feet from the base of the system.

- Infiltration BMP systems should be designed using a suitable factor of safety (FOS) to account for uncertainties in the known infiltration rates (as generally required by the controlling authorities), and reduction in performance over time.

- As with any infiltration system, proper care will need to be provided. Best management practices should be followed at all times, especially during inclement weather. Provisions for the management of any siltation, debris within the BMP, or overgrown vegetation (including root systems) should be considered. An appropriate inspection schedule will need to adopted and provided to all interested or affected parties.

- Any designed system will require regular and periodic maintenance, which may include rehabilitation or complete replacement of the filter media (e.g., sand, gravel, filter fabrics, topsoil, or mulch) or other components used in construction, so that the design life exceeds 15 years. Due to the potential for piping and adverse seepage conditions, a burrowing rodent control program should also be implemented onsite.

- Newly established vegetation or landscaping (including phreatophytes) may have root systems that will influence the performance of the BMP or nearby LID systems.

- The potential for surface flooding, in the case of system blockage, should be evaluated by the design civil engineer.

- Any proposed utility backfill materials (e.g., inlet or outlet piping or other subsurface utilities) located within or near the proposed area of the BMP may become saturated. This is due to the potential for piping, water migration, and seepage along the utility trench line backfill. If utility trenches cross or are proposed near the BMP, cut-off walls or other water barriers will need to be installed to mitigate the potential for piping and excess water entering the utility backfill materials. Planned or existing utilities may also be subject to piping of fines into open-graded gravel backfill layers unless separated from overlying or adjoining BMP by geotextiles or slurry backfill.

LIMITATIONS

The materials encountered on the project site and used for our analysis are believed representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during mass grading. Site conditions may vary due to seasonal changes or other factors.

Inasmuch as our study is based upon our review and engineering analyses and field test data, the conclusions and recommendations are professional opinions. These opinions have been derived in accordance with current standards of practice, and no warranty, either express or implied, is given. Standards of practice are subject to change with time. GSI assumes no responsibility or liability for work or testing performed by others, or their inaction; or work performed when GSI is not requested to be onsite, to evaluate if our recommendations have been properly implemented. Use of this report constitutes an agreement and consent by the user to all the limitations outlined above, notwithstanding any other agreements that may be in place. In addition, this report may be subject to review by the controlling authorities. Thus, this report brings to completion our scope of services for this portion of the project.

The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to contact our office.

Respectfully submitted,

Attention: Ms. Kim Corcoran

Subject: Preliminary Geotechnical Investigation, Proposed Bradley Gardens Skilled Nursing Facility Building Addition, 980 W. 7th Street, City of San Jacinto, Riverside County, California 92582 (APN 435-330-003)

Dear Ms. Corcoran:

In accordance with your request and authorization, GeoSoils, Inc. (GSI), has performed a preliminary geotechnical investigation of the subject site. The purpose of our study was to evaluate the general geologic and geotechnical conditions at the existing skilled nursing facility, relative to the currently proposed development thereon, and to present preliminary recommendations for grading and the design, and construction of foundations, earth retaining structures, pavements, and hardscape from a geotechnical viewpoint.

Our evaluation primarily focuses on the proposed 43-bed skilled nursing facility (Building A1) depicted on the overall site plan, dated September 18, 2025, prepared by Gregg Maedo & Associates ([GMA], 2025 [see Appendix A]). It is our understanding that the existing office building renovation into a 16-bed facility (Building C) is still being contemplated, and based on the type of construction (building renovation) is not specifically addressed herein. If necessary, geotechnical recommendations for the proposed building renovation can be provided, once the planning for the proposed renovation is better understood.

Proposed Building A1 on the east side of the existing facility will be constructed in the open area, and will include demolition of a building in the southeast corner of the site. The need for retaining walls is unknown at this time; however, GSI has included recommendations for conventional retaining walls herein, if needed.

EXECUTIVE SUMMARY

Based on our review of the available data (see Appendix A), field exploration, laboratory testing, geologic and geotechnical engineering analyses, as well as our past experience on nearby sites, the proposed development of the skilled nursing facility building addition appears to be feasible from a geotechnical viewpoint, provided the recommendations presented in the

text of this report are properly incorporated into the design and construction of the project. Based on the existing body of geotechnical data accumulated during our recent subsurface exploration and laboratory testing, and from previous geotechnical work on nearby projects, the most significant elements of this study are summarized below:

- The subsurface data obtained, and regional geologic mapping by Dibblee (2003) indicate that the site is mantled by a thin layer of topsoil and disturbed fill, which is underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas (Qa). The topsoil and disturbed fill thickness was relatively thin (approximately 2 to 3 feet). Underlying the topsoil and disturbed fill, Quaternary-age (Holocene- to late Pleistocene-age) alluvial sand and clay of valley areas extend to the depths explored (between 30 and 60 feet below existing grades), although no significant clay layers were encountered during our subsurface investigation. Provided that the recommended remedial earthwork techniques are incorporated into the proposed development plans, the support of new fills and settlement-sensitive improvements by the onsite earth materials is considered feasible. However, proposed settlement-sensitive improvements that do not receive mitigation in the form of remedial earthwork may be subject to ground deformations and associated distress.

- No groundwater was encountered during our site exploration to a depth in excess of 60 feet below the ground surface (bgs). Based on our review of the California Department of Water Resources Water Data Library (CDWR; 2025), nearby well measurements reviewed appear to be regional groundwater measurements at depths of approximately 170 and 155 feet (State Well No. 04S01W27P005S [March 7, 1991], and Site Code No. 337748N1169760W001 [December 6, 2011], respectively) at sites with similar ground surface elevations. However, our review of historic groundwater measurements in the San Jacinto and Temecula basins (U.S. Geological Survey, 1919, Water Supply Paper 429) indicates groundwater in the basin may have been as shallow as 40 feet bgs. Groundwater conditions are subject to change as a result of climatic variations, rainfall, up-gradient irrigation practices, broken or damaged underground utilities.

- While site soils are potentially erodible, based on the flat laying nature of the site the presence of landslide deposits, slumps, or other significant forms of mass wasting were not observed within the proposed development area during fieldwork nor during our geologic map reviews.

- The site is situated in an area of active faults. The nearby San Jacinto and Casa Loma fault zones are considered active and are included within Alquist-Priolo Earthquake Fault Zones. Our review of published data indicates that there are no known active faults crossing the site (Jennings and Bryant, 2010), and the site is not located within an Alquist-Priolo Earthquake Fault Zone (California Geological Survey [CGS], 2018). In

addition, our review of the Riverside County Information Technology (RCIT) Map My County website (2025) indicates no County faults are mapped onsite and site is not located within a County fault zone. Therefore, surface fault rupture to adversely affect the proposed development is considered low. Due to the proximity of regional faults with documented Holocene movement, the proposed development could experience moderate to strong ground motions over its design life, as with all development in southern California. Therefore, the seismic ground motion values and design parameters provided herein should be incorporated into project planning. Further discussions of our fault activity review and photolineament analysis are presented herein.

- Our review indicates that the subject site is susceptible to secondary seismic hazards, including ground deformations from seismically-induced liquefaction or densification. Our review of the RCIT (2025) Map My County website indicates the site is mapped within an area designated as having a "moderate" potential for liquefaction, and is located in a zone of "Active" subsidence (RCIT, 2025). As such, liquefaction and settlement analyses were conducted, and are further discussed herein. However, these secondary seismic hazards can be mitigated to acceptable levels through the proposed site earthwork and foundation design recommended herein.

- Site soils are considered to exhibit a very low expansion potential (Expansion Index [E.I.] ranging between 0 and 20). The design of building foundations and other proposed site improvements should consider these expansive characteristics of the onsite soils.

- GSI conducted sampling of the near-surface onsite earth materials for general soil corrosivity testing. The corrosivity testing included the evaluation of pH, soluble sulfates, chlorides, and saturated resistivity. The test results indicate that the tested sample is moderately alkaline with respect to soil acidity or alkalinity, are is moderately corrosive to ferrous metals when saturated, presents negligible sulfate exposure to concrete (Exposure Class "S0" per Table 19.3.1.1 of American Concrete Institute [ACI] 318-14), and exhibits relatively low concentrations of soluble chlorides. On a preliminary basis, reinforced concrete mix design should minimally conform to Exposure Classes "S0," "C1," and "W0" outlined in Table 19.3.2.1 of ACI 318-14, as the foundations would likely be exposed to moisture. It should be noted that GSI does not practice in the field of corrosion engineering. Therefore, additional recommendations may be obtained from a qualified corrosion engineer should corrosion mitigation be necessary, as determined by the project architect, civil engineer, or structural engineer, as warranted.

- The underlying alluvium has some potential to consolidate due to foundation and fill loading during a seismic event based on historic groundwater levels. Our evaluation of settlement potential (both static and seismic), has considered settlement due to structural loads on footings, subsurface geometry, and historic groundwater levels.

- The minimum depth of remedial earthwork excavations across the area of proposed development are anticipated to be on the order of 5 to 7 feet. The actual depth of remedial grading excavations would be based on the conditions exposed inside the excavation during remedial grading. In areas to receive proposed ancillary surface improvements, such as pavements and flatwork, a minimum 2-foot thick layer of recompacted fill should be provided beneath these improvements. In addition, all footings should be supported by at least 3 feet of recompacted fill, which can be further evaluated once the proposed structural loads are provided for GSI's review.

- Assuming wall loads of 1 to 3 kips/foot, and column loads of 20 to 100 kips, the use of a structural mat foundation, or other foundation designed to tolerate the site's soil conditions and seismic settlement potential may be used. These assumptions should be revisited once the final plans and structural loads are made available to GSI.

- Recommendations for Portland cement concrete (PCC) and asphaltic concrete (AC) pavements are provided herein. Due to the relatively sandy nature of the near-surface soils onsite , pavement subgrades composed of these earth materials are anticipated to perform adequately under anticipated traffic loads.

- Temporary slopes for excavations less than 10 feet deep should not be constructed steeper than a 1:1 horizontal to vertical (h:v) gradient, provided that running sands or groundwater seepage are not present. Based on the proximity of existing building improvements, which will remain in-service adjacent to recommended remedial grading, the use of slot-cutting techniques or localized shoring may be necessary. All temporary slopes should be observed by GSI prior to workers entering excavations.

- The recommendations presented herein should be incorporated into the design and construction considerations of the project.

The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to contact our office.

Respectfully submitted,

GeoSoils, Inc.

PRELIMINARY GEOTECHNICAL INVESTIGATION
PROPOSED BRADLEY GARDENS SKILLED NURSING FACILITY
BUILDING ADDITION, 980 W. 7TH STREET
CITY OF SAN JACINTO, RIVERSIDE COUNTY
CALIFORNIA 92582 (APN 435-330-003)

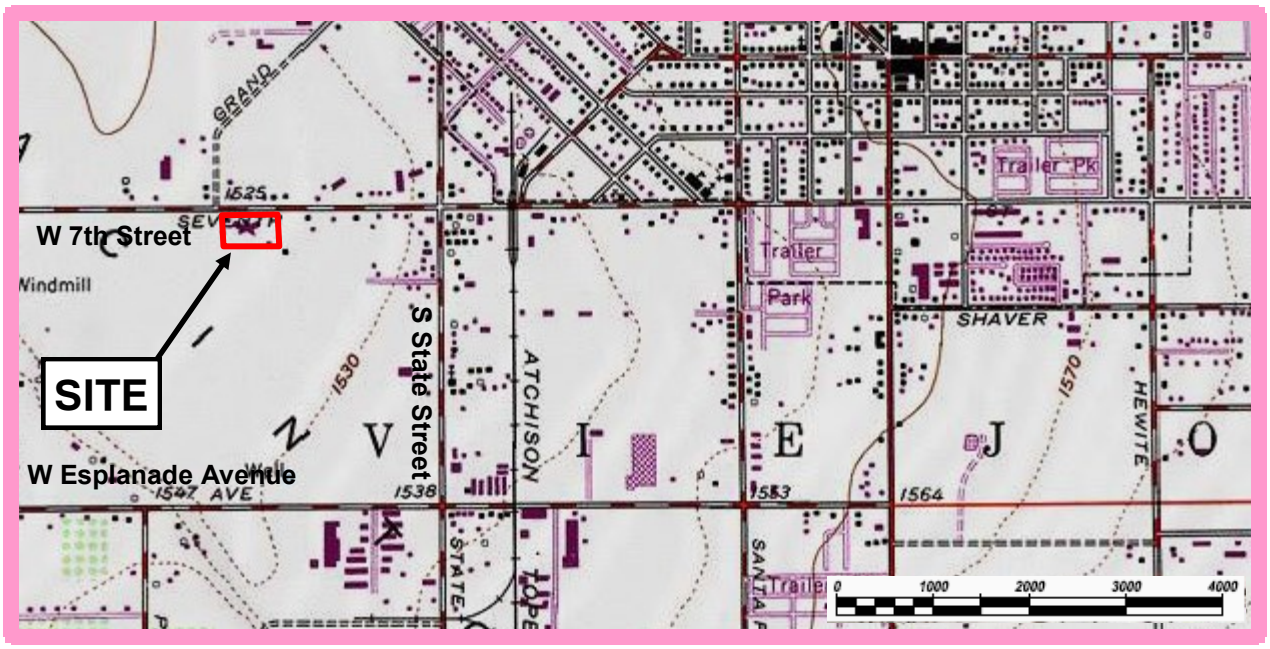
SCOPE OF SERVICES

The scope of our services has included the following:

1. Review of in-house geologic and geotechnical literature, maps, and aerial photos of the site and vicinity (text and Appendix A).

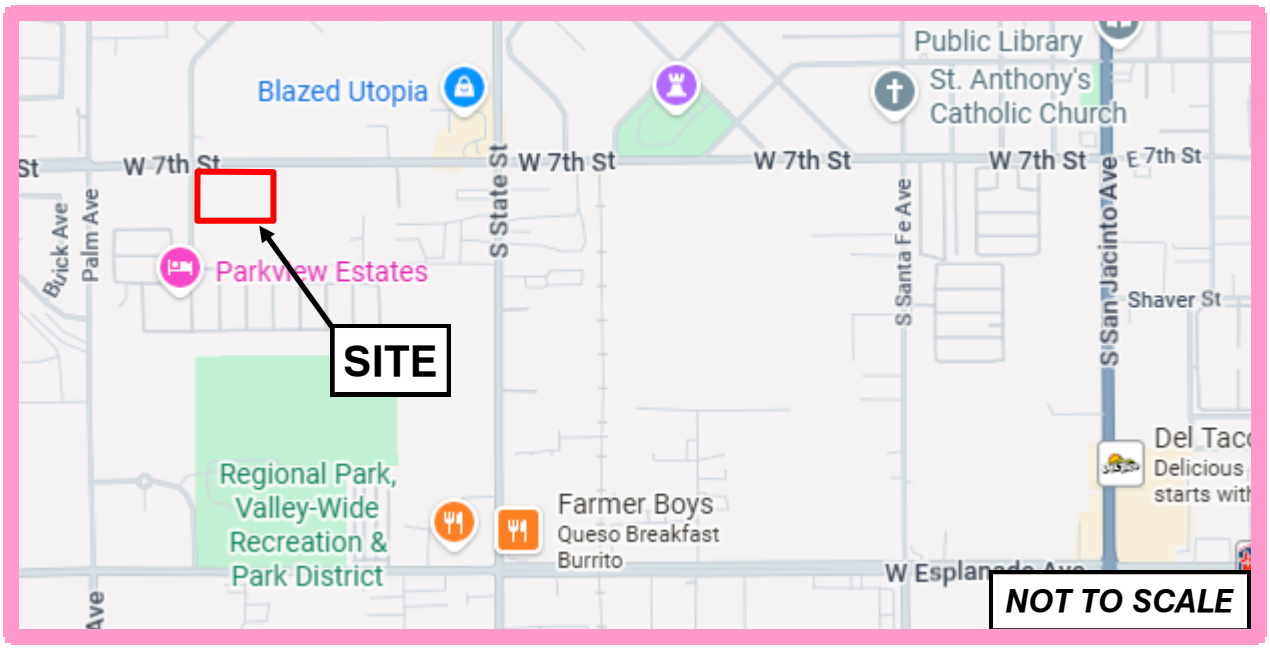
2. Geologic reconnaissance mapping and subsurface exploration consisting of the advancement of four (4) exploratory hollow-stem auger borings (B-1 through B-4), with a truck-mounted drill rig, and four (4) Cone Penetration Test (CPT) soundings (CPT-1 through CPT-4), for geotechnical logging and soil sampling (text and Appendix B).

3. Evaluation of geologic, seismic hazards and regional seismicity (text and Appendix C).



4. Appropriate laboratory testing of representative bulk and relatively undisturbed soil samples collected during our subsurface exploration program (text and Appendix D).

5. Engineering and geologic analyses of data collected (text and Appendix E).



6. Preparation of this geotechnical report, accompaniments, and general grading guidelines (text and Appendix F).

SITE DESCRIPTION AND PROPOSED DEVELOPMENT

The overall site consists of an approximately 2.98-acre, rectangular-shaped area of developed land. The proposed Building A1 is located on the east side of the existing health care facility. The site is located on the southeast corner of the intersection of W 7th Street and S. Grand Avenue, in the City of San Jacinto, Riverside County, California (see Figure 1 - Site Location Map). The physical address of the existing facility is 980 W. 7th Street, City of San Jacinto, Riverside County, California 92582. As discussed herein, the overall care facility is referred to as site, project site, or property.

SITE LOCATION MAP

Figure 1

The geographic coordinates of the approximate centroid of Building A1 is at a latitude of 33.77956 degrees and a longitude of -116.97718 degrees. The property is bounded by undeveloped land on the south, east and west, by residential development to the southwest, and commercial development to the north, across W 7th Street. In general, the site is flat-lying to very gently sloping in a southeasterly direction. According to Google Earth Pro (GEP, 2025), site elevations vary between approximately 1,527 and 1,525 feet Mean Sea Level (MSL), for an overall relief of about 2 feet. The site is sparsely vegetated and has shrubs and trees surrounding the existing facility. Within the proposed building footprint, the western margin is currently used for an exercise yard by the patients. Elsewhere, it is earthen or covered with gravel (driveway area).

Existing site improvements primarily consist of several single-story buildings with an asphaltic concrete (AC) parking lot to the north. A U-shaped drive aisle exists near the entrance to the site from W 7th Street. Existing underground utilities are present beneath the pavements. There are also improvements in the area of the proposed building which consist of various sidewalks, a basketball court, and exercise yard fences. The proposed development (Building A1) is planned to be a single-story health care building with an improved fire access lane and small parking lot. Building loads are assumed to be typical for these types of structures. Sewage disposal is proposed to tie into the regional municipal system.

BACKGROUND

The facility was first approved to provide Medicare and Medicaid services on May 29, 1968 (Nursing Home Report, 2025). Existing onsite buildings appear to be primarily wood-frame construction and stucco exteriors, with shallow concrete slabs and foundations. The exercise yard area was added sometime between 2011 and 2012. Since that time, the site has been maintained and slightly modified to its current configuration. Construction records of the existing facility were not available at the time of this report and it is believed that most of the single-story facility buildings were constructed upon relatively shallow fill soils (less than 3 feet in thickness). Records of the initial grading on this site were not available for GSI's review. Given the age of the existing development (circa 1968), it is unlikely that a geotechnical report for the development of this site is currently available.

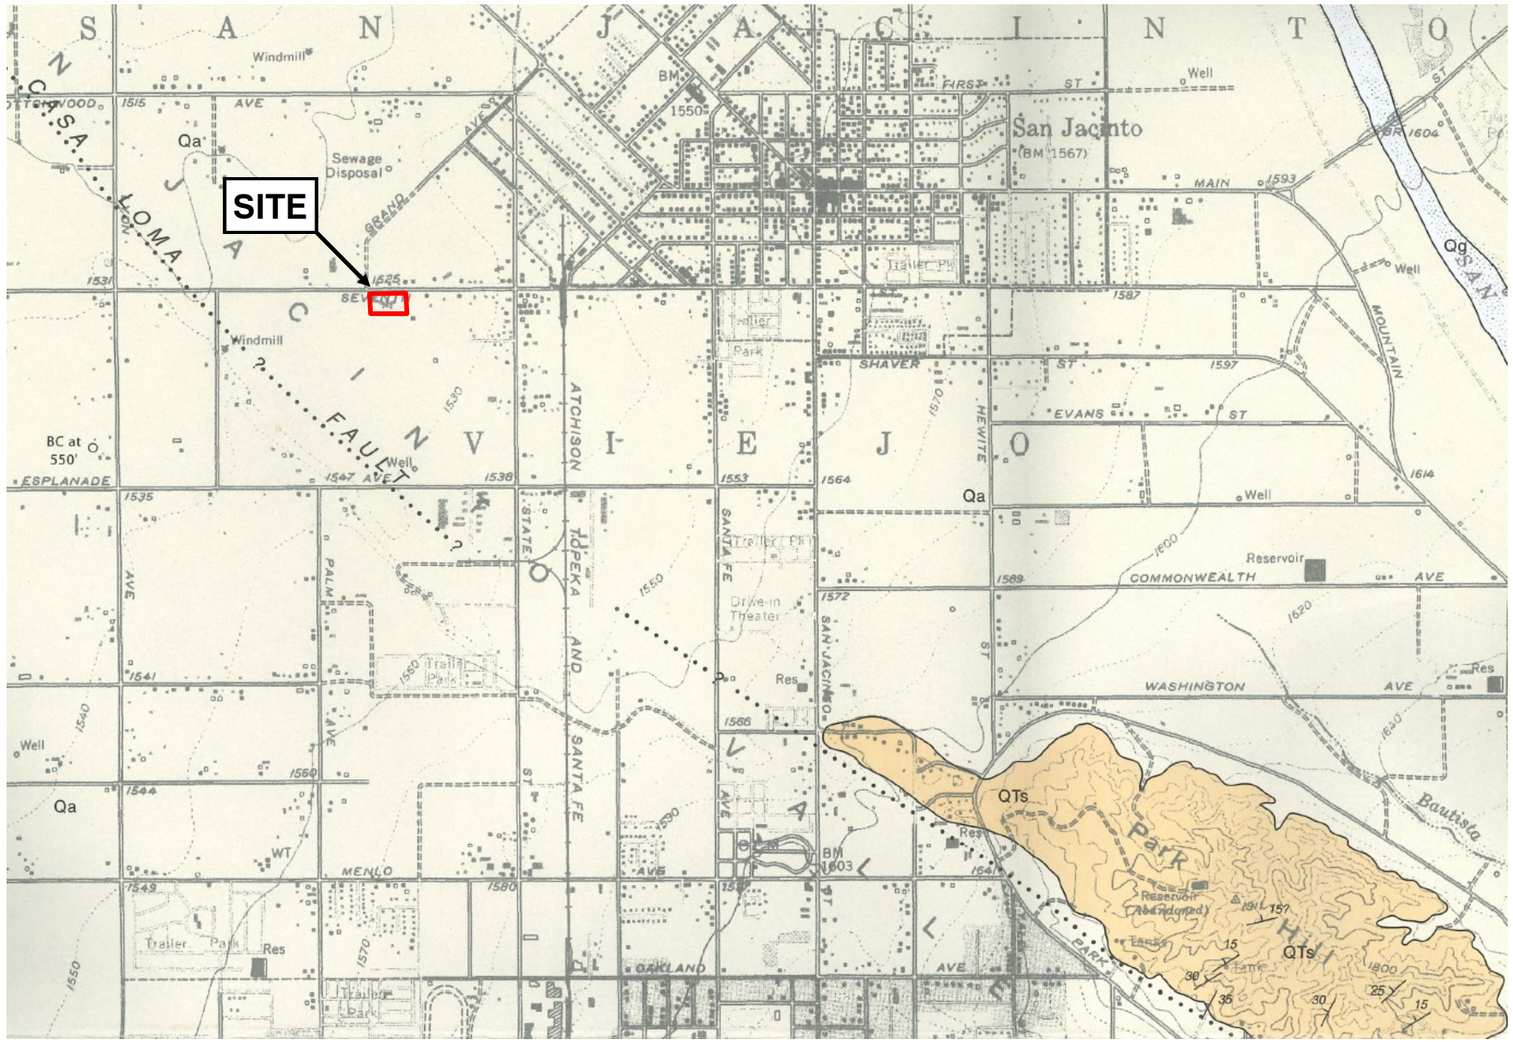
SITE EXPLORATION

Surface observations and subsurface explorations were performed by GSI representatives on November 26, 2025. Near-surface soil and geologic conditions were explored with four (4) exploratory hollow-stem auger borings (B-1 through B-4), advanced with a truck-mounted drill rig. In addition, four (4) supplemental Cone Penetration Test (CPT) soundings (CPT-1 through CPT-4) were also advanced in the footprint of Building A1. The borings and CPT soundings were logged or observed by a geologist from this office who also

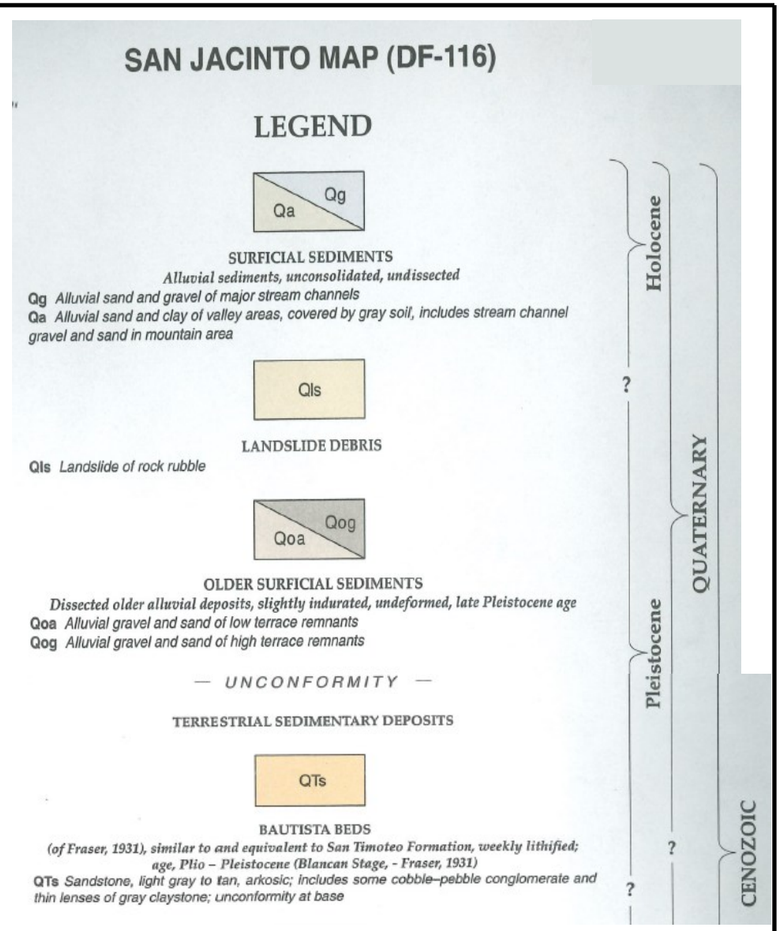
collected representative bulk and relatively undisturbed soil samples for appropriate laboratory testing. Logs of the borings and CPT soundings are presented in Appendix B. The approximate locations of the borings and CPT soundings are shown on the attached Geotechnical Map (see Plate 1), which uses the overall site plan by GMA (2025) as a base.

