Point ID	Depth (ft)	q_t (tsf)	σ_v' (tsf)	c	C_q	$q_{c,1}$ (tsf)	Δq_c	$q_{c,1,mod}$ (tsf)	$CRR_{7.5}$	Belongs to trans. layer	Clay-like behaviour	FS

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

:: Liquefaction Potential Index calculation data :: (continued)

Depth (ft)	FS	F_L	w_z	d_z	LPI	Depth (ft)	FS	F_L	w_z	d_z	LPI

Overall liquefaction potential: 1.54

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)

Estimation of post-earthquake settlements

Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

Total estimated settlement: 1.12

Abbreviations

$q_{c,1,mod}$:	Equivalent clean sand cone resistance
$q_{c,1N,mod}$:	Equivalent clean sand normalized cone resistance
FS:	Factor of safety against liquefaction
e_v (%):	Post-liquefaction volumentric strain
DF:	e_v depth weighting factor
Settlement:	Calculated settlement

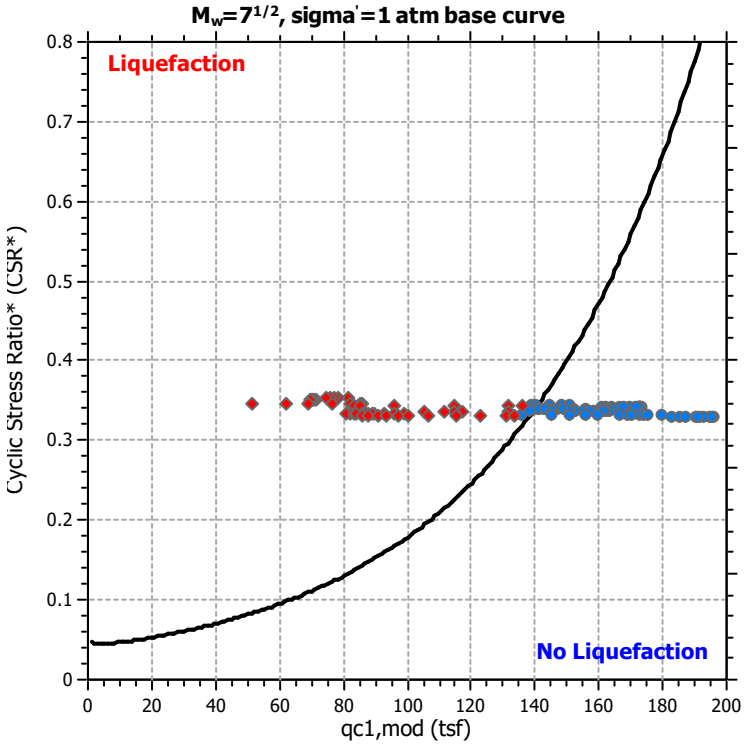
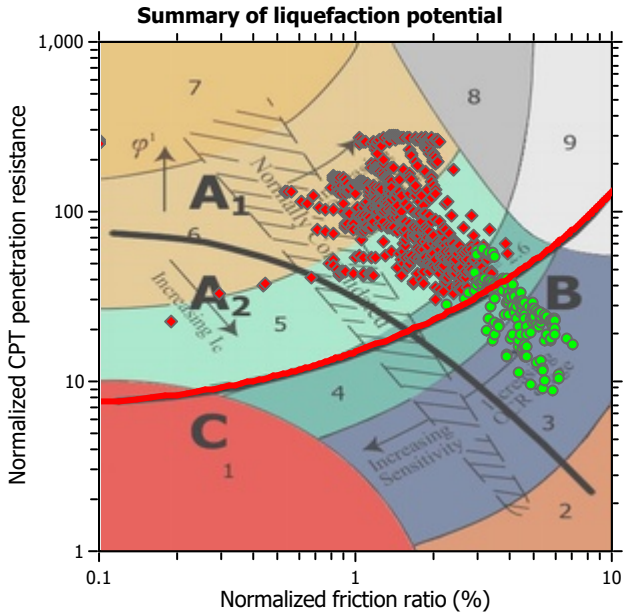
LIQUEFACTION ANALYSIS REPORT



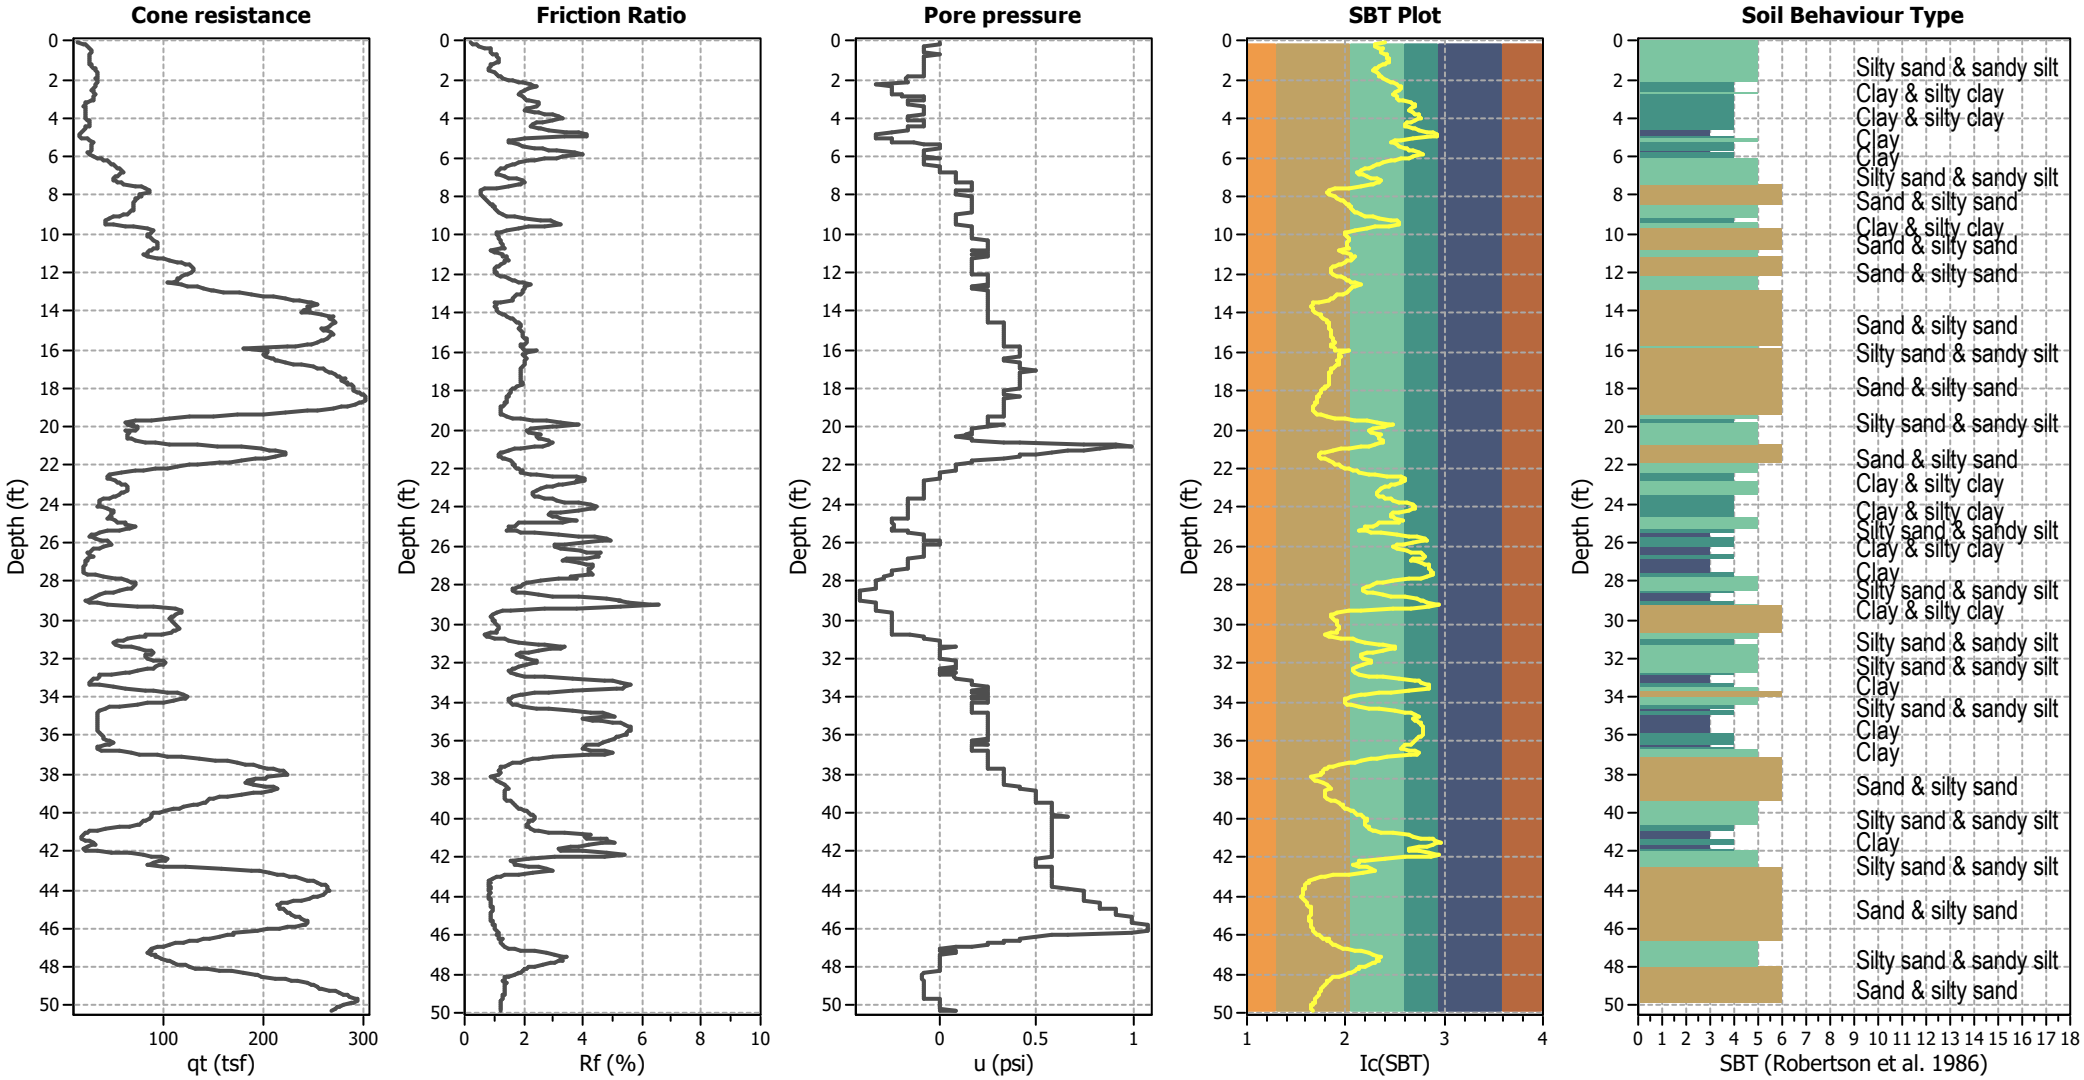
Project title : GeoSoils / Bradley Gardens **Location : 980 W. 7th St, San Jacinto, CA**



CPT file : CPT-2

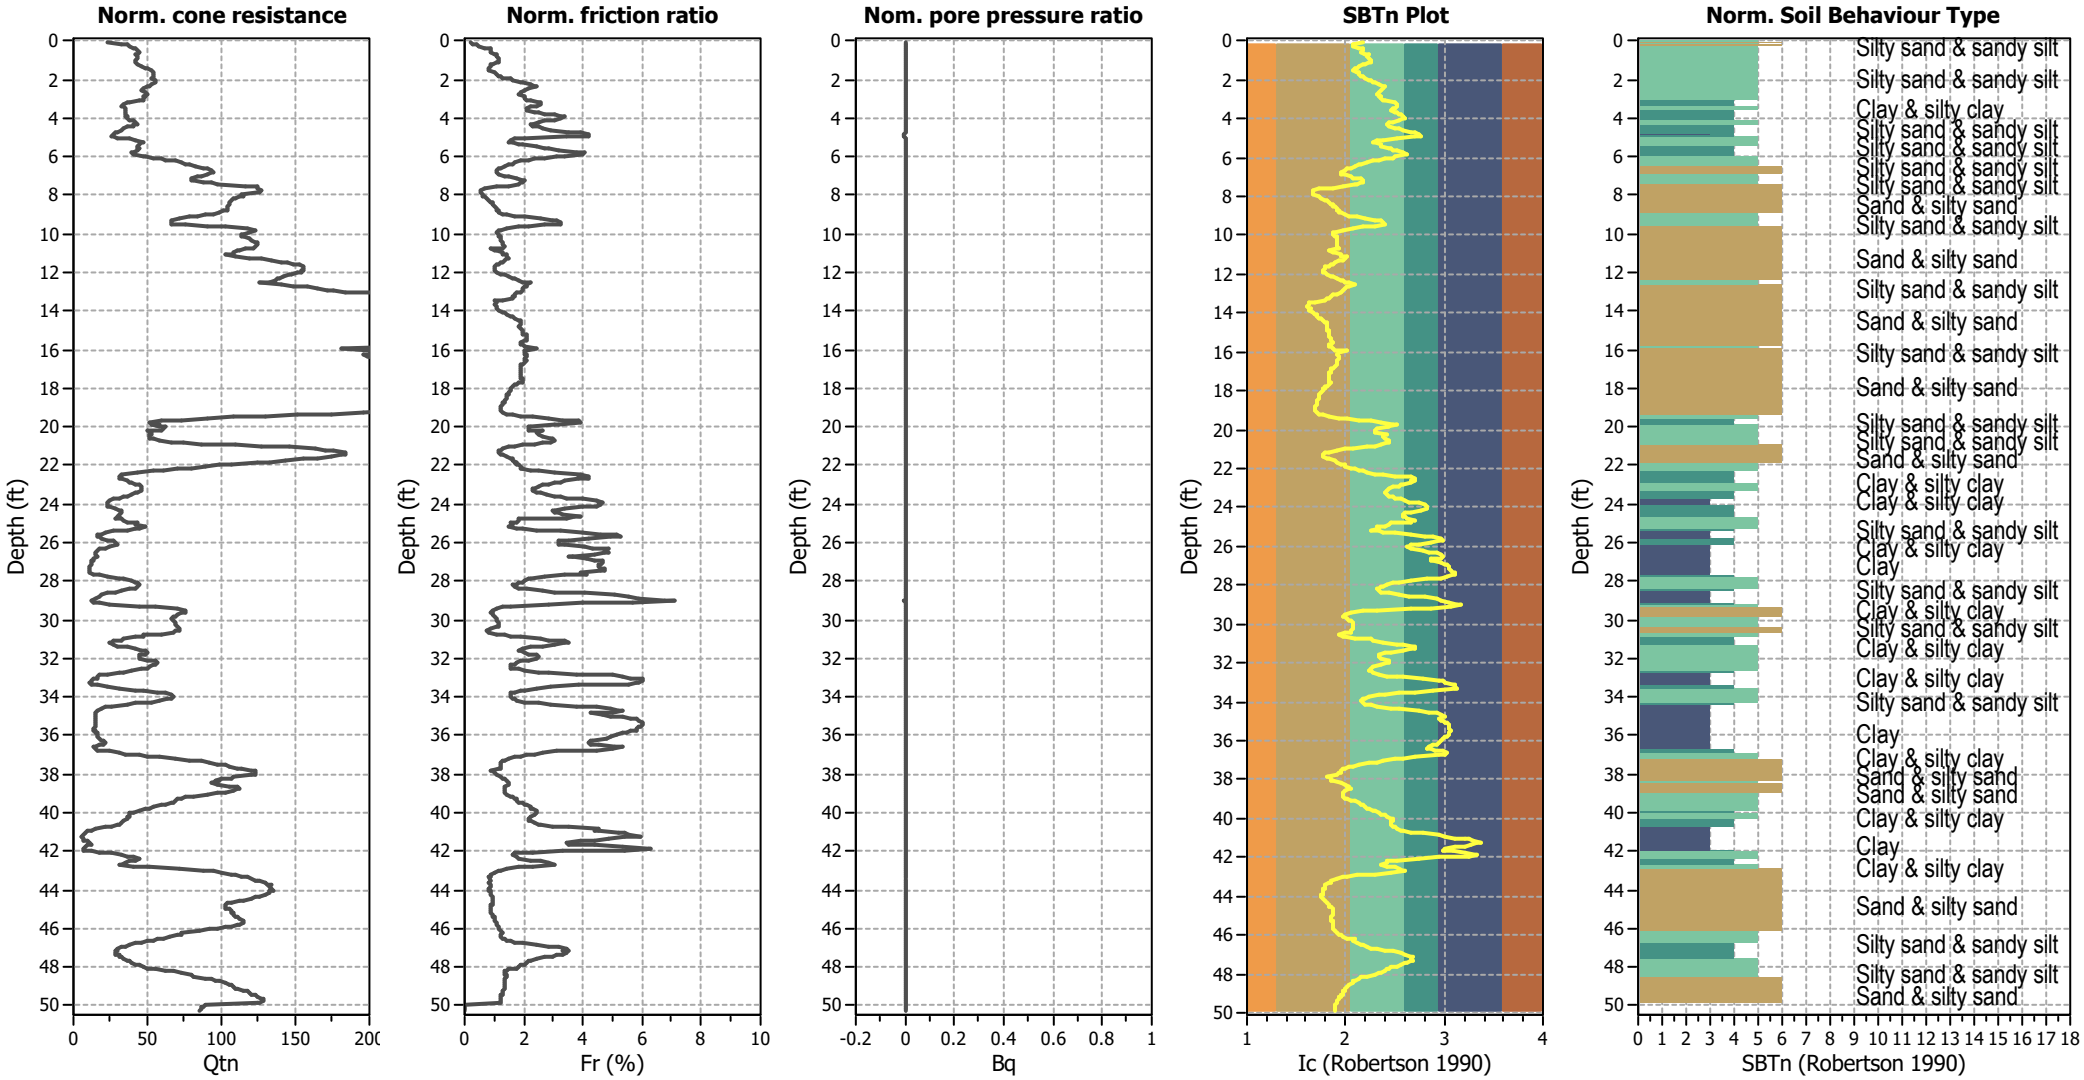
Input parameters and analysis data

Analysis method:	Moss et al. (2006)	G.W.T. (in-situ):	100.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	Moss et al. (2006)	G.W.T. (earthq.):	40.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	1	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	8.10	Ic cut-off value:	2.60	Trans. detect. applied:	No	MSF method:	Method based
Peak ground acceleration:	1.07	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

SBT legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

CPT basic interpretation plots (normalized)

Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

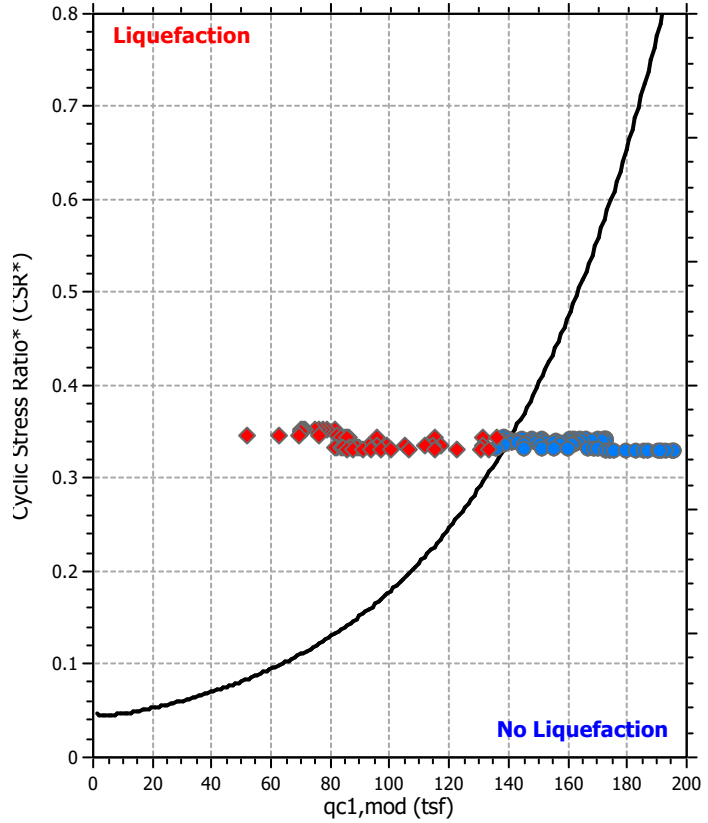
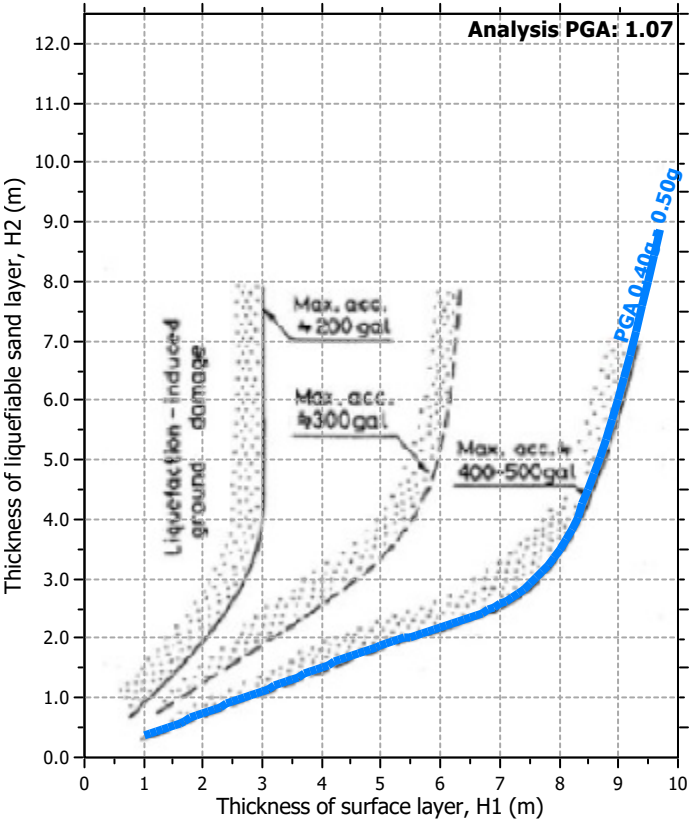
F.S. color scheme



- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

:: Liquefaction Potential Index calculation data :: (continued)

Depth (ft)	FS	F_L	w_z	d_z	LPI	Depth (ft)	FS	F_L	w_z	d_z	LPI

Overall liquefaction potential: 1.76

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)

Estimation of post-earthquake settlements

Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

:: Post-earthquake settlement of dry sands ::

Total estimated settlement: 1.00

Abbreviations

$q_{c,1,mod}$: Equivalent clean sand cone resistance
$q_{c,1N,mod}$: Equivalent clean sand normalized cone resistance
FS: Factor of safety against liquefaction
e_v (%): Post-liquefaction volumentric strain
DF: e_v depth weighting factor
Settlement: Calculated settlement

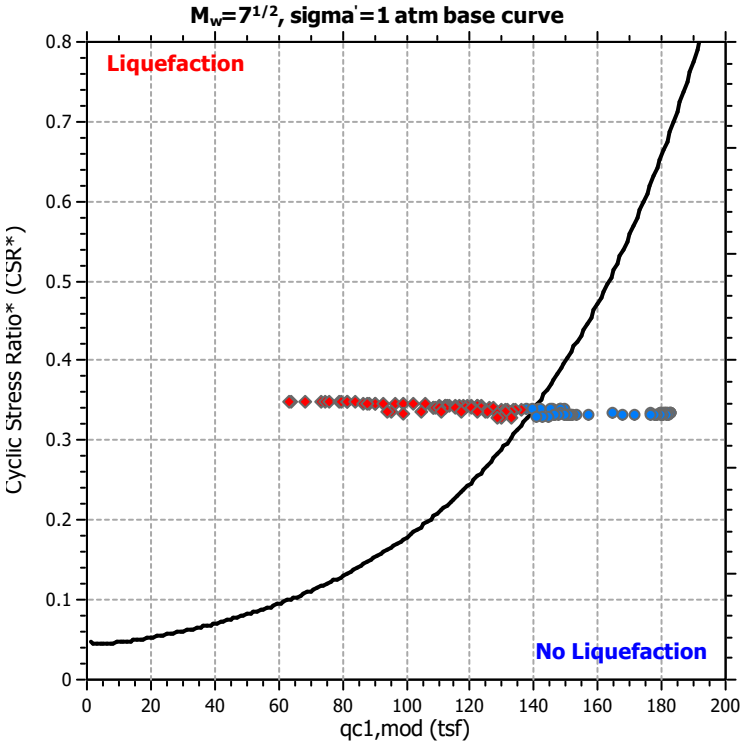
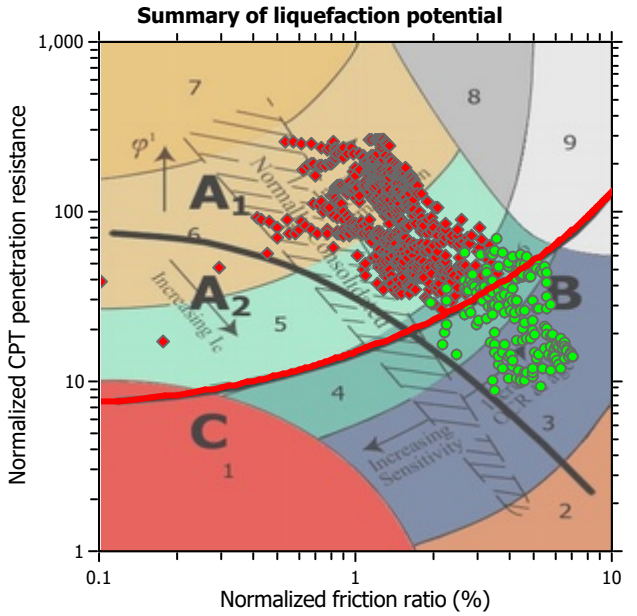
LIQUEFACTION ANALYSIS REPORT