GEOLOGY

Regional Geologic Setting



The property is situated near the northeastern margin of the Perris Block, a portion of a prominent natural geomorphic province in southwestern California known as the Peninsular Ranges. The Peninsular Ranges are characterized by steep, elongated ranges and valleys that trend northwesterly. The Peninsular Ranges extend north to the base of the San Gabriel Mountains and south into Baja California, Mexico. The Perris Block is a stable structural block bounded on the west by the Elsinore fault zone and on the east by the San Jacinto fault zone. The province is bounded on the north and northeast by the Transverse Ranges, on the south and southeast by the Colorado Desert geomorphic province. This province is typified by plutonic and metamorphic rocks (bedrock) which comprise the majority of the mountain masses, with relatively thin volcanic and sedimentary deposits discontinuously overlying the bedrock, and with Plio/Pleistocene-age (Quaternary-age) alluvial fan deposits filling in the valleys and younger alluvium filling in the incised drainages. The alluvial deposits are derived from the waterborne deposition of the products of weathering and erosion of the bedrock. Regional geologic mapping by Dibblee (2003) indicates the site is underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas (Qa), although no significant clay layers were encountered during our subsurface investigation. The regional geology of the site and near-vicinity is shown on Figure 2, which uses Dibblee (2003) as a base.



Site Geology

The site geologic units encountered or observed during our subsurface investigation and site reconnaissance included near surface topsoil and disturbed fill, underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas at depth. The earth materials are generally described below from the youngest to the oldest. The distribution of these materials is shown on Plate 1. The relationship of the geological units is shown in profile on Geologic Cross Sections A-A' and B-B' (Plate 2).

Topsoil and Disturbed Fill (Not Mapped)

Topsoil and disturbed fill were encountered in all the borings advanced onsite. The topsoil and disturbed fill generally consist of brown, moist, loose to medium dense silty sands with some occasional roots and rootlets. Based on the available data, the thickness of the topsoil and disturbed fill was relatively thin (approximately 2 to 3 feet). Due to the low relative densities

and potential for adverse settlements, all of the existing topsoil and disturbed fill should be removed and recompacted during site grading activities. The removed topsoil and disturbed fill may be reused for compacted fills, provided it has been cleansed of deleterious materials (e.g., weeds, grasses, and concentrations of organic matter) prior to placement onsite as engineered fill.

Quaternary-Age Alluvial Sand and Clay of Valley Areas (Map Symbol - Qa)

In general, the topsoil and disturbed fill is underlain by relatively young (Holocene- to late Pleistocene-age) alluvial deposits, described by Dibblee (2003) as alluvial sand and clay of valley areas. However, as encountered during our subsurface investigation the site soils were generally sandy with minor silt layers encountered at depth. The alluvial deposits generally consist of light brown and dark gray, grayish brown, and light gray, medium dense, silty sand and silt with a few minor sandy layers. The alluvium is generally damp to moist and locally wet to saturated. The observed alluvial deposits extend to depths beyond 60 feet, and are estimated to be hundreds of feet in thickness based on the data reviewed. The near surface alluvial deposits (upper 5 to 7 feet) should be removed and recompacted during site grading. In-place low density alluvial deposits should be removed to competent materials (e.g., greater than or equal to 105 pcf or greater than or equal to 85 percent compaction). The removed alluvial deposits may be reused for compacted fills, provided that they have been cleansed of deleterious materials prior to placement onsite as engineered fill.

GROUNDWATER

No groundwater or seepage were encountered during our field exploration in Borings B-1 through B-4 nor CPTs 1 through 4, at depths ranging between approximately 30 and 60 feet bgs. As such, groundwater is not expected to be a factor during construction of the proposed project. Based on our review of the California Department of Water Resources Water Data Library (CDWR; 2025), nearby well measurements reviewed appear to be regional groundwater measurements at depths of approximately 170 and 155 feet (State Well No. 04S01W27P005S [March 7, 1991], and Site Code No. 337748N1169760W001 [December 6, 2011], respectively) at sites with similar ground surface elevations. However, our review of historic groundwater measurements in the San Jacinto and Temecula basins (U.S. Geological Survey, 1919, Water Supply Paper 429) indicates groundwater near the center of the basin may have been as shallow as 40 feet bgs. However, in California, the legislature passed the Sustainable Groundwater Management Act (SGMA), creating a statewide framework for groundwater regulation. The Eastern Municipal Water District (EMWD), and several other water purveyors, have been actively managing the San Jacinto basin as part of a voluntary Assembly Bill 3030 effort passed in 1992. As such, it is unlikely the groundwater will reach historic levels as the basin is now adjudicated.

However, there is a potential for perched water to occur both during and following site development along zones of contrasting permeability (e.g., fill lifts, sandy and clayey bedding, or discontinuities). Sources of perched water may include infiltrated rain water, over-irrigation, or damaged underground utilities. These observations reflect site conditions at the time of our investigation and do not preclude future changes in local groundwater conditions that were not obvious at the time of our investigation.

FAULTING AND REGIONAL SEISMICITY

Our review indicates that there are no known active faults crossing this site (Jennings and Bryant, 2010), and the site is not within an Alquist-Priolo Earthquake Fault Zone (California Geological Survey [CGS], 2018). In addition, our review of the RCIT Map My County website (2025) indicates no County faults are mapped onsite and site is not located within a County fault zone. However, the site is situated in a region of active faulting, as is all of southern California. These faults include, but are not limited to: the San Andreas fault; the San Jacinto fault; and the Elsinore fault zone.

The closest known active fault is the San Jacinto fault, located at an approximate distance of 2.0 miles (3.2 kilometers) to the east-northeast. However, the nearby San Andreas fault, and design fault for the subject site, is located at an approximate distance of 17.1 miles (27.5 kilometers) to the northeast.

Portions of the San Jacinto and San Andreas faults have demonstrated movement in the Holocene Epoch (last 11,700 years); and therefore, are considered active and located within Alquist-Priolo Earthquake Fault Zones (CGS, 2018). Cao, et al. (2003) indicates that the San Andreas fault is an "A" fault with a slip rate of 24.0 ($\pm$6.0) millimeters per year, and is capable of producing a maximum magnitude (M_w) 7.5 earthquake. The location of the San Andreas and San Jacinto faults, and other major faults that could have an effect on the site in the form of moderate to strong ground motions, are shown on the Regional Fault Map (see Figure 3). In addition, the Riverside County Information Technology (RCIT) fault hazard mapping in the site vicinity is shown on the County Fault Map (see Figure 4).

Fault Activity Review (Alquist-Priolo Fault Zones)

Based on our review of available fault hazard mapping (CGS, 2025 and 2018 and RCIT, 2025) a small splay of the San Jacinto fault projects towards the subject property. This fault trace is described as the "Casa Loma" segment of the San Jacinto fault zone.

Our fault activity review included reviews of previous fault-finding and geotechnical investigations by Gary S. Rasmussen & Associates (GR&A, 1986, County Geo. No. 409), Lewis S. Lohr & Associates (LSL&A, 1991, County Geo. No. 790) and by Leighton & Associates (L&A, 2003, County Geo. No. 1189). These previous investigations, just northwest of the site, found no evidence of offsets or active faulting within the trench exposures evaluated. As such, it appears the small fault splay dies-out before reaching the

site proximity. A map showing the Alquist-Priolo earthquake zones of required investigation (CGS, 2025) is provided on Figure 5. A map showing the nearby Alquist-Priolo site investigation reports reviewed (GR&A, 1986, LSL&A, 1991, and L&A, 2003) is provided on Figure 6.

Aerial-photographic Lineament Analysis

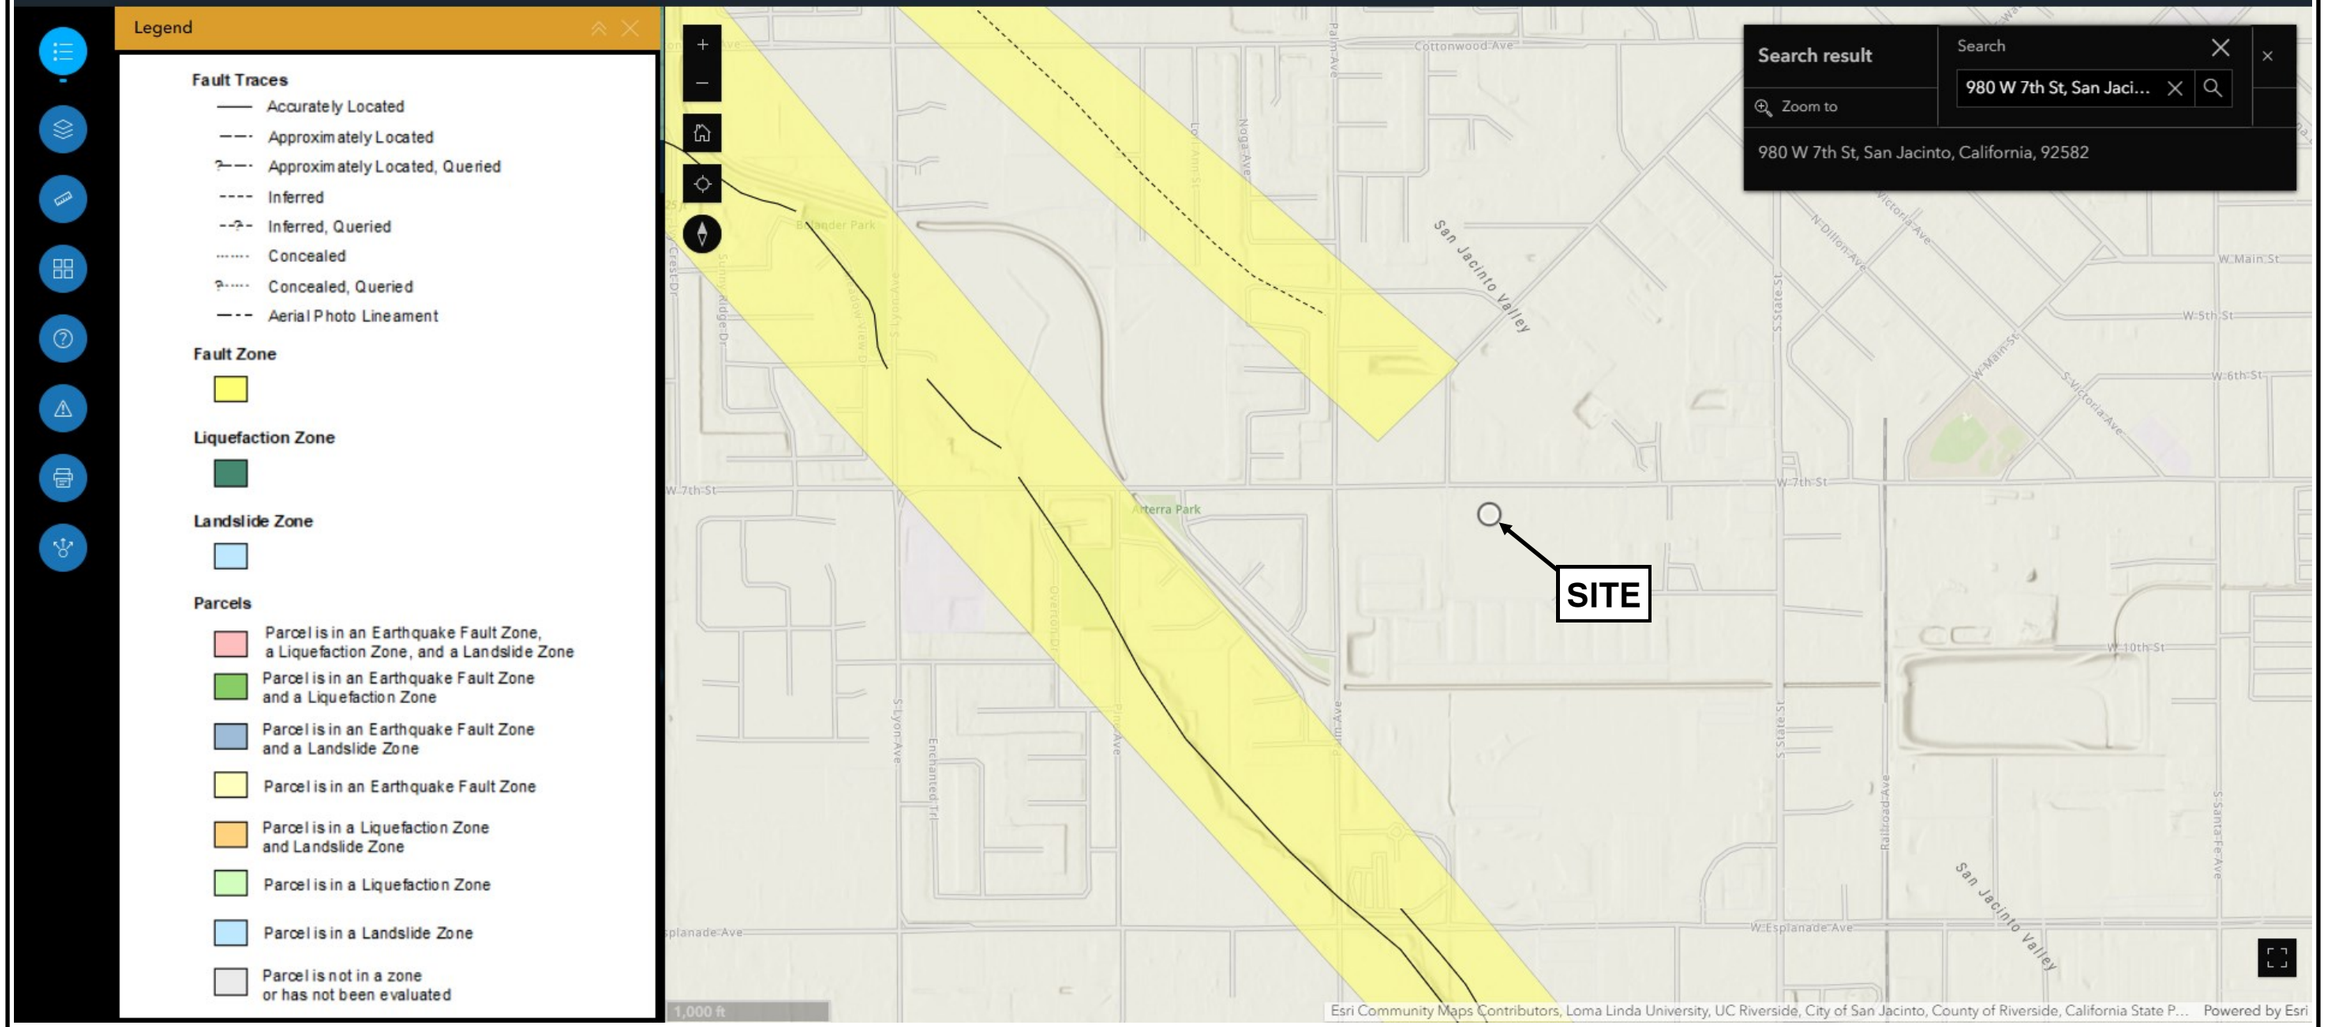
In order to identify possible unmapped faults and to evaluate topographic expressions of published fault traces in the proximity, a lineament analysis was performed using stereoscopic black-and-white aerial photographs (United States Department of Agriculture [USDA], 1980). Lineaments were generally classified as strong, moderate, or weak. A strong lineament is a well-defined feature that can be continuously traced several hundred feet to a few thousand feet. A moderate lineament is less well-defined, somewhat discontinuous, and can be traced for only a few hundred feet. A weak lineament is discontinuous, poorly defined, and can be traced for a few hundred feet or less. Based on our review and analysis, a moderate photolineament was noted west- northwest of the site, and correlates well with the mapped location of the Casa Loma segment of the San Jacinto fault zone. No lineaments specifically cross or project toward the project site. Furthermore, the site is not transected by geomorphic features indicative of active faulting.

Regional Seismicity

General

The subject site is located within a seismically active region, subject to moderate to strong earthquakes occurring along many active fault splays. The possibility of ground motions at the site, may be considered as approximately similar to the southern California region as a whole.

Historical Site Earthquake Records



Historical site seismicity was evaluated with the USGS website application "Search Earthquake Catalog" (https://earthquake.usgs.gov/earthquakes/search/). This program performs a search of the historical earthquake records for magnitude 5.0 to greater than 7.0 seismic events within a search area, between the years of January, 1800 through December, 2025. A historical earthquake epicenter map is generated from the historical data, and is presented on Figure 7. Our research of regional geologic and seismic data did not reveal any known instances of ground failure within the site associated with regional seismic activity.

Seismic Ground Motion Values

Using a latitude of 33.77956 degrees and a longitude of -116.97718, a Risk Category of III (provided by the architect) and based on the site conditions, the following table summarizes the design criteria obtained from the 2022 CBC, Chapter 16 Structural Design, Section 1613, Earthquake Loads. The ASCE Hazard Tool (ASCE Hazard Tool) has been used to aid in

design. As the site is potentially liquefiable, the site may be classified as Site Class F. However, as we assume that the fundamental period of the proposed structure is less than 0.5 seconds, the site is classified as D (Appendix C). Since site class is D, a site-specific procedure would be required, but it is not performed as we follow the Exception of Section 11.4.8.1, ASCE 7-16, Supplement 3. A printout of the ASCE Design Hazards Report is presented in Appendix C.

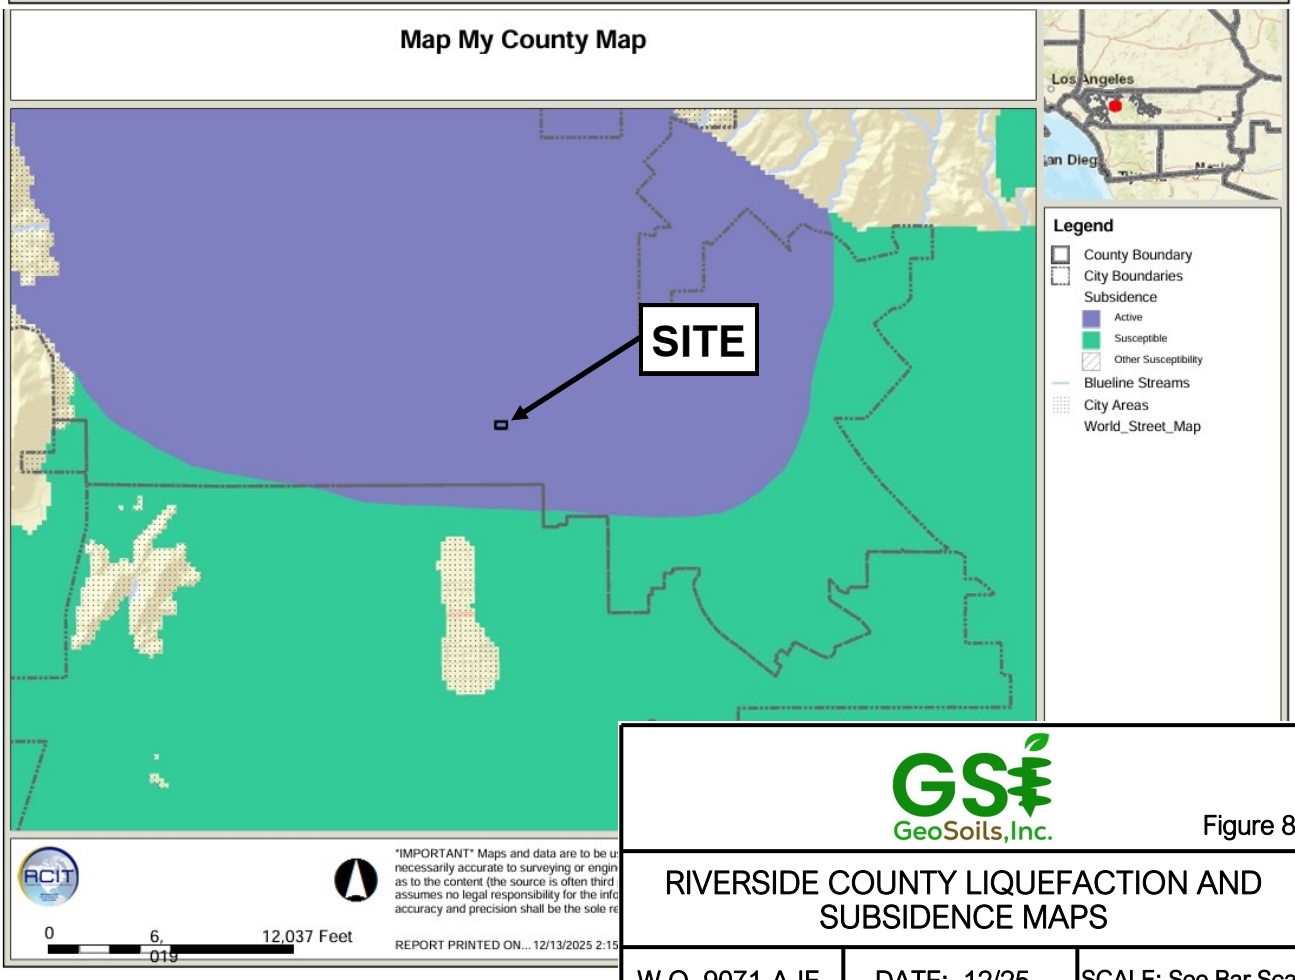
Seismic Design Category	E	Section 1613.2.5



Conformance to the criteria above for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur in the event of a large earthquake. The primary goal of seismic design is to protect life, not to eliminate all damage, since such design may be economically prohibitive. Cumulative effects of seismic events are not addressed in the 2022 CBC (CBSC, 2022) and regular maintenance and repair following locally significant seismic events will likely be necessary, as is the case in all southern California.

LIQUEFACTION POTENTIAL

General

Based on our review, the CGS has not prepared Seismic Hazard Mapping for the San Jacinto Quadrangle. However, our review of the RCIT (2025) Map My County website indicates the site is mapped within an area designated as having a "moderate" potential for liquefaction (RCIT, 2025 [see Figure 8, Riverside County Liquefaction and Subsidence Maps]). As such, liquefaction and seismic settlement analyses were conducted, and are discussed below.

GeoSoils, Inc.

Figure 8

RIVERSIDE COUNTY LIQUEFACTION AND SUBSIDENCE MAPS

W.O. 9071-A-IE	DATE: 12/25	SCALE: See Bar Scale

Figures Adapted from: Riverside County Information Technology (RCIT), Map My County Website, 2025

Liquefaction

Liquefaction is a phenomenon where earthquake- induced ground motions increase the pore pressure in saturated, sand-like soils until it is equal to the overburden pressure. When this occurs, the soil can completely lose its shear strength and enter a liquefied state. The possibility of liquefaction is dependent upon grain size, relative density, fines consistency, confining pressure, saturation of the soils, and intensity and duration of seismic ground motions. In order for liquefaction to occur, three criteria must be met: underlying loose, sand-like soils, a groundwater depth of less than about 50 feet, and a potential for seismic ground motions from nearby large-magnitude earthquakes.

Following a review of the subsurface borings, CPT data and laboratory testing, the CPT data was evaluated for liquefaction potential within the site. For the analyses, GSI used a groundwater depth of 40 feet below the existing grade to account for potential historic groundwater levels, although unlikely, at the time of the seismic event for the currently planned development.

The liquefaction analysis was performed, based on the CPT data obtained (CPT-1 through CPT-4) and was conducted using the commercially available CPT liquefaction assessment software, CLiq v.3.5.4.2 (Geologismiki, 2025). We used the soil information from the CPT data, and seismic parameters PGA_M = 1.074g and magnitude M= 8.1 earthquake. This magnitude was calculated from deaggregation analysis using the USGS Tool interactive website (Appendix C). Calculations of liquefaction potential indicate that sandy layers below the ground water table could be potentially liquefiable. No bearing capacity failure, sand boils, or lateral spreading are anticipated, based on the available data. Computer printouts from the analysis are presented in Appendix E.

Seismic Densification

Seismic densification is a phenomenon that typically occurs in low relative density granular soils (e.g., USCS classified as SP, SW, and SM) that are above the groundwater table and are significantly dry of optimum moisture content. During the seismic-induced ground shaking, these natural sediments deform under loading and volumetrically strain, resulting in ground surface settlements. These unsaturated granular soils are susceptible if left in their original density (unmitigated), and are significantly drier than the optimum water content (as defined by the ASTM D 1557). Seismic densification phenomenon has a low, to perhaps moderate potential to affect planned site improvements; however, will be mitigated by recommended remedial grading and appropriate foundation design. Calculations of seismically induced settlements are presented in Appendix E.

We estimate approximately 3-inch of total seismically induced ground settlement may occur at the site. The seismic total settlements at each of the CPT locations, including dry (above GWT) and wet (below GWT) are presented in the Table below.

CPT No.	Dry settlement (in)	Wet settlement (in)	Total Settlement (in)
1	0.62	1.12	1.74
2	1.05	1	2.05
3	3.14	1.21	4.35
4	3.16	0.75	3.91
		Average =	3.01

The differential settlements were calculated using the total settlement at each CPT location and the horizontal distances between them. The angular distortions (Δ/L) are consistent with ASCE 7-16, Chapter 12.13.9. These calculations are presented in the Table below.

CPT No.		Differential Settlement, Δ (in.)	Distance, L (ft)	Δ/L
1	2	0.31	50	0.001
1	3	2.61	87	0.003
1	4	2.17	119	0.002
2	3	2.3	109	0.002
2	4	1.86	152	0.001
3	4	0.44	55	0.001

Lateral Spreading

Lateral spread phenomenon is described as the lateral movement of stiff, surficial, mostly intact blocks of sediment or compacted fill displaced downslope towards a free face along a shear zone that has formed within the liquefied sediment. The resulting ground deformation typically has extensional fissures at the head of the failure, shear deformations along the side margins, and compression or buckling of the soil at the toe. Given, the location and flat laying nature of the site, the potential for lateral spreading to directly affect the site is considered low, based on the available data.

SUBSIDENCE POTENTIAL

Subsidence and Ground Fissures

Our review of the RCIT (2025) Map My County website indicates the site is located in a zone of "Active" subsidence (RCIT, 2025 [see Figure 8, Riverside County Liquefaction and Subsidence Maps]). The effects of areal subsidence and ground fissures generally occur at the transition or boundaries between low-lying areas and adjacent hillside terrain, where materials of substantially different engineering properties (e.g., alluvium vs. bedrock) are present.

Subsidence and ground fissures may also occur due to groundwater or fluid withdrawal and regional tectonics. Documented subsidence within the basin roughly corresponds to the limits of the bounding Casa Loma and San Jacinto fault zones (Lofgren, 1976). There is historical evidence that subsidence has occurred within the San Jacinto basin and the site area, including as much as 0.26 feet (Lofgren, 1976), occurring north of the site during the period of 1964 to 1973. Thus, the subsidence has been attributed to withdrawal of groundwater and regional tectonics along bounding fault zones. However, subsidence has eased appreciably, as a result of the groundwater basin being adjudicated.

The most significant ground fissures are located in the northwestern part of the valley adjacent to and immediately west of the Casa Loma fault, north and northwest of Lakeview (Morton, 1994). Ground fissures in the immediate site vicinity have not been documented.

As such, subsidence and ground fissures at the subject site due to groundwater withdrawal and regional tectonics should be no greater than other nearby already developed areas. As discussed previously, California regulations have been enacted by the Sustainable Groundwater Management Act (SGMA) to mitigate the subsidence potential from the withdraw of groundwater. Provided the SGMA guidelines are properly implemented, the potential for areal subsidence or ground fissures from subsidence owing to groundwater withdrawal, is considered low, but may not be entirely precluded.

OTHER SECONDARY SEISMIC HAZARDS

The following list includes other secondary seismic related hazards that have been considered during our evaluation of the site. The hazards listed are considered negligible or mitigated as a result of site location, soil characteristics, and typical site development procedures indicated herein:

- Lateral spreads
- Ground Lurching or Shallow Ground Rupture
- Tsunami
- Seiche and Dam Inundation

Following implementation of remedial earthwork and design of foundations described herein, this potential would be no greater than that for other existing structures and improvements in the immediate vicinity that comply with current and adopted building standards. Other geologic hazard considerations are addressed below.

Other Geologic Hazard Considerations

The California Geological Survey Note 48 (2022) identifies a number of exceptional geologic hazards that can occur at individual sites, but do not occur statewide. An evaluation of these exceptional conditions is referred to as a Conditional Geologic Assessment by Note 48. Specific assessment items listed in Note 48 are addressed in the table below.

Conditional Geologic Assessment

HAZARD	ASSESSMENT	REFERENCE
Methane Gas, Hydrogen-Sulfide Gas, or Tar Seeps	Not applicable, site is not located with an identified oil field.	California Geological Energy Management Division (CalGEM) Well Finder Program, and DOGGR Online Mapping System (DOMS, 2025).
Volcanic Eruption	Not applicable, site is not in a known hazard area for volcanic eruptions.	U.S. Geological Survey Bulletin 1847 and Geologic mapping by Dibblee (2003).
Flooding and Dam Inundation	The proposed project is located within FEMA Flood Zone X, not located within a County Flood zone, and not located within a dam inundation area.	FEMA Flood Maps, Map My County Website, and Division of Safety of Dams (DSOD).
Tsunami and Seiche Inundation	Not Applicable	See above Sections.
Radon-222 Gas	Not Applicable, typically a concern in the California Coast Ranges.	California Radon Survey (1990) and Nagda (1994).
Naturally Occurring Asbestos	Not Applicable, site is not within an area more likely to contain naturally occurring asbestos.	Churchill and Hill, 2000 (Open-File Report OFR-2000-19)
Hydrocollapse Due to Anthropic Use of Water	Drilling, CPT, and groundwater data indicate that soils are not likely to experience hydrocollapse.	See Groundwater Section.
Regional Subsidence	Our review of Lofgren (1976) and the Map My County Website indicates the site is located within an “Active” zone of subsidence.	Lofgren (1976) and Map My County Website. See above Sections.
Clays and Cyclic Softening	Soils underlying the site are predominately granular. No plastic clays encountered onsite.	See Appendix B and below sections.

LABORATORY TESTING

General

Laboratory testing was performed on representative onsite earth materials in order to evaluate their physical characteristics. The test procedures used and laboratory results obtained are presented below.

Classification

Soils were classified visually according to the Unified Soils Classification System (per ASTM D 2488). The soil classifications are shown on the Boring Logs in Appendix B.

Moisture-Density Relations

The field moisture contents and dry unit weights were measured for relatively undisturbed samples in the laboratory in general accordance with ASTM D 2937 and ASTM D 2216. The dry unit weight was calculated in pounds per cubic foot (pcf), and the field moisture content was calculated as a percentage of the dry unit weight. The results of these tests are indicated on the Boring Logs in Appendix B.

Laboratory Standard

The maximum dry density and optimum moisture content were evaluated for a representative bulk sample of the near-surface soil. The laboratory standard used was ASTM D 1557. The moisture-density relationship obtained for this soil is shown below:

SAMPLE LOCATION AND DEPTH (FT)	SOIL TYPE	MAXIMUM DRY DENSITY (PCF)	OPTIMUM MOISTURE CONTENT (%)
B-2 @ 0-5'	Silty Sand (SM)	113.6	13.1

Expansion Potential

A representative bulk sample of the near-surface soil was evaluated for expansion potential. The Expansion Index (E.I.) test was performed in accordance with ASTM Standard D 4829. The results of the expansion testing are presented in the following table.

SAMPLE LOCATION AND DEPTH (FT)	LABORATORY EXPANSION INDEX (E.I.)	EXPANSION POTENTIAL*
B-1 @ 0-5'	7	Very Low

Direct Shear Tests

Shear testing was performed on relatively undisturbed samples of site soil encountered in the borings. Shear tests were performed in general accordance with ASTM Test Method D 3080 in a Direct Shear Machine of the strain control type. The shear test results are presented in Appendix D, and summarized in the following table:

SAMPLE LOCATION AND DEPTH (FT)	PEAK		RESIDUAL	
	COHESION (PSF)	FRICTION ANGLE (DEGREES)	COHESION (PSF)	FRICTION ANGLE (DEGREES)
B-1 @ 7.5 (undisturbed)	38	36	22	33
B-4 @ 15 (undisturbed)	224	37	87	34

Saturated Resistivity, pH, and Soluble Sulfates

GSI conducted sampling of onsite earth materials for general soil corrosivity testing. The testing included evaluation of soil pH, soluble sulfates, soluble chlorides, and saturated resistivity. These preliminary data should be used by the project structural engineer (or corrosion engineer) in their evaluation of site corrosivity mitigation measures. The soluble sulfate and corrosion potential results are shown as follows, and are presented in Appendix D:

LOCATION AND DEPTH (FT)	SOLUBLE SULFATES PERCENTAGE BY WEIGHT	pH	CHLORIDE (mg/kg)	RESITIVITY (OHMS-CM)
B-1 @ 0-5	0.005	8.0	21	3,500

For preliminary planning purposes, and based upon the soluble sulfate test results and the American Concrete Institute (ACI, 2014), the soluble sulfate content is listed as Exposure Class “S0” (<0.10 Water-Soluble Sulfate in soil, percentage by weight), per the ACI, 2014 (Table 19.3.1.1). Based on the results of the resistivity and pH testing, the onsite soils are

generally considered moderately alkaline (a pH of 7.9 to 8.4 is considered moderately alkaline), and are considered moderately corrosive to ferrous metals in a saturated state (2,000 to 10,000 ohm-cm is considered moderately corrosive). Chlorides are generally low and below action levels.

Although the site soils are categorized as being moderately corrosive to ferrous metals in a saturated state, it is our understanding that ferrous metals embedded in properly poured and formed concrete with the proper mix should be adequately protected from these conditions. As stated above, the soluble sulfate content is listed as Exposure Class "S0" (ACI, 2014). However, reinforced concrete mix design for foundations, slab-on-grade floors, and pavements should also conform to Exposure Classes "S0," "W0," and "C1" in Table 19.3.1.1 of ACI 318-14, as concrete would likely be exposed to moisture. Based upon the laboratory test results obtained, a consulting corrosion engineer may be retained to provide specific recommendations for foundations, utility piping, or other subsurface structures, as warranted.

Resistance Value (R-Value)

Resistance value, or R-Value testing, was performed on a representative soil sample in accordance with CalTrans Test Method 301, and yielded a test result of R=31. The results of R-Value testing are presented in Appendix D. Based on the testing results obtained, preliminary pavement design recommendations are presented herein.

Conformance Testing for Expansion, Corrosion and Concrete Mix Design

Upon completion of grading, additional laboratory testing should be performed on representative samples of soil exposed near pad grade to evaluate its corrosive effects on concrete and steel, and expansion characteristics. Additional comments may be obtained from a qualified corrosion engineer at that time based on the level of corrosion protection required by the project architect, structural engineer, or civil engineer. It is assumed that the need for corrosion protection of steel reinforcement will be further evaluated by the project structural engineer or project architect.

PRELIMINARY CONCLUSIONS AND RECOMMENDATIONS

General

Based on our review of the existing body of near-site geotechnical data, and our field exploration, laboratory testing, and geotechnical engineering analysis, it is our opinion that the project site appears suitable to receive the proposed development from a geotechnical engineering and geologic viewpoint, provided that the recommendations presented in the following sections are incorporated into the design and construction phases of site development. The primary geotechnical concerns with respect to the proposed development are:

1. The presence of existing near-surface topsoil and disturbed fills, and the presence of underlying near-surface loose to medium dense sandy to silty young alluvial deposits.

2. The static and seismic settlement potential of underlying alluvial soils.

3. The depth to competent bearing material below existing grades.

4. The corrosion potential of onsite soils.

5. Regional seismic activity.

The recommendations presented herein consider these as well as other aspects of the site. The engineering analyses, performed, concerning site preparation and the recommendations presented herein have been completed using the information provided and obtained during our field work. In the event that any significant changes are made to proposed site development, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and the recommendations of this report are evaluated or modified in writing by this office. Foundation design parameters are considered preliminary until the foundation design, layout, and structural loads are provided to this office for review.

1. Owing to the presence of potentially compressible existing topsoil and disturbed fill, and near-surface alluvial deposits there will be a potential for distress to settlement-sensitive improvements, absent mitigation. Thus, the near-surface layers of existing topsoil and disturbed fill, and near-surface alluvial deposits should be removed and recompacted to current industry standards and Code as recommended herein within the building footprint. Remedial removals should be conducted to approximately 5 to 7 feet below existing grades. Proposed parking areas and fire access lanes should be graded and recompacted within the upper 2 feet of the existing finish surface.

2. Geotechnical engineering, observation, and testing services should be provided by GSI during grading to aid the contractor in removing unsuitable soils and in their effort to compact the fill. Geologic observations should also be performed during grading to observe and further evaluate site geologic conditions. Although unlikely, if adverse geologic features are encountered, supplemental recommendations and earthwork may be warranted.

3. The near-surface existing topsoil and disturbed fill, and near-surface alluvial deposits (Qa) is considered potentially compressible; and therefore, unsuitable for the support of settlement-sensitive improvements in its present condition, based on current industry standards. In order to reduce the effects of settlement, remedial earthwork should be performed within the areas of proposed development. Remedial grading should be performed to at least 5 feet outside the proposed building footprint, where

feasible. Removals on the order of 2 feet are recommended for other areas supporting settlement-sensitive improvements (e.g., parking lot and fire access lane).

4. Our expansion index test indicates very low expansive soils underlie the site in the near-surface. Preliminary foundation design and construction recommendations are provided herein for these soil conditions.

5. Building foundations will need to be designed to tolerate the soil conditions, and the potential settlements discussed herein. Based on the potential for seismic settlement, the use of a conventional foundation system (e.g., shallow spread and continuous footings) does not appear practical for the proposed building. As such, recommendations for building foundations, including mat slabs, are provided herein.

6. The seismic ground motion values provided herein should be considered during the design and construction of the proposed development.

7. General Earthwork and Grading Guidelines are provided at the end of this report as Appendix F. Specific recommendations are provided in the following sections.

EARTHWORK CONSTRUCTION RECOMMENDATIONS

General

All earthwork should conform to the guidelines presented in the 2022 CBC (CBSC, 2022), the requirements of the City of San Jacinto or County of Riverside, and the General Earthwork and Grading Guidelines presented in Appendix F, except where specifically superseded in the text of this report. Prior to earthwork, a GSI representative should be present at the preconstruction meeting to provide additional earthwork guidelines, if needed, and review the earthwork schedule. GSI should be notified in advance of any fill placement, supplemental regrading of the site, or backfilling underground utility trenches and retaining walls after rough earthwork has been completed. This includes grading for driveway approaches, driveways, and exterior hardscape.

During earthwork construction, all site preparation and the general grading procedures of the contractor should be observed and the fill selectively tested by a representative(s) of GSI. If unusual or unexpected conditions are exposed in the field, they should be reviewed by GSI and, if warranted, modified or additional recommendations will be offered. All applicable requirements of local and national construction and general industry safety orders, the Occupational Safety and Health Act (OSHA), and the Construction Safety Act should be met. It is the onsite general contractor's and individual subcontractors' responsibility to provide a safe working environment for our field staff who are onsite. GSI does not consult in the area of safety engineering.

Site Preparation

All existing improvements (e.g., underground utilities or foundations, if present), vegetation and deleterious debris should be removed from the site prior to the start of construction.

Treatment of Existing Ground

1. Removal of all topsoil and disturbed fill, and near surface weathered alluvial deposits will be necessary prior to fill placement, in areas proposed for settlement-sensitive improvements. The near surface deposits should be removed to competent materials (e.g., greater than or equal to 85 percent compaction, or greater than or equal to 105 pcf for in-place native materials, as evaluated by a GSI representative), if not removed by proposed excavation within areas proposed for settlement-sensitive improvements. For preliminary planning purposes, these depths are estimated to be on the order of 5 to 7 feet across the majority of the site. Variations from these thicknesses should be anticipated. A minimum of 3 feet of 90 percent compaction fill should underlie the proposed foundation. The foundation area shall be defined as the area extending from the edge of the mat for a distance of 5 feet. Actual depths of removals will be evaluated in the field during grading by GSI.

2. After the above removals, the upper 6 inches of the exposed subsoils should be scarified, brought to at least optimum moisture content, and recompacted to a minimum relative compaction of 90 percent of the laboratory standard

3. The existing onsite soils may be reused as compacted fill provided that any significant concentrations of vegetation and miscellaneous trash and debris are removed prior to or during fill placement.

4. Localized deeper removal may be necessary due to buried drainage channel meanders or dry porous materials. The project geotechnical consultant or geologist should observe all removal areas during the grading.

Fill Placement

1. Fill materials should be cleansed of major vegetation and debris prior to placement.

2. Fill materials should be brought to at least optimum moisture, placed in thin 6- to 8-inch lifts and mechanically compacted to obtain a minimum relative compaction of 90 percent of the laboratory standard (ASTM D 1557).

3. Any import materials should be observed and evaluated suitable by GSI prior to placement on the site. Foundation designs may be altered if import materials have a greater sulfate or expansion values than the onsite materials encountered during our preliminary investigation.

Temporary Slopes

Temporary slopes may be constructed at a gradient of 1:1 (h:v) of flatter (Cal-OSHA Type "B" soil), up to 15 feet in height, provided no seepage, groundwater, or running sands are encountered, and no equipment or stockpiles are located within a distance of "H" from the top of the temporary slope, where "H" is the height of the slope. All temporary slopes should be observed by GSI prior to the entry of unprotected workers, as needed. Although not anticipated, should any adverse conditions be exposed, temporary slopes may need to be inclined to flatter gradients or receive shoring. Shored excavations would be recommended if property lines or existing improvements that need to remain in serviceable use do not allow for the temporary slope gradient recommended herein.

Slot-Cut Grading

Due to the necessity for completing removals immediately adjacent to existing foundations that will remain in place, remedial earthwork adjacent to the existing health care facility may need to use "alternating slot" excavation methodology, also referred to as the "A-B-C" slot-cutting method, so that the existing foundation system is not adversely undermined and exposed to an elevated potential for distress. On a preliminary basis, slot widths should not exceed 5 to 6 linear feet. Consultation with the structural engineer is recommended prior to implementing slot excavations near the existing structure, that are above a 1:1 (h:v) projection from the outboard limits of remedial grading excavations. The structural engineer should evaluate if the recommended width of the slots will adversely affect bearing support of the existing improvements. The width of the slots may need to be reduced based on the results of the structural engineer's evaluation. Pre-construction surveys and survey monitoring should be performed in conjunction with site grading and shoring (if used), as necessary. If considered necessary, recommendations for temporary shoring are provided below.

TEMPORARY SHORING RECOMMENDATIONS

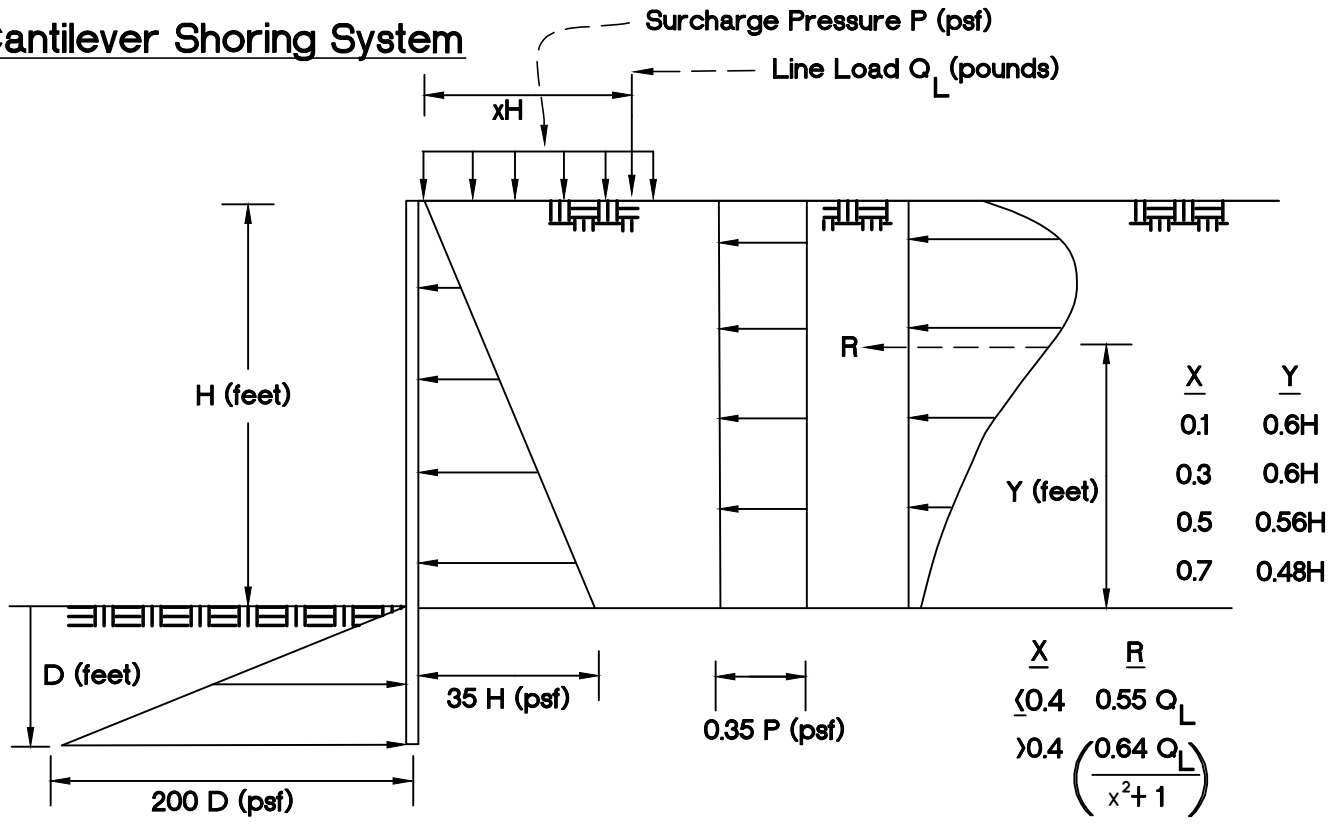
If needed, based on the anticipated remedial grading, the following temporary shoring recommendations are provided.

Lateral Earth Pressures for Temporary Shoring Design

1. Pressure diagrams showing the recommended application of active and passive earth pressures, and uniform and live load surcharges on temporary shoring systems are illustrated in Figure 9.

2. The active pressure to be used for temporary shoring design may be computed by the triangular pressure distribution shown in Figure 9.