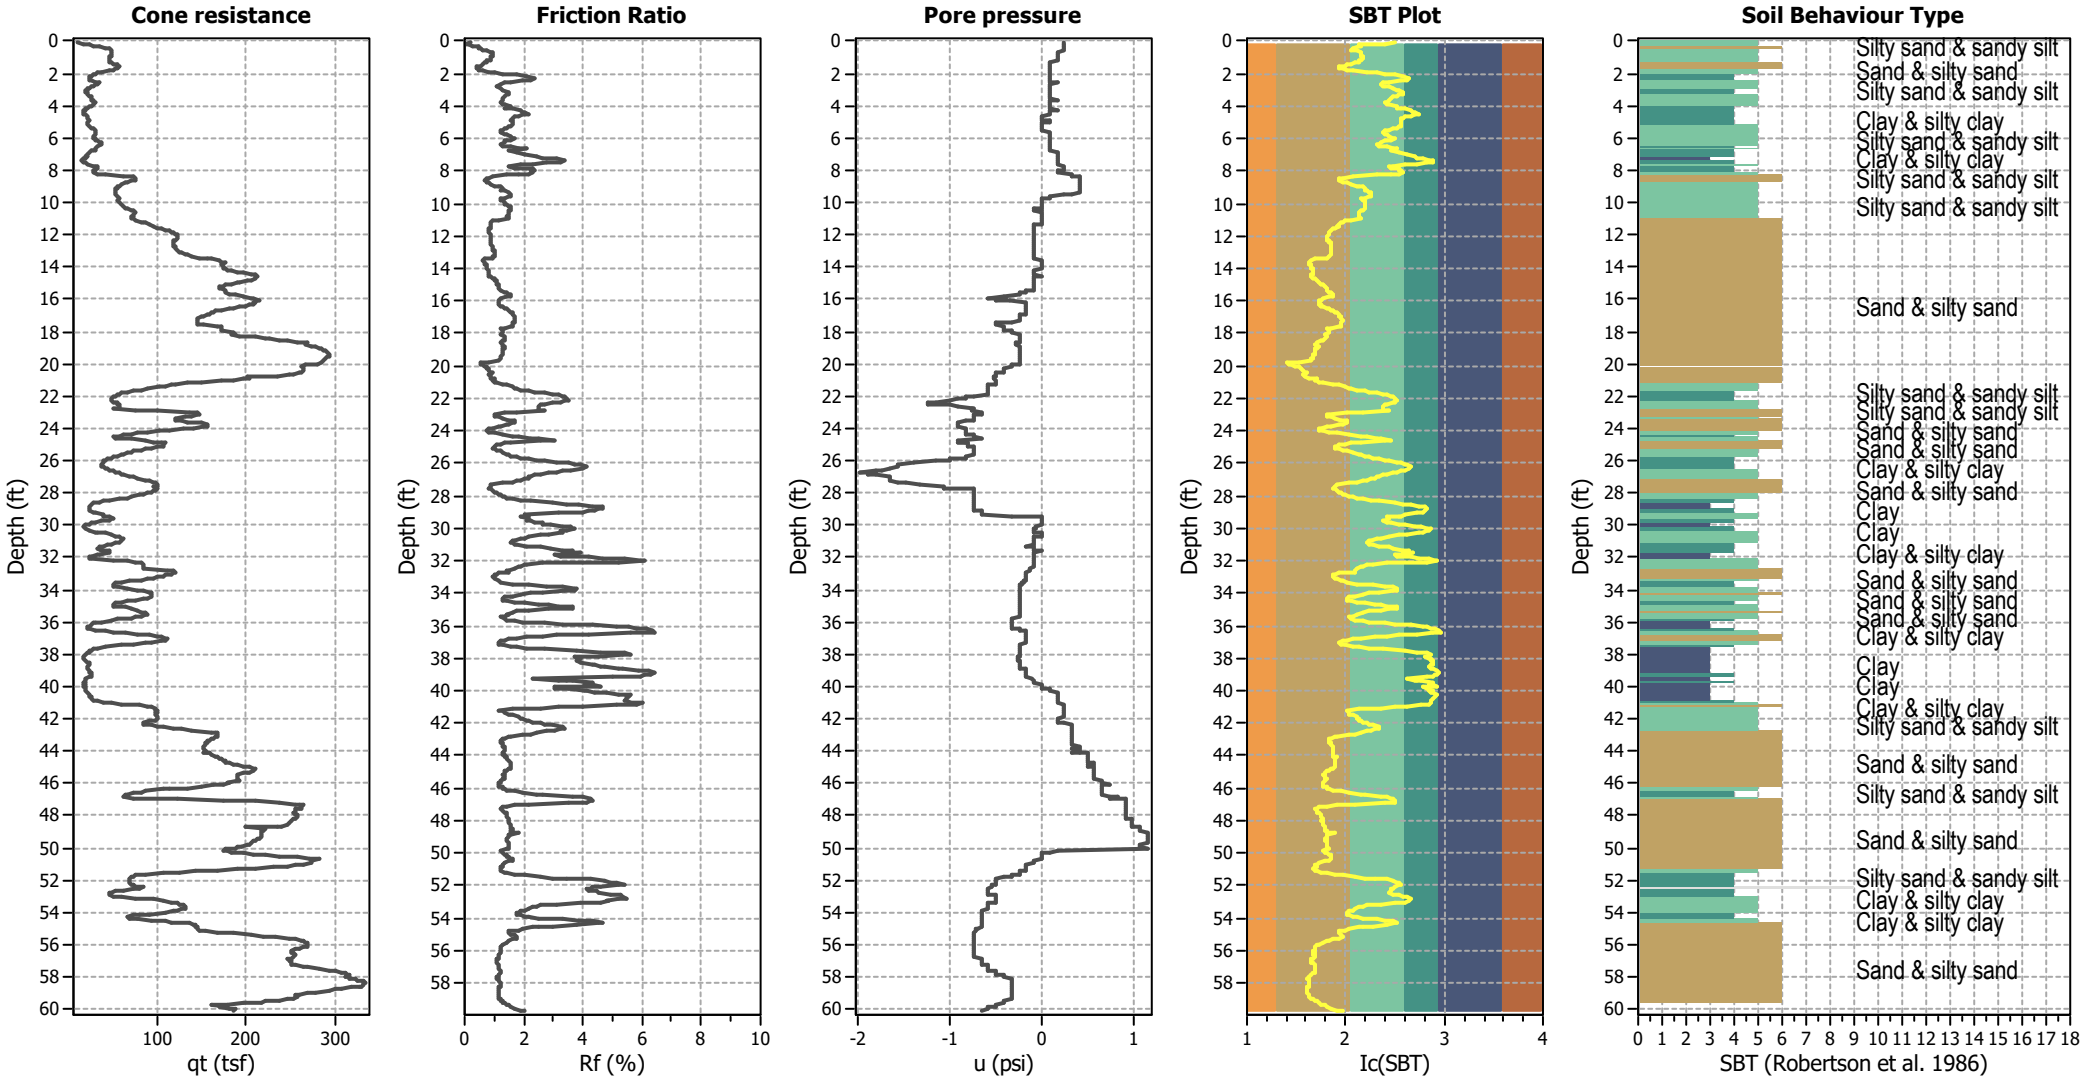
Project title : GeoSoils / Bradley Gardens **Location : 980 W. 7th St, San Jacinto, CA**



CPT file : CPT-3

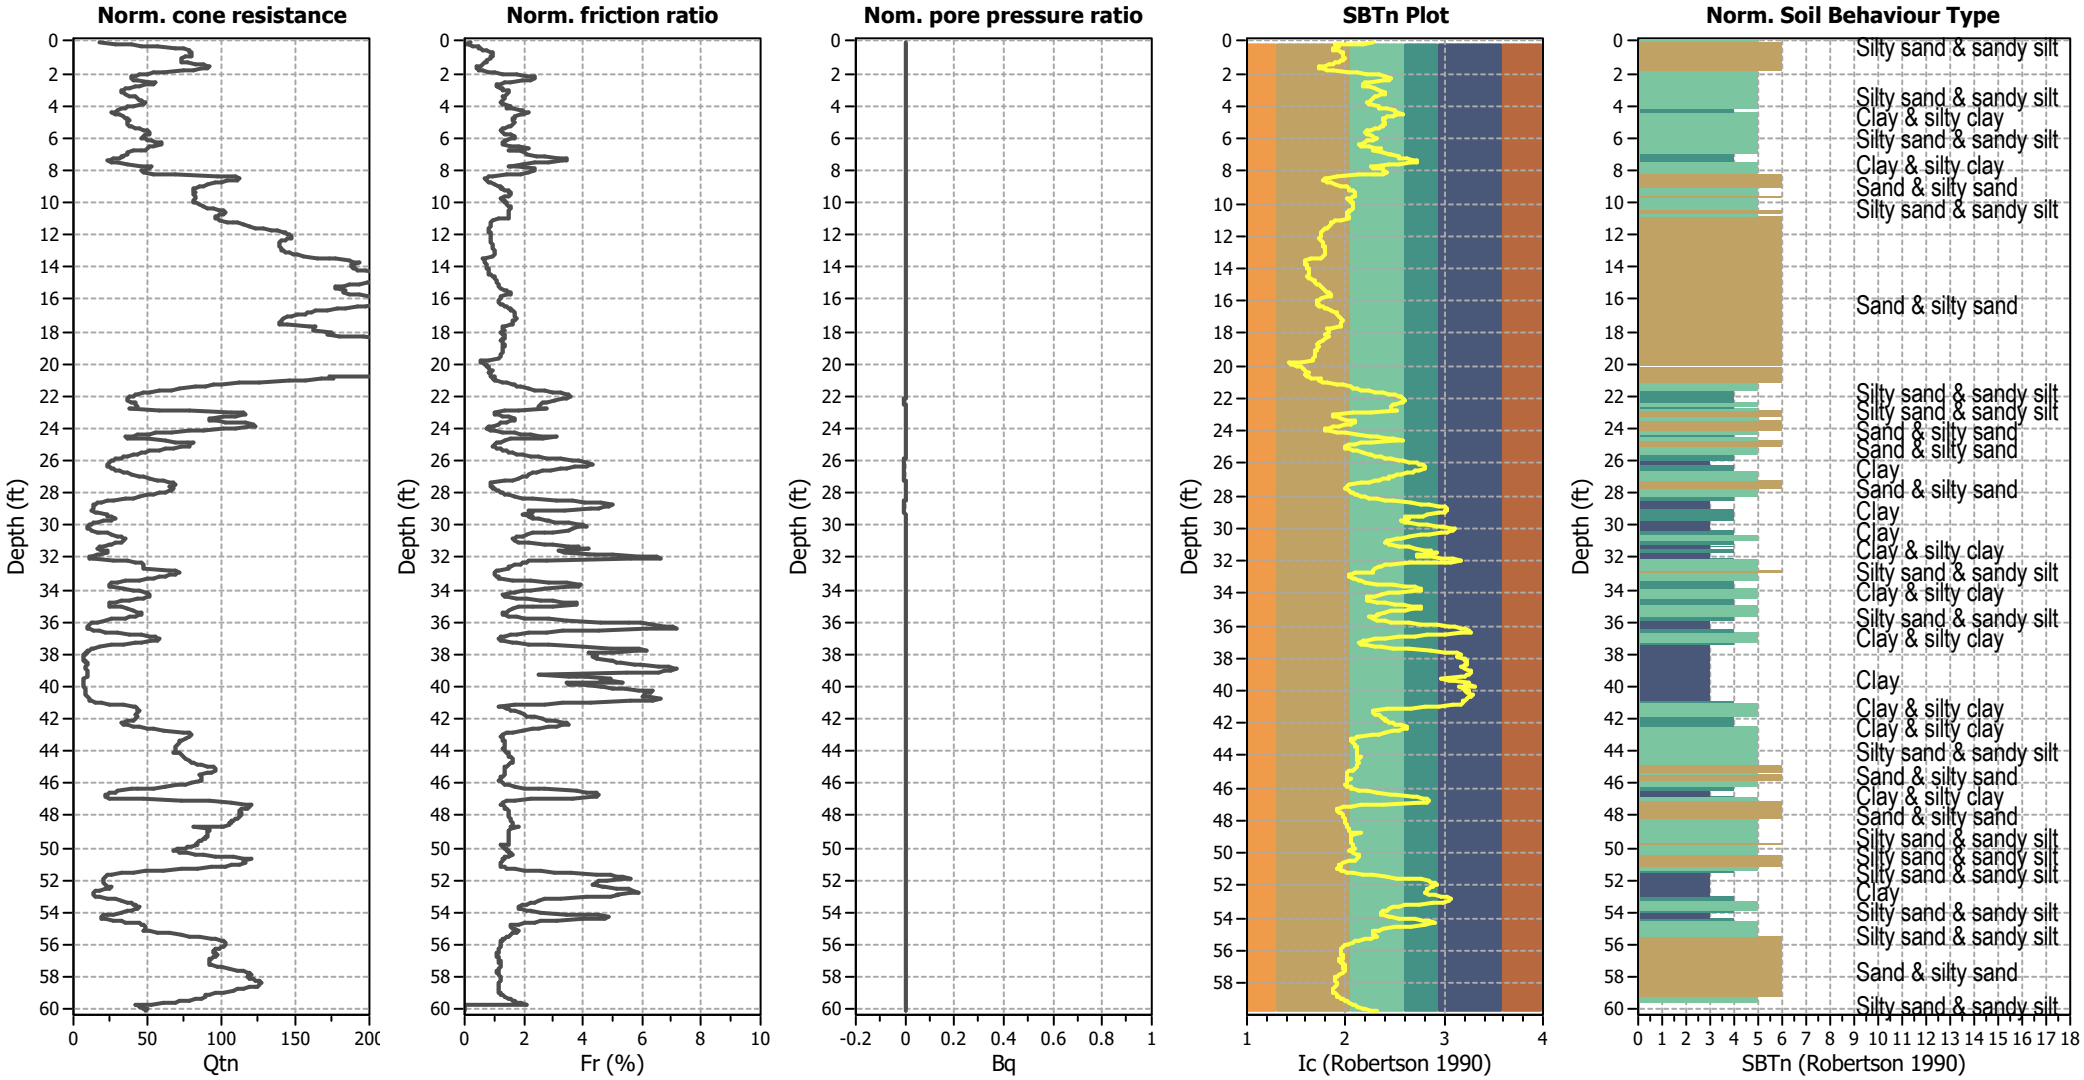
Input parameters and analysis data

Analysis method:	Moss et al. (2006)	G.W.T. (in-situ):	100.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	Moss et al. (2006)	G.W.T. (earthq.):	40.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	1	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	8.10	Ic cut-off value:	2.60	Trans. detect. applied:	No	MSF method:	Method based
Peak ground acceleration:	1.07	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

SBT legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

Liquefaction analysis overall plots

Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No

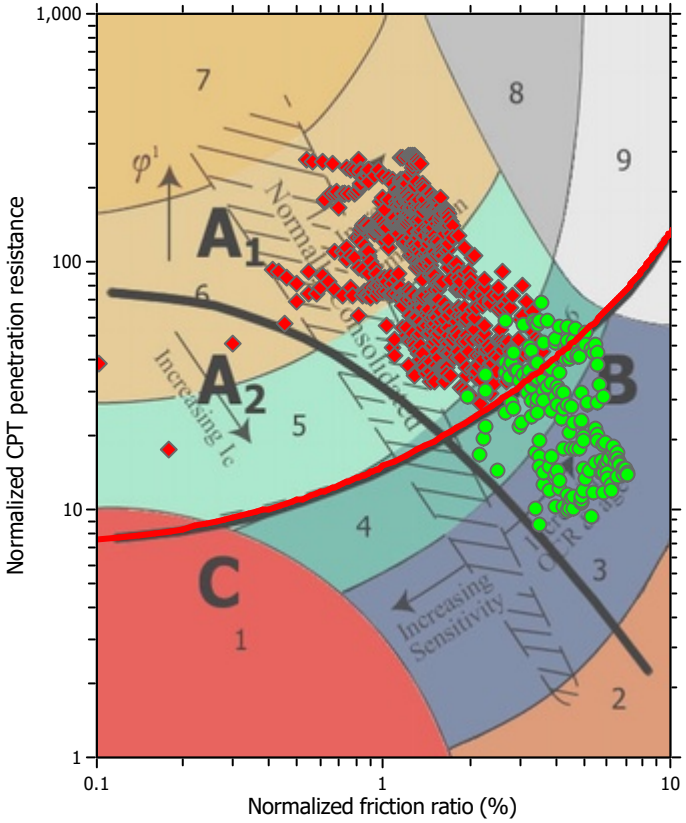
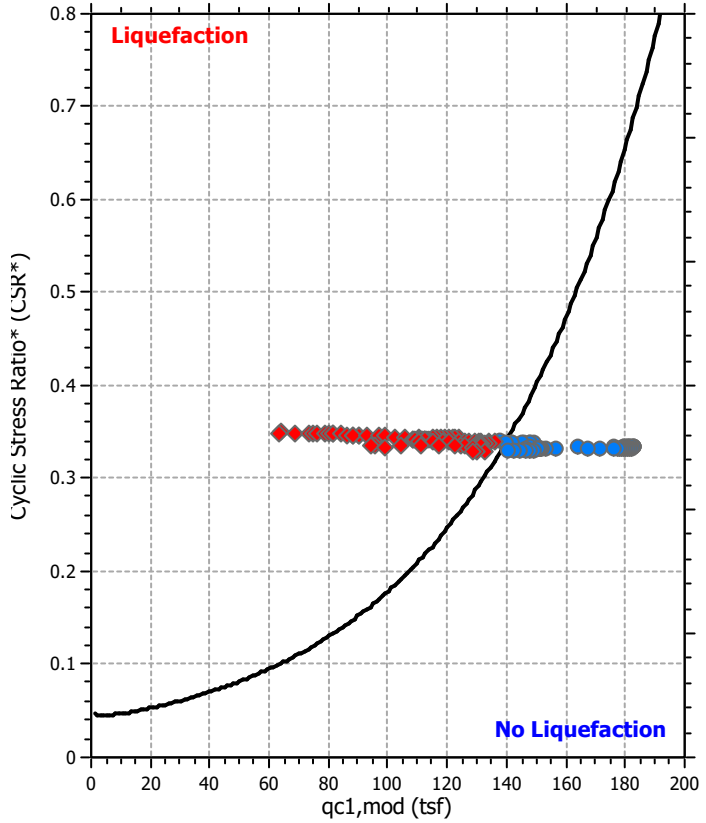
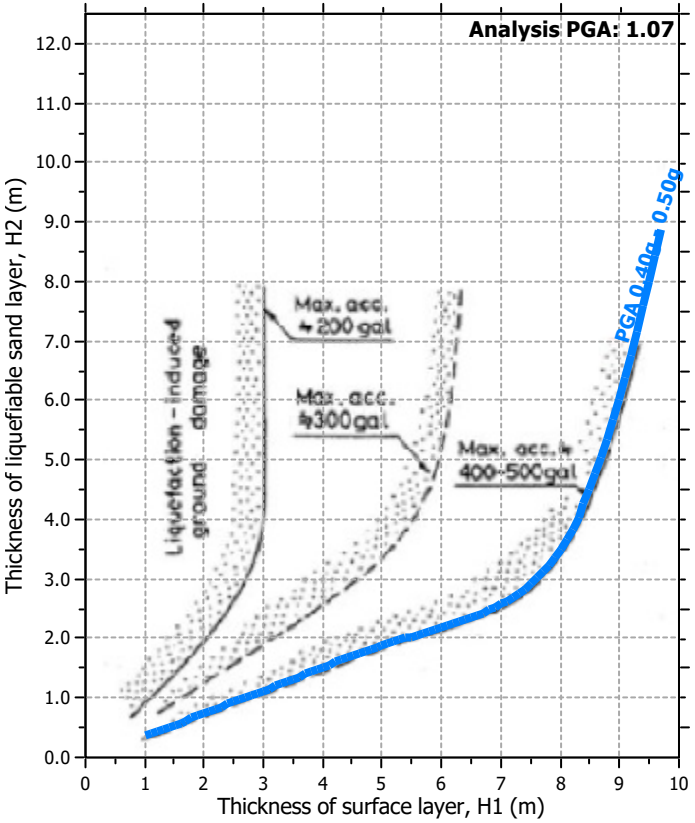
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft



F.S. color scheme



- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Abbreviations

Depth:	Depth from free surface, at which CPT was performed (ft)
q_c:	Measured cone resistance (tsf)
f_s:	Sleeve friction resistance (tsf)
u:	Pore pressure (tsf)
Fines content:	Percentage of fines in soil (%)
Unit weight:	Bulk soil unit weight (pcf)

:: Cyclic Stress Ratio fully adjusted (CSR*) calculation data ::

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

Overall liquefaction potential: 1.78

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)

Estimation of post-earthquake settlements

Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

Total estimated settlement: 1.21

Abbreviations

$q_{c,1,mod}$: Equivalent clean sand cone resistance
$q_{c,1N,mod}$: Equivalent clean sand normalized cone resistance
FS: Factor of safety against liquefaction
e_v (%): Post-liquefaction volumentric strain
DF: e_v depth weighting factor
Settlement: Calculated settlement

Abbreviations

q_t: Total cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Adjusted and corrected cone resistance due to fines
I_c: Soil behavior type index
$S_{u(liq)}/\sigma'_v$: Calculated liquefied undrained strength ratio
$S_{u(peak)}/\sigma'_v$: Calculated peak undrained strength ratio

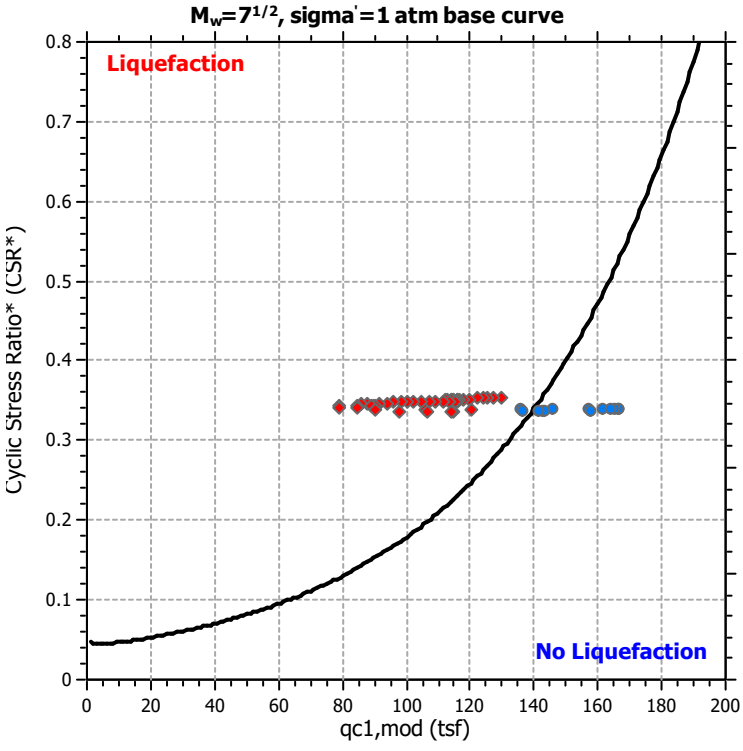
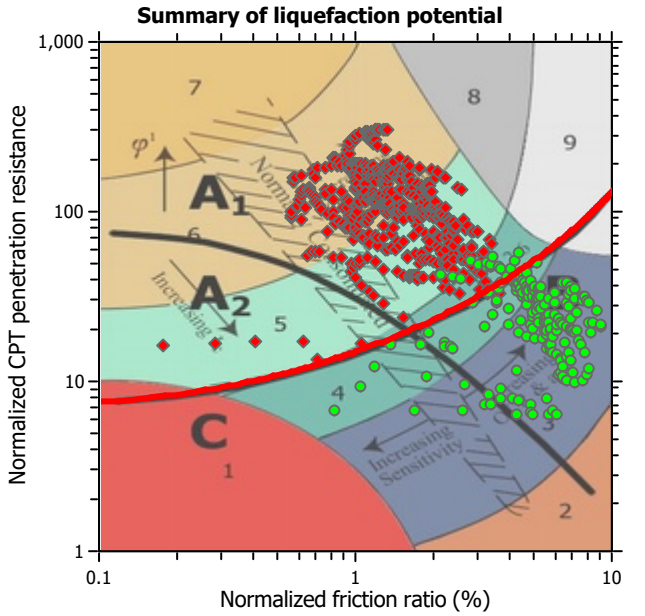
LIQUEFACTION ANALYSIS REPORT



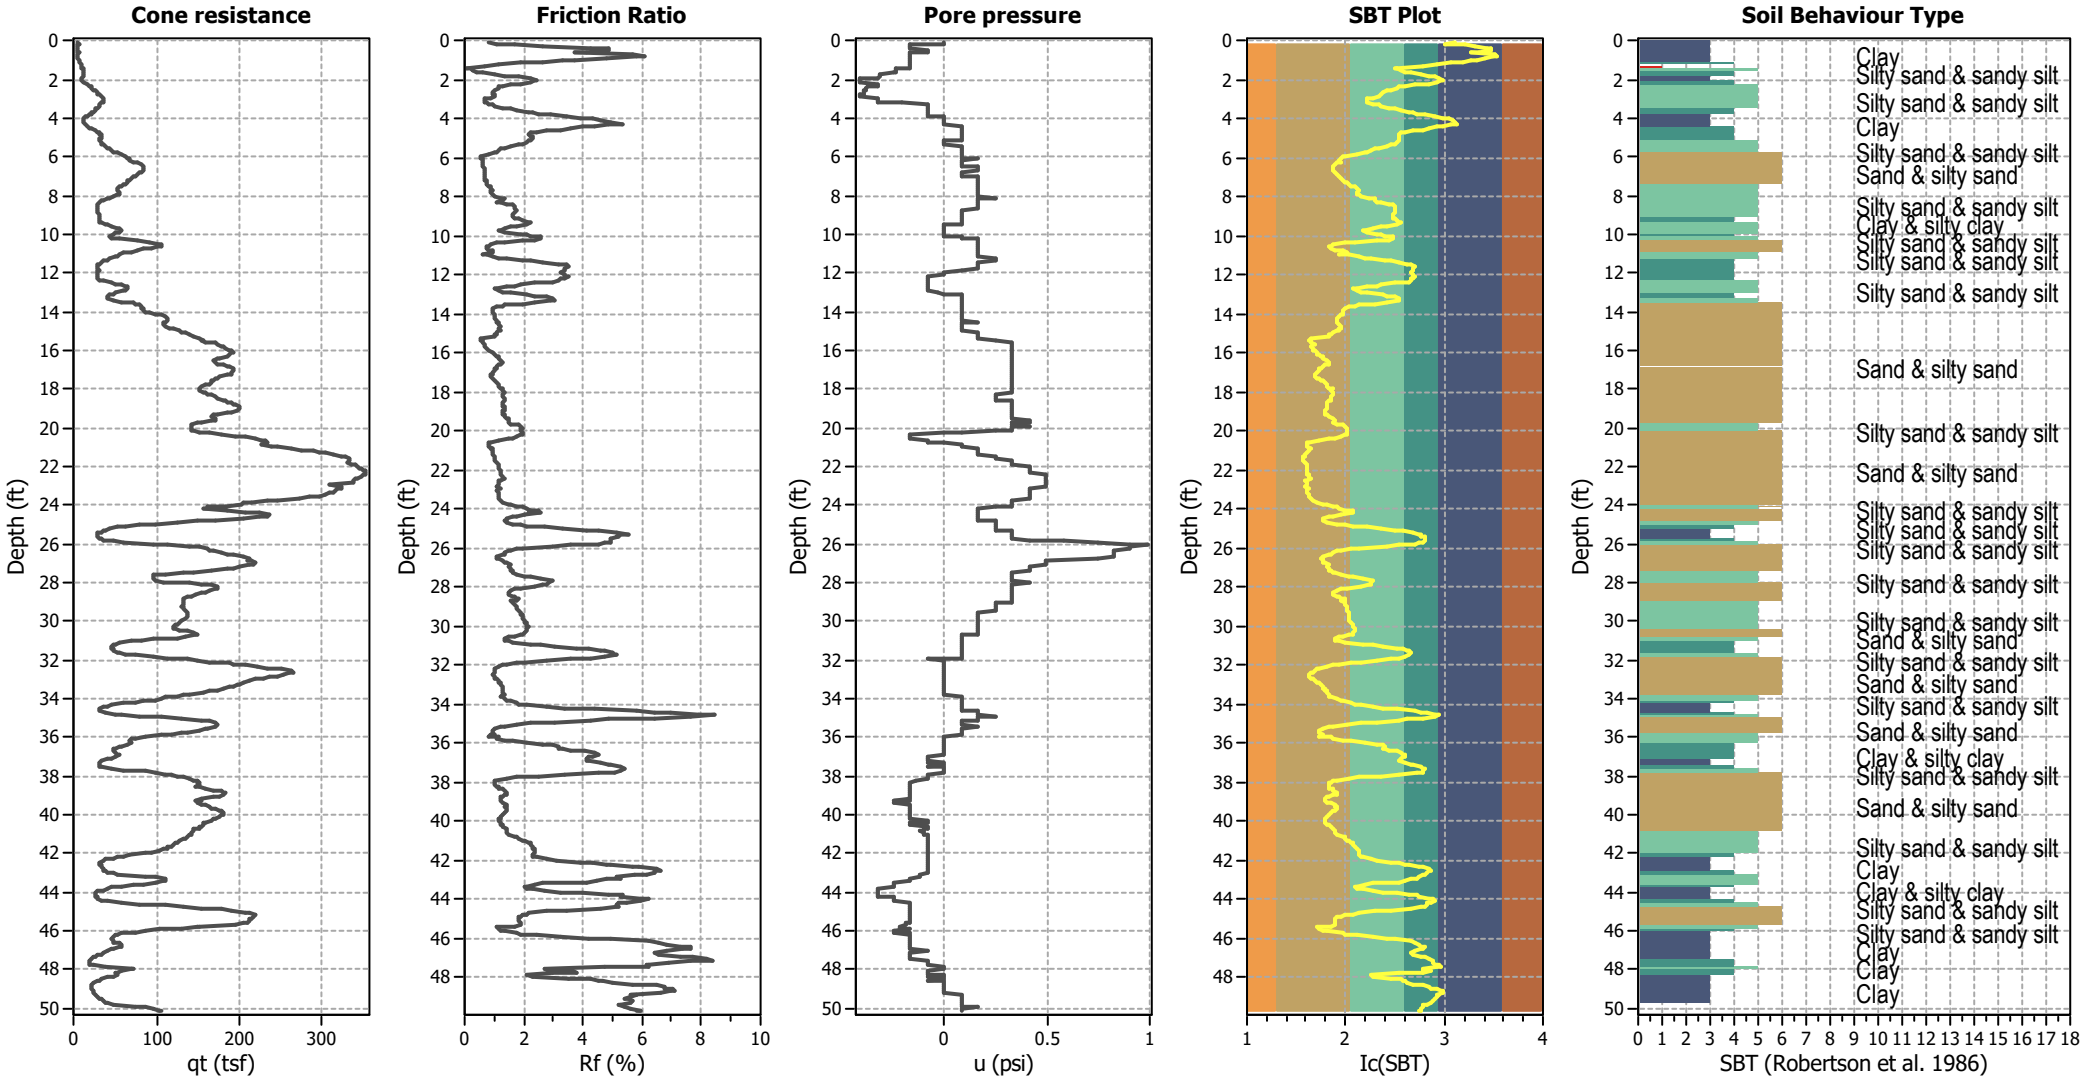
Project title : GeoSoils / Bradley Gardens **Location : 980 W. 7th St, San Jacinto, CA**