3. Passive pressure for the design of temporary shoring may be computed as an equivalent fluid as shown in Figure 9.

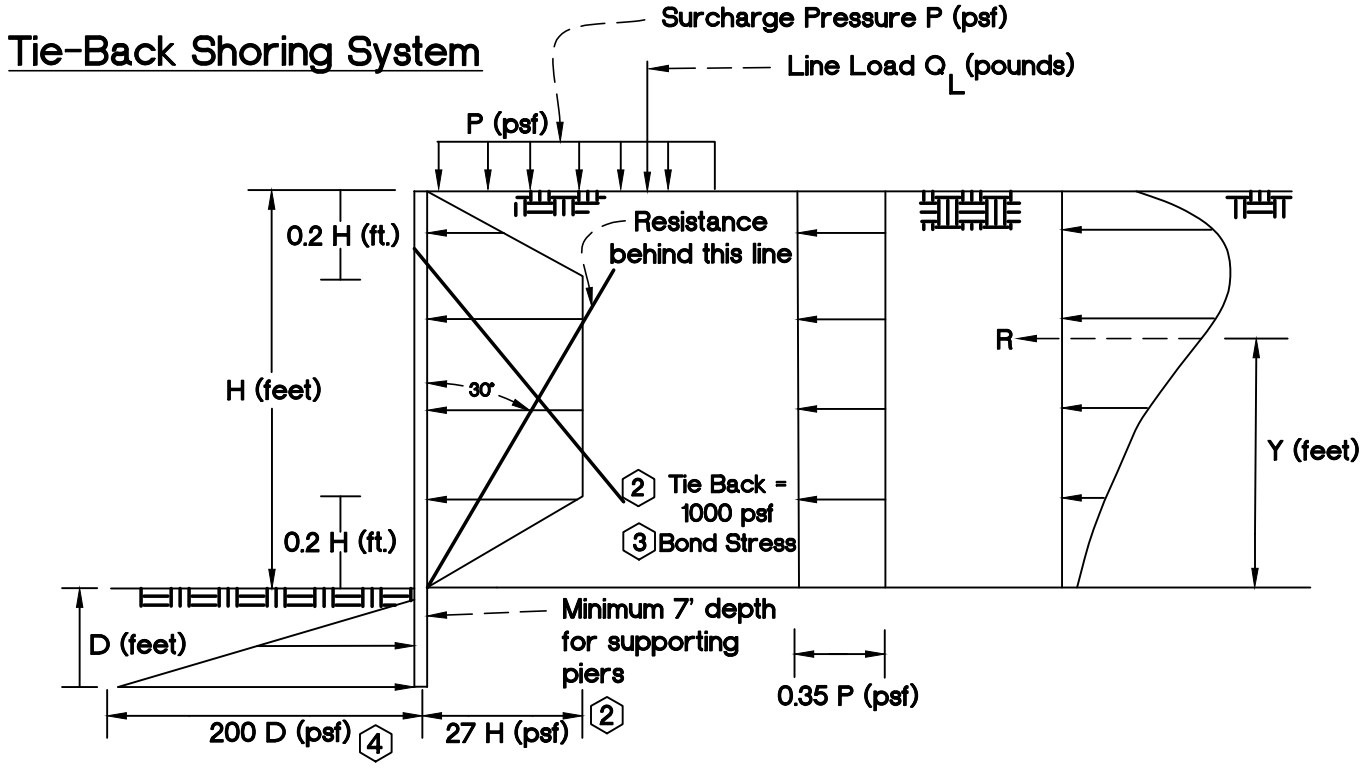


4. The above criteria assume the absence of soils with an E.I. > 20 behind the shoring and that hydrostatic pressure is not allowed to accumulate behind the shoring.

5. These recommendations are for a temporary shoring system with retained soil heights up to approximately 15 feet. Restraining elements, bracing, or the use of walers or rakers would likely be necessary for shoring of greater heights. The use of lateral resisting elements such as tiebacks or soil nails may be infeasible.

6. An empirical equivalent fluid pressure approach may be used to compute the horizontal pressure against the shoring. Appropriate fluid unit weights are provided for specific slope gradients of the retained material (see Figure 9). These do not include other superimposed loading imparted by traffic, structures, earthquakes, or adverse geologic conditions. Traffic surcharge for shoring should be modeled as a minimum 100 psf/ft load for light passenger vehicle traffic and at least 300 psf/ft for heavy (HS20) axle loads in the upper 5 feet of the shoring. These surcharges would apply if traffic will occur within "H" of the back of the shoring (where "H" equals the height of the retained earth). It is not recommended to allow sloping surcharge (other than level backfill) within a distance of "H" behind the shoring system from either stockpiled soils, stockpiled building materials, or temporary or permanent graded slopes, where "H" equals the height of the retained earth. Steeper slope gradients (more than level) will increase the equivalent fluid pressure for shoring design, significantly, and increase shoring costs. Regrading, if possible, is recommended prior to shoring installation to reduce the potential for sloping surcharge.

7. The shoring system should be designed such that the maximum lateral deformation at the top or bottom of the soldier pile does not exceed the value recommended by the shoring designer.



Cantilever Shoring System

X	Y
0.1	0.6H
0.3	0.6H
0.5	0.56H
0.7	0.48H

X	R
<0.4	$0.55\ Q_L$
>0.4	$\left(\frac{0.64\ Q_L}{x^2+1}\right)$

Tie-Back Shoring System

NOTES

1. Include groundwater effects below groundwater level.
2. Include water effects below groundwater level.
3. Grouted length greater than 7 feet; field test anchor strength.
4. Neglect passive pressure below base of excavation to a depth of one pier diameter.

GeoSoils, Inc.

Figure 9

LATERAL EARTH PRESSURES FOR TEMPORARY SHORING SYSTEMS

W.O. 9071-A-IE	DATE: 12/25	SCALE: None

8. The design of restraining elements, walers, bracing, and rakers should be provided by the project structural consultant or shoring designer, if necessary.

Shoring Construction Recommendations

1. The excavation and installation of the soldier piles should be observed and documented by the project geotechnical consultant to further evaluate the geologic conditions within the influence of the shoring and to ensure the soldier pile construction conforms to the requirements of the shoring plan.

2. Drilled excavations for soldier piles should be straight and plumb. The contractor should periodically recheck the drilled excavation for plumbness, especially when oversized rock constituents and debris are encountered.

3. Although not anticipated based on the available subsurface data, casing should be provided in drilled excavations if excessive groundwater or caving conditions are encountered. The bottom of the casing should be at least 4 feet below the top of the concrete as the concrete is placed and the casing is withdrawn. This should be considered during project planning. The exact tip elevation of the soldier piles should be clearly indicated on the shoring plans.

4. All concrete should be delivered through a tremie immediately after the approval of the drilled excavation and steel placement. Care should be taken to prevent striking the walls of the excavations with the tremie during concrete placement. Concrete should not be allowed to free fall more than 5 feet. “Tailgating” concrete is not recommended.

5. The height of exposed soils during vertical excavation should not exceed 4 feet. The entire excavation should receive lagging prior to the end of each workday. Alternatively, loose soil may be used as a temporary buttress located below a 1:1 (h:v) plane projected down and toward the excavation from the top of the unsupported soils. No excavation should be left unsupported overnight.

6. A complete and accurate record of all soldier pile locations, depths, concrete, strengths, quantity of concrete per pile, and other information should be maintained by the special inspector and geotechnical consultant. The shoring design engineer should be notified of any unusual conditions encountered during installation.

Excavation Observation and Monitoring

When excavations are made adjacent to an existing structure (e.g., building or underground utilities) there is a risk of some damage to that improvement, even if a well-designed system of excavation or shoring (if used), is planned and installed. Therefore, we recommend that a

systematic program of observations be made before, during, and after construction to evaluate the effects (if any) of construction on the existing structures.

Monitoring should include the measurement of any horizontal and vertical movements of both the existing structures and any shoring or bracing (if used). If shoring will be included in the proposed development, as determined by the designer, the locations and the type of the monitoring devices should be selected as soon as the total shoring system is designed and approved.

Reference points on the existing structures or improvements should be placed as low as possible on the exterior walls of buildings, adjacent to the excavation. Exact locations may be dictated by critical points within the structure, such as bearing walls or columns for buildings; and surface points on roadways and sidewalks near the top of the excavation. The points on a shoring system (if used) should be placed under or very near the points on the structures.

For a survey monitoring system, an accuracy of a least 0.01 foot should be required. Reference points should be installed and read initially prior to grading or excavation. The readings should continue until all construction below ground has been completed and the backfill has been brought up to final grade.

The frequency of readings will depend upon the results of previous readings and the rate of grading. Weekly readings could be assumed throughout the duration of grading with daily readings during rapid excavation near the bottom and at critical times during slot-cutting or installation of shoring for support. The reading should be plotted by the Surveyor and then reviewed by the Geotechnical Engineer and shoring designer (if used). Video or photographic documentation should be taken, where necessary.

Embankment Factors and Rippability

Embankment factors (shrinkage or bulking) for the site have been estimated based upon our experience with other sites in the general vicinity, and review of laboratory density testing of near-surface soils. It is apparent that shrinkage would vary with depth and with areal extent over the site, based on previous site use and the loose to medium dense nature of the existing topsoil and disturbed fill and native alluvial deposits. Variables include previous vegetation, weed control, discing, and previous filling or exporting. However, all these factors are difficult to define in a three-dimensional fashion, and the contractor's compaction efforts may also contribute some variance. Therefore, the information presented below represents average shrinkage and bulking values, using the following assumptions.

Undocumented Artificial Fill (Afu) ..... 10% to 15% shrinkage
Alluvium Deposits (Qoa) ..... 7% to 10% shrinkage

Rippability

All site soil is anticipated to be readily removed and re-graded with well-working earth moving equipment suitable for the scope of grading.

PRELIMINARY RECOMMENDATIONS - FOUNDATIONS

General

Preliminary recommendations for foundation design and construction are provided in the following sections. These preliminary recommendations have been developed from our understanding of the currently planned site development, site observations, subsurface exploration, laboratory testing, and engineering analyses. Foundation design should be re-evaluated at the conclusion of site grading or remedial earthwork for the as-graded soil conditions. Although not anticipated, revisions to these recommendations may be necessary. In the event that the information concerning the proposed development plan is not correct, or any changes in the design, location or loading conditions of the proposed buildings are made, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and conclusions of this report are modified or approved in writing by this office. We anticipate that the wall loads of 1 to 3 kips/foot, and column loads of 20 to 100 kips will be used. Based on the loads and subgrade conditions, we recommend the use of a structural mat foundation, or other stiffened foundation system designed to tolerate the onsite alluvial deposits and estimated settlement deformations. These assumptions should be revisited once the final plans and structural design are provided for GSI review.

The information and recommendations presented in this section are not meant to supersede design by the project structural engineer or civil engineer specializing in structural design. Upon request, GSI could provide additional input or consultation regarding soil parameters, as related to foundation design. From a geotechnical viewpoint, foundation design and construction should minimally conform to the following:

Structural Mat Foundations - Proposed Health Care Building

A structural mat-type foundation may be considered for the proposed healthcare building, considering the anticipated seismic settlement potential, and the underlying soil conditions.

For a mat foundation uniformly bearing on properly compacted engineered fill, a maximum allowable net bearing capacity of 2,000 psf and a minimum depth of 18 inches below the lowest adjacent grade may be used in the design. These values may be increased by one-third for short-term loads including wind or seismic. Mat-type slab foundations should be designed in accordance with 2022 CBC (CBSC, 2022) criteria for the soil conditions prevalent

onsite. Mat-type foundation may be either ribbed or uniform thickness (UTF) with a perimeter beam.

The passive earth pressure may be computed as an equivalent fluid having a density of 150 pcf, with a maximum earth pressure of 2,000 psf. The upper 6 inches of passive pressure should be neglected if not confined by slabs or pavement. For lateral sliding resistance, a 0.25 coefficient of friction may be utilized for concrete in contact with approved structural fill derived from the onsite soils, when multiplied by the dead load. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

A vertical modulus of subgrade reaction (K_s) of 100 pounds per cubic inch (pci) may be used in the design of mat foundations bearing on approved structural fill soils that are very low expansive. The modulus of subgrade reaction is a unit value for a 1-foot square footing and should be scaled in accordance with the following equation when used with the design of larger foundations. This assumes that the foundation and slab is underlain with properly compacted structural fill with an average relative compaction of 90 percent of the laboratory standard (per ASTM D 1557).

$$K_R = K_S \left[\frac{B+1}{2B} \right]^2$$

where: K_S = unit subgrade modulus
K_R = scaled subgrade modulus
B = foundation width (in feet)

Mat slabs may be uniform thickness foundations (UTF) or may incorporate the use of edge footings for moisture cut-off barriers. The recommendations for a mat type of foundation assume that the soils below the slab are compacted fill.

PRELIMINARY SETTLEMENT EVALUATION

GSI has estimated the potential magnitudes of seismic total settlement, differential settlement, and angular distortion for the project. The analyses were based on laboratory test results and subsurface data collected from borings and CPT completed in preparation of this study. Site specific conditions affecting the magnitude of settlement include earth material types, depth of remedial grading (e.g., thickness of planned fills), left-in-place compressible earth materials, moisture content, and density.

Static Settlement

The maximum expected static settlement is on the order of 1 inch with differential settlement on the order of ½ inch in a 30-foot span (e.g., angular distortion of approximately 1/720).

Assuming that remedial earthwork is completed in accordance with the recommendations provided herein, the majority of the foundation settlement on the underlying soils should occur at the end of construction.

Seismic Settlement

We calculated a total seismic settlement of 3 inch and a differential settlement of 0.003L. The seismic settlements have been discussed in the Liquefaction section of this report.

SOIL MOISTURE CONSIDERATIONS

GSI has evaluated the potential for vapor or water transmission through the concrete floor slabs, in light of typical floor coverings and improvements. Please note that slab moisture emission rates range from about 2 to 27 lbs/24 hours/1,000 square feet from a typical slab (Kanare, 2005), while floor covering manufacturers generally recommend about 3 lbs/24 hours as an upper limit. The recommendations in this section are not intended to preclude the transmission of water or vapor through the foundation or slabs.

Foundation systems and slabs shall not allow water or water vapor to enter into the structures so as to cause damage to another building component or to limit the installation of the type of flooring materials typically used for the particular application (State of California, 2025). These recommendations may be exceeded or supplemented by a "water proofing" specialist, the architect, or structural consultant. Thus, the Client or architect will need to evaluate the following in light of a cost vs. benefit analysis, along with disclosure to all interested or affected parties. It should also be noted that vapor transmission will occur in new slab-on-grade floors as a result of chemical reactions taking place within the curing concrete. Vapor transmission through concrete floor slabs as a result of concrete curing has the potential to adversely affect sensitive floor coverings depending on the thickness of the concrete floor slab, and the floor covering. It is possible that a slab moisture sealant may be needed prior to the placement of sensitive floor coverings if a thick mat slab is used and the time frame between concrete and floor covering placement is relatively short.

Considering the E.I. test results, anticipated typical water vapor transmission rates, and floor coverings and improvements (to be chosen by the client or architect) that can tolerate those rates without distress, the following alternatives are provided:

1. Concrete slab should be thicker.

2. Concrete slab underlayment should consist of a 15-mil vapor retarder, or equivalent, with all laps sealed per the 2022 CBC (CBSC, 2022) and the manufacturer's recommendation. The vapor retarder should comply with the ASTM E 1745 - Class A criteria, and be installed in accordance with ACI 302.1R-04, and ASTM D 1643.

3. The 15-mil vapor retarder (ASTM E 1745 - Class A) shall be installed per the recommendations of the manufacturer, including all penetrations (e.g., pipe, ducting, or rebar).

4. The vapor retarder should be underlain with 2 inches of sand (SE>30), and should be overlain by a 2-inch thick layer of sand (SE>30).

5. Concrete should have a maximum water/cement ratio of 0.50. This shall not supersede ACI 318-14 guidelines for corrosion or other corrosive requirements. Additional concrete mix design recommendations should be provided by the project structural consultant or waterproofing specialist. Concrete finishing and workability should be addressed by the project structural consultant and a waterproofing specialist.

6. Where floor slab water to cement ratios are as indicated above, or admixtures used, the Project Structural Consultant should also make changes to the concrete in the grade beams and footings in kind, so that the concrete used in the foundation and slabs are designed or treated for more uniform moisture protection.

7. The owner should be specifically advised which areas are suitable for tile flooring, wood flooring, or other types of water-vapor sensitive flooring.

8. Additional recommendations regarding water or vapor transmission should be provided by the structural engineer or foundation designer and should be consistent with the specified floor coverings indicated by the architect.

Regardless of the mitigation, some limited moisture or moisture vapor transmission through the foundation and floor slab should be anticipated, and areas potentially using moisture sensitive floor coverings or moisture sensitive storage, should be identified. construction crews may require special training for installation of certain product(s), as well as concrete finishing techniques. The use of specialized product(s) should be approved by the slab designer and water-proofing consultant.

PRELIMINARY RETAINING WALL DESIGN PARAMETERS

General

Recommendations for the design and construction of conventional masonry retaining walls are provided herein, if needed. Recommendations for specialty walls (e.g., crib, earthstone, or geogrid) can be provided upon request, and would be based on site specific conditions. If walls allow water to accumulate in the backfill, the water should be conveyed via a non-erosive device to an appropriate inlet, per the recommendations of the design civil engineer.

Conventional Retaining Walls

The design parameters provided below assume native onsite materials with an expansion index up to an E.I. of 20 are used to backfill any retaining wall. The type of backfill, should be specified by the wall designer, and clearly shown on the plans. Building walls, below grade, should be water-proofed. Waterproofing should also be provided for site retaining walls in order to reduce the potential for efflorescence staining.

Preliminary Retaining Wall Foundation Design

The preliminary foundation design for conventional retaining walls should incorporate the following recommendations:

Minimum Footing Embedment - 18 inches below the lowest adjacent grade (excluding landscape layer [upper 6 inches]).

Minimum Footing Width - 24 inches.

Allowable Bearing Pressure - An allowable vertical bearing pressure of 2,000 pcf may be used in the preliminary design of retaining wall foundations provided that the footing maintains a minimum width of 24 inches and extends at least 18 inches into approved engineered fill overlying dense formational materials. This pressure may be increased by one-third for short-term wind and seismic loads.

Passive Earth Pressure - A passive earth pressure of 150 pcf with a maximum earth pressure of 2,250 psf may be used in the preliminary design of retaining wall foundations provided the foundation is embedded into properly compacted silty to clayey sand fill.

Lateral Sliding Resistance - A 0.25 coefficient of friction may be used for a concrete to soil contact when multiplied by the dead load. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

Backfill Soil Density - A soil density of 120 to 130 pcf may be used in the design of retaining wall foundations. This assumes an average engineered fill compaction of at least 90 percent of the laboratory standard (ASTM D 1557).

Footing Setbacks - All retaining wall footing setbacks from slopes should comply with Figure 1808.7.1 of the 2022 CBC. GSI recommends a minimum horizontal setback distance of 7 feet, as measured from the bottom, outboard edge of the footing to the face to the 2:1 (h:v) slope face.

Any retaining wall footings near the perimeter of the site, or not within areas of placed compacted fills will likely need to be deepened into unweathered dense formational materials for adequate vertical and lateral bearing support.

Restrained Walls

Any retaining wall that will be restrained prior to placing and compacting backfill material or retaining walls that have re-entrant or male corners, should be designed for an at-rest equivalent fluid pressure (EFP) of 57 pcf. The design should include any applicable surcharge loading. For areas of male or re-entrant corners, the restrained wall design should extend a minimum distance of twice the height of the wall (2H) laterally from the corner.

Cantilevered Walls

The recommendations presented below are for cantilevered retaining walls with retained soil heights up to 10 feet. Design parameters for retaining walls less than 3 feet in height may be superseded by the Riverside County regional standard design. Active earth pressure may be used for retaining wall design, provided the top of the wall is not restrained from minor deflections. An equivalent fluid pressure approach may be used to compute the horizontal pressure against the wall. Appropriate fluid unit weights are given below for specific slope gradients of the retained material. These do not include other superimposed loading conditions due to traffic, structures, seismic events, or adverse geologic conditions. When wall configurations are finalized, the appropriate loading conditions for superimposed loads can be provided upon request.

For preliminary planning purposes, the structural consultant or wall designer should incorporate the surcharge of traffic on the back of retaining walls, if traffic will occur within a horizontal distance of "H" from the backside of the retaining walls, where "H" equals the retained soil height. The traffic surcharge may be taken as 100 psf/ft in the upper 5 feet of the wall for light passenger vehicle traffic (e.g., cars, vans, or pick-up trucks). This does not include the surcharge of parked vehicles which should be evaluated at a higher surcharge to account for the effects of seismic loading. Equivalent fluid pressures for the design of cantilevered retaining walls are provided in the following table:

SURFACE SLOPE OF RETAINED MATERIAL (HORIZONTAL:VERTICAL)	EQUIVALENT FLUID WEIGHT P.C.F.
Level	37
2:1 (h:v)	54

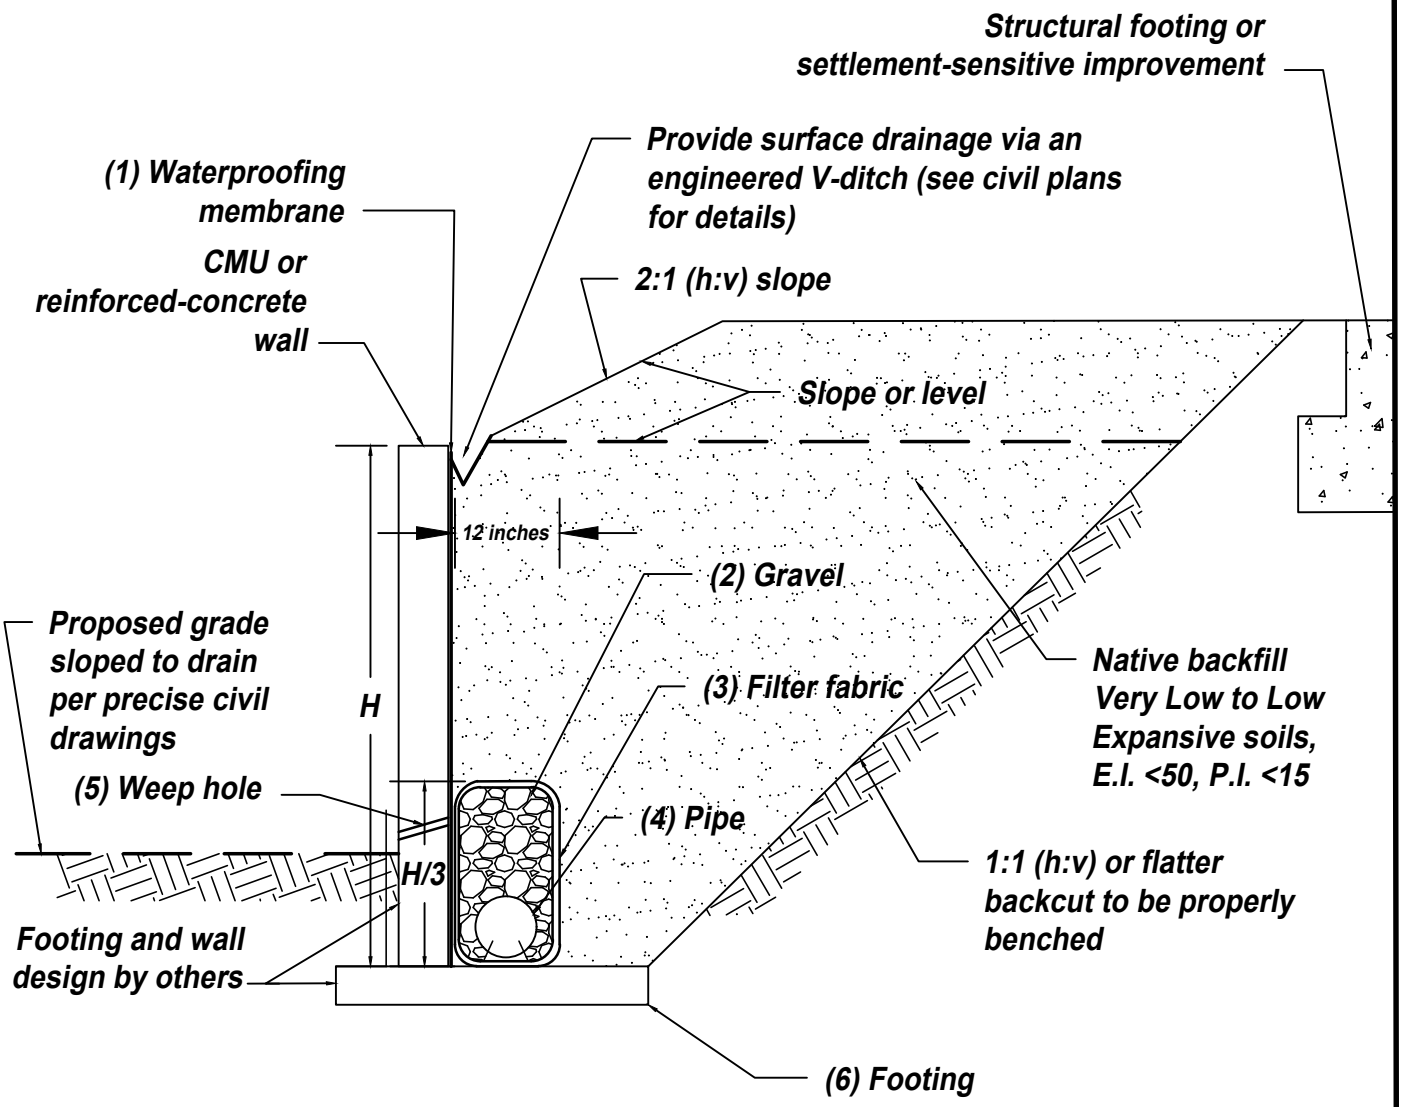
Seismic Surcharge

The Mononobe-Okabe method is commonly utilized for calculating seismically induced active and passive lateral earth pressures and is based on the limit equilibrium Coulomb theory for static stress conditions. This method entails three fundamental assumptions (e.g., Seed and Whitman, 1970): Wall movement is sufficient to ensure either active or passive conditions, the driving soil wedge inducing the lateral earth pressures is formed by a planar failure surface starting at the heel of the wall and extending to the free surface of the backfill, and the driving

soil wedge and the retaining structure act as rigid bodies, and therefore, experiences uniform accelerations throughout the respective bodies (U.S. Army Corps of Engineers, 2003, Engineering and Design - Stability Analysis of Concrete Structures).

- Seismic Lateral Earth Pressure = 39 pcf (equivalent fluid weight).

The seismic lateral earth pressure given above is a triangle increasing with depth, and the resultant of this pressure is an increment of force which should be applied to the back of the wall at 1/3 of the wall height from the wall base. The seismic increment of earth pressure should be added to the static active earth pressure. Even for the at-rest (Ko) condition, the seismic increment of earth pressure should be added to the static active earth pressure, not to the at-rest static earth pressure (SEAOC Seismology Committee, 2019).



Per 2022 CBC Section 1803.5.12 dynamic seismic lateral earth pressures shall be applied to foundation walls and retaining walls supporting more than 6 feet of backfill. Dynamic seismic lateral earth pressures may also be applied to shorter walls at the discretion of the structural engineer.

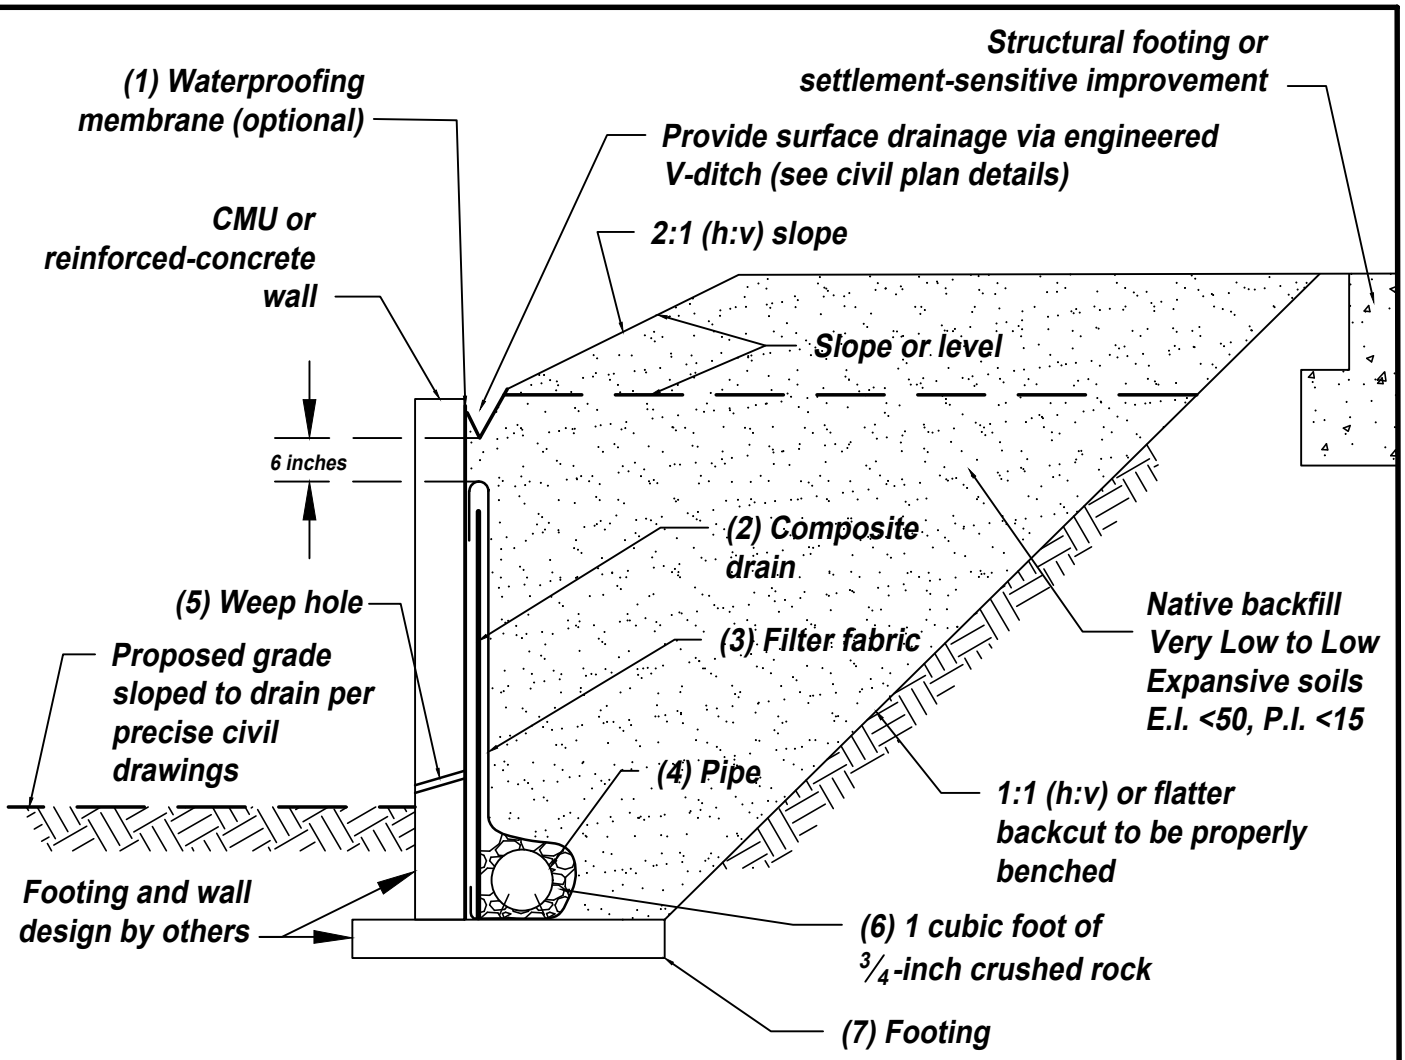
Retaining Wall Backfill and Drainage

Positive drainage must be provided behind all retaining walls in the form of gravel wrapped in geofabric and outlets. A backdrain system is considered necessary for retaining walls that are 2 feet or greater in height. Details 1, 2, and 3, present the backdrainage options discussed below. Backdrains should consist of a 4-inch diameter perforated PVC or ABS pipe encased in either Class 2 permeable filter material or ¾-inch to 1½-inch gravel wrapped in approved filter fabric (Mirafi 140 or equivalent). The filter material should extend a minimum of 1 horizontal foot behind the base of the walls and upward at least 1 foot. For limited access and confined areas, (panel) drainage behind the wall may be constructed in accordance with Detail 2 (Retaining Wall Backfill and Subdrain Detail Geotextile Drain).

Materials with an expansion index (E.I.) potential of greater than 20 should not be used as backfill for retaining walls. Retaining wall backfill materials should be moisture conditioned and mixed to achieve the soil's optimum moisture content, placed in relatively thin lifts (6 to 8 inches) with relatively light equipment, and compacted to at least 90 percent relative compaction.

Outlets should consist of a 4-inch diameter solid PVC or ABS pipe spaced no greater than approximately 100 feet apart, with a minimum of two outlets, one on each end. The use of weep holes, only, in walls higher than 2 feet, is not recommended. The surface of the backfill should be sealed by pavement or the top 18 inches compacted with native soil (E.I. ≤ 20).

(1) Waterproofing membrane.



(2) Gravel: Clean, crushed, ¾ to 1½ inch.

(3) Filter fabric: Mirafi 140N or approved equivalent.

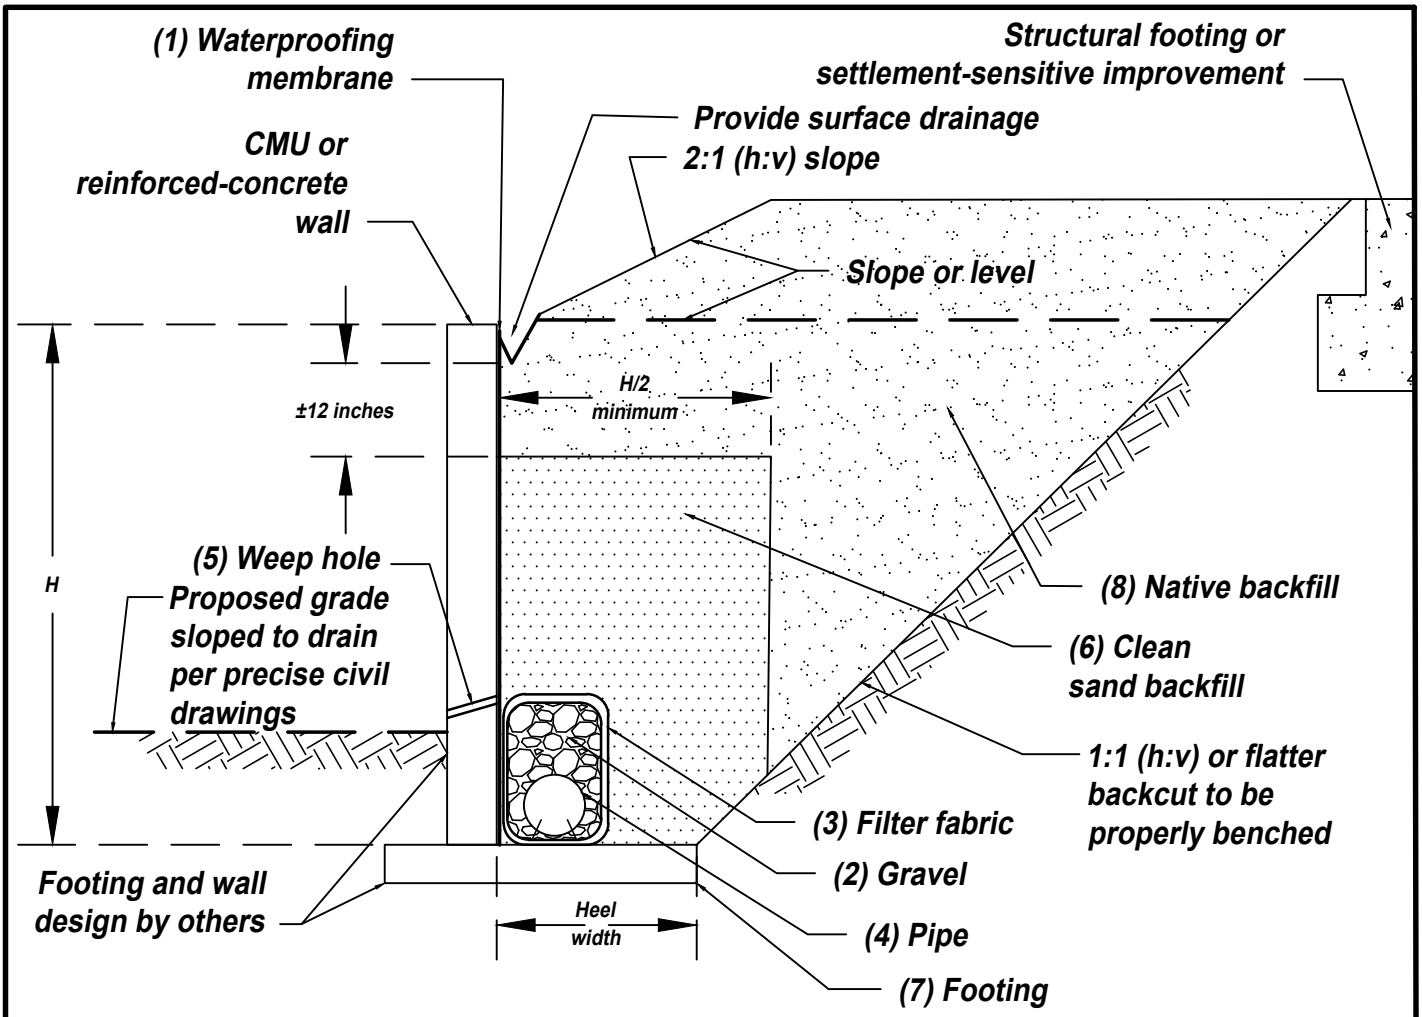
(4) Pipe: 4-inch-diameter perforated PVC, Schedule 40, or approved alternative with minimum of 1 percent gradient sloped to suitable, approved outlet point (perforations down).

(5) Weep holes: For CMU walls, Omit grout every other block, at or slightly above finished surface. For reinforced concrete walls, minimum 2-inch diameter weep holesspaced at 20 foot centers along the wall and placed 3 inches above finished surface. Design civil engineer to provide drainage at toe of wall. No weep holes for below-grade walls.

(6) Footing: If bench is created behind the footing greater than the footing width using level fill or cut natural earth materials, an additional "heel" drain will likely be required by geotechnical consultant.

(1) Waterproofing membrane (optional): Liquid boot or approved mastic equivalent.

(2) Drain: Miradrain 6000 or J-drain 200 or equivalent for non-waterproofed walls; Miradrain 6200 or J-drain 200 or equivalent for waterproofed walls (all perforations down).



(3) Filter fabric: Mirafi 140N or approved equivalent; place fabric flap behind core.

(4) Pipe: 4-inch-diameter perforated PVC, Schedule 40, or approved alternative with minimum of 1 percent gradient to proper outlet point (perforations down).

(5) Weep holes: For CMU walls, Omit grout every other block, at or slightly above finished surface. For reinforced concrete walls, minimum 2-inch diameter weep holesspaced at 20 foot centers along the wall and placed 3 inches above finished surface. Design civil engineer to provide drainage at toe of wall. No weep holes for below-grade walls.

(6) Gravel: Clean, crushed, ¾ to 1½ inch.

(7) Footing: If bench is created behind the footing greater than the footing width using level fill or cut natural earth materials, an additional "heel" drain will likely be required by geotechnical consultant.

(1) Waterproofing membrane: Liquid boot or approved masticequivalent.

(2) Gravel: Clean, crushed, ¾ to 1½ inch.

(3) Filter fabric: Mirafi 140N or approved equivalent.

(4) Pipe: 4-inch-diameter perforated PVC, Schedule 40, or approved alternative with minimum of 1 percent gradient to proper outlet point (perforations down).

(5) Weep hole: For CMU walls, Omit grout every other block, at or slightly above finished surface. For reinforced concrete walls, minimum 2-inch diameter weep holesspaced at 20 foot centers along the wall and placed 3 inches above finished surface. Design civil engineer to provide drainage at toe of wall. No weep holes for below-grade walls.

(6) Clean sand backfill: Must have sand equivalent value (S.E.) of 35 or greater; can be densified by water jetting upon approval by geotechnical engineer.

(7) Footing: If bench is created behind the footing greater than the footing width using level fill or cut natural earth materials, an additional "heel" drain will likely be required by geotechnical consultant.

(8) Native backfill: If E.I. <21 and S.E. ≥35 then all sand requirements also may not be required and will be reviewed by the geotechnical consultant.

Proper surface drainage should also be provided. For additional mitigation, consideration should be given to applying a water-proof membrane to the back of all retaining structures. The use of a waterstop should be considered for all concrete and masonry joints.

Wall and Retaining Wall Footing Transitions

Site walls are anticipated to be founded on footings designed in accordance with the recommendations in this report. Should wall footings transition from cut to fill, the structural consultant or wall designer may specify either:

a) A minimum of a 2-foot overexcavation and recompaction of cut materials for a distance of 2H, from the point of transition, where "H" equals the wall height.

b) Increase the amount of reinforcing steel and wall detailing (e.g., expansion joints or crack control joints) such that an angular distortion of 1/360 for a distance of 2H on either side of the transition may be accommodated. Expansion joints should be placed no greater than 20 feet on-center, in accordance with the structural engineer's or wall designer's recommendations, regardless of whether or not a transition condition exists. Expansion joints should be sealed with a flexible, non-shrink grout.

c) Embed the footings entirely into suitable native formational material (e.g., deepened footings).

If transitions from cut to fill transect the wall footing alignment at an angle of less than 45 degrees (plan view), then the designer should follow recommendation "a" (above) and until such transition is between 45 and 90 degrees to the wall alignment.

STORM WATER INFILTRATION KSAT RATE EVALUATION AND DISCUSSION

U.S. Department of Agricultural (USDA) Review

A review of the United States Department of Agriculture database ([USDA]; 2025 and 1993) indicates that the surficial soils units mapped at the site consist of the Grangeville sandy loam, 0 to 5 percent slopes (GrB) and the Grangeville fine sandy loam, 0 to 5 percent slopes (GvB). The USDA (2025) indicates that the capacity of the most limiting layer to transmit water (Ksat) within the Grangeville sandy loam, is high (1.98 to 5.95 inches per hour [in/hr]) and falls into hydrologic soil groups (HSGs) "A/D." The USDA (2025) also indicates that capacity of most limiting layer to transmit water (Ksat) within the Grangeville fine sandy loam is moderately high to high (0.57 to 1.98 in/hr) and falls into hydrologic soil groups (HSGs) "B/D." Infiltration into HSG "D" soils are considered potentially feasible with some limitations. However, infiltration into HSG "A and B" soils is potentially feasible.

Infiltration Basin Siting Requirements

Our review of the general infiltration basin siting requirements and limitations (CASQA, 2003), indicates sites characterized as belonging to Hydrologic Soil Group "A," "B," and "C" may be suitable for infiltration, requiring a minimum soil infiltration rate of 0.5 inches/hour (CASQA, 2003). However, the County of Riverside water pollution prevention Water Quality Management Plan (WQMP, 2012), guidance document for the Santa Ana Region states: "the minimum long-term post-development infiltration rate must be at least 0.83 inches per hour."

The design engineer will need to review basin siting requirements by the WQMP (2012) and CASQA (2003) with respect to any proposed water quality BMP system. The recommendations proved herein are based on WQMP (2012), State criteria (CASQA, 2003), and our experience on nearby sites with similar geologic conditions. Based on our review of the USDA data and our subsurface explorations, similar conditions likely prevail throughout the site, including sandy fine-grained surficial soils.

Onsite Storm Water Quality Best Management Practice (BMP) Systems

Should onsite infiltration-systems be planned for Best Management Practices (BMP's) or Low Impact Development (LID) principles for the project, certain guidelines must be followed in the planning, design, and construction of such systems. Such systems, if improperly designed or implemented without consideration of the geotechnical aspects of site conditions, can contribute to flooding, saturation of bearing materials beneath site improvements, slope instability, and possible concentration and contribution of pollutants into the groundwater or storm drain or utility trench systems.

A key factor in these systems is the infiltration rate (often referred to as the percolation rate) which can be ascribed to, or determined for, the earth materials within which these systems are installed. Additionally, the infiltration rate of the designed system (which may include gravel, sand, mulch and topsoil, or other amendments) will need to be considered. Locally, relatively impermeable formations include: clayey surficial soils, igneous and metamorphic bedrock, as well as future fine grained fill soils.

Some of the methods which are used for onsite infiltration include percolation basins, dry wells, bio-swale or bio-retention, permeable pavers and pavement, infiltration trenches, filter boxes and subsurface infiltration galleries or chambers. Some of these systems are constructed using native and import soils, perforated piping, and filter fabrics while others employ structural components such as stormwater infiltration chambers and filters or separators. Every site will have characteristics which should lend themselves to one or more of these methods, but not every site is suitable for BMPs. In practice, BMPs are usually initially designed by the project design civil engineer. Applicable governing agency requirements should be reviewed and included in design considerations.

The following geotechnical guidelines should be considered when designing onsite BMP systems:

- It is not good engineering practice to allow water to saturate soils, especially near slopes or improvements; however, the controlling agency may now require the use of stormwater BMPs.

- Areas adjacent to, or within, the BMP that are subject to inundation should be properly protected against scouring, undermining, and erosion, in accordance with the recommendations of the design engineer.

- Where infiltration BMP systems are located near buildings or improvements, impermeable liners and subdrains should be used along the bottom or sides of bioretention swales or basins located within the influence of structures. Impermeable liners used in conjunction with BMP basins should consist of a 30-mil polyvinyl chloride (PVC) membrane that is covered by a minimum of 12 inches of clean soil, free from rocks and debris, with a maximum 4:1 (h:v) slope inclination, or flatter, and meets the following minimum specifications:

  Solid Soils Specific Gravity (ASTM D792): 1.2 (g/cc, min.); Tensile (ASTM D 882): 73 (lb/in-width, min); Elongation at Break (ASTM D882): 380 (%, min); Modulus (ASTM D882): 32 (lb/in-width, min.); and Tear Strength (ASTM D1004): 8 (lb/in, min); Seam Shear Strength (ASTM D882) 58.4 (lb/in, min); Seam Peel Strength (ASTM D882) 15 (lb/in, min).

- Subdrains should consist of at least 4-inch diameter Schedule 40 or SDR 35 drain pipe with perforations oriented down. The drain pipe should be sleeved with a filter sock.

- Storm drain, standpipes, and utilities that cross BMPs should be slurried with a 3-sack slurry mix, to 5 feet outside the structure.

- Infiltrations systems should not be installed within approximately 8 feet of building foundations utility trenches, and walls, or a 1:1 (horizontal to vertical [h:v]) slope (down and away) from the bottom elements of these improvements. Alternatively, deepened foundations may be used.
- Infiltration systems should not be installed adjacent to pavement or hardscape improvements. Alternatively, deepened or thickened edges and curbs or impermeable liners may be used in areas adjoining the BMP.

- As with any infiltration BMP, localized ponding and groundwater seepage should be anticipated. The potential for seepage or perched groundwater to occur after site development should be disclosed to all interested or affected parties.

- Installation of infiltration BMP systems should avoid expansive soils (Expansion Index [E.I.] ≥51) or soils with a relatively high plasticity index (P.I. > 20).

- Infiltration BMP systems should not be installed where the vertical separation of the groundwater level is less than approximately 10 feet from the base of the system.

- Infiltration BMP systems should be designed using a suitable factor of safety (FOS) to account for uncertainties in the known infiltration rates (as generally required by the controlling authorities), and reduction in performance over time.

- As with any infiltration system, proper care will need to provided. Best management practices should be followed at all times, especially during inclement weather. Provisions for the management of any siltation, debris within the BMP, or overgrown vegetation (including root systems) should be considered. An appropriate inspection schedule will need to adopted and provided to all interested or affected parties.

- Any designed system will require regular and periodic maintenance, which may include rehabilitation or complete replacement of the filter media (e.g., sand, gravel, filter fabrics, topsoil, or mulch) or other components used in construction, so that the design life exceeds 15 years. Due to the potential for piping and adverse seepage conditions, a burrowing rodent control program should also be implemented onsite.

- Newly established vegetation or landscaping (including phreatophytes) may have root systems that will influence the performance of the BMP or nearby LID systems.

- The potential for surface flooding, in the case of system blockage, should be evaluated by the design civil engineer.

- Any proposed utility backfill materials (e.g., inlet or outlet piping or other subsurface utilities) located within or near the proposed area of the BMP may become saturated. This is due to the potential for piping, water migration, and seepage along the utility trench line backfill. If utility trenches cross or are proposed near the BMP, cut-off walls or other water barriers will need to be installed to mitigate the potential for piping and excess water entering the utility backfill materials. Planned or existing utilities may also be subject to piping of fines into open-graded gravel backfill layers unless separated from overlying or adjoining BMP by geotextiles or slurry backfill.