CPT file : CPT-4

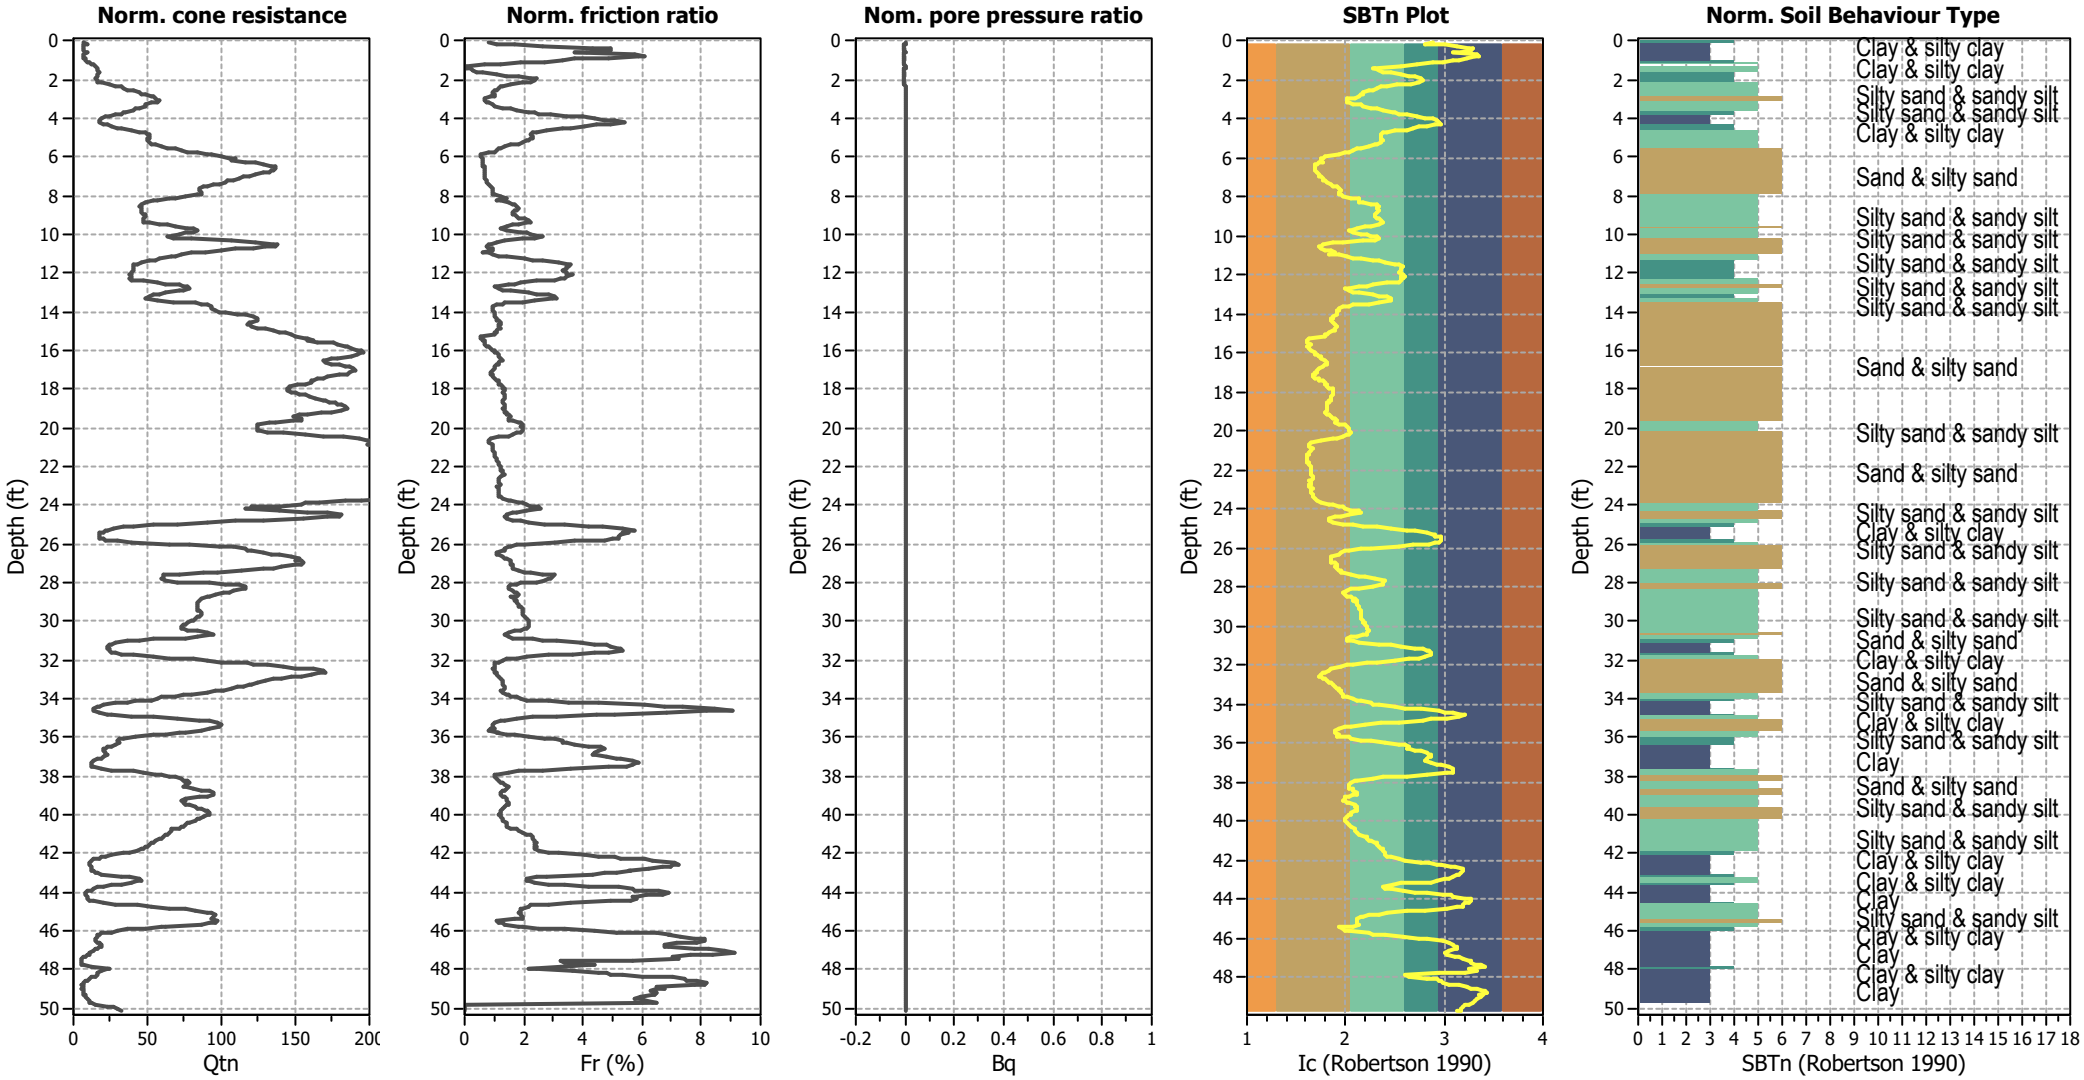
Input parameters and analysis data

Analysis method:	Moss et al. (2006)	G.W.T. (in-situ):	100.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	Moss et al. (2006)	G.W.T. (earthq.):	40.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	1	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	8.10	Ic cut-off value:	2.60	Trans. detect. applied:	No	MSF method:	Method based
Peak ground acceleration:	1.07	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	Moss et al. (2006)	Depth to water table (erthq.):	40.00 ft	Fill weight:	N/A
Fines correction method:	Moss et al. (2006)	Average results interval:	1	Transition detect. applied:	No
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	8.10	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

SBT legend

1. Sensitive fine grained
2. Organic material
3. Clay to silty clay
4. Clayey silt to silty
5. Silty sand to sandy silt
6. Clean sand to silty sand
7. Gravely sand to sand
8. Very stiff sand to
9. Very stiff fine grained

CPT basic interpretation plots (normalized)

Peak ground acceleration:	1.07	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	100.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

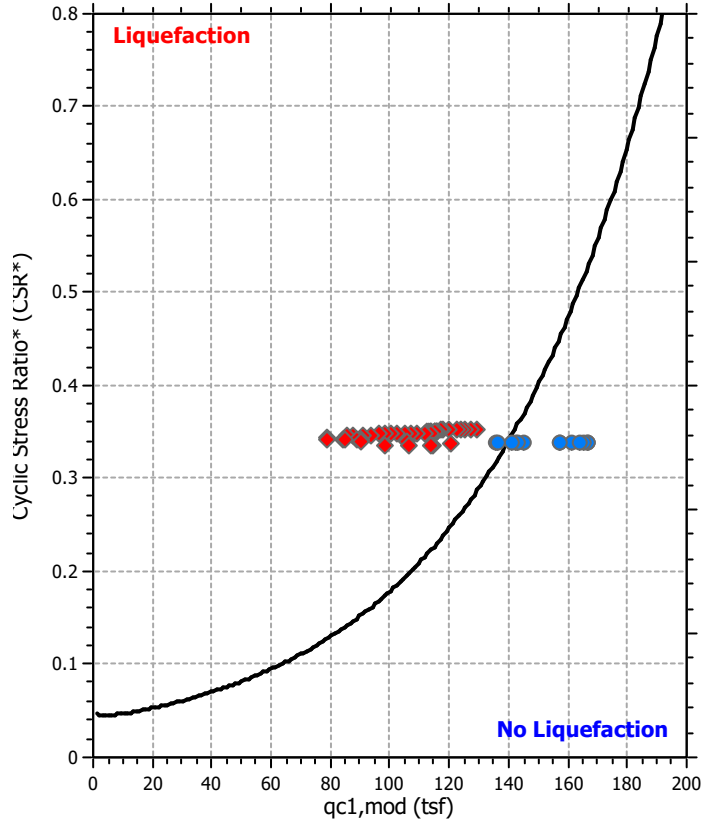
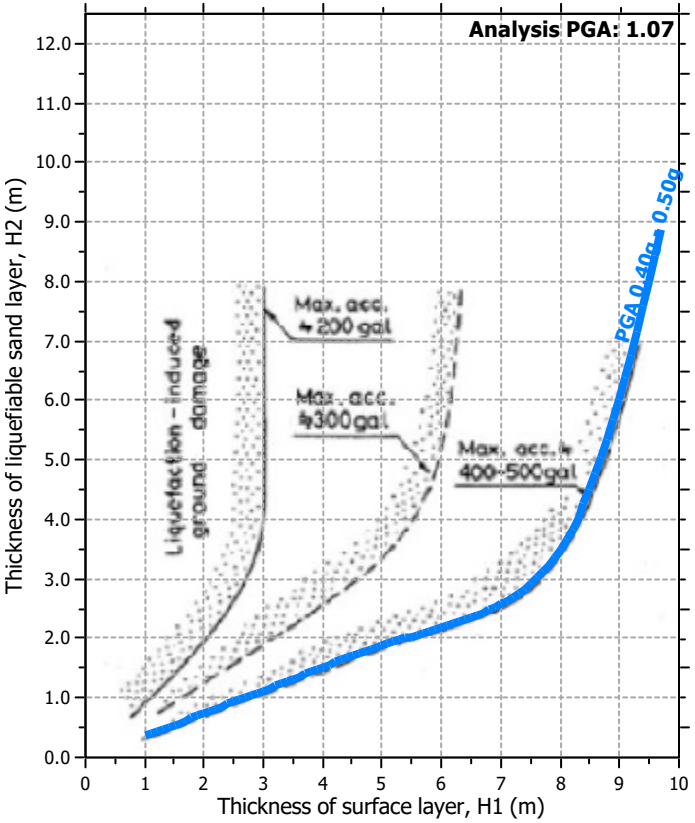
F.S. color scheme



- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy



LPI color scheme

- Very high risk
- High risk
- Low risk

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

:: Liquefaction Potential Index calculation data :: (continued)

Depth (ft)	FS	F_L	w_z	d_z	LPI	Depth (ft)	FS	F_L	w_z	d_z	LPI

Overall liquefaction potential: 1.33

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)

Estimation of post-earthquake settlements

Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

Abbreviations

$q_{c,1,mod}$: Equivalent clean sand cone resistance
$q_{c,1N,mod}$: Equivalent clean sand normalized cone resistance
FS: Factor of safety against liquefaction
e_v (%): Post-liquefaction volumentric strain
DF: e_v depth weighting factor
Settlement: Calculated settlement

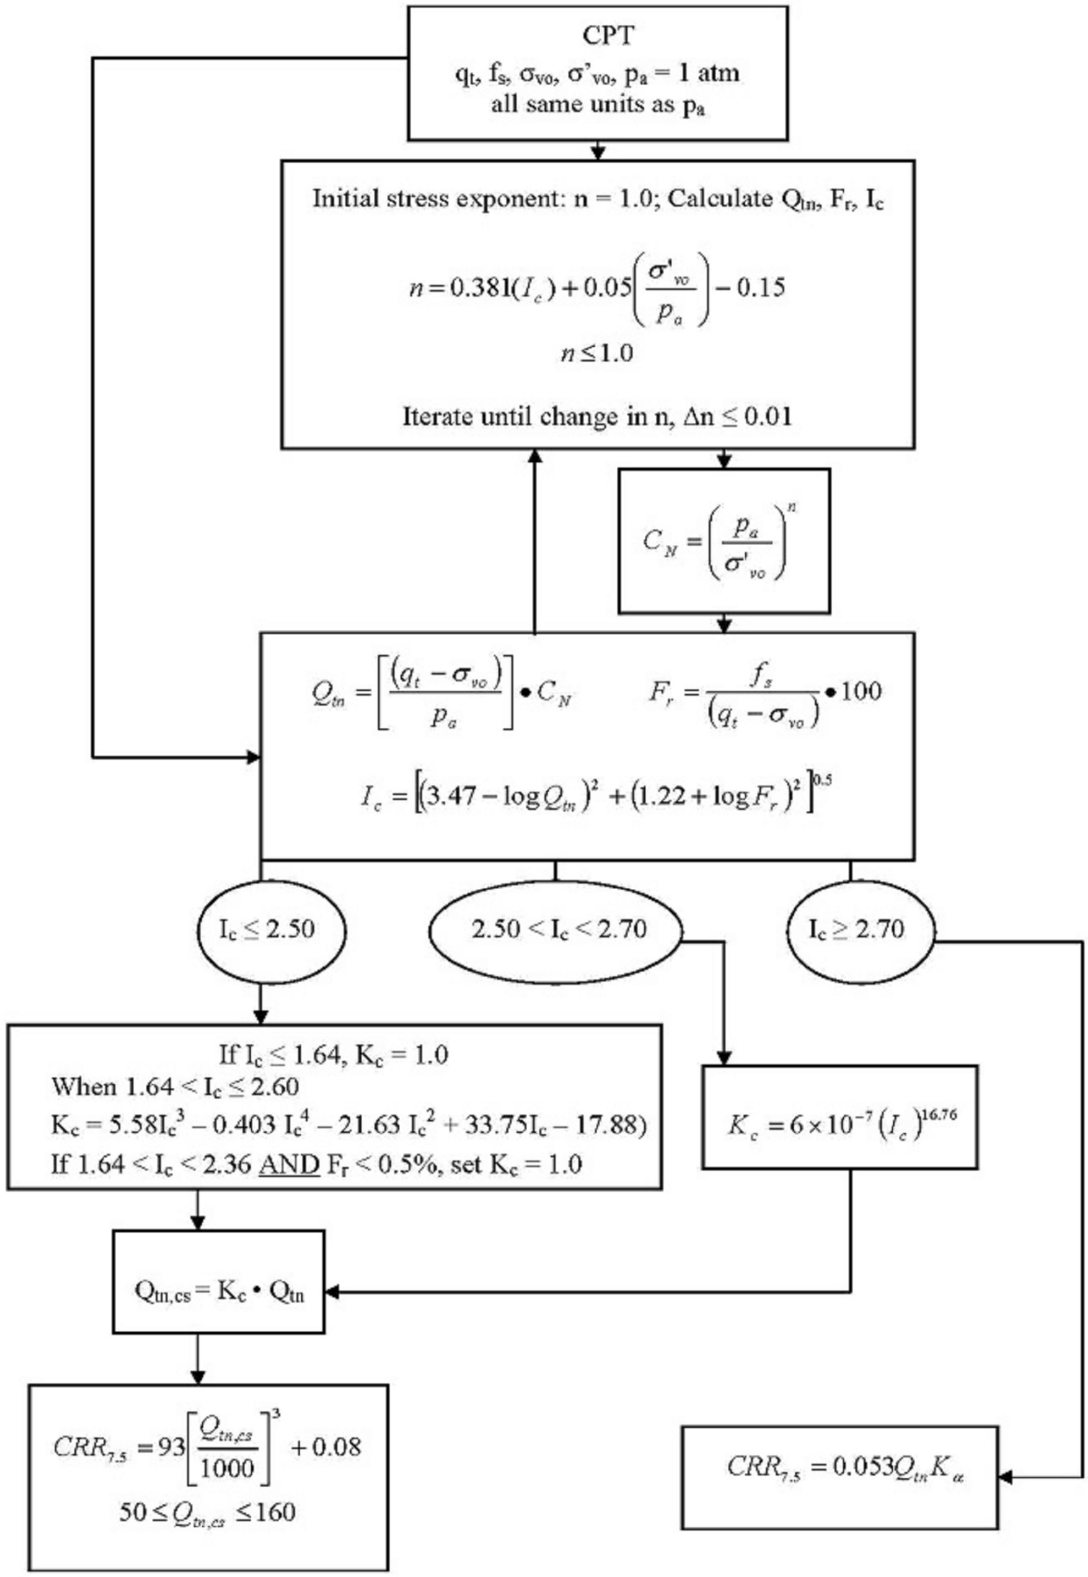
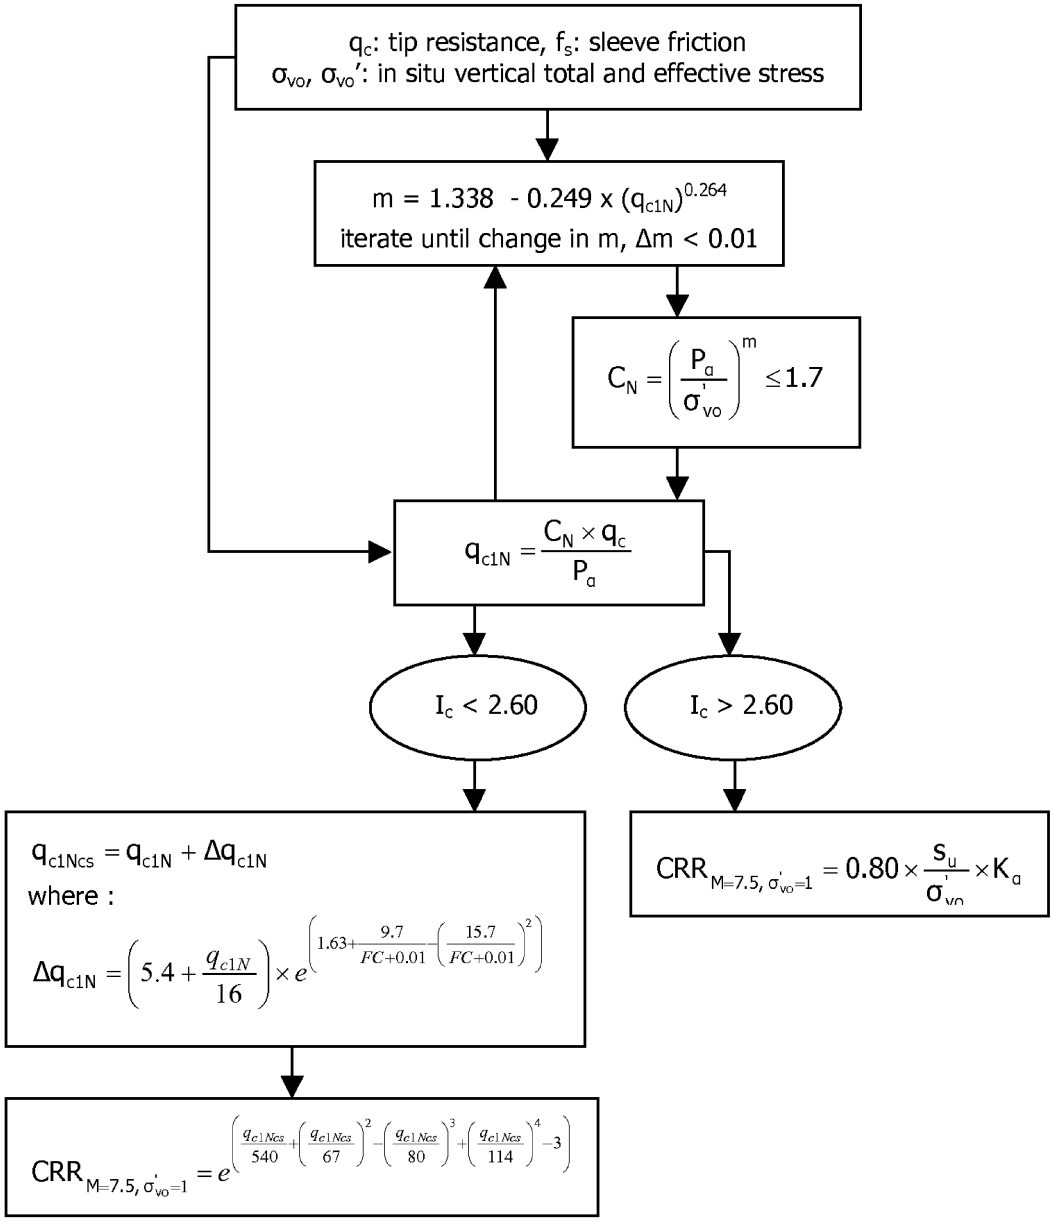
Procedure for the evaluation of soil liquefaction resistance, NCEER (1998)



Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. The procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:

[1] "Estimating liquefaction-induced ground settlements from CPT for level ground", G. Zhang, P.K. Robertson, and R.W.I. Brachman



Procedure for the evaluation of soil liquefaction resistance (all soils), Robertson (2010)

Calculation of soil resistance against liquefaction is performed according to the Robertson & Wride (1998) procedure. This procedure used in the software, slightly differs from the one originally published in NCEER-97-0022 (Proceedings of the NCEER Workshop on Evaluation of Liquefaction Resistance of Soils). The revised procedure is presented below in the form of a flowchart[1]:

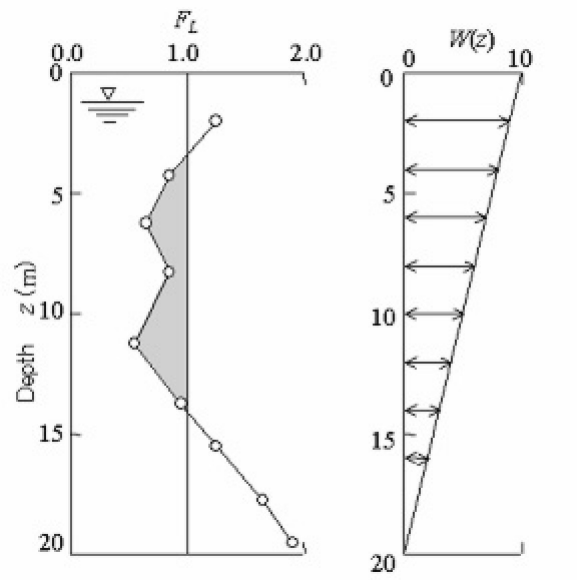
Procedure for the estimation of seismic induced settlements in dry sands

Robertson, P.K. and Lisheng, S., 2010, "Estimation of seismic compression in dry soils using the CPT" FIFTH INTERNATIONAL CONFERENCE ON RECENT ADVANCES IN GEOTECHNICAL EARTHQUAKE ENGINEERING AND SOIL DYNAMICS, Symposium in honor of professor I. M. Idriss, San Diego, CA

Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.



To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\mathbf{LPI} = \int_0^{20} (10 - 0{,}5z) \times F_L \times dz$$

where:
F_L = 1 - F.S. when F.S. less than 1
F_L = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high

Graphical presentation of the LPI calculation procedure

Shear-Induced Building Settlement (Ds) calculation procedure

The shear-induced building settlement (Ds) due to liquefaction below the building can be estimated using the relationship developed by Bray and Macedo (2017):

$$Ln(Ds) = c1 + c2 * LBS + 0.58 * Ln\left(Tanh\left(\frac{HL}{6}\right)\right) + 4.59 * Ln(Q) - 0.42 * Ln(Q)^2 - 0.02 * B + 0.84 * Ln(CAVdp) + 0.41 * Ln(Sa1) + \varepsilon$$

where Ds is in the units of mm, c1= -8.35 and c2= 0.072 for LBS ≤ 16, and c1= -7.48 and c2= 0.014 otherwise. Q is the building contact pressure in units of kPa, HL is the cumulative thickness of the liquefiable layers in the units of m, B is the building width in the units of m, CAVdp is a standardized version of the cumulative absolute velocity in the units of g-s, Sa1 is 5%-damped pseudo-acceleration response spectral value at a period of 1 s in the units of g, and ε is a normal random variable with zero mean and 0.50 standard deviation in Ln units. The liquefaction-induced building settlement index (LBS) is:

$$LBS = \sum W * \frac{\varepsilon_{shear}}{z} dz$$

where z (m) is the depth measured from the ground surface > 0, W is a foundation-weighting factor wherein W = 0.0 for z less than Df, which is the embedment depth of the foundation, and W = 1.0 otherwise. The shear strain parameter (ε_shear) is the liquefaction-induced free-field shear strain (in %) estimated using Zhang et al. (2004). It is calculated based on the estimated Dr of the liquefied soil layer and the calculated safety factor against liquefaction triggering (FSL).