PRELIMINARY PAVEMENT DESIGN RECOMMENDATIONS

General

The governing agency may retain the authority to approve the final structural design sections after subgrade elevations and actual resistance values (R-values) have been obtained at the conclusion of earthwork. Based on a general review of pavement designs for other nearby projects, and for estimation and bidding purposes, the pavement sections provided herein should be considered for preliminary design. Typically, actual pavement sections will likely vary, therefore final pavement sections should be based on actual R-value testing performed during, or shortly after, the access driveway and parking area grading, and for any proposed exterior street and improvements.

Asphaltic Concrete (AC) Pavements

The preliminary design for Asphaltic Concrete (AC) was evaluated based on an R-value of R=31, and the use of concrete shoulders (curb or gutter) at the edge of pavement. The preliminary pavement sections presented are also based on the traffic indices likely for the project (to be assigned by the project civil engineer), County of Riverside roadway design requirements (Standard Plan No. 114), and the guidelines presented in the latest revision to the California Department of Transportation "Highway Design Manual," seventh edition. Based on an R-value of 31, the following preliminary pavement design sections are presented.

STREET CLASSIFICATION	TRAFFIC INDEX (T.I.)[1]	STANDARD PAVEMENT DESIGNS		
		R-VALUE	AC INCHES	CLASS 2 BASE ROCK[2] INCHES
Access Road or Local Street	5.5	31	3.0**	7.0
Enhanced Local Street	6.5	31	3.6**	8.5
Collector (Road)	7.0	31	4.0**	9.0

[1] T.I.s are taken from the County of Riverside Department of Transportation, Standard Plan No. 114, "Roadway Design Requirements" (2022).
[2] Assumed R-values for base rock R=78 - Greenbook or Cal-Trans standard Class 2 base rock.
** County of Riverside minimum Class 2 base or asphaltic concrete

The preliminary pavement sections provided above are intended as a minimum guideline. If thinner or highly variable pavement sections are constructed, increased maintenance and repair could be expected. Consideration should be given to the increased potential for distress from overuse of paved street areas by heavy equipment and construction related heavy traffic (e.g., concrete trucks or loaded supply trucks), particularly when the final section is not in place (e.g., topcoat). Best management construction practices should be followed at all times, especially during inclement weather.

Portland Concrete Cement (PCC) Pavement

The preliminary design for Portland Cement Concrete Pavement (PCCP) was evaluated using a subgrade R-value of 31. The preliminary PCCP sections are provided in the following table.

PORTLAND CONCRETE CEMENT PAVEMENTS (PCCP)*					
TRAFFIC AREAS	CONCRETE TYPE	PCP THICKNESS (INCHES)	TRAFFIC AREAS	CONCRETE TYPE	PCCP THICKNESS (INCHES)
Light Vehicles	520-C-2500	6.0	Dumpster Aprons (Trash Service)	520-C-2500	7.0
	560-C-3250	5.0		560-C-3250	6.0
NOTE: All PCCP is designed as un-reinforced and bearing directly on compacted subgrade. However, a 4-inch thick leveling course of compacted aggregate base, or crushed rock may be considered to improve performance. All PCCP should be properly detailed (jointing) per the industry standard. Pavements may be additionally reinforced with #4 reinforcing bars, placed 18 inches on center, each way, for improved performance. * To be re-evaluated based on exposed field conditions and R-values obtained following rough grading.					

The transition of the pavement from parking to traffic lanes should be made over a distance of 24 inches, with crack control joints (weaken plane) or contact joints at the end of the transition. A minimum 4-inch layer of base rock, in traffic and dumpster areas, should be considered to improve traffic lane performance. Base rock may consist of either ¾-inch crushed rock or Caltrans Class 2 aggregate base. Crushed rock may be compacted by vibratory methods. Aggregate base should be compacted to a minimum relative compaction of 95 percent.

Weakened Plane Joints

Transverse and longitudinal weakened plane joints may be constructed in accordance with County standards. Transverse weakened plane joints should be spaced no farther than 15 feet apart, and no closer than 5 feet. Longitudinal weakened plane joints should be spaced no farther than 20 feet apart, and no less than 5 feet.

Expansion Joints and Contact Joints

Transverse expansion joints should be constructed at 120-foot spacings, or in accordance with County standards. Transverse and longitudinal contact joints should be constructed in accordance with the recommendations of the design engineer. Within large slab areas, joint spacings should be no greater than 20 feet.

Slab Reinforcement

The preliminary PCC Pavements for this project are designed as unreinforced and should perform adequately, assuming proper construction. If additional control of internal slab stresses (e.g., curing shrinkage, thermal expansion and contraction), then the use of No. 4 reinforcing bars, 18 inches on center each way, should be considered.

The upper 12 inches of subgrade should be compacted to a minimum relative compaction of 95 percent of the minimum dry density (ASTM D 1557). Aggregate base compaction should be 95 percent of the maximum dry density (ASTM D 1557). If adverse conditions (e.g., wet or saturated ground) are encountered during preparation of subgrade, special construction methods may need to be employed. R-value testing and pavement design analysis should be performed upon completion of grading for the project.

PAVEMENT GRADING RECOMMENDATIONS

General

All section changes should be properly transitioned. If adverse conditions are encountered during the preparation of subgrade materials, special construction methods may need to be employed. A GSI representative should be present for the preparation of subgrade, base rock, and asphalt concrete.

Subgrade

Within access lanes and parking areas, all surficial deposits of loose soil material should be removed and recompacted as recommended. After the loose soils are removed, the bottom is to be scarified to a depth of at least 6 inches, moisture conditioned as necessary and compacted to 95 percent of the maximum laboratory density or the Riverside County minimum, as determined by test designation ASTM D 1557.

Deleterious material, excessively wet or dry pockets, concentrated zones of oversized rock fragments, and any other unsuitable materials encountered during grading should be removed. The compacted fill material should then be brought to the elevation of the proposed subgrade for the pavement. The subgrade should be proof-rolled in order to promote a uniform firm and unyielding surface. All grading and fill placement should be observed by GSI.

Crushed Aggregate Base Rock

Compaction tests are required for the recommended base section. Minimum relative compaction required will be 95 percent of the laboratory maximum density as determined by ASTM test method D 1557 or Caltrans Test Method Number California 216.

Paving

Prime coat may be omitted if all of the following conditions are met:

1. The asphalt pavement layer is placed within two weeks of completion of base and subbase course.

2. Traffic is not routed over completed base before paving.

3. Construction is completed during the dry season of May through October.

4. The base is kept free of debris prior to placement of asphaltic concrete.

If construction is performed during the wet season of November through April, prime coat may be omitted if no rain occurs between completion of base course and paving and the time between completion of base and paving is reduced to three days, provided the base is free of loose soil or debris. Where prime coat has been omitted and rain occurs, traffic is routed over base course, or paving is delayed, measures shall be taken to restore base course, and subgrade to conditions that will meet specifications as directed by the geotechnical consultant.

Drainage

Positive drainage should be provided for all surface water to drain towards the area swale, curb and gutter, or to an approved drainage channel. Positive site drainage should be maintained at all times. Water should not be allowed to pond or seep into the ground, such as from behind unprotected curbs, both during and after grading. If planters or landscaping are adjacent to paved areas, measures should be taken to minimize the potential for water to enter the pavement section, such as thickened edges, or enclosed planters. Also, best management construction practices should be strictly adhered to at all times to minimize the potential for distress during construction and roadway improvements.

Additional Considerations

To mitigate perched groundwater, consideration should be given to installation of subgrade separators (cut-offs) between pavement subgrade and landscape areas, although this is not a requirement from a geotechnical standpoint. Cut-offs, if used, should be 6 inches wide and at least 12 inches below the pavement subgrade contact or 12 inches below the crushed aggregate base rock, if used.

DRIVEWAY, CONCRETE APRONS, FLATWORK, AND OTHER IMPROVEMENTS

General

The soil materials on site are anticipated to be very low expansive. A GSI representative should be present for the preparation of driveway, aprons, and flatwork subgrade materials. The following recommendations are presented for all exterior flatwork:

1. The subgrade area for concrete slabs should be compacted to achieve a minimum 90 percent relative compaction, and then be presoaked to optimum moisture content, or greater. The moisture content of the subgrade should be proof tested within 72 hours prior to concrete placement.

2. Exterior concrete slabs should be cast over a non-yielding surface, consisting of a 4-inch layer of Class 2 base, crushed rock, gravel, or clean sand (or County minimum, whichever is greater), that should be compacted and level prior to placement of concrete. If very low expansive soils are present, the base, rock, gravel, or sand may be deleted. The layer or subgrade should be wet-down completely prior to placement of concrete, to minimize loss of concrete moisture to the surrounding earth materials.

3. Exterior pedestrian slabs should be a minimum of 4 inches thick. Driveway slabs and approaches should be a minimum of 5 inches thick additionally have a thickened edge (12 inches) adjacent to all landscape areas, to help impede infiltration of landscape water under the slab. Trash disposal (dumpster) area aprons should be a minimum of 6 inches thick and meet minimum County standards, as necessary.

4. The use of transverse and longitudinal control joints is recommended to help control slab cracking due to concrete shrinkage or expansion. Two ways to mitigate such cracking are: a) add a sufficient amount of reinforcing steel, increasing tensile strength of the slab; and, b) provide an adequate amount of control and expansion joints to accommodate anticipated concrete shrinkage and expansion. The exterior slabs should be scored or saw cut, ½ to ⅜ inches deep, often enough so that no section is greater than 10 feet by 10 feet. For sidewalks or narrow slabs, control joints should be provided at intervals of every 6 feet. The slabs should be separated from the foundations and sidewalks with expansion joint filler material.

5. No traffic should be allowed upon the newly placed concrete slabs until they have been properly cured to within 75 percent of design strength. Concrete compression strength should be a minimum of 2,500 psi.

6. Driveways, sidewalks, and patio slabs adjacent to the structure should be separated from the structure with thick expansion joint filler material. In areas directly adjacent to a continuous source of moisture (e.g., irrigation or planters), all joints should be additionally sealed with flexible mastic.

7. Planters and walls (sound walls or retaining walls) should not be tied to the structure.

8. Overhang structures should be supported on the slabs, or structurally designed with continuous footings tied in at least two directions.

9. Any masonry landscape or sound walls that are to be constructed throughout the property should be grouted and articulated in segments no more than 20 feet long. These segments should be keyed or doweled together.

10. If settlement concerns or expansive soils are present, utilities may be enclosed within a closed utilidor (vault) or designed with flexible connections to accommodate differential settlement or expansive soil conditions (if present).

11. Positive site drainage should be maintained at all times. Finish grade on the building pad should provide a minimum of 1 to 2 percent fall to the street, as indicated herein. Drainage reversals could occur, including post-construction settlement, if relatively flat drainage gradients are not periodically maintained by the owner and interested or affected parties.

12. Air conditioning (A/C) units should be supported by slabs that are incorporated into the building foundation or constructed on a rigid slab with flexible couplings for plumbing and electrical lines. A/C waste water lines should be drained to a suitable non-erosive outlet.

13. Shrinkage cracks could become excessive if proper finishing and curing practices are not followed. Finishing and curing practices should be performed per the California Nevada Cement Association (CNCA) guidelines. Mix design should incorporate rate of curing for climate and time of year, sulfate content of soils, corrosion potential of soils, and fertilizers used on site.

DEVELOPMENT CRITERIA

Drainage

Adequate surface drainage is a very important factor in reducing the likelihood of adverse performance of improvements and slopes. Surface drainage should be sufficient to mitigate ponding of water anywhere in the project area, and especially near pavements, and the tops of descending slopes. Surface drainage should be carefully taken into consideration during fine grading, landscaping, and building construction. Future landscaping or construction activities should not create adverse drainage conditions. Positive site drainage within the project area should be provided and maintained at all times. Drainage should not flow uncontrolled down any descending slope. Water should be directed away from foundations, pavements, and tops

of slopes, and not allowed to pond or seep into the ground. In general, the area within 5 feet around the proposed building should slope away from the structure and conform to Section 1804.4 of the 2022 CBC. Whenever possible, surface drainage should be above adjacent paved areas. Consideration should be given to avoiding construction of planters adjacent to structures. Building pad drainage should be directed toward approved drainage facilities. Down spouts, or drainage devices should outlet a minimum of 5 feet from the structure or into a subsurface drainage system. Areas of seepage may develop due to irrigation or heavy rainfall, and should be anticipated. Minimizing irrigation will lessen this potential. If areas of seepage develop, recommendations for reducing this effect could be provided upon request.

Erosion Control

Graded pads and any slopes will be subject to surficial erosion during and after grading. Onsite earth materials have a moderate to high erosion potential. Consideration should be given to providing hay bales and silt fences for the temporary control of surface water, from a geotechnical viewpoint.

Landscape Maintenance

Over-watering the landscape areas will adversely affect the proposed site improvements. We recommend that any proposed open-bottom planters adjacent to structures be eliminated for a minimum distance of 10 feet. As an alternative, closed-bottom type planters could be used. An outlet placed in the bottom of the planter could be installed to direct drainage away from the structure or any exterior concrete flatwork. If planters are constructed adjacent to the structure, the sides and bottom of the planter should be provided with a moisture barrier to prevent infiltration of irrigation water into the subgrade. Provisions should be made to drain the excess irrigation water from the planters without saturating the subgrade below or adjacent to the planters. Consideration should be given to the type of vegetation chosen and their potential effect upon surface improvements (e.g., some trees will have an effect on concrete flatwork with their extensive root systems). From a geotechnical standpoint leaching is not recommended for establishing landscaping. If the surface soils are processed for the purpose of adding amendments, they should be recompacted to at least 90 percent relative density.

Site Improvements

If any additional improvements (e.g., buildings, building additions, walls, pavements, swimming pool, or spa) are planned for the site, recommendations concerning the geological or geotechnical aspects of design and construction of said improvements could be provided upon request. This office should be notified in advance of any fill placement, grading of the site, or trench backfilling after rough grading has been completed. This includes any grading, underground utility trench backfill, pavement or flatwork construction.

Tile Flooring

Tile flooring can crack, reflecting cracks in the concrete slab below the tile, although small cracks in a conventional slab may not be significant. Therefore, the designer should consider additional steel reinforcement for concrete slabs-on-grade where tile will be placed. The tile installer should consider installation methods that reduce possible cracking of the tile such as slipsheets. Slipsheets or a vinyl crack isolation membrane (approved by the Tile Council of America or Ceramic Tile Institute) are recommended between tile and concrete slabs-on-grade.

Additional Grading

This office should be notified in advance of any fill placement, supplemental regrading of the site, or trench backfilling after rough grading has been completed. This includes grading for vehicular and pedestrian pavements and underground utility trench backfill.

Footing Trench Excavations

All footing excavations should be observed by a representative of this firm subsequent to trenching and prior to concrete form and steel reinforcement placement. The purpose of the observations is to evaluate that the excavations have been made into the recommended bearing material and to the minimum widths and depths recommended for construction. If loose or compressible earth materials are exposed within the footing excavation, a deeper footing or the removal and recompaction of the subgrade materials would be recommended at that time.

Underground Utility Trench Backfill

1. All underground utility trench backfill, including under-slab utility trench backfill, should be uniformly moisture conditioned to at least optimum moisture content and then be compacted to obtain a minimum relative density of 90 percent of the laboratory standard (per ASTM D 1557). Observation, selective probing, and field density testing should be provided to evaluate the desired results.

2. Exterior trenches adjacent to, and within areas extending below a 1:1 (h:v) plane projected down and away from the outside, bottom edges of the footings, and all trenches beneath hardscape features and in slopes, should be compacted to a relative density of at least 90 percent of the laboratory standard (per ASTM D 1557). Sand backfill, unless excavated from the trench, should not be used in these backfill areas. Compaction testing and observations, along with selective probing, should be accomplished to evaluate the desired results.

3. All trench excavations should conform to CAL/OSHA, state, federal, and local safety codes.

4. Underground utilities crossing grade beams, perimeter beams, or footings should either pass below the footing or grade beam using a hardened collar or foam spacer, or pass through the footing or grade beam in accordance with the recommendations of the structural engineer.

SUMMARY OF RECOMMENDATIONS REGARDING GEOTECHNICAL OBSERVATION AND TESTING

We recommend that observation and testing be performed by GSI at each of the following construction stages:

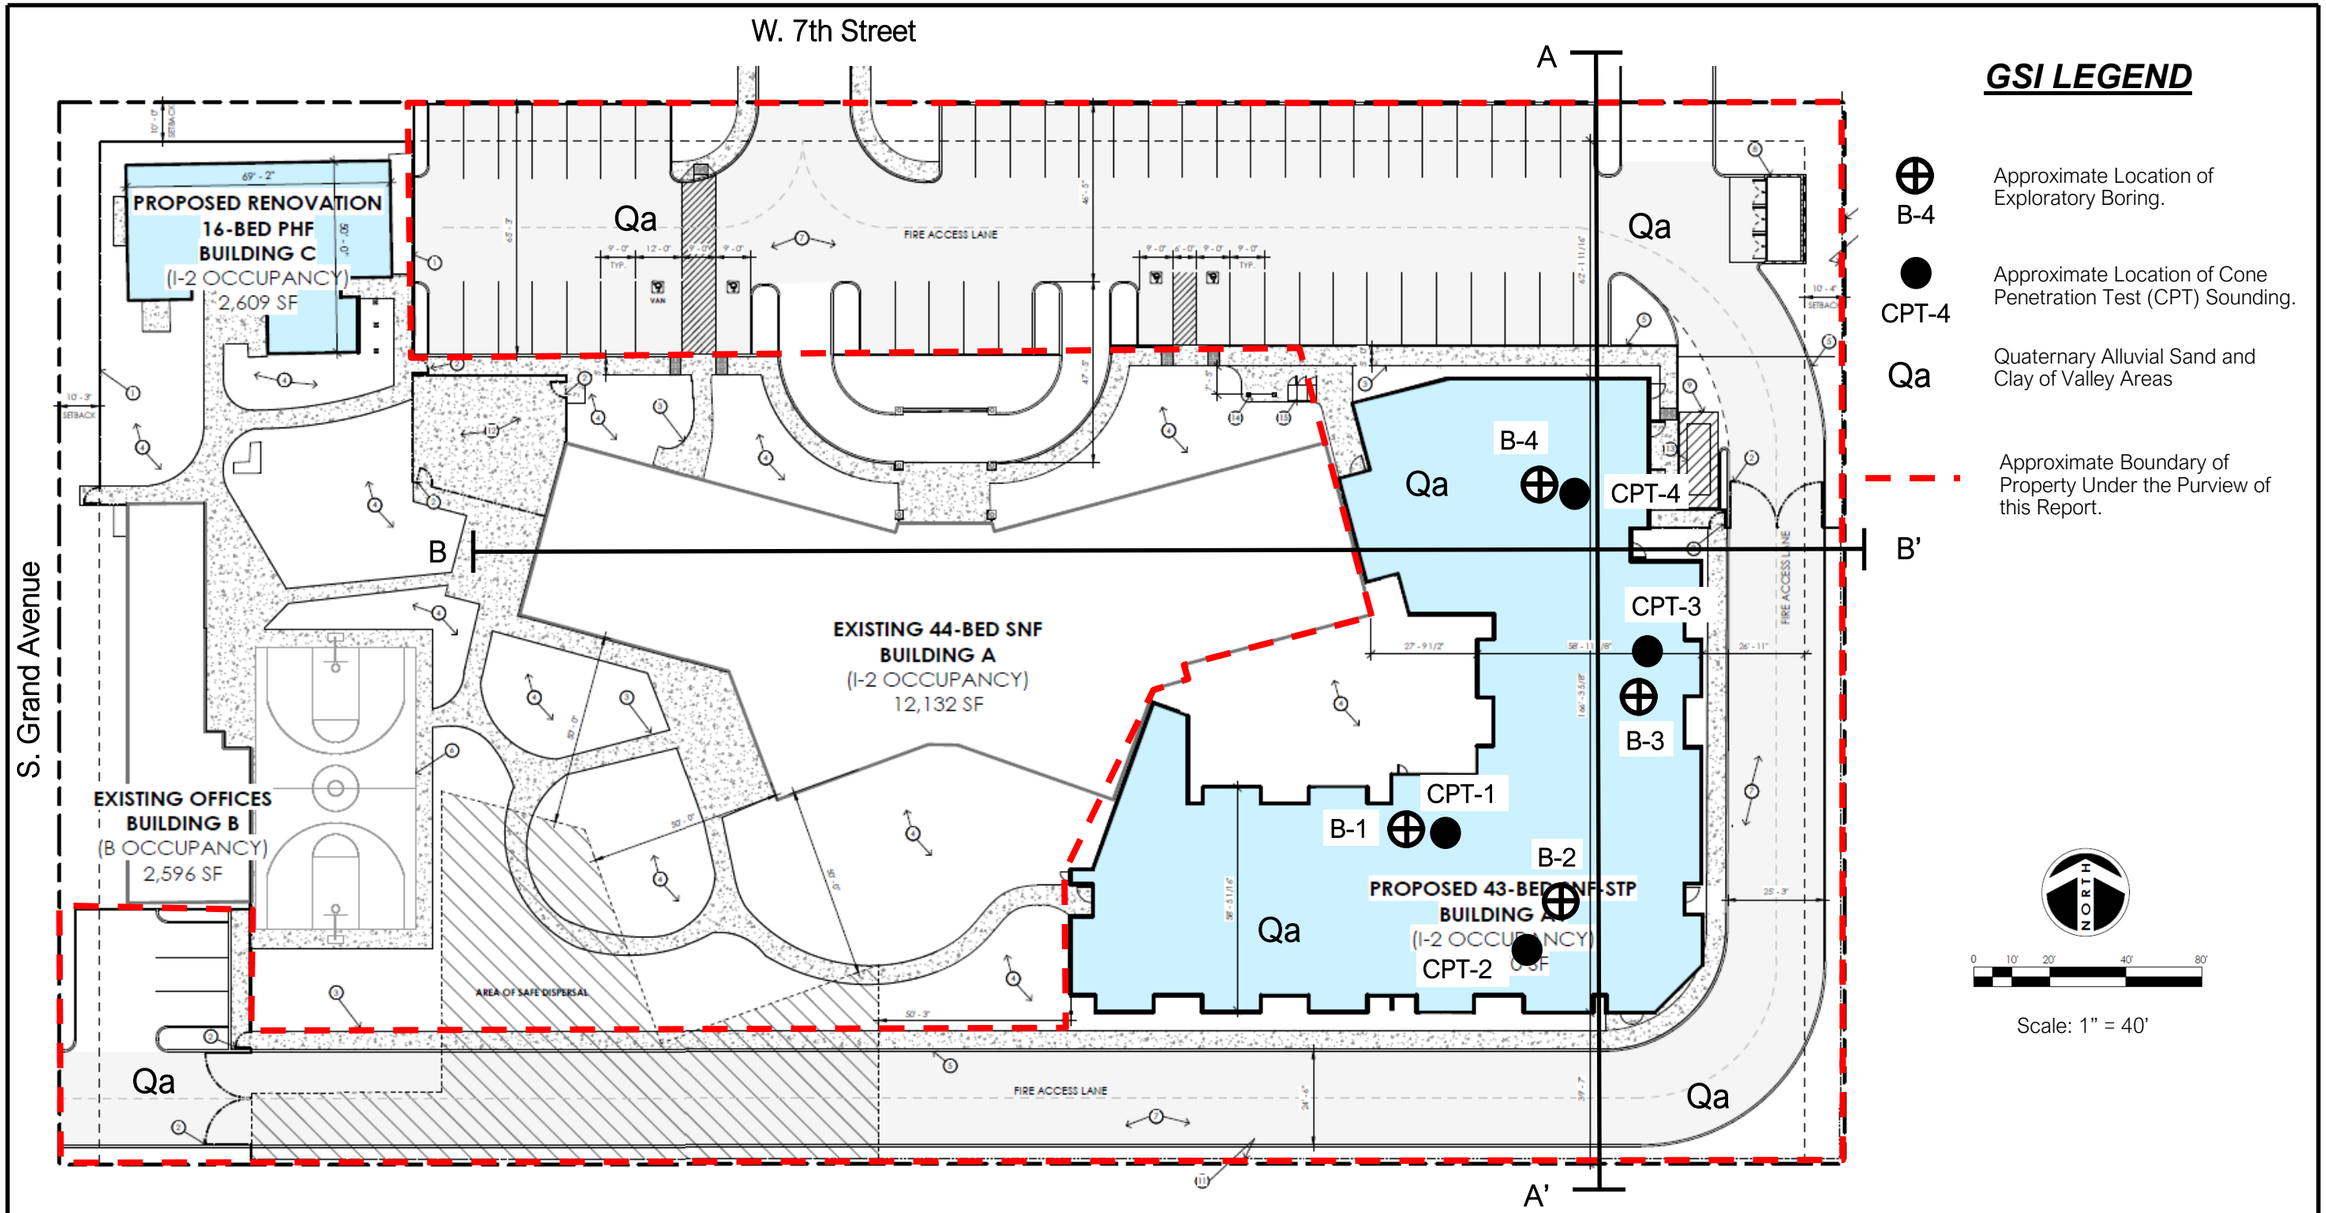
- During grading or pad recertification.
- During excavation greater than 4 feet.
- After excavation of the building foundation, retaining wall footings, and any free-standing wall footings, prior to the placement of reinforcing steel or concrete.
- Prior to placement of any concrete slabs-on-grade or flatwork, after presoaking of building pad and other flatwork subgrade, before the placement of concrete, reinforcing steel, capillary break (e.g., sand, pea-gravel, or gravel), or vapor retarders.
- During placement of backfill for area drain, interior (under-slab) plumbing, and underground utility trenches.
- During retaining wall subdrain construction and backfill.
- During vehicular and pedestrian pavement construction.
- When any unusual soil conditions are encountered during any construction operations, subsequent to the issuance of this report.
- When any owner improvements, such as flatwork, walls, pavements, or retaining walls are constructed, prior to construction.
- A report of geotechnical observation and testing should be provided at the conclusion of each of the above stages, in order to provide concise and clear documentation of site work, and to comply with code requirements.