APPENDIX F

GENERAL EARTHWORK AND GRADING GUIDELINES AND PRELIMINARY CRITERIA

GENERAL EARTHWORK, GRADING GUIDELINES, AND PRELIMINARY CRITERIA

General

These guidelines present general procedures and requirements for earthwork and grading as shown on the approved grading plans, including preparation of areas to be filled, placement of fill, installation of subdrains, excavations, and appurtenant structures or flatwork. The recommendations contained in the geotechnical report are part of these earthwork and grading guidelines and would supersede the provisions contained hereafter in the case of conflict. Evaluations performed by the consultant during the course of grading may result in new or revised recommendations which could supersede these guidelines or the recommendations contained in the geotechnical report. Generalized details follow this text.

The contractor is responsible for the satisfactory completion of all earthwork in accordance with provisions of the project plans and specifications and latest adopted Code. In the case of conflict, the most onerous provisions shall prevail. The project geotechnical engineer and engineering geologist (geotechnical consultant), or their representatives, should provide observation and testing services, and geotechnical consultation during the duration of the project.

EARTHWORK OBSERVATIONS AND TESTING

Geotechnical Consultant

Prior to the commencement of grading, a qualified geotechnical consultant (soil engineer and engineering geologist) should be employed for the purpose of observing earthwork procedures and testing the fills for general conformance with the recommendations of the geotechnical report(s), the approved grading plans, and applicable grading codes and ordinances.

The geotechnical consultant should provide testing and observation so that an evaluation may be made that the work is being accomplished as specified. It is the responsibility of the contractor to assist the consultants and keep them apprised of anticipated work schedules and changes, so that they may schedule their personnel accordingly.

All remedial removals, clean-outs, prepared ground to receive fill, key excavations, and subdrain installation should be observed and documented by the geotechnical consultant prior to placing any fill. It is the contractor's responsibility to notify the geotechnical consultant when such areas are ready for observation.

Laboratory and Field Tests

Maximum dry density tests to determine the degree of compaction should be performed in accordance with American Standard Testing Materials test method ASTM designation D-1557. Random or representative field compaction tests should be performed in accordance with test methods ASTM designation D-1556, D-2937 or D-2922, and D-3017, at intervals of approximately ±2 feet of fill height or approximately every 1,000 cubic yards placed. These criteria would vary depending on the soil conditions and the size of the project. The location and frequency of testing would be at the discretion of the geotechnical consultant.

Contractor's Responsibility

All clearing, site preparation, and earthwork performed on the project should be conducted by the contractor, with observation by a geotechnical consultant, and staged approval by the governing agencies, as applicable. It is the contractor's responsibility to prepare the ground surface to receive the fill, to the satisfaction of the geotechnical consultant, and to place, spread, moisture condition, mix, and compact the fill in accordance with the recommendations of the geotechnical consultant. The contractor should also remove all non-earth material considered unsatisfactory by the geotechnical consultant.

Notwithstanding the services provided by the geotechnical consultant, it is the sole responsibility of the contractor to provide adequate equipment and methods to accomplish the earthwork in strict accordance with applicable grading guidelines, latest adopted Code or agency ordinances, geotechnical report(s), and approved grading plans. Sufficient watering apparatus and compaction equipment should be provided by the contractor with due consideration for the fill material, rate of placement, and climatic conditions. If, in the opinion of the geotechnical consultant, unsatisfactory conditions such as questionable weather, excessive oversized rock or deleterious material, insufficient support equipment, etc., are resulting in a quality of work that is not acceptable, the consultant will inform the contractor, and the contractor is expected to rectify the conditions, and if necessary, stop work until conditions are satisfactory.

During construction, the contractor shall properly grade all surfaces to maintain good drainage and prevent ponding of water. The contractor shall take remedial measures to control surface water and to prevent erosion of graded areas until such time as permanent drainage and erosion control measures have been installed.

SITE PREPARATION

All major vegetation, including brush, trees, thick grasses, organic debris, and other deleterious material, should be removed and disposed of off-site. These removals must be concluded prior to placing fill. In-place existing fill, soil, alluvium, colluvium, or rock materials, as evaluated by the geotechnical consultant as being unsuitable, should be removed prior to any fill placement. Depending upon the soil conditions, these materials may be reused as

compacted fills. Any materials incorporated as part of the compacted fills should be approved by the geotechnical consultant.

Any underground structures such as cesspools, cisterns, mining shafts, tunnels, septic tanks, wells, pipelines, or other structures not located prior to grading, are to be removed or treated in a manner recommended by the geotechnical consultant. Soft, dry, spongy, highly fractured, or otherwise unsuitable ground, extending to such a depth that surface processing cannot adequately improve the condition, should be overexcavated down to firm ground and approved by the geotechnical consultant before compaction and filling operations continue. Overexcavated and processed soils, which have been properly mixed and moisture conditioned, should be re-compacted to the minimum relative compaction as specified in these guidelines.

Existing ground, which is determined to be satisfactory for support of the fills, should be scarified (ripped) to a minimum depth of 6 to 8 inches, or as directed by the geotechnical consultant. After the scarified ground is brought to optimum moisture content, or greater and mixed, the materials should be compacted as specified herein. If the scarified zone is greater than 6 to 8 inches in depth, it may be necessary to remove the excess and place the material in lifts restricted to about 6 to 8 inches in compacted thickness.

Existing ground which is not satisfactory to support compacted fill should be overexcavated as required in the geotechnical report, or by the on-site geotechnical consultant. Scarification, disc harrowing, or other acceptable forms of mixing should continue until the soils are broken down and free of large lumps or clods, until the working surface is reasonably uniform and free from ruts, hollows, hummocks, mounds, or other uneven features, which would inhibit compaction as described previously.

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical [h:v]), the ground should be stepped or benched. The lowest bench, which will act as a key, should be a minimum of 15 feet wide and should be at least 2 feet deep into firm material, and approved by the geotechnical consultant. In fill-over-cut slope conditions, the recommended minimum width of the lowest bench or key is also 15 feet, with the key founded on firm material, as designated by the geotechnical consultant. As a general rule, unless specifically recommended otherwise by the geotechnical consultant, the minimum width of fill keys should be equal to ½ the height of the slope.

Standard benching is generally 4 feet (minimum) vertically, exposing firm, acceptable material. Benching may be used to remove unsuitable materials, although it is understood that the vertical height of the bench may exceed 4 feet. Pre-stripping may be considered for unsuitable materials in excess of 4 feet in thickness.

All areas to receive fill, including processed areas, removal areas, and the toes of fill benches, should be observed and approved by the geotechnical consultant prior to placement of fill. Fills may then be properly placed and compacted until design grades (elevations) are attained.

COMPACTED FILLS

Any earth materials imported or excavated on the property may be utilized in the fill provided that each material has been evaluated to be suitable by the geotechnical consultant. These materials should be free of roots, tree branches, other organic matter, or other deleterious materials. All unsuitable materials should be removed from the fill as directed by the geotechnical consultant. Soils of poor gradation, undesirable expansion potential, or substandard strength characteristics may be designated by the consultant as unsuitable and may require blending with other soils to serve as a satisfactory fill material.

Fill materials derived from benching operations should be dispersed throughout the fill area and blended with other approved material. Benching operations should not result in the benched material being placed only within a single equipment width away from the fill/bedrock contact.

Oversized materials defined as rock, or other irreducible materials, with a maximum dimension greater than 12 inches, should not be buried or placed in fills unless the location of materials and disposal methods are specifically approved by the geotechnical consultant. Oversized material should be taken offsite, or placed in accordance with recommendations of the geotechnical consultant in areas designated as suitable for rock disposal. GSI anticipates that soils to be utilized as fill material for the subject project may contain some rock. Appropriately, the need for rock disposal may be necessary during grading operations on the site. From a geotechnical standpoint, the depth of any rocks, rock fills, or rock blankets, should be a sufficient distance from finish grade. This depth is generally the same as any overexcavation due to cut-fill transitions in hard rock areas, and generally facilitates the excavation of structural footings and substructures. Should deeper excavations be proposed (i.e., deepened footings, utility trenching, swimming pools, spas, etc.), the developer may consider increasing the hold-down depth of any rocky fills to be placed, as appropriate. In addition, some agencies/jurisdictions mandate a specific hold-down depth for oversize materials placed in fills. The hold-down depth, and potential to encounter oversize rock, both within fills, and occurring in cut or natural areas, would need to be disclosed to all interested/affected parties. Once approved by the governing agency, the hold-down depth for oversized rock (i.e., greater than 12 inches) in fills on this project is provided as 10 feet, unless specified differently in the text of this report. The governing agency may require that these materials need to be deeper, crushed, or reduced to less than 12 inches in maximum dimension, at their discretion.

To facilitate future trenching, rock (or oversized material), should not be placed within the hold-down depth feet from finish grade, the range of foundation excavations, future utilities, or underground construction unless specifically approved by the governing agency, the geotechnical consultant, or the developer's representative.

If import material is required for grading, representative samples of the materials to be utilized as compacted fill should be analyzed in the laboratory by the geotechnical consultant to evaluate it's physical properties and suitability for use onsite. Such testing should be performed three (3) days prior to importation. If any material other than that previously tested is encountered during grading, an appropriate analysis of this material should be conducted by the geotechnical consultant as soon as possible.

Approved fill material should be placed in areas prepared to receive fill in near horizontal layers, that when compacted, should not exceed about 6 to 8 inches in thickness. The geotechnical consultant may approve thick lifts if testing indicates the grading procedures are such that adequate compaction is being achieved with lifts of greater thickness. Each layer should be spread evenly and blended to attain uniformity of material and moisture suitable for compaction.

Fill layers at a moisture content less than optimum should be watered and mixed, and wet fill layers should be aerated by scarification, or should be blended with drier material. Moisture conditioning, blending, and mixing of the fill layer should continue until the fill materials have a uniform moisture content at, or above, optimum moisture.

After each layer has been evenly spread, moisture conditioned, and mixed, it should be uniformly compacted to a minimum of 90 percent of the maximum density as evaluated by ASTM test designation D 1557, or as otherwise recommended by the geotechnical consultant. Compaction equipment should be adequately sized and should be specifically designed for soil compaction, or of proven reliability to efficiently achieve the specified degree of compaction.

Where tests indicate that the density of any layer of fill, or portion thereof, is below the required relative compaction, or improper moisture is in evidence, the particular layer or portion shall be re-worked until the required density and moisture content has been attained. No additional fill shall be placed in an area until the last placed lift of fill has been tested and found to meet the density and moisture requirements, and is approved by the geotechnical consultant.

In general, per the latest adopted Code, fill slopes should be designed and constructed at a gradient of 2:1 (h:v), or flatter. Compaction of slopes should be accomplished by over-building a minimum of 3 feet horizontally, and subsequently trimming back to the design slope configuration. Testing shall be performed as the fill is elevated to evaluate compaction as the fill core is being developed. Special efforts may be necessary to attain the specified compaction in the fill slope zone. Final slope shaping should be performed by trimming and removing loose materials with appropriate equipment. A final evaluation of fill slope compaction should be based on observation or testing of the finished slope face. Where compacted fill slopes are designed steeper than 2:1 (h:v), prior approval from the governing agency, specific material types, a higher minimum relative compaction, special reinforcement, and special grading procedures will be recommended.

If an alternative to over-building and cutting back the compacted fill slopes is selected, then special effort should be made to achieve the required compaction in the outer 10 feet of each lift of fill by undertaking the following:

1. An extra piece of equipment consisting of a heavy, short-shanked sheepsfoot should be used to roll (horizontal) parallel to the slopes continuously as fill is placed. The sheepsfoot roller should also be used to roll perpendicular to the slopes, and extend out over the slope to provide adequate compaction to the face of the slope.

2. Loose fill should not be spilled out over the face of the slope as each lift is compacted. Any loose fill spilled over a previously completed slope face should be trimmed off or be subject to re-rolling.

3. Field compaction tests will be made in the outer (horizontal) ±2 to ±8 feet of the slope at appropriate vertical intervals, subsequent to compaction operations.

4. After completion of the slope, the slope face should be shaped with a small tractor and then re-rolled with a sheepsfoot to achieve compaction to near the slope face. Subsequent to testing to evaluate compaction, the slopes should be grid-rolled to achieve compaction to the slope face. Final testing should be used to evaluate compaction after grid rolling.

5. Where testing indicates less than adequate compaction, the contractor will be responsible to rip, water, mix, and recompact the slope material as necessary to achieve compaction. Additional testing should be performed to evaluate compaction.

SUBDRAIN INSTALLATION

Subdrains should be installed in approved ground in accordance with the approximate alignment and details indicated by the geotechnical consultant. Subdrain locations or materials should not be changed or modified without approval of the geotechnical consultant. The geotechnical consultant may recommend and direct changes in subdrain line, grade, and drain material in the field, pending exposed conditions. The location of constructed subdrains, especially the outlets, should be recorded/surveyed by the project civil engineer. Drainage at the subdrain outlets should be provided by the project civil engineer.

EXCAVATIONS

Excavations and cut slopes should be examined during grading by the geotechnical consultant. If directed by the geotechnical consultant, further excavations or overexcavation and refilling of cut areas should be performed, or remedial grading of cut slopes should be performed. When fill-over-cut slopes are to be graded, unless otherwise approved, the cut portion of the slope should be observed by the geotechnical consultant prior to placement of materials for construction of the fill portion of the slope. The geotechnical consultant should observe all cut slopes, and should be notified by the contractor when excavation of cut slopes commences.

If, during the course of grading, unforeseen adverse or potentially adverse geologic conditions are encountered, the geotechnical consultant should investigate, evaluate, and make appropriate recommendations for mitigation of these conditions. The need for cut slope buttressing or stabilizing should be based on in-grading evaluation by the geotechnical consultant, whether anticipated or not.

Unless otherwise specified in geotechnical and geological report(s), no cut slopes should be excavated higher or steeper than that allowed by the ordinances of controlling governmental agencies. Additionally, short-term stability of temporary cut slopes is the contractor's responsibility.

Erosion control and drainage devices should be designed by the project civil engineer and should be constructed in compliance with the ordinances of the controlling governmental agencies, or in accordance with the recommendations of the geotechnical consultant.

COMPLETION

Observation, testing, and consultation by the geotechnical consultant should be conducted during the grading operations in order to state an opinion that all cut and fill areas are graded in accordance with the approved project specifications. After completion of grading, and after the geotechnical consultant has finished observations of the work, final reports should be submitted, and may be subject to review by the controlling governmental agencies. No further excavation or filling should be undertaken without prior notification of the geotechnical consultant or approved plans.

All finished cut and fill slopes should be protected from erosion and be planted in accordance with the project specifications or as recommended by a landscape architect. Such protection and planning should be undertaken as soon as practical after completion of grading.

JOB SAFETY

General

At GSI, getting the job done safely is of primary concern. The following is the company's safety considerations for use by all employees on multi-employer construction sites. On-ground personnel are at highest risk of injury, and possible fatality, on grading and construction projects. GSI recognizes that construction activities will vary on each site, and that site safety is the prime responsibility of the contractor; however, everyone must be safety conscious and responsible at all times. To achieve our goal of avoiding accidents, cooperation between the client, the contractor, and GSI personnel must be maintained.

In an effort to minimize risks associated with geotechnical testing and observation, the following precautions are to be implemented for the safety of field personnel on grading and construction projects:

Safety Meetings: GSI field personnel are directed to attend contractor's regularly scheduled and documented safety meetings.

Safety Vests: Safety vests are provided for, and are to be worn by GSI personnel, at all times, when they are working in the field.

Safety Flags: Two safety flags are provided to GSI field technicians; one is to be affixed to the vehicle when on site, the other is to be placed atop the spoil pile on all test pits.

Flashing Lights: All vehicles stationary in the grading area shall use rotating or flashing amber beacons, or strobe lights, on the vehicle during all field testing. While operating a vehicle in the grading area, the emergency flasher on the vehicle shall be activated.

If the contractor's representative observes any of our personnel who do not follow the above, we request that it be brought to the attention of our office.

Test Pits Location, Orientation, and Clearance

The technician is responsible for selecting test pit locations. A primary concern should be the technician's safety. Efforts will be made to coordinate locations with the grading contractor's authorized representative, and to select locations following or behind the established traffic pattern, preferably outside of current traffic. The contractor's authorized representative (supervisor, grade checker, dump man, operator, etc.) should direct excavation of the pit and safety during the test period. Of paramount concern should be the soil technician's safety, and obtaining enough tests to represent the fill.

Test pits should be excavated so that the spoil pile is placed away from oncoming traffic, whenever possible. The technician's vehicle is to be placed next to the test pit, opposite the spoil pile. This necessitates the fill be maintained in a drivable condition. Alternatively, the contractor may wish to park a piece of equipment in front of the test holes, particularly in small fill areas or those with limited access.

A zone of non-encroachment should be established for all test pits. No grading equipment should enter this zone during the testing procedure. The zone should extend approximately 50 feet outward from the center of the test pit. This zone is established for safety and to avoid excessive ground vibration, which typically decreases test results.

When taking slope tests, the technician should park the vehicle directly above or below the test location. If this is not possible, a prominent flag should be placed at the top of the slope. The contractor's representative should effectively keep all equipment at a safe operational distance (e.g., 50 feet) away from the slope during this testing.

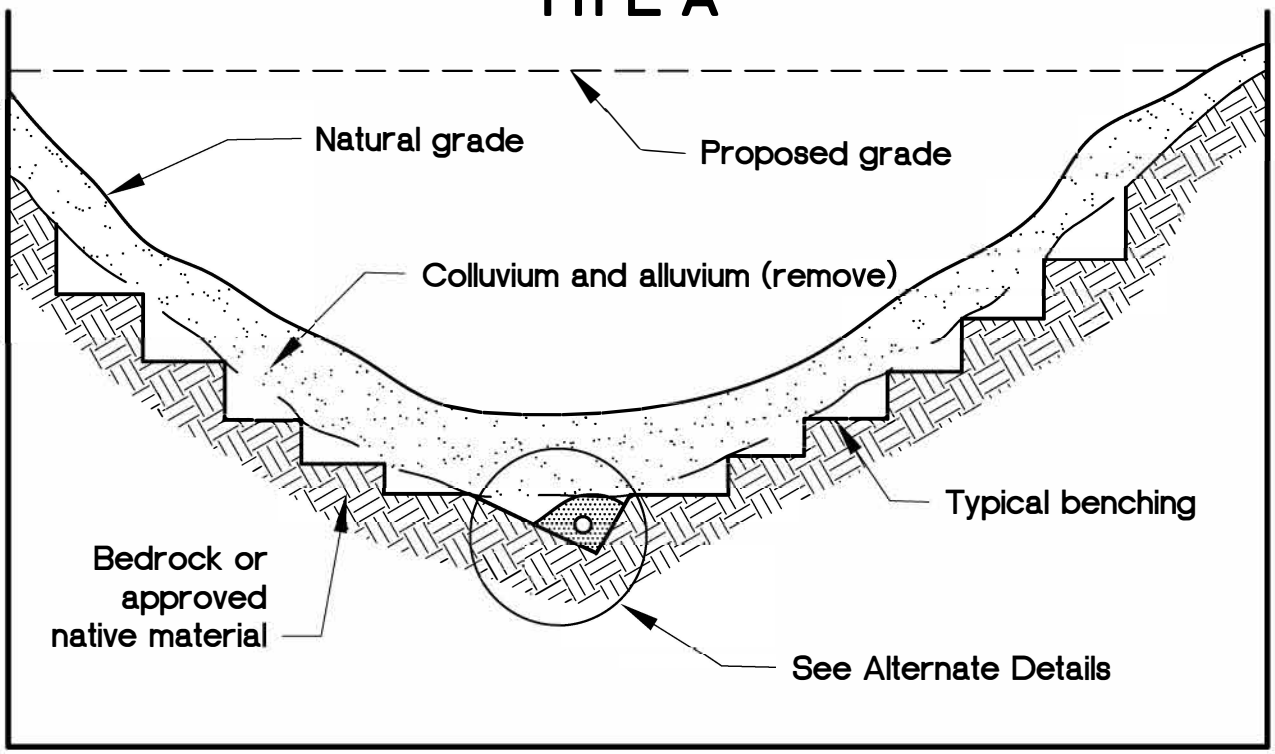
The technician is directed to withdraw from the active portion of the fill as soon as possible following testing. The technician's vehicle should be parked at the perimeter of the fill in a highly visible location, well away from the equipment traffic pattern. The contractor should inform our personnel of all changes to haul roads, cut and fill areas or other factors that may affect site access and site safety.

If the technician's safety is jeopardized or compromised because of the contractor's failure to comply with any of the above, the technician is required, by company policy, to immediately withdraw and notify his/her supervisor. The grading contractor's representative will be

contacted to affect a solution. However, in the interim, no further testing will be performed until the situation is rectified. Any fill placed can be considered unacceptable and subject to reprocessing, recompaction, or removal.

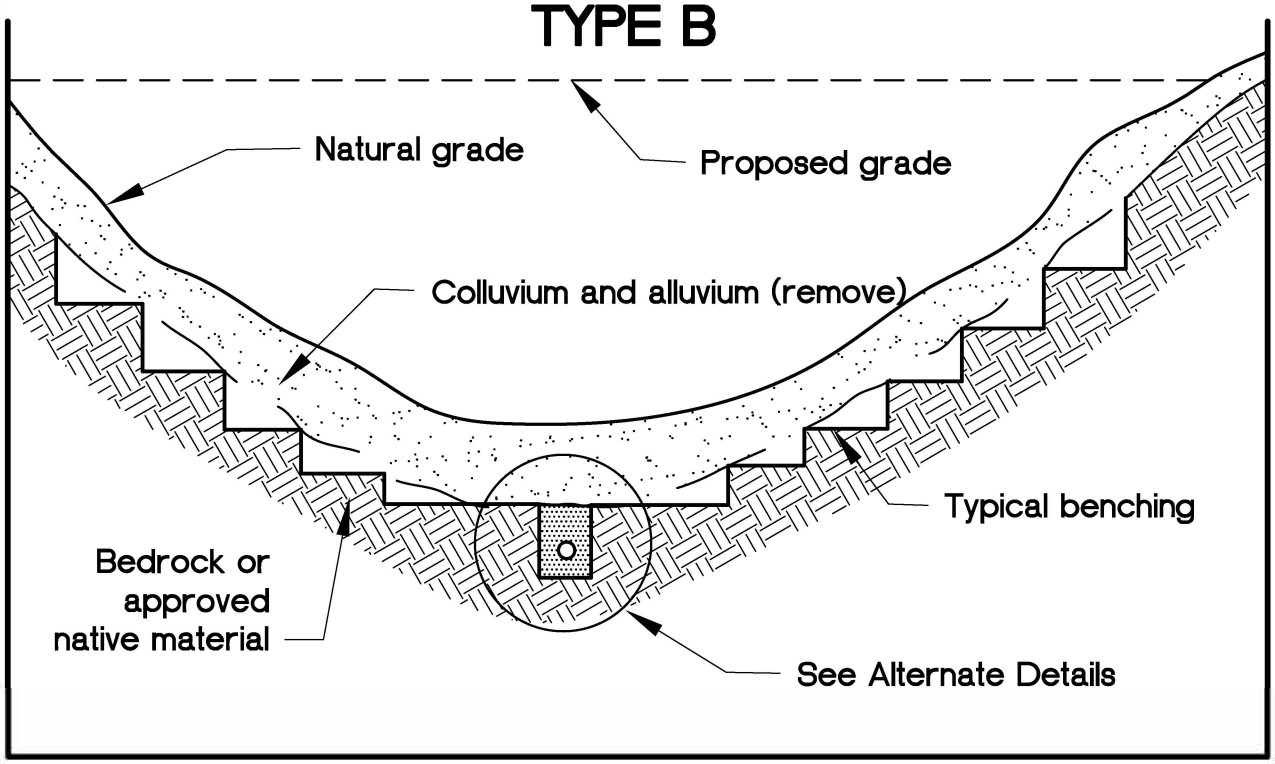
If the soil technician does not comply with the above or other established safety guidelines, we request that the contractor bring this to the technician's attention and notify this office. Effective communication and coordination between the contractor's representative and the soil technician is strongly encouraged to implement the above safety plan.

Trench and Vertical Excavation



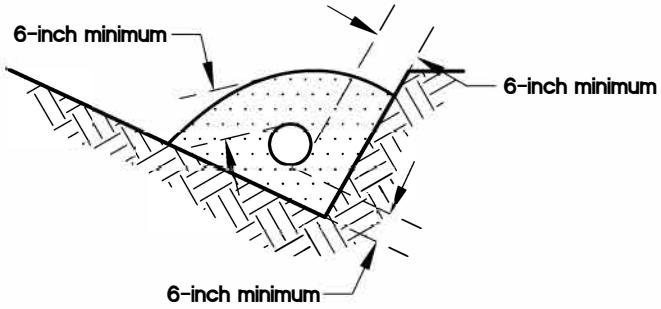
It is the contractor's responsibility to provide safe access into trenches where compaction testing is needed. Our personnel are directed not to enter any excavation or vertical cut which: 1) is 5 feet or deeper unless shored or laid back; 2) displays any evidence of instability, has any loose rock or other debris which could fall into the trench; or 3) displays any other evidence of any unsafe conditions regardless of depth.

All trench excavations or vertical cuts more than 5 feet deep, which any person enters, should be shored or laid back. Trench access should be provided in accordance with Cal/OSHA and/or state and local standards. Our personnel are directed not to enter any trench by being lowered or "riding down" on the equipment.

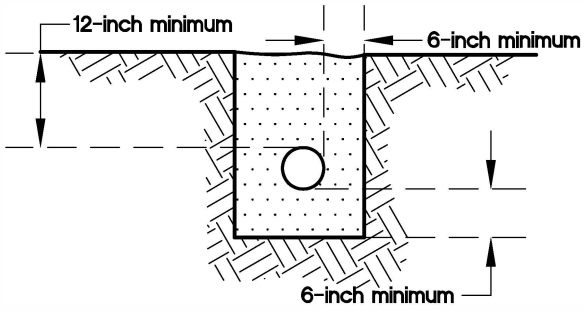


If the contractor fails to provide safe access to trenches for compaction testing, our company policy requires that the soil technician withdraw and notify his/her supervisor. The contractor's representative will be contacted to affect a solution. All backfill not tested due to safety concerns or other reasons could be subject to reprocessing and/or removal.

If GSI personnel become aware of anyone working beneath an unsafe trench wall or vertical excavation, we have a legal obligation to put the contractor and owner/developer on notice to immediately correct the situation. If corrective steps are not taken, GSI then has an obligation to notify Cal/OSHA and/or the proper controlling authorities.



TYPE A



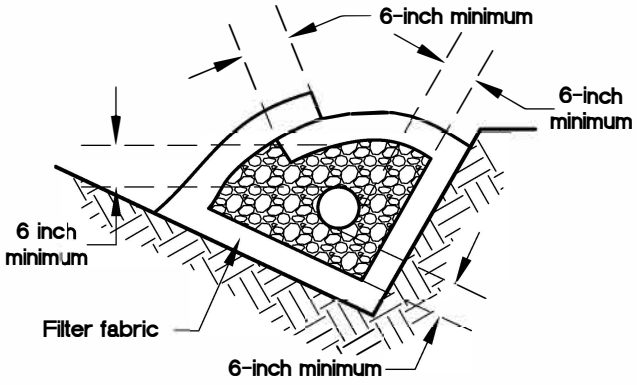
TYPE B

Selection of alternate subdrain details, location, and extent of subdrains should be evaluated by the geotechnical consultant during grading.

A-1

B-1

Filter material: Minimum volume of 9 cubic feet per lineal foot of pipe.



Perforated pipe: 6-inch-diameter ABS or PVC pipe or approved substitute with minimum 8 perforations (¼-inch diameter) per lineal foot in bottom half of pipe (ASTM D-2751, SDR-35, or ASTM D-1527, Schd. 40).

For continuous run in excess of 500 feet, use 8-inch-diameter pipe (ASTM D-3034, SDR-35, or ASTM D-1785, Schd. 40).