OTHER DESIGN PROFESSIONALS AND CONSULTANTS

The design civil engineer, structural engineer, post-tension designer, architect, landscape architect, or wall designer should review the recommendations provided herein, incorporate those recommendations into all their respective plans, and by explicit reference, make this report part of their project plans. This report presents minimum design criteria for the design of slabs, foundations and other elements possibly applicable to the project. These criteria should not be considered as substitutes for actual designs by the structural engineer or designer. The recommendations contained herein are not intended to preclude the transmission of water or vapor through the slab or foundation. The structural engineer or foundation and slab designer should provide recommendations to not allow water or vapor to enter into the structure so as to cause damage to another building component, or so as to limit the installation of the type of flooring materials typically used for the particular application.

The structural engineer or designer should analyze actual soil-structure interaction and consider, as needed, bearing, expansive soil influence, and strength, stiffness and deflections in the various slab, foundation, and other elements in order to develop appropriate, design-specific details. As conditions dictate, it is possible that other influences will also have to be considered. The structural engineer or designer should consider all applicable codes and authoritative sources where needed. If analyses by the structural engineer or designer result in less critical details than are provided herein as minimums, the minimums presented herein should be adopted. It is considered likely that some, more restrictive details will be required.

If the structural engineer or designer have any questions or requires further assistance, they should not hesitate to call or otherwise transmit their requests to GSI. In order to mitigate potential distress, the foundation and improvement's designer should confirm to GSI and the governing agency, in writing, that the proposed foundations and improvements can tolerate the amount of differential settlement and expansion characteristics, and other design criteria specified herein.



PLAN REVIEW

Final project plans (grading, precise grading, foundation, retaining wall or landscaping), should be reviewed by this office prior to construction, so that construction is in accordance with the conclusions and recommendations of this report. Based on our review, supplemental recommendations or further geotechnical studies may be warranted.

LIMITATIONS

The materials encountered on the project site and used for our analysis are believed representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during mass grading. Site conditions may vary due to seasonal changes or other factors.

Inasmuch as our study is based upon our review and engineering analyses and laboratory data, the conclusions and recommendations are professional opinions. These opinions have been derived in accordance with current standards of practice, and no warranty, either express or implied, is given. Standards of practice are subject to change with time. GSI assumes no responsibility or liability for work or testing performed by others, or their inaction; or work performed when GSI is not requested to be onsite, to evaluate if our recommendations have been properly implemented. Use of this report constitutes an agreement and consent by the user to all the limitations outlined above, notwithstanding any other agreements that may be in place. In addition, this report may be subject to review by the controlling authorities. Thus, this report brings to completion our scope of services for this portion of the project. All samples will be disposed of after 30 days, unless specifically requested by the client, in writing.

BORING AND CPT LOGS

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions			Group Symbols	Typical Names
Coarse-Grained Soils More than 50% retained on No. 200 sieve	Gravels 50% or more of coarse fraction retained on No. 4 sieve	Clean Gravels	GW	Well-graded gravels and gravel-sand mixtures, little or no fines
			GP	Poorly graded gravels and gravel-sand mixtures, little or no fines
		Gravel with	GM	Silty gravels gravel-sand-silt mixtures
			GC	Clayey gravels, gravel-sand-clay mixtures
	Sands more than 50% of coarse fraction passes No. 4 sieve	Clean Sands	SW	Well-graded sands and gravelly sands, little or no fines
			SP	Poorly graded sands and gravelly sands, little or no fines
		Sands with Fines	SM	Silty sands, sand-silt mixtures
			SC	Clayey sands, sand-clay mixtures
Fine-Grained Soils 50% or more passes No. 200 sieve	Silts and Clays Liquid limit 50% or less		ML	Inorganic silts, very fine sands, rock flour, silty or clayey fine sands
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
			OL	Organic silts and organic silty clays of low plasticity
	Silts and Clays Liquid limit greater than 50%		MH	Inorganic silts, micaceous or diatomaceous fine sands or silts, elastic silts
			CH	Inorganic clays of high plasticity, fat clays
			OH	Organic clays of medium to high plasticity
Highly Organic Soils			PT	Peat, mucic, and other highly organic soils

CONSISTENCY OR RELATIVE DENSITY

CRITERIA

Standard Penetration Test

Penetration Resistance N (blows/ft)	Relative Density
0 - 4	Very loose
4 - 10	Loose
10 - 30	Medium
30 - 50	Dense
> 50	Very dense

Standard Penetration Test

Penetration Resistance N (blows/ft)	Consistency	Unconfined Compressive Strength (tons/ft^2)
<2	Very Soft	<0.25
2 - 4	Soft	0.25 - .050
4 - 8	Medium	0.50 - 1.00
8 - 15	Stiff	1.00 - 2.00
15 - 30	Very Stiff	2.00 - 4.00

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Bradley Gardens project located at 980 W. 7th Street in San Jacinto, California. The work was performed by Kehoe Testing & Engineering (KTE) on November 26, 2025. The scope of work was performed as directed by GeoSoils, Inc. (GSI) personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at four locations to determine the soil lithology. A summary is provided in **TABLE 2.1**.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-1	50	
CPT-2	50	
CPT-3	60	
CPT-4	50	

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm^2 cone with a cone net area ratio of 0.83. The following parameters were recorded at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At location CPT-3, shear wave measurements were obtained at approximately 10-foot intervals. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil behavior type on the CPT plots is derived from the attached CPT SBT plot (Robertson, "Interpretation of Cone Penetration Test…", 2009) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Steven P. Kehoe
President

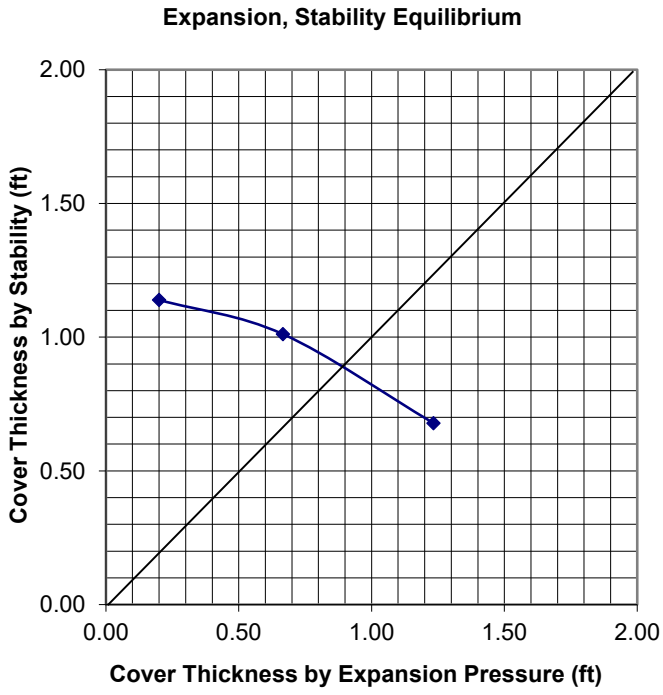
CORROSION REPORT SUMMARY

Project No: **9071-A-IE**
Project Name: **Corcoran Construction, Inc.**
Report Date: **December 9, 2025**

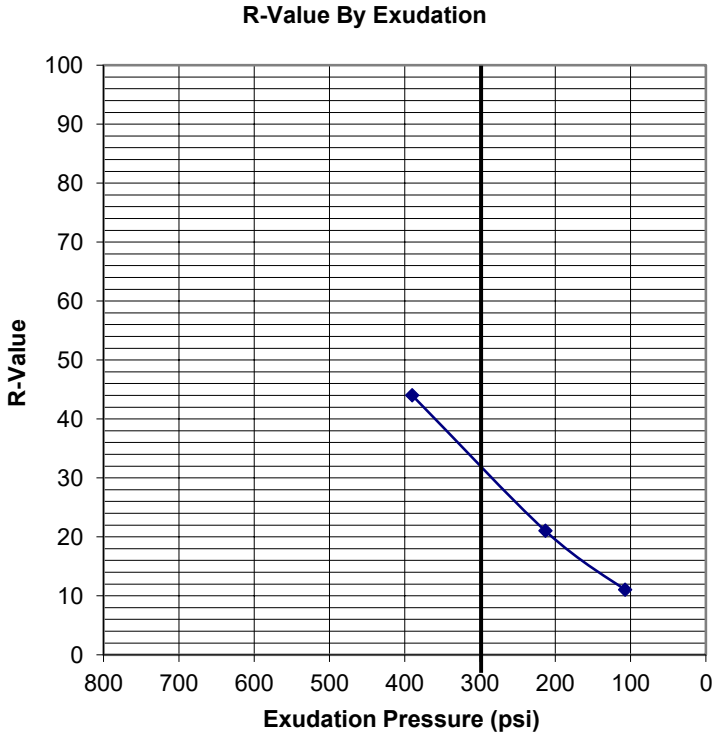
SAMPLE ID	pH (H+)	Minimum Resistivity (ohm/cm)	Sulfate Content (wt%)	Chloride Content (mg/kg)
B-1, 0-5ft	8.0	3500	0.005	21

Sample testing in accordance with: pH - CTM 643, Resistivity - CTM 643
Sulfate - CTM 417, Chloride - CTM 422

Remarks: _____



TEST SPECIMEN		A	B	C	D
Compactor air pressure	PSI	330	200	110	
Water added	%	3.3	5.6	7.9	
Moisture at compaction	%	15.6	17.9	20.2	
Height of sample	IN	2.42	2.52	2.55	
Dry density	PCF	112.6	107.0	103.8	
R-Value by exudation		47	21	11	
R-Value by exudation, corrected		44	21	11	
Exudation pressure	PSI	390	213	107	
Stability thickness	FT	0.68	1.01	1.14	
Expansion pressure thickness	FT	1.23	0.67	0.20	



DESIGN CALCULATION DATA

Traffic index, assumed	5.0
Gravel equivalent factor, assumed	1.25
Expansion, stability equilibrium	0.88
R-Value by expansion	31
R-Value by exudation	32
R-Value at equilibrium	**31**

SAMPLE INFORMATION

Sample Location:	B-1, 0-5ft
Sample Description:	Gray Silty Sand
Notes:	-
	0% Retained on 3/4 inch sieve
Test Method:	Cal-Trans Test 301

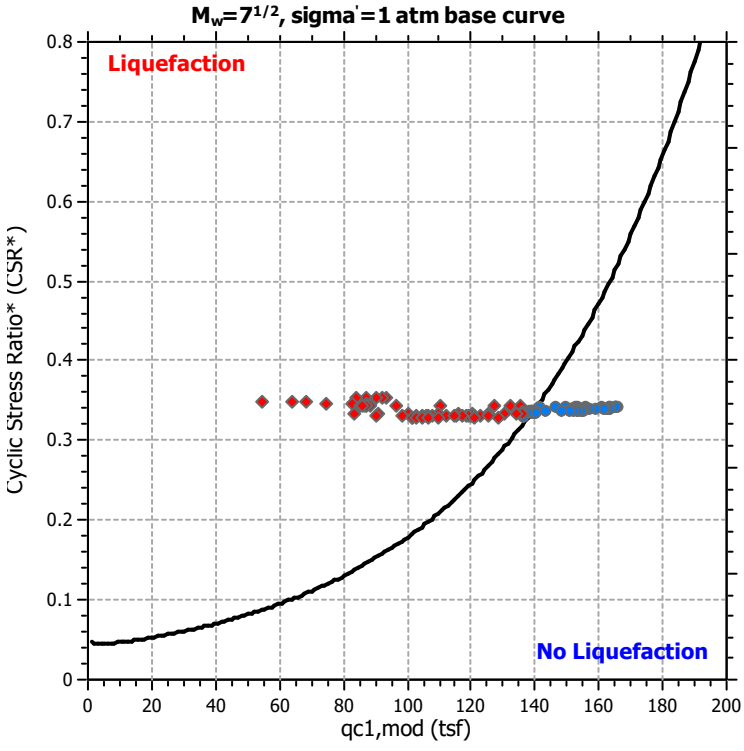
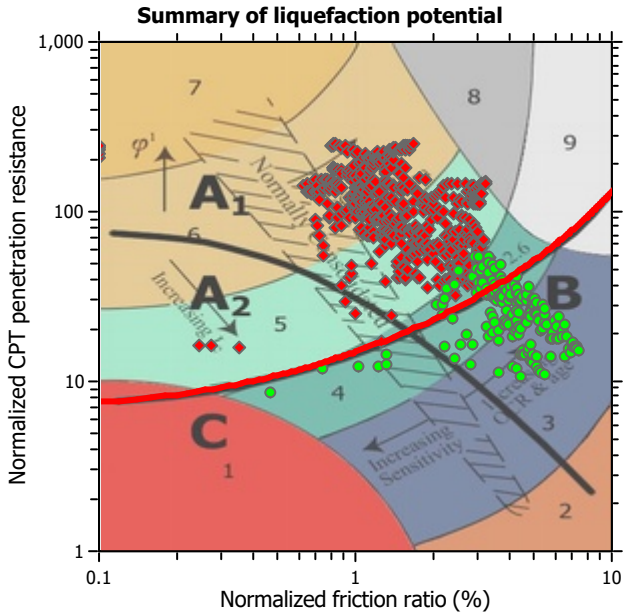
LIQUEFACTION ANALYSIS REPORT



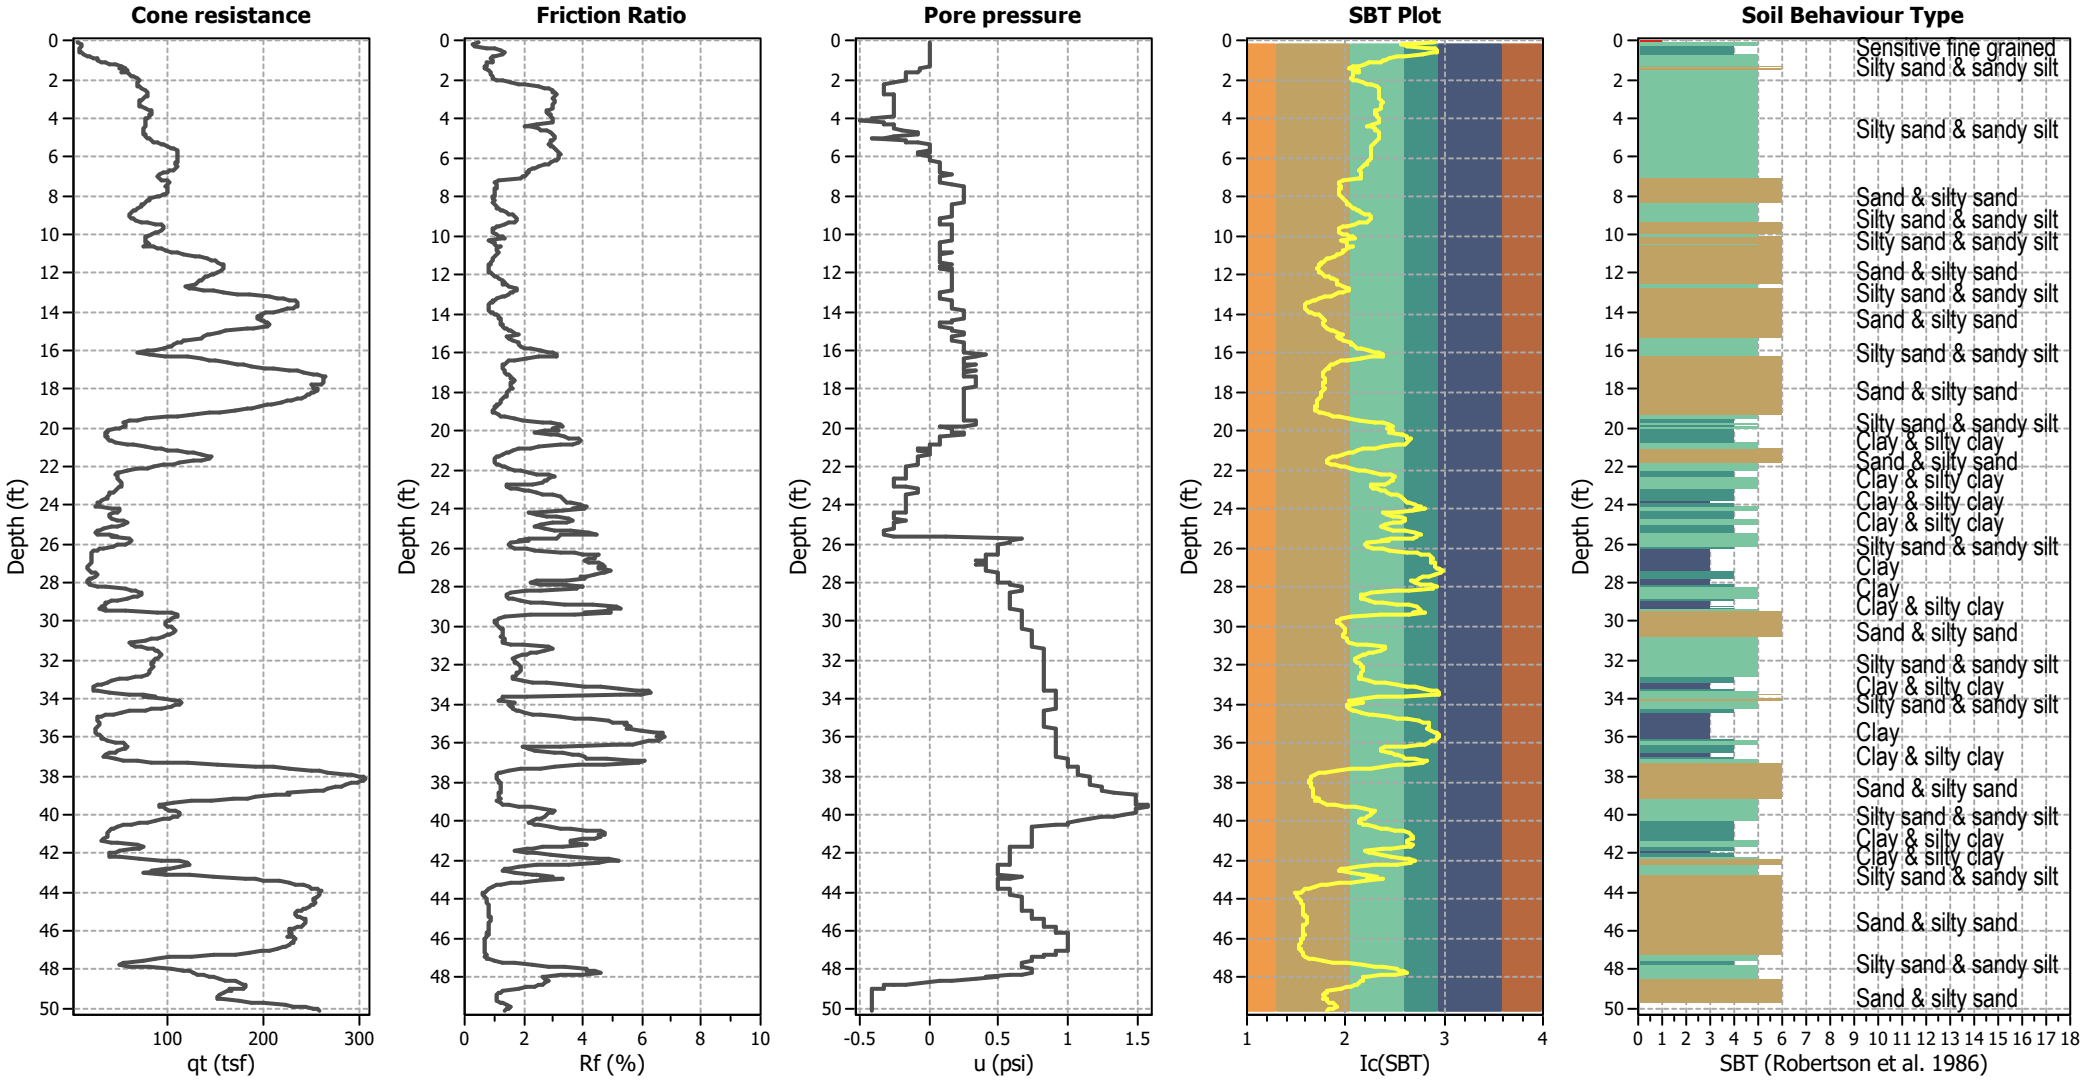
Project title : GeoSoils / Bradley Gardens **Location : 980 W. 7th St, San Jacinto, CA**



CPT file : CPT-1

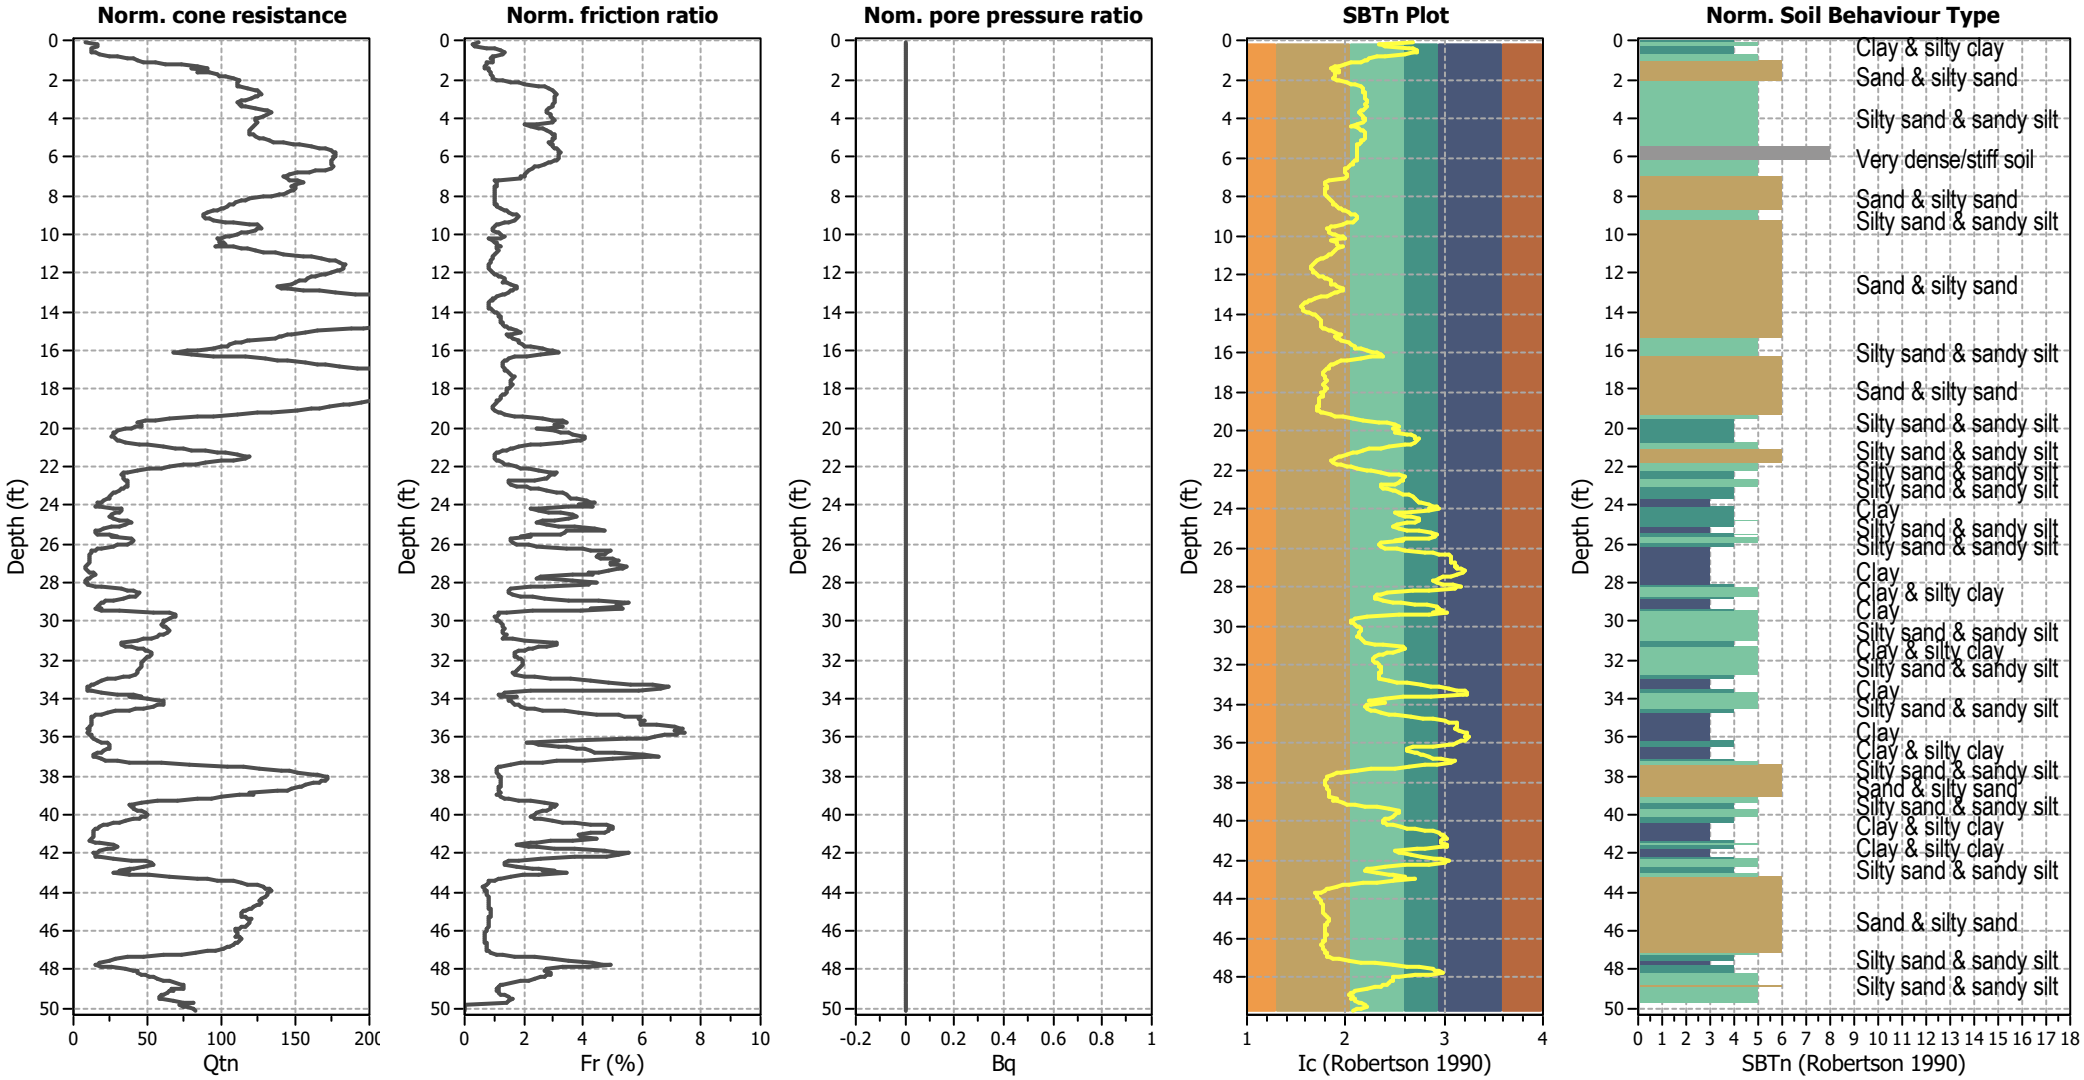
Input parameters and analysis data

Analysis method:	Moss et al. (2006)	G.W.T. (in-situ):	100.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	Moss et al. (2006)	G.W.T. (earthq.):	40.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	1	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	8.10	Ic cut-off value:	2.60	Trans. detect. applied:	No	MSF method:	Method based
Peak ground acceleration:	1.07	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



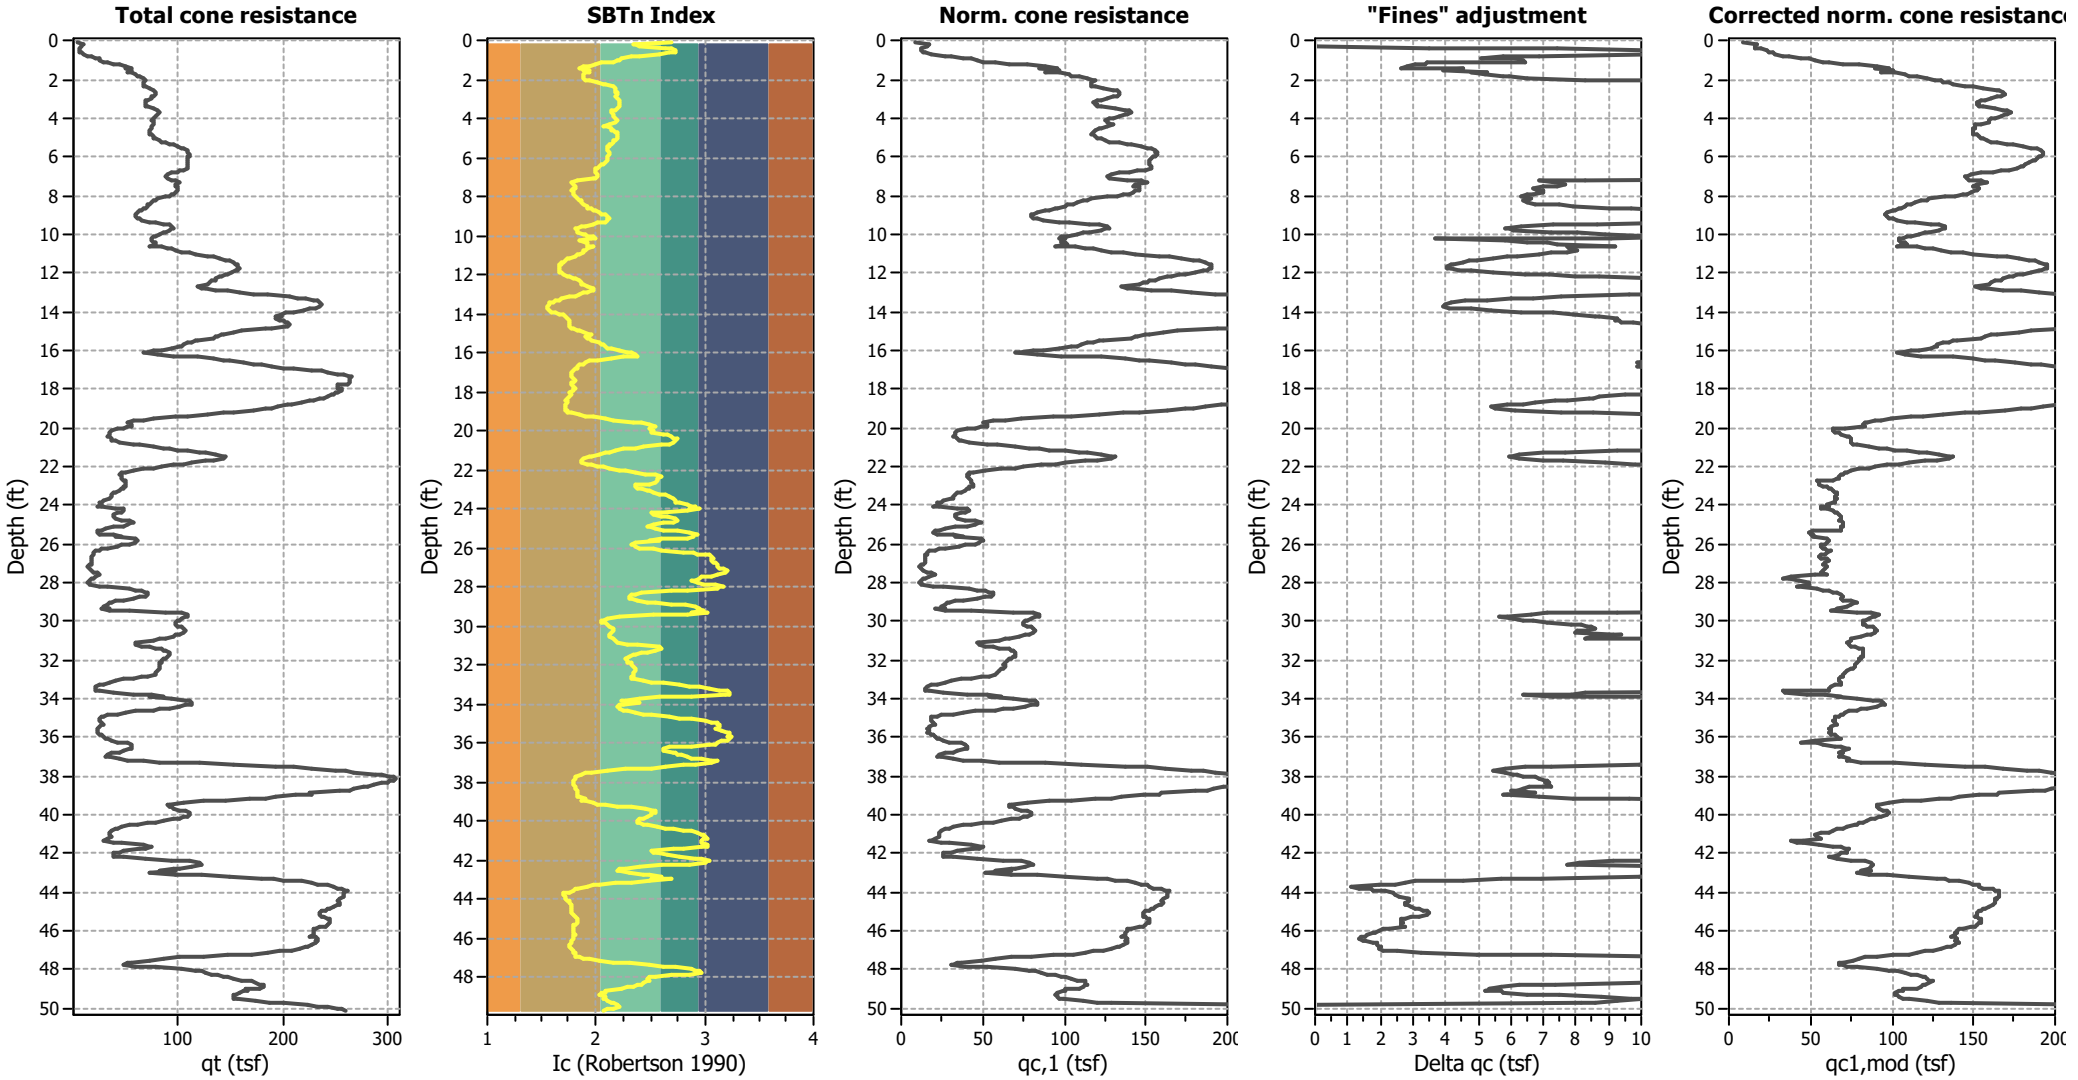
Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

SBT legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

CPT basic interpretation plots (normalized)



Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

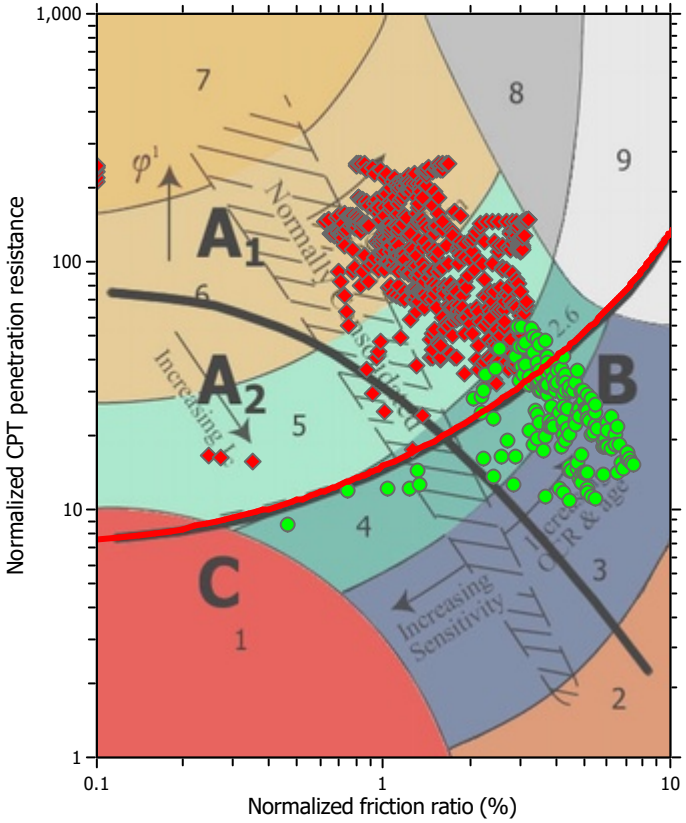
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

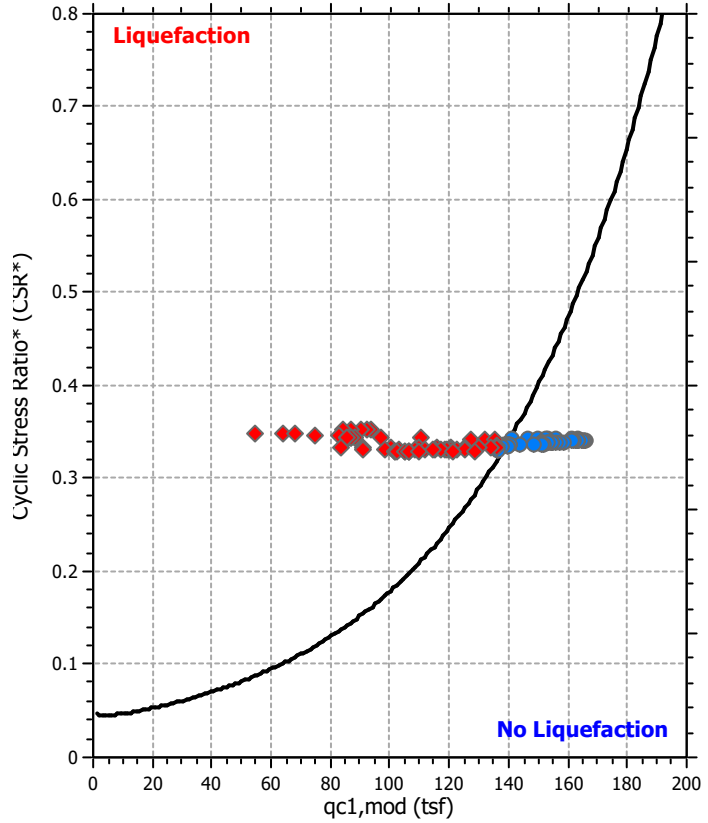
Liquefaction analysis overall plots

Input parameters and analysis data

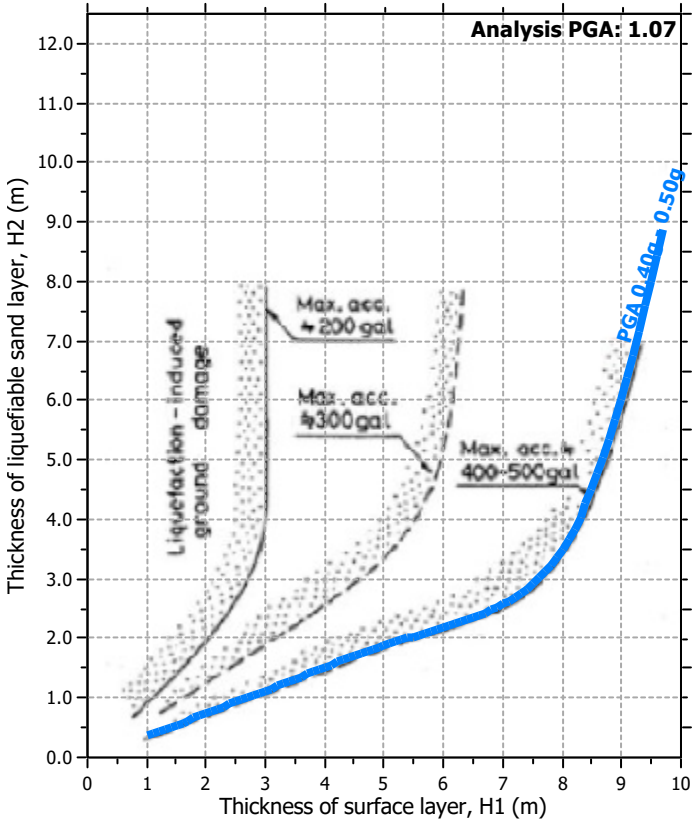
Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft



F.S. color scheme



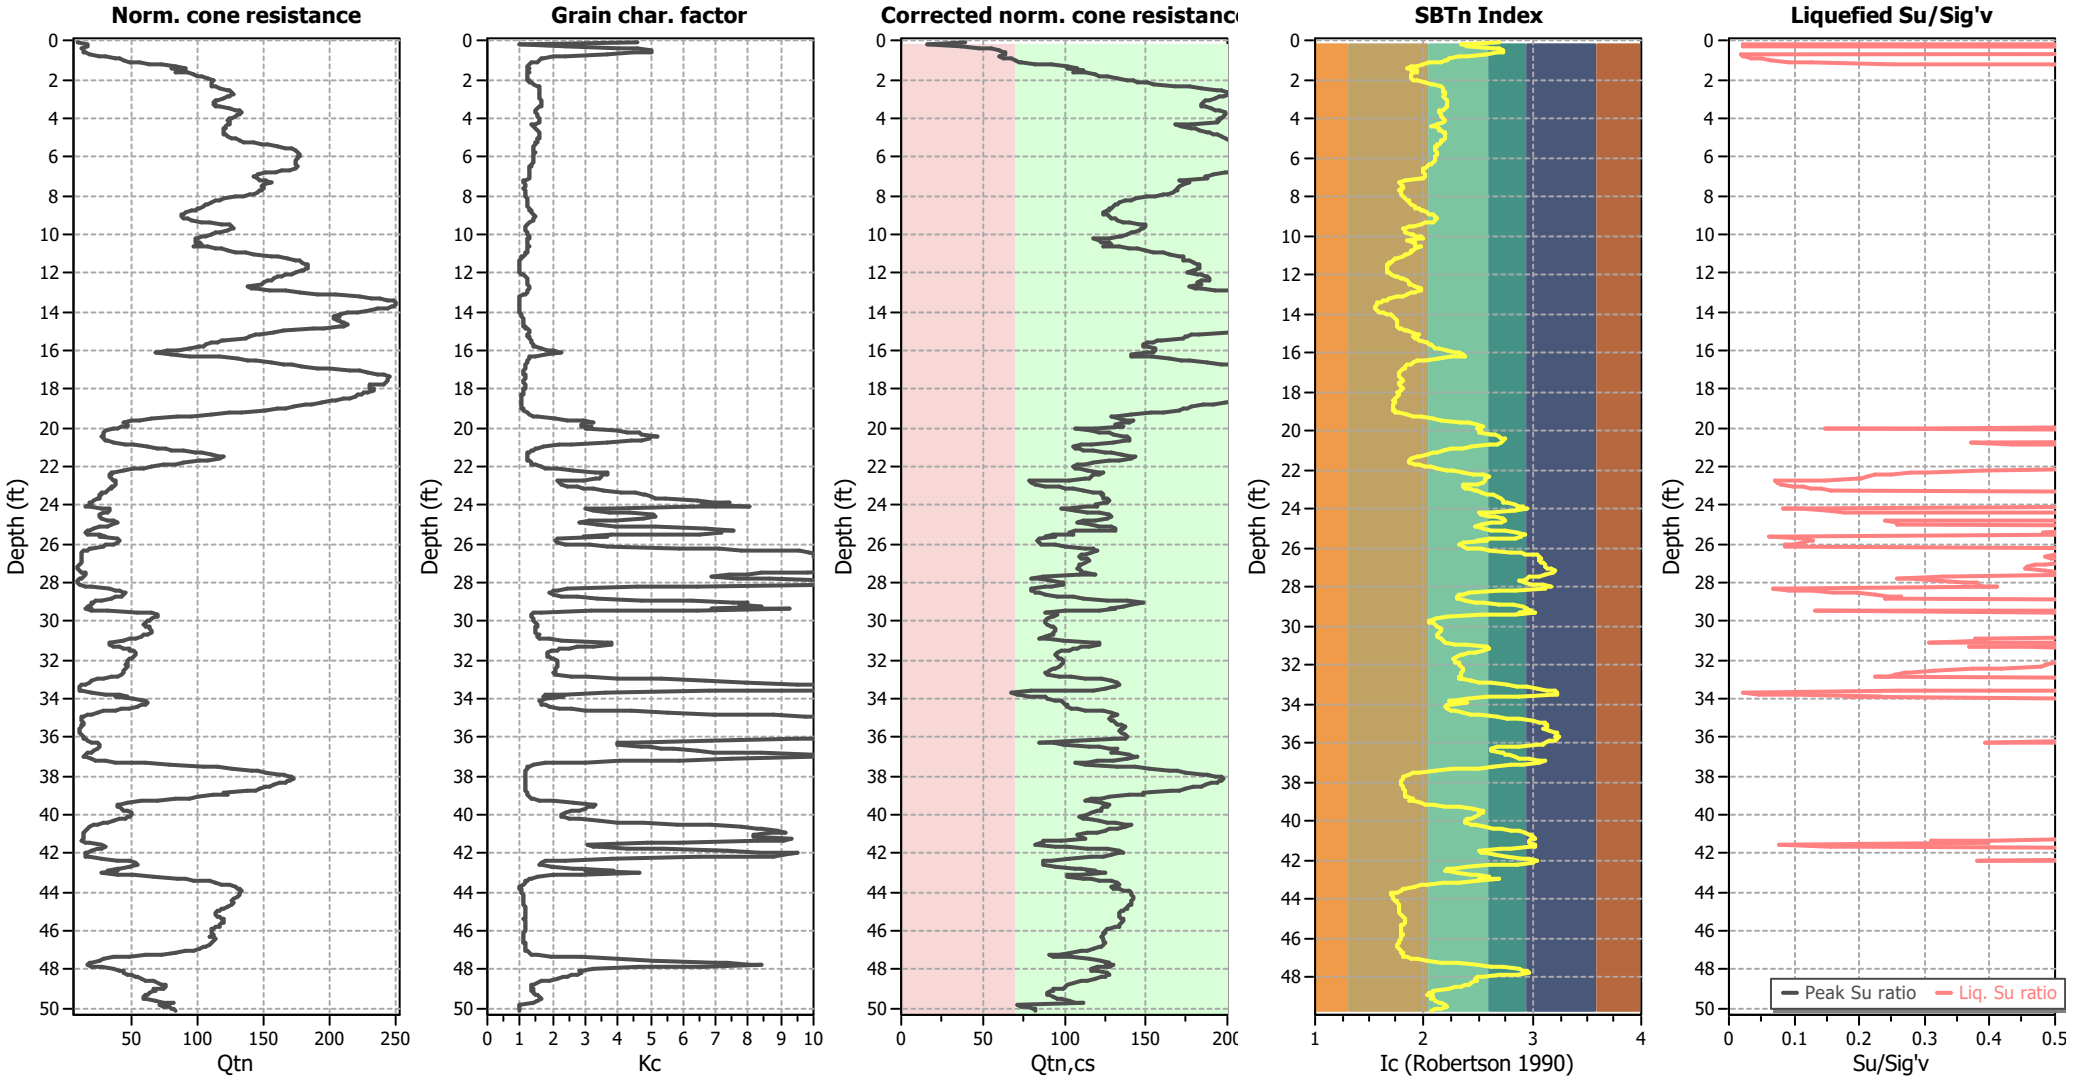
- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Liquefaction analysis summary plots



Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted