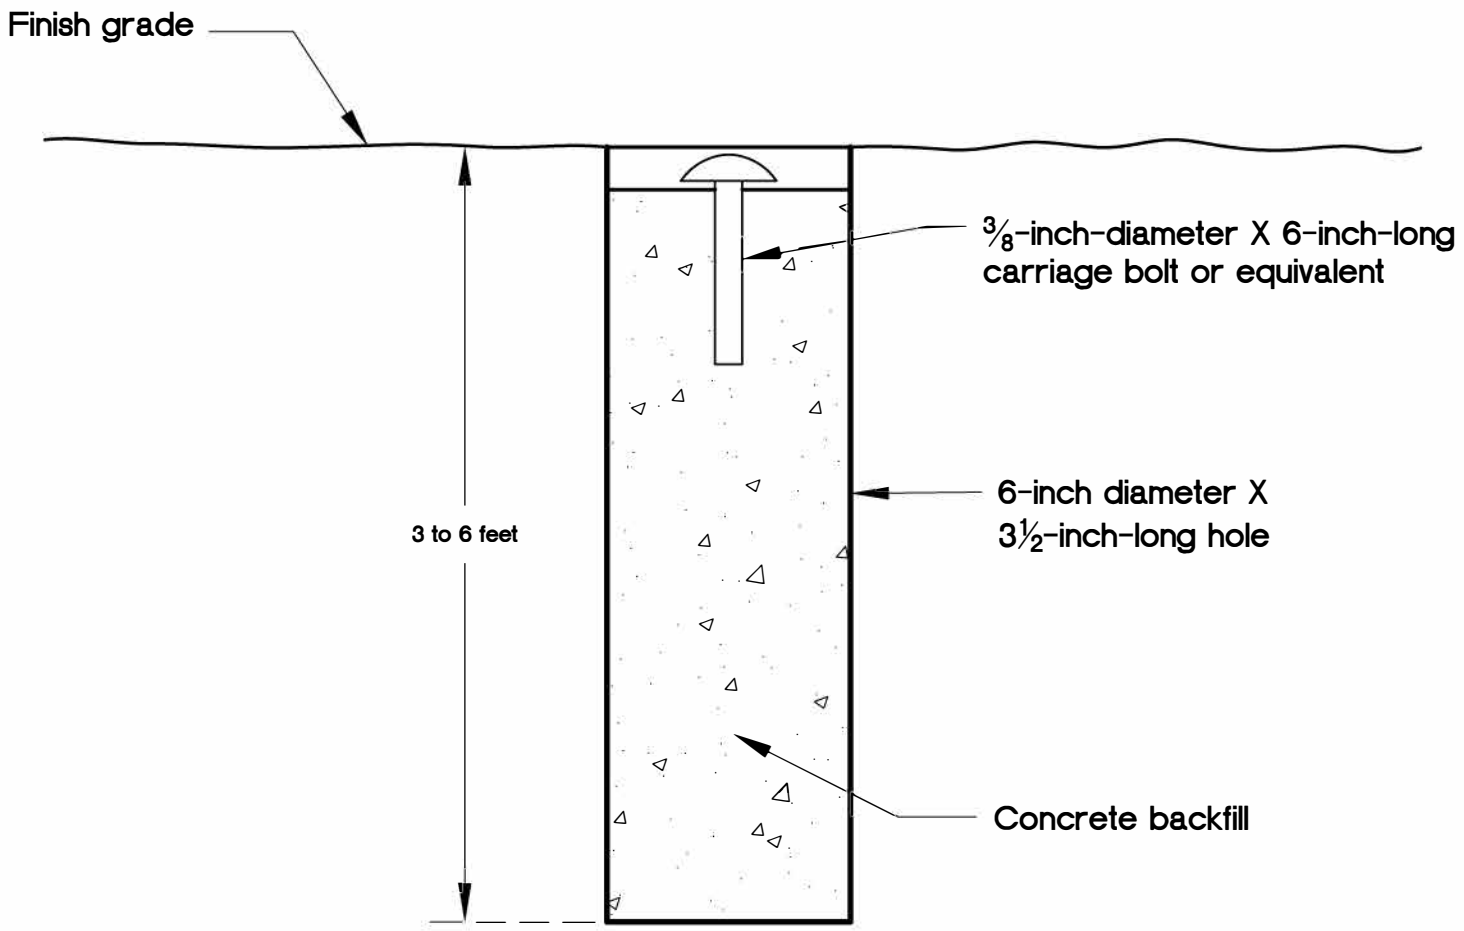
ROCK FALL MITIGATION DETAIL

Plate F-16



NOTES:

1. Locations of settlement plates should be clearly marked and readily visible (red flagged) to equipment operators.
2. Contractor should maintain clearance of a 5-foot radius of plate base and withiin 5 feet (vertical) for heavy equipment. Fill within clearance area should be hand compacted to project specifications or compacted by alternative approved method by the geotechnical consultant (in writing, prior to construction).
3. After 5 feet (vertical) of fill is in place, contractor should maintain a 5-foot radius equipment clearance from riser.
4. Place and mechanically hand compact initial 2 feet of fill prior to establishing the initial reading.
5. In the event of damage to the settlement plate or extension resulting from equipment operating within the specified clearance area, contractor should immediately notify the geotechnical consultant and should be responsible for restoring the settlement plates to working order.
6. An alternate design and method of installation may be provided at the discretion of the geotechnical consultant.

1.0 INTRODUCTION AND LOCATION

This paleontological resource assessment has been completed for the Bradley Gardens Project, located at 980 West 7th Street in the southern portion of the city of San Jacinto, Riverside County, California (Figures 1 and 2). The 2.98-acre project consists of one parcel (Assessor's Parcel Number [APN] 435-330-003) and is situated within Section 34, Township 4 South, Range 1 West, in the United States Geological Survey (USGS) *Lakeview, California* topographic quadrangle map (see Figure 2). The applicant proposes removal and/or modifications to the existing buildings within the parcel and the construction of a new care building with associated hardscape, landscape, and infrastructure.

As the lead agency, the City of San Jacinto has required the preparation of a paleontological assessment to evaluate the project's potential to yield paleontological resources. The paleontological assessment of the project included a review of paleontological literature and fossil locality records in the area; a review of the underlying geology; and recommendations to mitigate impacts to potential paleontological resources, if necessary.

2.0 REGULATORY SETTING

State of California

The California Environmental Quality Act (CEQA), which is patterned after the National Environmental Policy Act, is the overriding environmental regulation that sets the requirement for protecting California's paleontological resources. CEQA mandates that governing permitting agencies (lead agencies) set their own guidelines for the protection of nonrenewable paleontological resources under their jurisdiction.

Under "Guidelines for Implementation of the California Environmental Quality Act," as amended in December 2018 (California Code of Regulations [CCR] Title 14, Division 6, Chapter 3, Sections 15000 et seq.), procedures define the types of activities, persons, and public agencies required to comply with CEQA. Section 15063 of the CCR provides a process by which a lead agency may review a project's potential impact to the environment, whether the impacts are significant, and provide recommendations, if necessary.

Project Development Map
The Bradley Gardens Project

In CEQA's Environmental Checklist Form, a question to respond to is, "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (Appendix G, Section VII, Part f). This is to ensure compliance with California Public Resources Code Section 5097.5, the law that protects nonrenewable resources including fossils, which is paraphrased below:

a) A person shall not knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands.
b) As used in this section, "public lands" means lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof.
c) A violation of this section is a misdemeanor.

City of San Jacinto

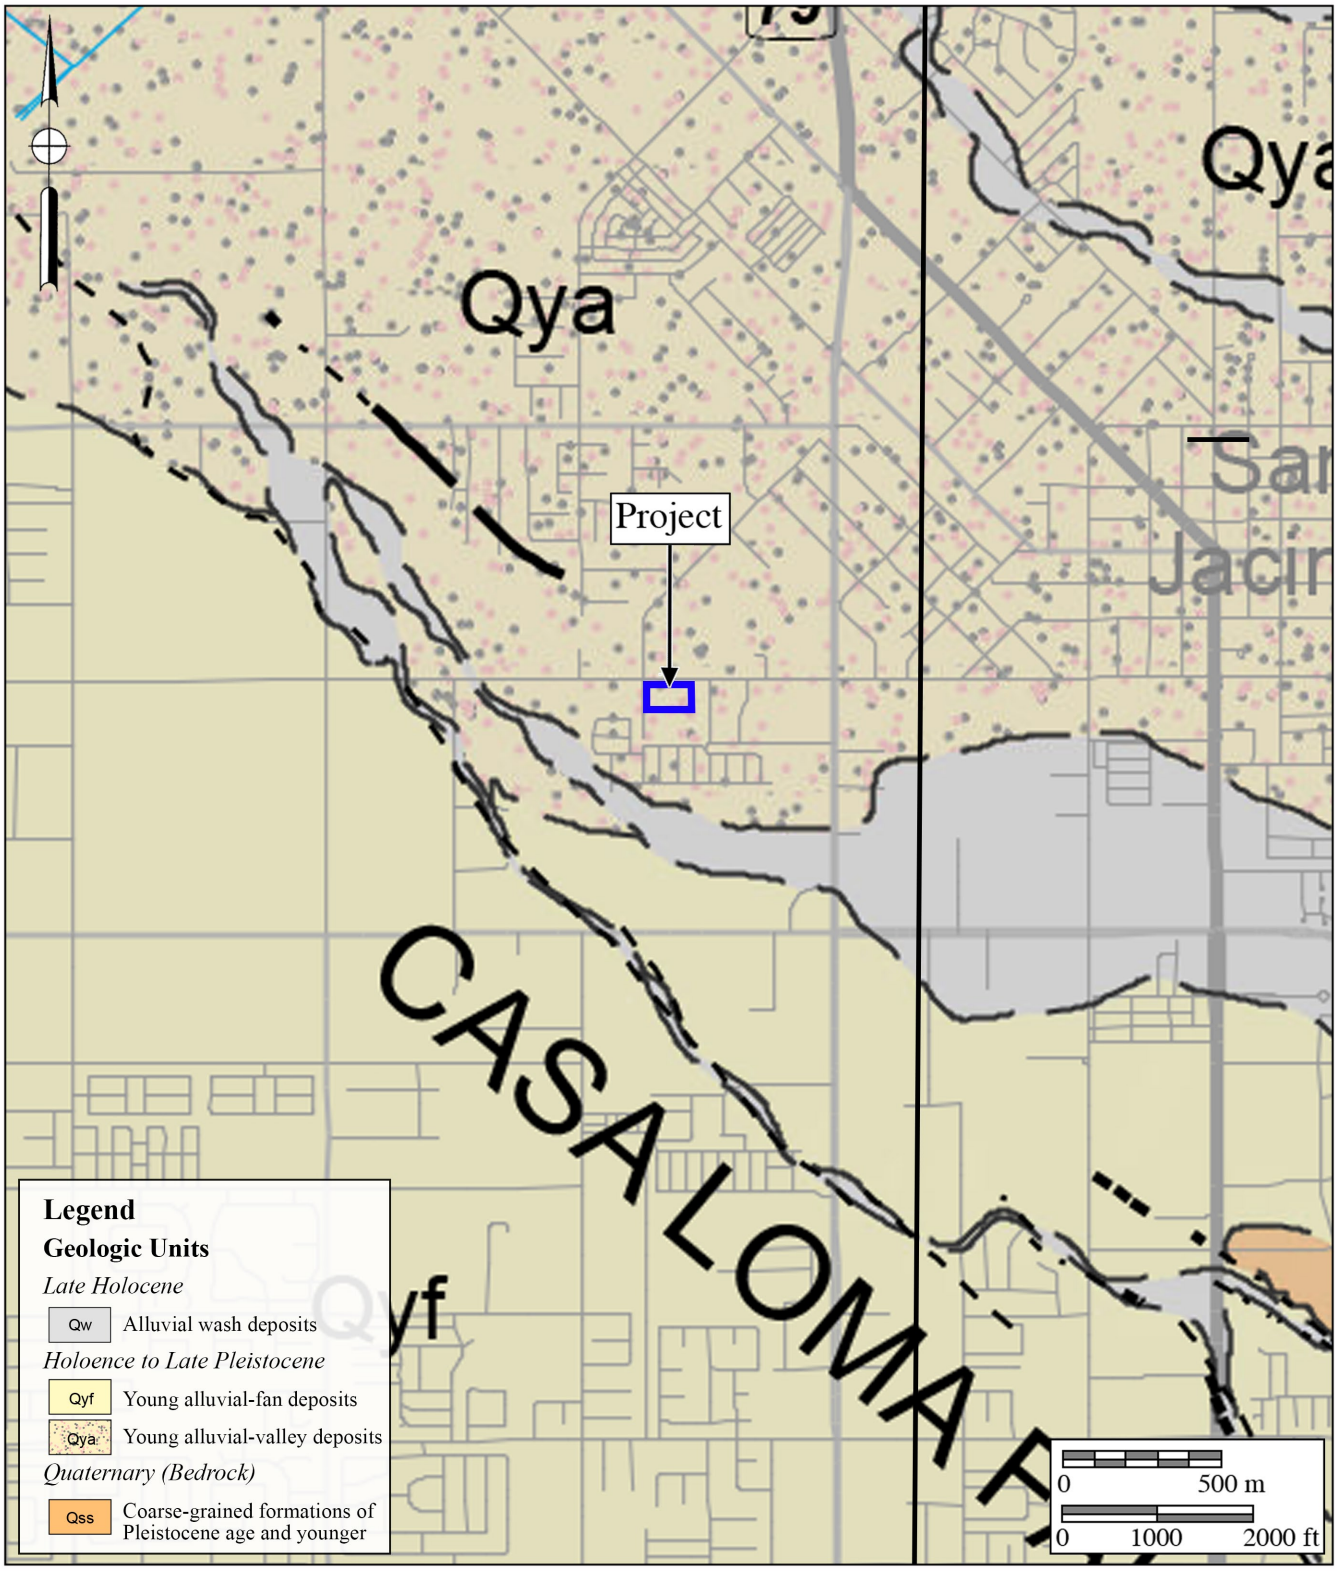
The 2022 Envision San Jacinto – General Plan 2040 addresses cultural resources in its Resource Management chapter. The City of San Jacinto's Final Environmental Impact Report (EIR) identifies an existing potential for earth disturbance activities to adversely impact significant paleontological resources (City of San Jacinto 2022). Policy Resource Management (RM) 3.1 Preservation serves to preserve paleontological resources, stating "Protect areas containing significant historic, archaeological, paleontological, and tribal cultural resources, as defined by the California Public Resources Code." In response, Action RM-3e, stated below and in the City's Draft EIR (De Novo Planning Group 2022), is provided to reduce adverse impacts to paleontological resources to a level below significant (City of San Jacinto 2022):

> The City shall require an assessment of the potential for development proposals to significantly impact paleontological resources pursuant to the California Environmental Quality Act Guidelines. If the project involves earthworks, the City may require a study conducted by a professional paleontologist to determine if paleontological assets are present, and if the project will significantly impact the resources. If significant impacts are identified, the City may require the project to be modified to avoid impacting the paleontological materials, require monitoring of rock units with high potential to contain significant nonrenewable paleontological resources, or require mitigation measures to mitigate the impacts, such as recovering the paleontological resources for preservation.

3.0 GEOLOGY

Regionally, the project lies within the San Jacinto Valley, east of the Lakeview Mountains. The surficial geology at the project is mapped as Holocene and late Pleistocene-aged young alluvial valley deposits (area colored pale olive-gray with dots labeled "Qya" on Figure 4, after Lancaster et al. 2012). These deposits are characterized as clay, silt, sand, and gravel along stream valleys and alluvial flats of larger rivers. Disturbed deposits likely overlie the undisturbed alluvial deposits.

4.0 PALEONTOLOGICAL RESOURCES



Definition

Paleontological resources are the remains of prehistoric life that have been preserved in geologic strata. These remains are called fossils and include bones, shells, teeth, and plant remains (including their impressions, casts, and molds) in the sedimentary matrix, as well as trace fossils such as footprints and burrows. Fossils are considered older than 5,000 years of age (Society of Vertebrate Paleontology 2025) but may include younger remains (subfossils) when viewed in the context of local extinction of the organism or habitat. Fossils are considered a nonrenewable resource under state and local guidelines (see Sections 2.0 and 5.0 of this report).

Paleontological Locality Records Search

A paleontological literature review and collections and locality records search was conducted for the project using records from prior Brian F. Smith and Associates, Inc., and BFSA Environmental Services, a Perennial Company (BFSA) projects, the Division of Geological Sciences at the San Bernardino County Museum (SBCM), the Los Angeles County Museum of Natural History, the San Diego Society of Natural History (SDSNH), and the Western Science Center (WSC), as well as data from published and unpublished paleontological literature (Jefferson 1991). The resulting locality records search did not identify any previously recorded fossil localities within the project boundaries.

The closest known fossil localities were recovered during mitigation monitoring for improvements at the Monte Vista Middle School, situated approximately one mile northeast of the project. The late Pleistocene fossils consisted of the shells of freshwater snails and the bones of frogs, snakes, lizards, and mammals, as well as the dental remains of rodents, including those of pocket gophers (*Thomomys* sp.) (SDSNH locality number 7971). This locality was recovered as a result of screenwashing about 400 pounds of fossiliferous sedimentary matrix consisting of pale olive siltstone, collected at approximately seven feet deep in an area mapped as young alluvial valley deposits. The deposits were interpreted as representing a fluvial overbank environment and are mapped within the same geologic unit by Lancaster et al. (2012) as the current project.

BFSA Environmental Services
A Perennial Company

Figure 4

Geologic Map

The Bradley Gardens Project

Geology after Lancaster et al. (2012)

Other fossil localities were discovered during mitigation monitoring for the construction of the Eastside Pipeline (De Novo Planning Group 2022), a little more than three miles west of the project. From WSC records, these Pleistocene vertebrate localities extend from Esplanade Avenue to as far south as Stetson Avenue and are situated within areas mapped as young alluvial valley deposits. Fossil specimens include rodents (*Thomomys* sp., *Dipodomys* sp.), camels (*Camelops* sp.), and more (Stoneburg 2024).

Approximately four miles south of the project, south of the Hemet-Ryan Airport off Warren Road, a locality consisting of the bones of an extinct horse and other unidentified large mammal remains were discovered during mitigation monitoring. Fossils were recovered from 10 places at the locality, at depths as little as a few feet below the surface, in an area mapped as young alluvial valley deposits (Kennedy 2006). These fossils are housed at the WSC. From similar deposits as the project, the closest SBCM localities are located at Lakeview Hot Springs near Lake Perris, and the nearest LACM locality is near the Lake Skinner reservoir.

Project Survey

BFSA staff, under the supervision of Principal Investigator Todd A. Wirths, M.S., P.G., conducted a project survey on February 6, 2026, employing a series of parallel survey transects spaced at approximately 15-meter intervals. The entire property was covered by the survey process. Approximately half of the area proposed for development had existing structures, with the remainder occurring as paved parking lots and graded dirt areas. The proposed development area was 100 percent disturbed. No paleontological resources, or evidence indicating the presence of paleontological resources, were identified as a result of the survey.

5.0 PALEONTOLOGICAL SENSITIVITY

Overview

The degree of paleontological sensitivity of any particular area is based upon a number of factors, including the documented presence of fossiliferous resources on a site or in nearby areas, the presence of documented fossils within a particular geologic formation or lithostratigraphic unit, and whether or not the original depositional environment of the sediments is one that might have been conducive to the accumulation of organic remains that may have become fossilized over time. Holocene alluvium is generally considered to be geologically too young to contain significant nonrenewable paleontological resources (*i.e.,* fossils) and is thus typically assigned a low paleontological sensitivity. Pleistocene (older than 11,700 years old) alluvial and alluvial fan deposits in the Inland Empire and western Riverside County, however, are known to yield important terrestrial vertebrate fossils, such as extinct mammoths, mastodons, giant ground sloths, extinct species of horse, bison, camel, saber-toothed cats, and others (Jefferson 1991). These Pleistocene sediments are accorded a high paleontological resource sensitivity.

Professional Standards

The Society of Vertebrate Paleontology (2025) has put forth the guideline criteria, a "Fossil Prediction Map System" (FPMS), which include six categories of paleontological sensitivity for geologic units (formations) that might be impacted by a proposed project, as listed below:

- *5 = Very High Potential:* Highly fossiliferous geologic units that consistently and predictably preserve scientifically significant fossils.
- *4 = High Potential:* Highly fossiliferous geologic units that preserve scientifically significant fossils, but their concentrations vary and are less predictable than 5.
- *3 = Moderate Potential:* Fossiliferous geologic units that are often marine in origin and in which fossils may be common, but scientifically significant fossils are isolated or sparse.
- *2 = Low Potential:* Geologic units that are not likely to preserve fossils, including sedimentary deposits that are generally younger than 11,700 years before present, older sedimentary units that only rarely preserve fossils, or units that exhibit physical and chemical alteration (diagenetic changes) that make fossil preservation unlikely.
- *1 = Very Low Potential:* Geologic units that are not likely to contain recognizable fossils including Precambrian units and units that are igneous or metamorphic, excluding air-fall and reworked volcanic ash.
- *U = Undetermined Potential:* Geologic units that cannot be assigned an informed FPMS designation. This includes units that have not been subject to prior field surveys but that contain lithologies or preserve depositional settings that are known to be conducive to fossil preservation, units that have not been published in the scientific literature, and units in which reports of fossils have not been verified.

Using these criteria, and based upon the distribution of nearby fossil localities, surficial fill and Holocene alluvial deposits at the project have a low potential to yield significant paleontological resources. The underlying Pleistocene young alluvial deposits may be considered to have a high potential to yield significant paleontological resources. The depth of age transition from Holocene to Pleistocene within the alluvial deposits at the project is unknown.

City of San Jacinto Sensitivity Assessment

The surficial alluvial deposits at the project are regarded by the City of San Jacinto as having a low potential to contain paleontological resources; however, the potential increases to high with (an unspecified) depth, in accordance with their increasing (verging into Pleistocene) age (De Novo Planning Group 2022:5.7–5.16).

6.0 CONCLUSION AND RECOMMENDATIONS

Research has confirmed the existence of potentially fossiliferous Pleistocene alluvial deposits that underlie Holocene deposits at the project. The occurrence of terrestrial vertebrate fossils from Pleistocene-aged alluvial deposits in western Riverside County and San Jacinto is well documented. The high paleontological sensitivity rating assigned to this formation for yielding paleontological resources supports the recommendation that paleontological monitoring be implemented during mass grading and excavation activities within these deposits to mitigate any adverse impacts (loss or destruction) to potential nonrenewable paleontological resources. Since the younger deposits are likely very thin at the surface, full-time monitoring at the project is warranted starting at three feet deep below the current surface. Monitoring disturbed soils or artificial fill deposits is not recommended.

A Paleontological Resource Impact Mitigation Program (PRIMP) with the recommended mitigation monitoring procedures at the project is outlined below. When implemented, this PRIMP would reduce potential impacts to paleontological resources to a level below significant.

Suggested PRIMP

1. All mitigation programs should be performed by a qualified professional (project) paleontologist, defined as an individual with a master's or doctorate in paleontology or geology, who has proven experience in paleontology and is knowledgeable in professional paleontological procedures and techniques. Fieldwork may be conducted by a qualified paleontological monitor, defined as an individual who has experience in the collection and salvage of fossil materials. The paleontological monitor shall always work under the direction of a qualified paleontologist.
2. Monitoring of mass grading and excavation activities shall be performed by a qualified paleontologist or paleontological monitor. Full-time monitoring for paleontological resources from three feet deep below the surface will be conducted in areas where grading, excavation, or drilling activities occur in undisturbed alluvium to mitigate any adverse impacts (loss or destruction) to potential nonrenewable paleontological resources. The duration and frequency of monitoring may be altered at the discretion of the project paleontologist based upon geologic conditions encountered. Monitoring is not warranted in disturbed soils, such as artificial fill, or in crystalline bedrock formations, should they become exposed.
3. Paleontological monitors will be equipped to salvage fossils as they are unearthed to avoid construction delays and to remove samples of sediment that are likely to contain the remains of small fossil invertebrates and vertebrates. The monitor must be empowered to temporarily halt or divert equipment to allow for the removal of abundant or large specimens in a timely manner. The monitor shall notify the project paleontologist, who will then notify the concerned parties of the discovery.

Monitoring may be reduced if the potentially fossiliferous units are not present in the subsurface or, if they are present, are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources.

4. In accordance with the "Microfossil Salvage" section of the Society of Vertebrate Paleontology guidelines (2025), bulk sampling and screening of fine-grained sedimentary deposits (including carbonate-rich paleosols) must be performed if the deposits are identified to possess indications of producing fossil "microvertebrates" to test the feasibility of the deposit to yield fossil bones and teeth. If indicators of potential microvertebrate fossils are found, screening of a test sample (approximately 600 pounds) is recommended, according to the Society of Vertebrate Paleontology guidelines. If feasible, wet screening shall be conducted on-site. If screening yields significant fossils, removing and processing a "standard sample" of 6,000 pounds shall be performed.
5. Preparation of recovered specimens to a point of identification and permanent preservation will be conducted, including screen washing sediments to recover small vertebrates and invertebrates if indicated by the results of test sampling.
6. All fossils must be deposited in an accredited institution (university or museum) that maintains collections of paleontological materials. The Western Science Center in Hemet, California, is the preferred institution for fossils recovered within the County of Riverside. All costs of the paleontological monitoring and mitigation program, including any one-time charges by the receiving institution, are the responsibility of the developer.
7. Preparation of a final monitoring and mitigation report of findings and significance will be completed, including lists of all fossils recovered and necessary maps and graphics to accurately record their original location(s). A letter documenting receipt and acceptance of all fossil collections by the receiving institution must be included in the final report. The report, when submitted to and accepted by the appropriate lead agency (*e.g.,* the City of San Jacinto), will signify satisfactory completion of the project program to mitigate impacts to any nonrenewable paleontological resources.

7.0 CERTIFICATION

I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this paleontological report, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief and have been compiled in accordance with CEQA criteria.

Subject: **Phase I Environmental Site Assessment**
Bradley Gardens
980 W 7th St
San Jacinto, California 92582
Partner Project No. 25-560235.1

Dear Erin Gallagher,

Partner Engineering and Science, Inc. (Partner) is pleased to provide this Phase I Environmental Site Assessment (Phase I ESA) report of the abovementioned address (the "subject property"). This assessment was performed in conformance with the scope and limitations as detailed in the ASTM Practice E1527-21 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process and Client Agreement.

This assessment included a site reconnaissance as well as research and interviews with representatives of the public, property ownership, site manager, and regulatory agencies. An assessment was made, conclusions stated, and recommendations outlined.

We appreciate your trust in Partner and the opportunity to provide environmental services to you. If you have any questions concerning this report, or if we can assist you in any other matter, please contact me at (619) 925-9672 or at MLambson@partneresi.com.

Sincerely,

Mark Lambson
Principal

EXECUTIVE SUMMARY

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in accordance with the scope of work and limitations of ASTM Practice E1527-21, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) and set forth by EPD Solutions for the property located at 980 W 7th St in San Jacinto, Riverside County, California (the "subject property"). The Phase I Environmental Site Assessment is designed to provide EPD Solutions with an assessment concerning environmental conditions (limited to those issues identified in the report) as they exist at the subject property.

Property Description

The subject property is located on the southeast corner of the intersection of West 7th Street and South Grand Avenue within a residential and light industrial area of Riverside County, California. Please refer to the table below for a further description of the subject property:

SUBJECT PROPERTY DATA

Address(es):	980 W 7th St, San Jacinto, California
Additional Current Address(es):	None Identified
Historical Address(es):	39241 West 7th Street
Property Use:	Inpatient Rehabilitation
Land Acreage (Ac):	2.98
Number of Buildings:	Four
Number of Floors:	Building A through D: One
Gross Building Area (SF):	18,411
Net Rentable Area (SF):	18,411
Date of Construction:	Buildings A, C, and D: 1964; Building B: 1971
Parcel Number:	435-330-003
Type of Construction:	Concrete slab-on-grade foundations with wood framed stucco finished walls and a pitched asphalt shingle roofs
Current Tenants:	The Bradley Gardens Rehabilitation Center
Site Assessment Performed By:	James Erwin of Partner
Site Assessment Conducted On:	February 6, 2026
Regulatory Radius Report Date:	February 2, 2026
Lien Search Date:	N/A
Report Date:	February 23, 2026
FOIAs Date:	February 2026
Groundwater Flow Direction (Inferred):	Northwest

Estimated Depth to Groundwater (Feet bgs):	Approximately 170 to 175

The subject property is currently occupied by Bradley Gardens Rehabilitation Center. Onsite operations consist of commercial inpatient rehabilitation and convalescent care, food preparation, administrative office operations, and routine property maintenance activities. In addition to the current structures, the subject property is also improved with asphalt-paved parking areas, associated landscaping, and perimeter fencing.

According to available historical sources, the subject property was formerly undeveloped as early as 1938; developed with three of the current commercial structures circa 1964; and developed with the remaining structure (Building B) by 1971. Tenants on the subject property have included Colonial Nursing Home (1964); Colonial Convalescent Hospital (1974-1996); and Bradley Gardens Convalescent Center (2001-Present).

The adjoining properties are tabulated below:

ADJOINING PROPERTIES

Direction	Land Use/Occupant
North:	West 7th Street beyond which is Talley Metal Fabrication (911-989 West 7th Street)
East:	Vacant land (APNs: 435-330-005, 435-330-006)
South:	Vacant land (APNs: 435-330-004)
Southwest:	South Grand Avenue beyond which is the Parkview Estates Mobile Home Park (913 South Grand Avenue)
West:	South Grand Avenue beyond which is vacant land (APN: 435-320-001)
Northwest:	South Grand Avenue beyond which is a single-family residential structure (1011 West 7th Street)

Findings and Opinions

Recognized Environmental Condition

A recognized environmental condition (REC) refers to the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

Controlled Recognized Environmental Condition

A controlled recognized environmental condition (CREC) refers to a REC affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, activity and use limitations or other property use limitations).

- Partner did not identify any CRECs during the course of this assessment.

Historical Recognized Environmental Condition

A historical recognized environmental condition (HREC) refers to a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations).

- Partner did not identify any HRECs during the course of this assessment.

Business Environmental Risk

A Business Environmental Risk (BER) is a risk which can have a material environmental or environmentally driven impact on the business associated with the current or planned use of commercial real estate, not necessarily related to those environmental issues required to be investigated in this practice. The following was identified during the course of this assessment:

- Due to the age of the subject property buildings, there is a potential that asbestos-containing material (ACM) and/or lead-based paint (LBP) are present. Should these materials be replaced, the identified suspect ACMs would need to be sampled to confirm the presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants. Building D is slated for demolition and redevelopment, and as such should have ACM and LBP sampling and testing conducted prior to demolition activities.

Significant Data Gaps

No significant data gaps affecting the ability of the Environmental Professional to identify a REC were encountered during this assessment.

Conclusions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-21 of 980 W 7th St in San Jacinto, Riverside County, California (the “subject property”). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs, CRECs, or HRECs in connection with the subject property; however, a BER was identified. Based on the conclusions of this assessment, Partner recommends the following:

- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs and LBP located at the subject property.

1.0 INTRODUCTION

Partner Engineering and Science, Inc. (Partner) has performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Practice E1527-21 and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312) for the property located at 980 W 7th St in San Jacinto, Riverside County, California (the "subject property"). Any exceptions to, or deletions from, this scope of work are described in the report.

1.1 Purpose

The purpose of this ESA is to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard E1527-21) affecting the subject property that: 1) constitute or result in a material violation or a potential material violation of any applicable environmental law; 2) impose any material constraints on the operation of the subject property or require a material change in the use thereof; 3) require clean-up, remedial action or other response with respect to Hazardous Substances or Petroleum Products on or affecting the subject property under any applicable environmental law; 4) may affect the value of the subject property; and 5) may require specific actions to be performed with regard to such conditions and circumstances. The information contained in the ESA Report will be used by Client to: 1) evaluate its legal and financial liabilities for transactions related to foreclosure, purchase, sale, loan origination, loan workout or seller financing; 2) evaluate the subject property's overall development potential, the associated market value and the impact of applicable laws that restrict financial and other types of assistance for the future development of the subject property; and/or 3) determine whether specific actions are required to be performed prior to the foreclosure, purchase, sale, loan origination, loan workout or seller financing of the subject property.

This ESA was performed to permit the User to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "landowner liability protections," or "LLPs"). ASTM Standard E1527-21 constitutes "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B).

1.2 Scope of Work

The scope of work for this ESA is in accordance with and to the extent necessary to achieve the goal of the requirements set forth in the ASTM Standard E1527-21. This assessment included: 1) a property and adjoining site reconnaissance; 2) interviews with key personnel; 3) a review of historical sources; 4) a review of regulatory agency records; and 5) a review of a regulatory database report provided by a third-party vendor. Partner contacted local agencies, such as environmental health departments, fire departments and building departments to obtain readily ascertainable information to determine any current and/or former hazardous substances usage, storage and/or releases of hazardous substances on the subject property. Additionally, Partner researched readily available information on the presence of activity and use limitations (AULs) at these agencies. As defined by ASTM E1527-21, AULs include both legal (that is, institutional) and physical (that is, engineering) controls that may include legal or physical restrictions or limitations on the use of, or access to, a site or facility: 1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil, soil vapor, groundwater, or surface water on the subject property; or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls (IC/ECs), are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil, soil vapor, groundwater, and/or surface water on a property.

If requested by Client, this report may also include the identification, discussion of, and/or limited sampling of asbestos-containing materials (ACMs), lead-based paint (LBP), mold, and/or radon.

1.3 Limitations

Partner warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an ESA of a property for the purpose of identifying recognized environmental conditions. There is a possibility that even with the proper application of these methodologies there may exist on the subject property conditions that could not be identified within the scope of the assessment or which were not reasonably identifiable from the available information. Partner believes that the information obtained from the record review and the interviews concerning the subject property is reliable. However, Partner cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete. The conclusions and findings set forth in this report are strictly limited in time and scope to the date of the evaluations. The conclusions presented in the report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed-upon services or the time and budgeting restraints imposed by the Client. No other warranties are implied or expressed.

Some of the information provided in this report is based upon personal interviews, and research of available documents, records, and maps held by the appropriate government and private agencies. This report is subject to the limitations of historical documentation, availability, and accuracy of pertinent records, and the personal recollections of those persons contacted.

This practice does not address requirements of any state or local laws or of any federal laws other than the all appropriate inquiry provisions of the LLPs. Further, this report does not intend to address all of the compliance and safety concerns, if any, associated with the subject property.

Environmental concerns, which are beyond the scope of a Phase I ESA as defined by ASTM include the following: ACMs, LBP, radon, and lead in drinking water. These issues may affect environmental risk at the subject property and may warrant discussion and/or assessment; however, are considered non-scope issues. If specifically requested by the Client, these non-scope issues are discussed in Section 6.3.

1.4 User Reliance

EPD Solutions (herein referred to as Client) engaged Partner to perform this assessment in accordance with an agreement governing the nature, scope and purpose of the work as well as other matters critical to the engagement. All reports, both verbal and written, are for the sole use and benefit of Client. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with Partner granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against Partner, its officers, employees, vendors, successors or assigns. Any such unauthorized user shall be responsible to protect, indemnify and hold Partner, Client and their respective officers, employees, vendors, successors and assigns harmless from any and all claims, damages, losses, liabilities, expenses (including reasonable attorneys' fees) and costs attributable to such Use. Unauthorized use of this report shall constitute acceptance of and commitment to these responsibilities, which shall be irrevocable and shall apply regardless of the cause of action or legal theory pled or asserted. Additional legal penalties may apply.

This report has been completed under specific Terms and Conditions relating to scope, relying parties, limitations of liability, indemnification, dispute resolution, and other factors relevant to any reliance on this report. Any parties relying on this report do so having accepted the Terms and Conditions for which this report was completed. A copy of Partner's standard Terms and Conditions can be found at http://www.partneresi.com/terms-and-conditions.php.

1.5 Limiting Conditions

The findings and conclusions contain all the limitations inherent in these methodologies that are referred to in ASTM Practice E1527-21.

Specific limitations and exceptions to this ESA are more specifically set forth below:

- Interviews with past or current owners, operators and occupants were not reasonably ascertainable and thus constitute a data gap. Based on information obtained from other historical sources, this data gap is not expected to alter the findings of this assessment.
- Partner requested information relative to deed restrictions and environmental liens, a title search, and completion of the AAI User Questionnaire from the Report User. This information was not provided at the time of the assessment. This data gap is not expected to alter the findings of this assessment.
- Partner was unable to determine the property use at 5-year intervals when the use of the subject property changed, which constitutes a data gap. Partner reviewed all standard historical sources and conducted appropriate interviews. This data gap is not expected to alter the findings of this assessment.
- Partner observed approximately 90% of all interior units and all common areas. Based on the size and nature of use of the unobserved patient rooms within Building A, this limited method of observation is not expected to alter the overall findings of this assessment.

2.0 SITE DESCRIPTION

2.1 Site Location and Legal Description

The subject property at 980 W 7th St in San Jacinto, California is located on the southeast corner of the intersection of West 7th Street and South Grand Avenue. According to the Riverside County Assessor (RCA), the subject property is legally described as 2.98 ACRES M/L IN POR LOT 13 AND LOT 14 MB 009/410 SD ESTUDILLO LAND & WATER CO ADD Lot 13 SubdivisionName ESTUDILLO LAND & WATER CO ADD Acres 002.98 M/L LotType Lot RecMapType Map Book RecordedCOCode SD MapPlatB 009 MapPlatP 410 PortionLot Portion Lot 14 LotType Lot. According to the RCA and Environmental Risk Information Services (ERIS), ownership is currently vested in Real San Jacinto Estate since 2024.

Please refer to Figure 1: Site Location Map, Figure 2: Site Plan, Figure 3: Topographic Map, and Appendix A: Site Photographs for the location and site characteristics of the subject property.

2.2 Current Property Use

The subject property is currently occupied by Bradley Gardens Rehabilitation Center. Onsite operations consist of commercial inpatient rehabilitation and convalescent care, food preparation, administrative office operations, and routine property maintenance activities. The subject property consists of a one-story impatient rehabilitation building (Building A), a one-story administrative office and storage building (Building B), a one-story maintenance and storage building (Building C), and a one-story vacant office building (Building D). . In addition to the current structures, the subject property is also improved with asphalt-paved parking areas, associated landscaping, and perimeter fencing.

The subject property is designated IL for Light Industrial development by the City of San Jacinto Planning Department

2.3 Current Use of Adjoining Properties

The subject property is located within a residential and light industrial area of Riverside County, California. During the vicinity reconnaissance, Partner observed the land uses on adjoining properties as defined in ASTM Practice E1527-21 as any real property or properties the border of which is contiguous or partially contiguous with that of the property, or that would be contiguous or partially contiguous with that of the property but for a street, road, or other public thoroughfare separating them. The adjoining properties are tabulated below:

ADJOINING PROPERTIES

Direction	Land Use/Occupant
North:	West 7th Street beyond which is Talley Metal Fabrication (911-989 West 7th Street)
East:	Vacant land (APNs: 435-330-005, 435-330-006)
South:	Vacant land (APNs: 435-330-004)
Southwest:	South Grand Avenue beyond which is the Parkview Estates Mobile Home Park (913 South Grand Avenue)
West:	South Grand Avenue beyond which is vacant land (APN: 435-320-001)
Northwest:	South Grand Avenue beyond which is a single-family residential structure (1011 West 7th Street)

2.4 Physical Setting Sources

2.4.1 Topography

TOPOGRAPHIC DATA SUMMARY

Quadrangle Year:	2021
Quadrangle Name:	San Jacinto, California
Source:	USGS 7.5 Minute Topographic Map
Elevation (Feet):	Approximately 1,528
Slope Direction:	.
Slope Degree:	Relatively flat

A copy of the most recent topographic map is included as Figure 3 of this report.

2.4.2 Hydrology

While under natural and undisturbed conditions shallow groundwater flow most frequently follows the topography of the land surface, natural or man-made features can affect flow direction, and the presumed flow may not match the actual flow directions at the subject property and vicinity.

HYDROLOGY DATA SUMMARY

Groundwater Flow Direction:	Northwest
Groundwater Flow Source:	Topographic map interpretation
Estimated Depth to Groundwater (Feet bgs):	Approximately 170 to 175
Estimated Depth Source:	A previous subsurface investigation conducted on a nearby property (GeoTracker Global ID T0606500201) and California Department of Water Resources (CDWR) Water Data Library (WDL) groundwater level data for well 10336 located 0.32 miles south of the subject property.
Closest Body of Surface Water Name:	San Jacinto Reservoir
Closest Body of Surface Water Distance (Miles):	Approximately 1.5
Closest Body of Surface Water Direction:	Northwest
Water System Operator:	Eastern Municipal Water District (EMWD)
Shallow Groundwater Use:	Used for domestic purposes

HYDROLOGY DATA SUMMARY

Source of Drinking Water:	Groundwater from the wells in the San Jacinto Upper Pressure Basin , which is balanced by recharge of surface water at percolation sites and water imported from the Colorado River via the State Water Project.

2.4.3 Geology/Soils

GEOLOGY AND SOIL DATA SUMMARY

Physiographic Province:	The subject property is located in the San Jacinto Valley, within the Perris Plain of the Peninsular Range Geomorphic Province of California. The San Jacinto Valley is fault-bound by sections of the San Jacinto Fault Zone including the Claremont Fault to the north, and the Casa Loma Fault to the South. The valley consists of a broad alluvial trough down-dropped by the Claremont and Casa Loma faults with approximately 1,000 feet of sedimentary fill derived from the San Jacinto River and it's tributaries.
Geologic Unit Description:	The uppermost geologic formation underlying the soils at the subject property is the Pleistocene to Holocene Age Quaternary alluvium and marine deposits formation. The primary rock in this formation is coarse-detrital and consists of both unconsolidated and semi-consolidated alluvium, lake, playa, and terrace deposits.
Geologic Data Source:	United States Department of Agriculture (USDA) Natural Resources Conservation Service Web Soil Survey
Soil Series Name:	Grangeville fine sandy loam, saline-alkali (GvB); Grangeville sandy loam, sandy substratum (GrB)
Soil Series Description:	Grangeville fine sandy loam, saline-alkali (GvB)is somewhat poorly drained, has slopes of 0 to 5 percent, with a parent material of alluvium derived from granite, and typically found on alluvial fans. Grangeville sandy loam, sandy substratum (GrB) is moderately well drained, with a parent material of alluvium derived from granite, and typically found on alluvial fans.

2.4.4 Flood Zone Information

FLOOD ZONE DATA SUMMARY

Source:	FEMA

FLOOD ZONE DATA SUMMARY

Community Panel No.	06035C1488H
FIRM Date:	April 19, 2017
Zone Designation:	Zone X (shaded); defined as moderate risk areas within the 0.2-percent-annual-chance floodplain, areas of 1-percent-annual-chance flooding where average depths are less than 1 foot, areas of 1-percent-annual-chance flooding where the contributing drainage area is less than 1 square mile, and areas protected from the 1-percent-annual-chance flood by a levee.

A copy of the reviewed flood map is included in Appendix B of this report.

3.0 HISTORICAL INFORMATION

Partner obtained historical use information about the subject property from a variety of sources. A chronological listing of the historical data found is summarized in the table below:

HISTORICAL USE INFORMATION

Years	Resource	Description/Use
1938-1962	Aerial Photographs, Topographic Maps	Vacant and/or undeveloped
1964-Present	Aerial Photographs, Assessor Records, City Directories, Topographic Maps, Onsite Observations	Commercial; tenants include Colonial Nursing Home (1964), Colonial Convalescent Hospital (1974-1996), and Bradley Gardens Convalescent Center (2001-Present)

Tenants on the subject property have included Colonial Nursing Home (1964); Colonial Convalescent Hospital (1974-1996); and Bradley Gardens Convalescent Center (2001-Present).

No potential environmental concerns were identified in association with the current or former use of the subject property.

3.1 Aerial Photograph Review

Partner obtained available aerial photographs of the subject property and surrounding area from ERIS on February 3, 2026. The inferred uses of the subject property and adjoining properties as interpreted from the aerial photographs in Appendix B are tabulated below:

Date: **1938**		Scale: 1"=500'
Subject Property:	Appears to be unimproved grassland	
North:	Appears to be unimproved grassland beyond a roadway	
East:	Appears to be unimproved grassland	
South:	Appears to be unimproved grassland	
Southwest:	Appears to be unimproved grassland beyond an unimproved roadway	
West:	Appears to be unimproved grassland beyond an unimproved roadway	
Northwest:	Appears to be unimproved grassland beyond a roadway	

Date: **1949**		Scale: 1”=500’
Subject Property:	No significant changes visible	
North:	No significant changes visible	
East:	Appears to be agricultural land developed with a rural residential structure	
South:	Appears to be agricultural land	
Southwest:	Appears to be agricultural land	

West:	Appears to be agricultural land
Northwest:	Appears to be agricultural land developed with a rural residential structure

Date:	**1953, 1962**	Scale:	1”=500’
Subject Property:	No significant changes visible		
North:	Appears to be agricultural land developed with rural residential structures		
East:	No significant changes visible		
South:	No significant changes visible		
Southwest:	No significant changes visible		
West:	No significant changes visible		
Northwest:	No significant changes visible		

Date:	**1972, 1980**	Scale:	1”=500’
Subject Property:	Appears to be developed with the four existing commercial structures		
North:	Appears to be developed with several residential structures and a commercial structure		
East:	Appears to be developed with a residential structure		
South:	No significant changes visible		
Southwest:	No significant changes visible		
West:	No significant changes visible		
Northwest:	Appears to be developed with residential structures beyond a roadway		

Date:	**1988, 1996**	Scale:	1”=500’
Subject Property:	No significant changes visible		
North:	No significant changes visible		
East:	No significant changes visible		
South:	Appears to be vacant land		
Southwest:	Appears to be developed with the existing mobile home park beyond a roadway		
West:	No significant changes visible		
Northwest:	No significant changes visible		

Date:	**2002, 2006, 2009, 2010, 2012, 2014, 2016, 2018, 2020, 2022, 2024**	Scale:	1”=500’
Subject Property:	No significant changes visible		
North:	Appears to be developed with the existing light industrial and residential		

	structures
East:	Appears to be vacant land
South:	No significant changes visible
Southwest:	No significant changes visible
West:	No significant changes visible
Northwest:	No significant changes visible

Copies of reviewed aerial photographs are included in Appendix B of this report.

3.2 Fire Insurance Maps

Partner reviewed the collection of fire insurance maps (FIMs) from ERIS on January 31, 2026. FIM coverage was not available for the subject property.

A copy of the no coverage letter is included in Appendix B of this report.

3.3 City Directories

Partner reviewed historical city directories obtained from ERIS on February 3, 2026, for past names and businesses that were listed for the subject property and adjoining properties. The findings are tabulated below:

SUBJECT PROPERTY SUMMARY

City Directory Search for 980 W 7 Th St (Subject Property)	
Year(s)	**Occupant Listed**
1984	Colonial Cylsnt Hsp
1986	Colonial Cylsnt Hsp
1991	Langworthy Louise, Colonial Cvlsnt Hsp
1996	Fogel Miriam, Colonial Cvlsnt Hsp
2001	Bradley Gardens Convlsnt Ct
2003	Bradley Garden Convalescent
2008	Bradley Garden Convalescent
2012	Bradley Gardens Convalescent
2016	Bradley Gardens Convalescent
2020	Medhost, Bradley Gardens Convalescent
2024	Jerrold Gage, Bradley Gardens Convalescent

City Directory Search for 39241 W 7 Th St (Subject Property)	
Year(s)	**Occupant Listed**
1964 65	Yokes Irene, Colonial Nursing Home, Patterson H H

1974	Lawler Philip W Md, Colonial Cnvlst Hsp, San Jacnto Mdcl Ctr
1977	Williams G, Ellis Anna M, Colonial Cnvlst Hsp

Based on the city directory review, no environmentally sensitive listings were identified for the subject property addresses.

ADJOINING PROPERTY SUMMARY

*XXXX = A phone number is present but is not registered to a tenant or is disconnected.

Based on the city directory review, no environmentally sensitive listings were identified for the adjoining property addresses.

Copies of reviewed city directories are included in Appendix B of this report.

3.4 Historical Topographic Maps

Partner reviewed historical topographic maps obtained from ERIS on January 31, 2026. The following inferred uses of the subject property and adjoining properties interpreted from topographic maps in Appendix B and are tabulated below:

Date:	**1942, 1943**
Subject Property:	No structural development depicted
North:	Depicted with a residential or agricultural structure beyond a roadway
East:	No structural development depicted
South:	No structural development depicted
Southwest:	No structural development depicted
West:	No structural development depicted
Northwest:	Depicted with a residential structure beyond a roadway

Date:	**1953, 1956**
Subject Property:	No significant changes depicted
North:	Depicted with two residential structures beyond a roadway
East:	Depicted with a residential structure
South:	No significant changes depicted
Southwest:	No significant changes depicted
West:	No significant changes depicted
Northwest:	Depicted with two residential structures beyond a roadway

Date:	**1972, 1979, 1996**
Subject Property:	Depicted as developed with the four existing commercial nursing home structures
North:	Depicted with five residential or commercial structures beyond a roadway
East:	No significant changes depicted
South:	No significant changes depicted
Southwest:	No significant changes depicted
West:	No significant changes depicted
Northwest:	No significant changes depicted

Date:	**2012, 2015, 2018, 2021**
Subject Property:	No site-specific features are depicted
North:	Only roadways and/or water bodies are shown, and no site-specific features are depicted
East:	Only roadways and/or water bodies are shown, and no site-specific features are depicted
South:	Only roadways and/or water bodies are shown, and no site-specific features are depicted
Southwest:	Only roadways and/or water bodies are shown, and no site-specific features are depicted
West:	Only roadways and/or water bodies are shown, and no site-specific features are depicted
Northwest:	Only roadways and/or water bodies are shown, and no site-specific features are depicted

Copies of reviewed topographic maps are included in Appendix B of this report.

4.0 REGULATORY RECORDS REVIEW

4.1 Regulatory Agencies

State Department

REGULATORY AGENCY DATA

Name of Agency:	California Environmental Protection Agency (CalEPA)
Point of Contact:	CalEPA Regulated Sites Portal
Agency Address:	1001 I Street, Sacramento, CA 95814
Agency Phone Number:	(916) 323-2514
Date of Contact:	February 2, 2026
Method of Communication:	Online Research (https://siteportal.calepa.ca.gov/nsite/map/help)

Summary of Communication:

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the CalEPA.

Health Department

REGULATORY AGENCY DATA

Name of Agency:	Riverside County Department of Environmental Health (RCDEH)
Point of Contact:	NextRequest Online Portal
Agency Address:	4065 County Circle Drive, Riverside, CA 92503
Agency Phone Number:	(951) 358-5055
Date of Contact:	February 2, 2026
Method of Communication:	Online Request Form (https://riversidecountyca.nextrequest.com/requests/new)

Summary of Communication:

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the RCDEH.

Fire Department

REGULATORY AGENCY DATA

Name of Agency:	Riverside County Fire Department (RCFD)
Point of Contact:	NextRequest Online Portal
Agency Address:	210 West San Jacinto Avenue, Perris, CA 92570
Agency Phone Number:	(951) 940-6900

Date of Contact:	February 2, 0020
Method of Communication:	Online Request Form (https://riversidecountyca.nextrequest.com/requests/new)

Summary of Communication:

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the RCFD.

Building Department

REGULATORY AGENCY DATA

Name of Agency:	City of San Jacinto Building & Safety Department
Point of Contact:	Email of Request Form
Agency Address:	595 South San Jacinto Avenue, San Jacinto, CA 92583
Agency Phone Number:	(951) 487-7330
Date of Contact:	February 6, 0020
Method of Communication:	Email

Summary of Communication:

Building records were on file for the subject property in relation to the reroof of the building and a certificate of occupancy for a CNA school formally located in one of the buildings. Historical building records dating back to the original construction of the buildings were not provided. No evidence of dry cleaning equipment installation, USTs, or other environmentally sensitive equipment were on file with the City of San Jacinto Building and Safety Department, nor were any permits related to reconstruction after a fire.

Planning Department

REGULATORY AGENCY DATA

Name of Agency:	City of San Jacinto Planning Department
Point of Contact:	Online GIS Zoning Map
Agency Address:	595 South San Jacinto Avenue, San Jacinto, CA 92583
Agency Phone Number:	(951) 487-7330
Date of Contact:	February 2, 2026
Method of Communication:	Online Research (https://sanjacintoca.maps.arcgis.com/apps/webappviewer/index.html?id=ed1ebde8df5542ca8bffe8af1578c764)

Summary of Communication:

According to reviewed online documents, the subject property is zoned "IL" for "Light industrial" development by the City of San Jacinto Planning Department.

Oil & Gas Exploration

REGULATORY AGENCY DATA

Name of Agency:	California Geologic Energy Management Division (CalGEM)
Point of Contact:	CalGEM Well Finder Mapping Application
Agency Address:	715 P Street, MS 1900, Sacramento, CA 95814
Agency Phone Number:	(916) 445-9686
Date of Contact:	February 2, 2026
Method of Communication:	Online Research CalGEM Well Finder Mapping Application

Summary of Communication:

According to CalGEM, no oil or gas wells are located on or adjoining to the subject property.

Assessor's Office

REGULATORY AGENCY DATA

Name of Agency:	Riverside County Assessor (RCA)
Point of Contact:	RivCoView Parcel Search Database
Agency Address:	4080 Lemon Street, Riverside, CA 92501
Agency Phone Number:	(951) 955-6200
Date of Contact:	February 2, 0020
Method of Communication:	Online Research https://ca-riverside-acr.publicaccessnow.com/

Summary of Communication:

According to records reviewed, the subject property is identified by Assessor Parcel Number (APN) 435-330-003. The original three commercial structures (Buildings A, C, D) were constructed in 1964, and the fourth commercial structure (Building B) was constructed in 1971. No records regarding property ownership are readily available through the RCA website.

Air Pollution Control Agency

REGULATORY AGENCY DATA

Name of Agency:	South Coast Air Quality Management District (SCAQMD)
Point of Contact:	FIND Online Database
Agency Address:	21865 Copley Drive, Diamond Bar, CA 91765
Agency Phone Number:	(909) 396-2000
Date of Contact:	February 2, 2026
Method of Communication:	Online Research (https://xappprod.aqmd.gov/find)

Summary of Communication:

No Permits to Operate (PTO), Notices of Violation (NOV), or Notices to Comply (NTC) or the presence of AULs, dry cleaning machines, or USTs were on file for the subject property with the

SCAQMD.

Regional Water Quality Agency

REGULATORY AGENCY DATA

Name of Agency:	State Water Resources Control Board (SWRCB)
Point of Contact:	GeoTracker Online Database
Agency Address:	1001 I Street, Sacramento, CA 95814
Agency Phone Number:	866-480-1028
Date of Contact:	February 2, 2026
Method of Communication:	Online Research (http://geotracker.waterboards.ca.gov/)

Summary of Communication:

No records regarding hazardous substance use, storage or releases, or the presence of USTs and AULs on the subject property were on file with the SWRCB.

Department of Toxic Substances Control

REGULATORY AGENCY DATA

Name of Agency:	Department of Toxic Substances Control (DTSC)
Point of Contact:	EnviroStor and Hazardous Waste Tracking System (HWTS) Data Management Systems
Agency Address:	1001 I Street, Sacramento, CA 95814
Agency Phone Number:	(916) 551-1313
Date of Contact:	February 2, 2026
Method of Communication:	Online Research (https://www.envirostor.dtsc.ca.gov/public/; https://hwts.dtsc.ca.gov/report_search.cfm?id=5)

Summary of Communication:

The EnviroStor database is the DTSC's data management system for tracking cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known contamination or sites where there may be reason to investigate further. No records were identified for the subject property address on the EnviroStor database.

The DTSC Hazardous Waste Tracking System (HWTS) was researched for hazardous waste manifest data submitted to the California DTSC. EPA ID Number CAL000485599 was issued to GHD of San Jacinto LLC DBA The Bradly Gardens 2024 which remains active. Manifest records obtained from the DTSC HWTS for the EPA IDs issued to subject property occupants are further discussed in Section 4.2.2.

Copies of pertinent documents are included in Appendix B of this report.

4.2 Mapped Database Records Search

The regulatory database report provided by ERIS documents the listing of sites identified on federal, state, county, city, and tribal (when applicable) standard source environmental databases within the

approximate minimum search distance (AMSD) specified by ASTM Practice E1527-21. The data from these sources are updated as these data are released and integrated into one database. The information contained in this report was compiled from publicly available sources.

The environmental database information is used to identify environmental concerns in connection with the subject property. The listings also serve to identify the known indications of the storage, use, generation, disposal, or release of hazardous substance at the subject property and the potential for contaminants to migrate onto the subject property from off-site sources in groundwater or soil in the form of liquids or vapor.

Using the ASTM definition of migration, Partner considers the migration of hazardous substances or petroleum products in any form onto the subject property during the evaluation of each site listed on the radius report, which includes solid, liquid, and vapor.

4.2.1 Regulatory Database Summary

The following table lists the sites as categorized by the regulatory database within the prescribed AMSD. The locations of the sites are plotted utilizing a geographic information system, which geocodes the site addresses. The accuracy of the geocoded locations is approximately +/-300 feet.

DATABASE REPORT DATA

Database	AMSD Radius (mile)	Listings Identified		
		Subject Property	Adjoining Properties	Surrounding Area Sites of Concern
Federal NPL	1.00	N	N	N
Delisted NPL Site	0.50	N	N	N
Federal SEMS Site	0.50	N	N	N
Federal SEMS-ARCHIVE	0.50	N	N	N
Federal RCRA CORRACTS Facility	1.00	N	N	N
Federal RCRA TSDF Facility	0.50	N	N	N
Federal RCRA Generators Site (LQG, SQG, VSQG, CESQG)	Subject and Adjoining	N	N	N
Federal IC/EC Registries	Subject Property	N	N	N
Federal ERNS Site	Subject Property	N	N	N
Federal PFAS Facility	0.50	N	N	N
State/Tribal Equivalent NPL	1.00	N	N	N

State/Tribal Equivalent CERCLIS	1.00	N	N	N
State/Tribal Landfill/Solid Waste Disposal Site	0.50	N	N	N
State/Tribal Leaking Storage Tank Site (LUST/LPST)	0.50	N	N	N
State/Tribal Registered Storage Tank Sites (UST/AST)	Subject and Adjoining	N	N	N
State/Tribal IC/EC Registries	Subject and Adjoining	N	N	N
State/Tribal Voluntary Cleanup Sites (VCP)	0.50	N	N	N
State/Tribal Spills	0.25	N	N	N
Federal Brownfield Sites	0.50	N	N	N
State Brownfield Sites	0.50	N	N	N
State PFAS Facility	0.50	N	N	N
Additional Databases	Subject and Adjoining	**Y**	**Y**	N

4.2.2 Subject Property Listings

The subject property was identified on the Facility Registry Service/Facility Index (FINDS/FRS), Riverside County-Medical Waste Facilities (MED WST RIVERSIDE), and RCRA Non-Generators (RCRA NON GEN) databases in the regulatory database report, as discussed below:

SUBJECT PROPERTY DATABASE LISTING

	Database:	FINDS/FRS, MED WST RIVERSIDE, RCRA NON GEN
	Site Name:	The Bradley Gardens, GHD of San Jacinto DBA The Bradley Gardens
	Address:	980 West 7th Street
Discussion:	The rehabilitation and convalescent care center on the subject property is listed on the FINDS/FRS database (ID 110071738266) for unspecified hazardous waste generation under RCRA oversight at a continuing care and retirement community. The Riverside County database listing indicates the The Bradley Gardens is a small quantity generator of Medical Waste under Facility ID FA0000079, with a permit issue date of December 8, 2020. Based on the RCRA NON GEN listing for the EPA ID assigned to The Bradley Gardens (CAL000485599), no compliance or enforcement records were associated with	

	the facility. According to the DTSC HWTS, no manifest records indicating the types and amounts of hazardous wastes removed from the property were available since the creation of the EPA ID Number in 2024. Based on the lack of evidence of a release or significant regulatory violations, along with the regulatory oversight and status, these listings for the subject property are not expected to represent a significant environmental concern.

4.2.3 Adjoining Property Listings

One or more adjoining properties were identified on the California Environmental Reporting System (CERS) Hazardous Waste Sites (HAZ), Clandestine Drug Lab Sites (CDL), Toxic Pollutant Emissions Facilities (EMISSIONS), FINDS/FRS, Riverside County-Hazardous Waste Generator Sites List (HWG RIVERSIDE), and Riverside County-Disclosure Facility List (HZH RIVERSIDE) databases in the regulatory database report, as discussed below:

ADJOINING PROPERTY DATABASE LISTING

Property Name:	Talley Metal Fabrication, J Talley Corp, Talley & Ochoa Metal Fabrication
Address:	989 West 7th Street
Direction:	North
Hydrological Gradient:	Down-Gradient
Database Listing:	CERS HAZ, EMISSIONS, FINDS/FRS, HZH RIVERSIDE, RMP RIVERSIDE
Discussion:	The north adjoining property is occupied by Talley Metal Fabrication (Talley) for the storage of metal building materials fabrication of metal structures and building systems. Talley is listed on the FINDS/FRS database (IDs 110070089402, 110071787626) as a fabricated metal products and ornamental metal work manufacturing facility regulated under industrial stormwater and air emissions programs. The Riverside County listings indicate that Talley is an inactive Hazardous Materials Handler under Facility ID FA0022387. According to the CERS HAZ listing, Talley was issued a few minor regulatory compliance violations following inspections of the facility by the RCDEH in 2021 and 2024 for storing hazardous materials for metal cutting equipment that were not previously disclosed and lack of hazardous materials handling training documentation. The violations were subsequently resolved during follow-up inspections in 2022 and 2025. The EMISSIONS database indicates that Talley maintains an active PTO with the SCAQMD for the operation of a spray booth with solvent under the Facility ID 123141. Three Notices to Comply were issued by the SCAQMD to the site in 2009, 2001, and 2012 to maintain emission records for coasting sprayed inside the spray booth, and to only use complaint coatings and solvents, which were listed as in Compliance following reinspection later each of those years. Based on the regulatory oversight and absence of documented releases, these site listings are not expected to represent a significant environmental concern to the subject property.

ADJOINING PROPERTY DATABASE LISTING

Property Name:	Parkview Estates
Address:	913 South Grand Avenue
Direction:	Southwest
Hydrological Gradient:	Cross-Gradient
Database Listing:	CDL
Discussion:	The southwest adjoining property is occupied by a mobile home park, Parkview Estates. Based on the CDL listings for the property, two illegal drug labs were discovered on the property in the past. In 1996, an illegal drug lab was discovered at space 24, and in 2005 an illegal drug lab was discovered at space 18. No further information regarding the removal or cleanup of the illegal drug labs was available. Based on the absence of documented releases to the subsurface, along with the regulatory oversight of cleanup, these site listings are not expected to represent a significant environmental concern to the subject property.

Based on the findings, vapor migration is not considered an environmental concern at this time.

4.2.4 Surrounding Area Listings of Sites of Concern

No sites of concern are identified in the regulatory database report. Listed sites within the specified search radius of the subject property which appeared on local, State, or Federally published lists of sites that have had releases of hazardous substances, have been granted regulatory closure, were determined to be of sufficient distance, and/or are situated hydrologically cross- or down-gradient such that impact to the subject property is unlikely.

Based on the findings, vapor migration is not considered an environmental concern at this time.

4.2.5 Unplottable Listings

No unplottable listings are identified in the regulatory database report.

A copy of the regulatory database report is included in Appendix C of this report.

5.0 USER PROVIDED INFORMATION AND INTERVIEWS

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *User* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The *User* should provide the following information to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiries* is not complete. The *User* is asked to provide information or knowledge of the following:

- Review Title and Judicial Records for Environmental Liens and AULs
- Specialized Knowledge or Experience of the User
- Actual Knowledge of the User
- Reason for Significantly Lower Purchase Price
- Commonly Known or *Reasonably Ascertainable* information
- Degree of Obviousness
- Reason for Preparation of this Phase I ESA

Fulfillment of these user responsibilities is key to qualification for the identified defenses to CERCLA liability. Partner requested our Client to provide information to satisfy User Responsibilities as identified in Section 6 of the ASTM guidance.

Pursuant to ASTM Practice E1527-21, Partner requested the following site information from EPD Solutions (User of this report).

USER RESPONSIBILITIES

Item	Provided By User
AAI User Questionnaire	No
Title Records, Environmental Liens, and AULs	No
Specialized Knowledge	No
Actual Knowledge	No
Valuation Reduction for Environmental Issues	No
Identification of Key Site Manager	Yes
Reason for Performing Phase I ESA	Yes
Prior Environmental Reports	No

5.1 Interviews

5.1.1 Interview with Owner

The owner of the subject property since 2024, identified as Real San Jacinto Estate, was not available to be interviewed at the time of the assessment.

5.1.2 Interview with Report User

Please refer to Section 5.2 below for information requested from the Report User.

5.1.3 *Interview with Key Site Manager*

Mr. Tom Corcoran, key site manager, indicated that they had no information pertaining to any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the subject property; any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the subject property; or any notices from a governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

The key site manager further stated that there are no USTs, ASTs, clarifiers, oil/water separators, groundwater monitoring wells, or hazardous substance storage or generation on the subject property to the best of their knowledge.

5.1.4 *Interviews with Past Owners, Operators and Occupants*

Interviews with past owners, operators, and occupants were not conducted since information regarding the potential for contamination at the subject property was obtained from other sources.

5.2 User Provided Information

5.2.1 *Title Records, Environmental Liens, and AULs*

Partner was not provided with title records or environmental lien and AUL information for review as part of this assessment.

5.2.2 *Specialized Knowledge*

No specialized knowledge of environmental conditions associated with the subject property was provided by the User at the time of the assessment.

5.2.3 *Actual Knowledge of the User*

No actual knowledge of any environmental lien or AULs encumbering the subject property or in connection with the subject property was provided by the User at the time of the assessment.

5.2.4 *Valuation Reduction for Environmental Issues*

No knowledge of valuation reductions associated with the subject property was provided by the User at the time of the assessment.

5.2.5 *Commonly Known or Reasonably Ascertainable Information*

The User did not provide information that is commonly known or reasonably ascertainable within the local community about the subject property at the time of the assessment.

5.2.6 *Previous Reports and Other Provided Documentation*

No previous reports or other pertinent documentation was provided to Partner for review during the course of this assessment.

6.0 SITE RECONNAISSANCE

The weather at the time of the site visit was sunny and clear. Refer to Section 1.5 for limitations encountered during the field reconnaissance and Sections 2.1 and 2.2 for subject property operations. The table below provides the site assessment details:

SITE ASSESSMENT DATA

Site Assessment Performed By:	James Erwin
Site Assessment Conducted On:	February 6, 2026

The table below provides the subject property personnel interviewed during the field reconnaissance:

SITE VISIT PERSONNEL FOR 980 W 7TH ST (SUBJECT PROPERTY)

Name	Title/Role	Contact Number	Site Walk*
Tom Corcoran	CEO Edge Building Services	(951) 304-9776	Yes

* Accompanied Partner during the field reconnaissance activities and provided information pertaining to the current operations and maintenance of the subject property.

No potential environmental concerns were identified during the onsite reconnaissance.

6.1 General Site Characteristics

6.1.1 Solid Waste Disposal

Solid waste generated at the subject property is disposed of in commercial dumpsters located on the east side of the subject property. An independent solid waste disposal contractor, CR&R, removes solid waste from the subject property. Solid waste generated at the subject property includes food waste, household-type trash, and medical waste. Biohazardous medical waste is stored in a closet in Building D and is picked up monthly by a registered biohazardous waste disposal company. No evidence of illegal dumping of solid waste was observed during the Partner site reconnaissance.

6.1.2 Sewage Discharge and Disposal

Sanitary discharges on the subject property are directed into the municipal sanitary sewer system. The EMWD services the subject property vicinity. The facility utilized one underground grease trap located north of Building A for the kitchen drains. The grease trap is regularly serviced to prevent backups as the system is undersized for the amount of grease introduced to the drain system by the kitchen. Based on the nature of materials disposed of in the grease trap, its presence in not expected to represent a significant environmental concern,. No septic systems were observed or reported on the subject property.

6.1.3 Stormwater and Surface Water Drainage

Stormwater is removed from the subject property primarily by sheet flow action across the paved surfaces towards a stormwater channel located next to the public right of way or ground infiltration in the unpaved and landscaped areas on the subject property. No drywells were identified on the subject property.

6.1.4 Source of Heating and Cooling

Heating and cooling systems as well as domestic hot water equipment are fueled by electricity and natural gas provided by Southern California Edison (SCE) and Southern California Gas Company (SoCal

Gas Co.). The mechanical system is comprised of rooftop-mounted packaged electrical/natural gas HVAC units. Hot water is provided by individual natural gas water heaters.

6.1.5 Wells and Cisterns

No aboveground evidence of wells or cisterns was observed during the site reconnaissance.

6.1.6 Wastewater

Domestic wastewater generated at the subject property is disposed by means of the sanitary sewer system. No industrial processes are currently performed at the subject property.

6.1.7 Septic Systems

No septic systems were observed or reported on the subject property.

6.1.8 Additional Site Observations

No additional general site characteristics were observed during the site reconnaissance.

6.2 Potential Environmental Hazards

6.2.1 Hazardous Substances and Petroleum Products Used or Stored at the Site

No evidence of the use of reportable quantities of hazardous substances was observed on the subject property.

Small quantities of general maintenance supplies and paints were found to be properly labeled and stored at the time of the assessment with no signs of leaks, stains, or spills. The storage and use of maintenance supplies does not appear to pose a significant threat to the environmental integrity of the subject property at this time.

6.2.2 Aboveground & Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)

No evidence of current or former ASTs or USTs was observed during the site reconnaissance.

6.2.3 Evidence of Releases

No spills, stains, or other indications that a surficial release has occurred at the subject property were observed.

6.2.4 Polychlorinated Biphenyls (PCBs)

Older transformers and other electrical equipment could contain PCBs at a level that subjects them to regulation by the US EPA. PCBs in electrical equipment are controlled by US EPA regulations 40 CFR, Part 761. Under the regulations, there are three categories into which electrical equipment can be classified: 1) Less than 50 parts per million (ppm) of PCBs – “Non-PCB;” 2) 50 ppm-500 ppm – “PCB-Contaminated;” and, 3) Greater than 500 ppm – “PCB-Containing.” The manufacture, process, or distribution in commerce or use of any PCB in any manner other than in a totally enclosed manner was prohibited after July 2, 1979.

The on-site reconnaissance addressed indoor and outdoor transformers that may contain PCBs. One pole-mounted transformer was observed on the subject property. The transformer is labeled indicating Non-PCB content. No staining or leakage was observed in the vicinity of the transformer. Based on the good condition of the equipment, the transformer is not considered an environmental concern.

No other potential PCB-containing equipment (interior transformers, oil-filled switches, hoists, lifts, dock levelers, hydraulic elevators, balers, etc.) was observed on the subject property during Partner's reconnaissance.

6.2.5 Strong, Pungent or Noxious Odors

No strong, pungent or noxious odors were evident during the site reconnaissance.

6.2.6 Pools of Liquid

No pools of liquid were observed on the subject property during the site reconnaissance.

6.2.7 Drains, Sumps and Clarifiers

No drains, sumps, or clarifiers, other than those associated with storm water removal, were observed on the subject property during the site reconnaissance.

6.2.8 Pits, Ponds and Lagoons

No pits, ponds, or lagoons were observed on the subject property.

6.2.9 Stressed Vegetation

No stressed vegetation was observed on the subject property.

6.2.10 Additional Potential Environmental Hazards and Emerging Contaminants

Partner evaluated the current subject property use during the site reconnaissance for potential environmental hazards, including Per- and Polyfluoroalkyl Substances (PFAS) impacts to the subject property. Based on the site observations and/or interview information with the key site contact, likely PFAS impacts to the subject property based on current use were not identified. Based on this information, PFAS are not considered an environmental concern at this time.

No additional environmental hazards, including landfill activities or radiological hazards, were observed.

6.3 Non-ASTM Services

6.3.1 Asbestos-Containing Materials (ACMs)

Asbestos is the name given to a number of naturally occurring, fibrous silicate minerals mined for their useful properties such as thermal insulation, chemical and thermal stability, and high tensile strength. The Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.1101 requires certain construction materials to be presumed to contain asbestos, for purposes of this regulation. All thermal system insulation (TSI), surfacing material, and asphalt/vinyl flooring that are present in a building that have not been appropriately tested are "presumed asbestos-containing material" (PACM).

A limited, visual survey of areas accessible from ground level for the presence of suspect ACM at the subject property was conducted. The objective of this visual survey was to note the presence and condition of suspect ACM listed by EPA, OSHA, and other regulatory and recognized sources as suspect ACM and/or considered friable or non-friable. Please refer to the table below for identified suspect ACM:

SUSPECT ACMs

Suspect ACM	Location	Friable Yes/No	Physical Condition
Drywall Systems	Throughout Building A to Interior	No	Good
Floor Tiles	Throughout Building A and B	No	Fair

	Interior		
Floor Tile Mastic	Throughout Building A and B Interior	No	Fair
Spray-Applied Acoustical Material	Portions of the Ceiling of Building B and C	Yes	Fair
Stucco	Throughout Building A to D Exterior	No	Good

Prior to disturbance, renovation, or demolition activities to any of the structures, Partner recommends a comprehensive asbestos survey of the property be completed to determine the presence, condition, friability and likely future condition of suspect or confirmed ACM. All suspect materials must be handled as ACM according to local, state and federal regulations until the results of sampling and analysis indicate the material is a non-ACM. According to the US EPA, ACM that is intact and in good condition can, in general, be managed safely in-place under an Operations and Maintenance (O&M) Program until removal is dictated by renovation, demolition, or deteriorating material condition.

Partner was not provided building plans or specifications for review, which may have been useful in determining areas likely to have used ACM.

6.3.2 Lead-Based Paint (LBP)

Lead is a highly toxic metal that affects virtually every system of the body. LBP is defined as any paint, varnish, stain, or other applied coating that has 1 mg/cm2 (or 5,000 µg/g or 0.5% by weight) or more of lead. Congress passed the Residential Lead-Based Paint Hazard Reduction Act of 1992, also known as "Title X," to protect families from exposure to lead from paint, dust, and soil. Under Section 1017 of Title X, intact LBP on most walls and ceilings is not considered a "hazard," although the condition of the paint should be monitored and maintained to ensure that it does not become deteriorated. Further, Section 1018 of this law directed the Housing and Urban Development (HUD) and the US EPA to require the disclosure of known information on LBP and LBP hazards before the sale or lease of most housing built before 1978.

While LBP was banned for use in residential buildings in 1978, based on the commercial use of the subject property buildings, there is a potential that LBP may still be present. The facility is not considered to be child-occupied, therefore exposure to lead outside of OSHA-related activities is unlikely. Furthermore, all interior and exterior painted surfaces were observed in good condition with no signs of peeling, flaking, or chipping.

Actual material samples would need to be collected in order to determine if LBP is present.

6.3.3 Radon

Radon is a colorless, odorless, naturally occurring, radioactive, inert, gaseous element formed by radioactive decay of radium (Ra) atoms. The US EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, according to the table below:

EPA RADON ZONES

EPA Zones	Average Predicted Radon Levels	Potential
Zone 1	Exceed 4.0 pCi/L	Highest
Zone 2	Between 2.0 and 4.0 pCi/L	Moderate

Zone 3	Less than 2.0 pCi/L	Low

It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the US EPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Review of the US EPA Map of Radon Zones places the subject property in Zone 2. Based upon the radon zone classification, radon is not considered an environmental concern.

6.3.4 Lead in Drinking Water

LEAD IN DRINKING WATER SUMMARY

Water System Operator:	Eastern Municipal Water District (EMWD)
Source of Drinking Water:	Groundwater from the wells in the San Jacinto Upper Pressure Basin , which is balanced by recharge of surface water at percolation sites and water imported from the Colorado River via the State Water Project.
Year of Annual Water Quality Report:	2024
Compliance Status:	Water supplied is in compliance with all State and Federal regulations pertaining to drinking water standards for lead.

Water sampling was not conducted to verify water quality.

6.3.5 Microbial Growth

Molds are microscopic organisms found virtually everywhere, indoors and outdoors. Mold will grow and multiply under the right conditions, needing only sufficient moisture (e.g.in the form of very high humidity, condensation, or water from a leaking pipe, etc.) and organic material (e.g., ceiling tile, drywall, paper, or natural fiber carpet padding).

Partner observed accessible, interior areas of the subject property buildings for significant evidence of microbial growth with the exceptions detailed in Section 1.5 of this report; however, this assessment should not be used as a microbial survey or inspection. Additionally, this limited assessment was not designed to assess all areas of potential microbial growth that may be affected by microbial growth on the subject property. Rather, it is intended to give the client an indication as to whether or not conspicuous (based on observed areas) microbial growth is present at the subject property. This evaluation did not include a review of pipe chases, mechanical systems, or areas behind enclosed walls and ceilings.

The following indications of water damage or microbial growth were observed during Partner's visual assessment:

MICROBIAL GROWTH OBSERVATIONS

Location of area affected	Condition
Building D Maintenance Storage Garage	Minor microbial growth and water damage.

The roof is missing in a portion of the garage and is allowing rainwater to fall into the structure which is causing minor microbial growth and water damage. Building D is slated for demolition and redevelopment.

6.3.6 *Wetlands*

The subject property does not appear to be a potential wetland area based on information obtained from the United States Fish and Wildlife Service's Online Wetlands Mapper; however, a comprehensive wetlands survey would be required in order to formally determine actual wetlands on the subject property. No settling ponds, lagoons, surface impoundments, wetlands or natural catch basins were observed at the subject property during this assessment.

6.4 Adjoining Property Reconnaissance

The adjoining property reconnaissance consisted of observing the adjoining properties from the subject property premises.

6.4.1 *Hazardous Substances and Petroleum Products Used or Stored at the Site*

No hazardous substances or petroleum products were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.2 *ASTs/USTs for Hazardous Substances or Petroleum Products*

No ASTs or USTs for hazardous substances/petroleum products were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.3 *Evidence of Releases*

No evidence of a release was observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.4 *PCBs*

No PCB containing materials were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.5 *Strong, Pungent, or Noxious Odors*

No strong, pungent, or noxious odors were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.6 *Pools of Liquid*

No pools of liquid were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.7 *Drains, Sumps, and Clarifiers*

No drains, sumps, or clarifiers were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.8 *Pits, Ponds, and Lagoons*

No pits, ponds, or lagoons were observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.9 *Stressed Vegetation*

No stressed vegetation was observed on adjoining properties during the limited adjoining property reconnaissance.

6.4.10 Additional Potential Environmental Hazards and Emerging Contaminants

Partner evaluated the current adjoining property uses during the site reconnaissance for potential environmental hazards, including PFAS impacts to the subject property. Based on observations made from the subject property borders and/or information provided by key site contact, likely emerging contaminants or PFAS impacts to the subject property from current adjoining property uses were not identified. Based on this information, PFAS are not considered an environmental concern.

No additional environmental hazards were observed on adjoining properties during the limited adjoining property reconnaissance.

7.0 VAPOR ENCROACHMENT CONDITIONS

Partner conducted a limited non-intrusive vapor screening on the subject property to identify, to the extent feasible, the potential for vapor encroachment conditions (VECs) in connection with the subject property. This included consideration of chemicals of concern (COC) that may migrate as vapors into the subsurface of the subject property as a result of contaminated soil and groundwater on or near the property.

This screening utilized readily available data sources previously discussed in this Phase I ESA that includes:

- the physical setting of the subject property (Section 2.4),
- standard historical sources for the subject property, adjoining, and surrounding area (Section 3.0),
- known or potentially contaminated sites as identified from information from regulatory agencies and sites on Federal, State, tribal and local databases (Section 4.0), and
- information from the site reconnaissance (Section 6.0) of the subject property and observations of the surrounding properties.

The results of our data collection, reconnaissance, and analysis are tabulated below:

POTENTIAL FOR VAPOR ENCROACHMENT TO IMPACT THE SUBJECT PROPERTY

Area of Concern	Likely or Known VEC to Subject Property
Subject Property Existing Operations or Conditions (Sections 2.0 and 6.0)	None identified that impact the subject property.
Historical Uses of the Subject Property (Section 3.0)	None identified that impact the subject property.
Adjoining Property Operations or Existing Conditions (Sections 2.3 and 6.4)	None identified that impact the subject property.
Historical Uses of Adjoining Properties or Nearby Properties (Section 3.0)	None identified that impact the subject property.
Regulatory Review of sites identified on Federal, State, tribal and Local Environmental Databases which were located in the AMSD (Section 4.0)	None identified that impact the subject property.

Based on the findings of the limited non-intrusive vapor screening, vapor intrusion is unlikely to be an issue of concern in connection with the existing structures on the subject property. As such, no further assessment is recommended.

8.0 FINDINGS AND CONCLUSIONS

Findings and Opinions

Recognized Environmental Condition

A recognized environmental condition (REC) refers to the presence of hazardous substances or petroleum products in, on, or at the subject property due to a release to the environment; the likely presence of hazardous substances or petroleum products in, on, or at the subject property due to a release or likely release to the environment; or the presence of hazardous substances or petroleum products in, on, or at the subject property under conditions that pose a material threat of a future release to the environment.

- Partner did not identify any RECs during the course of this assessment.

Controlled Recognized Environmental Condition

A controlled recognized environmental condition (CREC) refers to a REC affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, activity and use limitations or other property use limitations).

- Partner did not identify any CRECs during the course of this assessment.

Historical Recognized Environmental Condition

A historical recognized environmental condition (HREC) refers to a previous release of hazardous substances or petroleum products affecting the subject property that has been addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the subject property to any controls (for example, activity and use limitations or other property use limitations).

- Partner did not identify any HRECs during the course of this assessment.

Business Environmental Risk

A Business Environmental Risk (BER) is a risk which can have a material environmental or environmentally driven impact on the business associated with the current or planned use of commercial real estate, not necessarily related to those environmental issues required to be investigated in this practice. The following was identified during the course of this assessment:

- Due to the age of the subject property buildings, there is a potential that asbestos-containing material (ACM) and/or lead-based paint (LBP) are present. Should these materials be replaced, the identified suspect ACMs would need to be sampled to confirm the presence or absence of asbestos prior to any renovation or demolition activities to prevent potential exposure to workers and/or building occupants. Building D is slated for demolition and redevelopment, and as such should have ACM and LBP sampling and testing conducted prior to demolition activities.

Significant Data Gaps

No significant data gaps affecting the ability of the Environmental Professional to identify a REC were encountered during this assessment.

Conclusions and Recommendations

Partner has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E1527-21 of 980 W 7th St in San Jacinto, Riverside County, California (the "subject property"). Any exceptions to, or deletions from, this practice are described in Section 1.5 of this report.

This assessment has revealed no evidence of RECs, CRECs, or HRECs in connection with the subject property; however, a BER was identified. Based on the conclusions of this assessment, Partner recommends the following:

- An Operations and Maintenance (O&M) Program should be implemented in order to safely manage the suspect ACMs and LBP located at the subject property.

9.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Partner has performed a Phase I Environmental Site Assessment of the property located at 980 W 7th St in San Jacinto, Riverside County, California in conformance with the scope and limitations of the protocol and the limitations stated earlier in this report. Exceptions to or deletions from this protocol are discussed earlier in this report.

By signing below, Partner declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR §312. Partner has the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. Partner has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

RE: CITY DIRECTORY RESEARCH
980 W 7th St
SAN JACINTO,CA 92582

Thank you for contacting ERIS for an City Directory Search for the site described above. Our staff has conducted a reverse listing City Directory search to determine prior occupants of the subject site and adjacent properties. We have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Listing Directories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either utilized the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as multiple digitized directories. These do not claim to be a complete collection of all reverse listing city directories produced.

ERIS has made every effort to provide accurate and complete information but shall not be held liable for missing, incomplete or inaccurate information. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are additional addresses or streets that require searching please contact us at 866-517-5204.

Search Criteria:
800-925 of S Grand Ave
900-1015 of W 7th St
ALL of W 9th St
Search Notes:
W 7th St address numbers change prior to 1984 (39170-39280)

Additional information

Request

CPRA records request for a Phase I ESA at the property addressed 980 West 7th Street, San Jacinto, CA 92582. APN: 435-330-003. I am seeking public records from the following agencies:

- RCDEH records related to wells, spill incidents, hazmat permits, hazardous waste inspections, aboveground storage tanks, or underground storage tanks.
- RCFD records for any fires that may have occurred at the property.

Department of Environmental Health Hazardous Materials Management Branch does not have responsive records to this request.

February 10, 2026, 8:07am by Dakodah Hiemstra, Office Assistant III (Staff)

Message from requester

Requester + Staff

Hi, the City of San Jacinto Building and Safety Department is reporting they have no records related to this request. The buildings on the property were constructed between 1964 and 1971 according to the Riverside County Assessor. I'd like to add on the RCTLMA Building and Safety Department to my request for potential building permit records related to this property.

Riverside County Fire Department has reviewed your request and has determined that no responsive records exist in relation to this request. We are aware that CALFIRE holds records of the type being requested and may have responsive records in relation to this request. Please find attached response letter.

If you request involved other county departments, they may response separately to this request.

Thank you

OUR MISSION

To deliver value to our diverse customers and the communities we serve by providing safe, reliable, economical and environmentally sustainable water, wastewater and recycled water services.

OUR VISION

To be recognized as a leading organization in performance, technology, and advocacy; advancing innovative solutions that provide an exceptional level of customer and community service.

EMWD wants you, our valued customer, to be confident that your drinking water is safe.

OUR CONTINUING COMMITMENT TO YOU

EMWD and its trained, certified water quality professionals are committed to...

- Providing high quality, safe drinking water at the lowest price possible.
- Monitoring and testing the water we serve to optimize quality and ensure it is always safe to drink.
- Finding and developing new water supply sources to ensure continued reliability for our customers.
- Providing educated staff to answer any questions from our customers.

Dear Valued EMWD Customer,

At Eastern Municipal Water District (EMWD), our guiding principles as an organization are rooted in public trust.

For 75 years, we have proudly served the community and done so with transparency, accountability, and safety at the forefront of our decisions as an organization. That commitment is reaffirmed every time you turn on your tap and a safe, clean and reliable water supply is delivered to you and your family.

That is why we are pleased to present our annual water quality report, which details the high-quality drinking water we delivered throughout 2024. This annual report shows how EMWD continues to meet all drinking water quality standards established by the United States Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Water Board).

EMWD uses state-of-the-art water treatment processes to provide a safe and highly reliable water supply while protecting public health. By efficiently maintaining and operating our facilities along with conducting rigorous monitoring and testing, EMWD consistently delivers high-quality tap water service. Water samples are collected throughout the year from EMWD's 36 drinking water sources to carefully test for 382 water quality constituents. In 2024, EMWD collected 8,120 water samples and performed 48,194 tests to monitor and ensure quality.

EMWD supports science-based standards that provide health benefits to the public in an economically balanced manner. While groundwater or surface waters can have trace contaminants, EMWD protects your health and safety by treating the water we deliver—ensuring your water meets or surpasses all regulated drinking water standards.

In 2024, our service area continued to grow in both population and geographic footprint. EMWD completed a consolidation of the City of Perris water system and began providing wholesale water service to northern San Diego County. While we serve one of the fastest-growing regions in California, we are focused on ensuring every customer can have confidence in the quality of water we provide.

The State Water Board requires that EMWD customers receive an annual copy of this report, which summarizes the results of water quality tests and provides specific details about sources and quality of the water served in your community. The guidelines for distributing this report allow for electronic delivery, instead of a paper copy in the mail. By delivering this report electronically, we reduce costs and eliminate paper waste associated with printing and mailing the report to our more than 171,000 accounts. We will be happy to provide you with a paper copy of this report upon request through our website at emwd.org/CCR or by calling us at 951-928-3777, extension 3430. Please note that you may change your delivery preference at any time.

We strongly encourage you to read this report and if you have any water quality questions, please feel free to contact Michelle Karras, Principal Environmental Analyst, or any of our Water Quality staff at 951-928-3777, extension 3327. We also encourage you to get the latest news and information from EMWD through our website at emwd.org.

Thank you for being part of the EMWD family and for trusting us to provide for you and your family with a safe and reliable water supply.

Joe Mouawad, P.E.
GENERAL MANAGER
EASTERN MUNICIPAL WATER DISTRICT

This annual water quality report contains important and useful information about the source and the tests used to ensure the quality and safety of your drinking water. It also describes how EMWD meets all drinking water standards as set by the United States Environmental Protection Agency (USEPA) and enforced by the State Water Resources Control Board (State Water Board).

About Regulations

In order to ensure that tap water is safe to drink, the United States Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Water Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

CONTAMINANTS THAT MAY BE PRESENT IN SOURCE WATER INCLUDE:

- MICROBIAL CONTAMINANTS, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock, and wildlife.
- INORGANIC CONTAMINANTS, such as salts and metals, can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- ORGANIC CHEMICAL CONTAMINANTS, including synthetic and volatile organic chemicals may be by-products of industrial processes or petroleum production, and can also come from gas stations, urban storm water runoff, agricultural application, and septic systems.
- PESTICIDES AND HERBICIDES may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- RADIOACTIVE CONTAMINANTS can be naturally-occurring or be the result of oil and gas production and mining activities.

SENSITIVE POPULATIONS

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised individuals such as those with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about their drinking water from their health care providers. USEPA and Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.

ABOUT NITRATE

Nitrate in drinking water at levels above 10 parts per million (ppm) is a health risk for infants of less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of an infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 10 ppm may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should seek advice from your health care provider.

ABOUT ARSENIC

While your drinking water meets the federal and state standard for arsenic, some of our sources do contain low levels of arsenic. The arsenic standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. The USEPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

UNREGULATED CONTAMINANTS

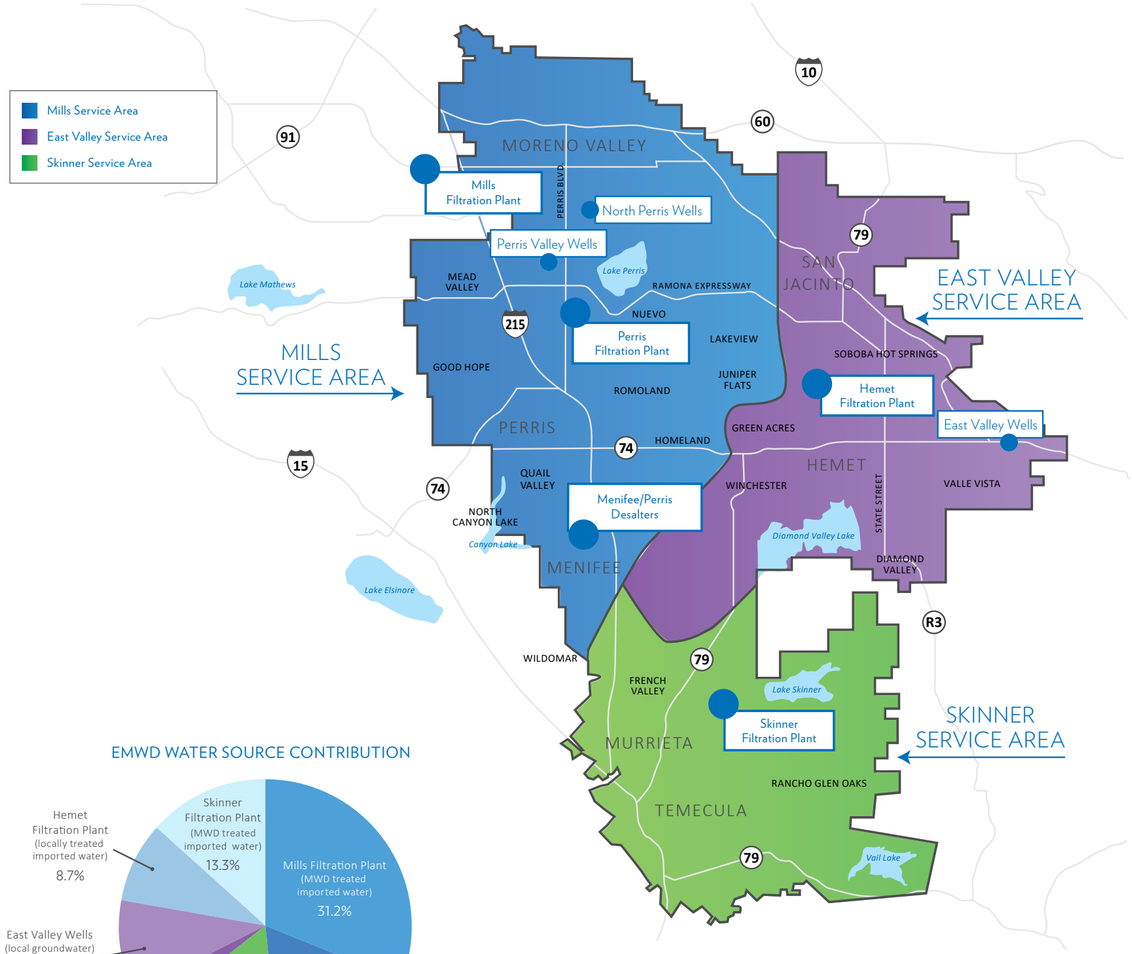
Unregulated contaminant monitoring helps USEPA and the State Water Board determine where certain contaminants occur and whether the contaminants need to be regulated.

ABOUT LEAD AND COPPER

Lead and copper are rarely found in source waters; however, both of these metals can enter drinking water by leaching from household plumbing and fixtures. Water that sits in your pipes for long periods of time may dissolve tiny amounts of lead and/or copper (parts per billion levels) into household water. The USEPA has developed the Lead and Copper Rule to protect public health by establishing an action level of 15 parts per billion (ppb) for lead and 1300 ppb for copper.

Lead can cause serious health effects in people of all ages, especially pregnant people, infants (both formula-fed and breastfed), and young children. Lead in drinking water is primarily from materials and parts used in service lines and in home plumbing. EMWD is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. Because lead levels may vary over time, lead exposure is possible even when your tap sampling results do not detect lead at one point in time. You can help protect yourself and your family by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Using a filter, certified by an American National Standards Institute accredited certifier to reduce lead, is effective in reducing lead exposures. Follow the instructions provided with the filter to ensure the filter is used properly. Use only cold water for drinking, cooking, and making baby formula. Boiling water does not remove lead from water. Before using tap water for drinking, cooking, or making baby formula, flush your pipes for several minutes. You can do this by running your tap, taking a shower, doing laundry or a load of dishes. If you have a lead service line or galvanized requiring replacement service line, you may need to flush your pipes for a longer period. If you are concerned about lead in your water and wish to have your water tested, contact EMWD Water Quality staff at 951-928-3777, extension 3327. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at https://www.epa.gov/safewater/lead.

In 2024, EMWD conducted an inventory of water service lines required by U.S. EPA's Lead and Copper Rule Revisions. EMWD determined through historical records, information provided directly by customers, and information acquired during physical field inspections that the water system contains no lead service lines or galvanized service lines requiring replacement in its distribution system. For more information or to access the inventory, visit https://www.emwd.org/lead-service-line-inventory.



PFAS (PER- AND POLYFLUOROALKYL SUBSTANCES)

PFAS are chemicals that are resistant to heat, water and oil and have been used for decades in hundreds of consumer products and industrial applications. As a result, these chemicals are often found in the environment.

Although PFAS compounds such as perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) are no longer manufactured in the United States, many products that contain the chemicals still exist, such as cosmetics, food packaging, clothing and furniture fabrics. In addition, other countries still make products containing these chemicals, which may be imported into the United States. PFAS have been monitored by water agencies and reported based on United States Environmental Protection Agency (USEPA) regulations. Information on PFAS in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at (800) 426-4791 or at www.epa.gov/pfas.

THE SOURCES OF YOUR TAP WATER...

MILLS SERVICE AREA | Water for this service area comes from a combination of sources:

- The Henry J. Mills Filtration Plant* treats imported surface water supplied solely from northern California through the State Water Project (SWP). The Mills Filtration Plant adjusts the fluoride levels in the water to an optimal level recommended by the Centers for Disease Control and Prevention (CDC) for oral health, and uses chloramine for final disinfection.

WATER FROM THE MILLS FILTRATION PLANT IS BLENDED WITH SEVERAL OTHER EMWD WATER SOURCES:

- Two Perris Valley Wells serve a limited area of Perris – along Perris Boulevard north and south of the Ramona Expressway.
- Four North Perris Wells serve the northeast area of Perris.
- The Perris Water Filtration Plant (PWFP) treats both Colorado River and SWP waters. This plant uses the latest ultrafiltration technology to remove particulate contaminants to produce quality, potable water. The PWFP serves Lakeview, Nuevo, Romoland, Homeland, and Juniper Flats. This plant uses chloramine for final disinfection.
- The Desalination Complex (Menifee and Perris I Desalters, and Perris II Desalter) convert salty groundwater into potable water using a reverse osmosis process. Menifee, North Canyon Lake, and Quail Valley are communities within the Mills Service Area to receive blended water from this desalination plant. The Desalination Complex uses chloramine for final disinfection.

EAST VALLEY SERVICE AREA | This service area is split into two regions:

WEST OF STATE STREET:

- The Hemet Water Filtration Plant (HWFP) treats both Colorado River and SWP waters. This plant uses the latest ultrafiltration technology to remove particulate contaminants and produce quality drinking water. This treatment plant uses chloramine for final disinfection. Local groundwater also supplies this area.

EAST OF STATE STREET:

- A system of deep groundwater wells serves these communities. These wells are treated by adding free chlorine for final disinfection.

SKINNER SERVICE AREA | Water for this service area comes from:

- The Robert A. Skinner Filtration Plant* treats water from the Colorado River and from the SWP. The Skinner Plant adjusts the fluoride levels in the water to an optimal level recommended by the CDC for oral health, and uses chloramine for final disinfection.

** The Mills and Skinner Filtration Plants are owned and operated by The Metropolitan Water District of Southern California. ** Typically served by the Mills Filtration Plant and occasionally served by the Skinner Filtration Plant. *** Typically served by the Hemet Water Filtration Plant and occasionally served by the Skinner Filtration Plant. **** This area is served water produced by Rancho California Water District (RCWD). You may view RCWD's Consumer Confidence Report on their website at www.ranchowater.com.*

PROTECTING YOUR DRINKING WATER

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline at (800) 426-4791 or online at www.epa.gov/ground-water-and-drinking-water.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. The land that the water comes into contact with is called the watershed; everything that happens to or in the watershed can affect the quality of your drinking water supply.

EMWD uses several sources of water to serve its customers, including surface water from the Colorado River and the State Water Project (SWP), as well as local groundwater.

An initial assessment of all the watersheds, both surface water and groundwater, was completed. The Colorado River, a surface water source, was reassessed in 2022 and found to be most vulnerable to recreational activities, urban and storm water runoff, increasing urbanization in the watershed, and wastewater.

Water from the SWP, also a surface water source, was reassessed in 2021 and found to be most vulnerable to urban and storm water runoff, wildlife, agriculture, recreational activities, and wastewater.

An assessment of all EMWD wells was completed in 2013. Two sources were considered vulnerable to airports and airplane maintenance associated with a contaminant detected in the water supply. In addition, other EMWD wells were considered most vulnerable to the following due to proximity (not associated with any contaminants): commercial and industrial activities, residential activities, agriculture, and other activities such as recreation and transportation.

You can view vulnerability assessments online at www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/DWSAP.html. You can also call 951-928-3777, ext. 3327 for a copy of EMWD's vulnerability assessments.

Protecting the sources of drinking water helps protect our health. It's everyone's responsibility, and here are a few ways you can help:

- **Eliminate excess use of lawn and garden fertilizers and pesticides – they contain hazardous chemicals that can reach your drinking water source.**
- **Pick up after your pets.**
- **Dispose of chemicals properly; take used motor oil to a recycling center.**

Facts about Total Coliform Bacteria

Water agencies test for the presence of coliform bacteria as an indicator of drinking water quality.

Coliform bacteria are naturally present in the environment and are generally not harmful. Coliform bacteria may occur in soil, vegetation, animal waste, sewage, and surface waters.

All water systems are required to comply with the state Revised Total Coliform Rule. All water systems are also required to comply with the federal Revised Total Coliform Rule. The federal rule maintains the purpose to protect public health by ensuring the integrity of the drinking water distribution system and monitoring for the presence of microbials (i.e. total coliform and E. coli *bacteria). The USEPA anticipates greater public health protection as the rule requires water systems that are vulnerable to microbial contamination to identify and fix problems. Water systems that exceed a specified frequency of total coliform occurrences are required to conduct an assessment to determine if any sanitary defects exist. If found, these must be corrected by the water system.*

Eastern Municipal Water District routinely tests for the presence of coliform bacteria as an indicator of the sanitary quality of drinking water. EMWD analyzed 3,198 coliform samples in 2024, five of which were total coliform positive. The maximum allowed by USEPA for coliforms is no more than 5 percent in any month. The highest monthly coliform result in 2024 was 0.4 percent, which complies with this standard. EMWD also tests for *E. coli* bacteria, which indicate fecal or sewage contamination. Zero samples tested positive for *E. coli* in 2024.

The City of Perris analyzed 312 coliform samples in 2024, none of which were total coliform positive. The highest monthly coliform result was zero percent. Zero samples tested positive for *E. coli* in 2024. A positive coliform test result does not necessarily mean a maximum contaminant level (MCL) has been exceeded, or that there is a problem in the water system.

More information and general guidelines on ways to lessen the risk of infection by microbes are available from the USEPA's Safe Drinking Water Hotline at **(800) 426-4791** or at **epa.gov/ground-water-and-drinking-water**.

ABBREVIATIONS

AL	Action Level
CCRDL	Consumer Confidence Report Detection Levels
CFU/mL	Colony-Forming Units per milliliter
DLR	Detection Limits for purposes of Reporting
grains/gallon	Grains per gallon
HPC	Heterotrophic Plate Count
HFPO-DA	Hexafluoropropylene Oxide Dimer Acid
LRAA	Locational Running Annual Average
MCL	Maximum Contaminant Level
MCLG	Maximum Contaminant Level Goal
MRDL	Maximum Residual Disinfectant Level
MRDLG	Maximum Residual Disinfectant Level Goal
MRL	Minimum Reporting Level: set by EPA for unregulated contaminant monitoring
NA	Not Applicable: no State or Federal standards are established
ND	Non-Detected: sample was taken and chemical was not detected
NL	Notification Level
NR	No Range: all result(s) were the same value
NTU	Nephelometric Turbidity Units
pCi/L	PicoCuries per Liter
PFAS	Per- and Polyfluoroalkyl Substances
PFBS	Perfluorobutanesulfonic Acid
PFHxS	Perfluorohexanesulfonic Acid
PFNA	Perfluorononanoic Acid
PHG	Public Health Goal
ppb	Parts per billion or micrograms per liter (µg/L)
ppm	Parts per million or milligrams per liter (mg/L)
ppt	Parts per trillion or nanograms per liter (ng/L)
RAA	Running Annual Average
RL	Reporting Limit
TDS	Total Dissolved Solids
TON	Threshold Odor Number
TT	Treatment Technique
µS/cm	MicroSiemens per centimeter; or micromhos per centimeter (µmho/cm)
—	Samples not required
=	Equal
>	Greater than
<	Less than
≤	Less than or equal to
#	Number
%	Percent

DEFINITIONS

90th Percentile: The value in a data set in which 90 percent of the set is less than or equal to this value.

Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Detection Limits for purposes of Reporting (DLR): State-determined level that a test can detect the chemical.

Disinfection By-Product: Compounds which are formed from mixing of organic or mineral precursors in the water with ozone, chlorine or chloramine. Bromate, Total Trihalomethanes, and Haloacetic Acids are disinfection by-products.

Grains per Gallon (grains/gallons): A measure of water hardness. One grain/gallon equals 17.1 ppm or mg/L

Heterotrophic Plate Count (HPC): a bacteriological test that counts the number of bacteria per milliliter of sample.

Locational Running Annual Average (LRAA): The Running Annual Average (RAA) at one sample location.

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the Public Health Goals (PHGs) or Maximum Contaminant Level Goals (MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the USEPA.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a disinfectant added for water treatment below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Notification Level (NL): Notification levels are health-based advisory levels established by the State Water Board for chemicals in drinking water that lack MCLs.

Primary Drinking Water Standard (Primary Standard): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Regulatory Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

Running Annual Average (RAA): The yearly average which is calculated every 3 months using the previous 12 months' data.

Secondary Drinking Water Standard (Secondary Standard): MCLs for contaminants that do not affect health but are used to monitor the aesthetics of the water.

Treatment Technique (TT): A required treatment process intended to reduce the level of a contaminant in drinking water.

FOOTNOTES

A Total coliform MCLs: No more than 5.0% of the monthly samples may be total coliform-positive. Compliance is based on distribution system samples. The MCL was not violated in 2024.

B Fecal coliform/*E. coli* MCLs: An MCL violation is the occurrence of two (2) consecutive total coliform-positive samples, one of which contains fecal coliform or *E. coli.* There were zero detected fecal coliforms. The MCL was not violated in 2024.

C HPCs were tested only in distribution system samples, which had no detectable chlorine residual. No less than 95% of all distribution system samples in one month may have no detectable chlorine residual and an HPC greater than 500 colony forming units per mL. The HPC results were no less than 98.8% in any month in 2024.

D Bromate is a disinfection by-product resulting from the use of ozone. Currently, the Mills and Skinner Filtration plants use ozone. Values above the MCL may be acceptable so long as the RAA complies with the MCL.

E DLR = 1.0 ppb for each Haloacetic Acid 5 (HAA5) analyte (dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid) except for monochloroacetic acid which has a DLR = 2.0 ppb. Locational running annual averages and ranges are calculated from 12 samples sites collected quarterly throughout the distribution system. HAA5s are a by-product of drinking water chlorination.

F The North Perris System is monitored annually for TTHM and HAA5. Compliance is determined by individual sample results and must be less than or equal to the MCL

G Total Trihalomethanes (TTHMs) are the sum of the following analytes: bromodichloromethane, bromoform, chloroform, and dibromochloromethane. Locational Running Annual Averages (LRAA) and ranges are calculated from 12 sample sites collected quarterly throughout the distribution system. TTHMs are a by-product of drinking water chlorination. Values above the MCL may be acceptable so long as the LRAA complies with the MCL.

H Compliance is determined by the average, however all samples are reviewed and any values outside the compliance range are noted and corrected if possible. Values above the MRDL or MCL may be acceptable so long as the average complies with the MCL.

I Lead and Copper are regulated as a Treatment Technique under the Lead and Copper Rule, which requires EMWD to take 50 water samples at the consumers' tap every three years. Results are from 2022. 20 tap samples are collected within the City of Perris water system service, and 20 tap samples are collected within the North Perris Water System service area every 3 years. Neither lead nor copper are typically found in the source waters but can get into water by way of internal corrosion of household plumbing.

J North Perris Water System last conducted lead and copper tap sampling in 2023. A total of 20 samples were collected, with 90th percentile lead result of <5 ppb and copper result of 180 ppb.

K The City of Perris water system last conducted lead and copper tap sampling in 2024. A total of 20 samples were collected, with 90th percentile lead result of <5 ppb and copper result of 150 ppb.

Represents 2019-2020 Data Values *Represents 2023 Data Values*

FOOTNOTES

(L) Data is representative of the Menifee and Perris I Desalters, and Perris II Desalter, also known as the Desalination Complex.

(M) Values are from Well 59 after granular activated carbon treatment.

(N) The turbidity level of the combined filter effluent at the Mills and Skinner Filtration plants shall be less than or equal to 0.3 NTU in 95% of the measurements taken each month and shall not exceed 1 NTU at any time. For the Perris and Hemet Filtration plants, the turbidity level of the combined filter effluent shall be less than or equal to 0.1 NTU in 95% of the measurements taken each month and shall not exceed 1 NTU at any time. Turbidity is a measure of the cloudiness of the water, is regulated as a treatment technique (TT) and is an indicator of treatment performance.

(O) Aluminum has both primary (1,000 ppb) and secondary (200 ppb) standards (MCLs).

(P) Metropolitan began fluoride treatment of water at Mills and Skinner Filtration plants in 2007.

(Q) The MCL of 5 pCi/Lis for combined radium (radium-226 + radium-228)

(R) Compliance is determined by the average, however all samples are reviewed and any values outside the compliance range are noted and corrected if possible. Values above the MRDL or MCL may be acceptable so long as the average complies with the MCL.

(S) Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration system. Secondary standards were based either on the treatment plant effluent or raw well water.

FOOTNOTES

(T) Water hardness, measured in grains per gallon as calcium carbonate, is characterized by the following scale: 0 - 4.4 is soft, 4.4 - 8.8 is moderately hard, 8.8 - 17.5 is hard and greater than 17.5 is very hard.

(U) A total of 29 PFAS compounds were analyzed. Detected compounds are presented in the report, all other PFAS compounds were non-detected.

(V) The State NL and RL is 500 ppt and 5,000 ppt, respectively. EPA MCL's were adopted in April 2024. Compliance is determined by a PFAS mixture containing at least two or more of PFHxS, PFNA, HFPO-DA, and PFBS. The calculated co-occuring levels shall not exceed a Hazard Index of 1 (unitless).

ONE PART PER MILLION (PPM) (mg/L) IS LIKE

- 1 second in 11.5 days
- 1 teaspoon in 1,302 gallons
- 1 drop in 13.6 gallons

The State allows EMWD to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Data presented is from sampling completed in 2024, unless otherwise indicated. Some of EMWD's data, though representative, are more than one year old.

ONE PART PER BILLION (PPB) (mg/L) IS LIKE

- 1 second in nearly 32 years
- 1 teaspoon in 1.3 million gallons
- 1 drop in 13,563 gallons

EMWD supports science-based standards that provide health benefits to the public in an economically balanced manner. Should more stringent standards be set, EMWD will meet them. EMWD's water has met and will continue to meet all regulations.

ONE PART PER TRILLION (PPT) (ng/L) IS LIKE

- 1 second in nearly 32,000 years
- 1 teaspoon in 1.3 billion gallons
- 1 drop in 13,563,368 gallons

Unregulated contaminant monitoring helps EPA and the State Water Board determine where certain contaminants occur and whether the contaminants need to be regulated.

Your 2024 Water Quality

CONSUMER CONFIDENCE REPORT

Issued July 2025

DO YOU WANT A PAPER OR ELECTRONIC COPY OF THIS REPORT?

The choice is yours! It's easy to tell us how you want to receive future water quality reports, or if you would like to change your current delivery method. Just use one of the following options:

1. Tell us online at **www.emwd.org/CCR**.
2. Call **951-928-3777, extension 3430**.

Public Meetings

EMWD's Board of Directors meetings are generally held on the 1st and 3rd Wednesdays of each month beginning at 9:00 a.m.

If you wish to attend a meeting, please call the Board Secretary during normal business hours at **951-928-3777, extension 4235** to confirm meeting dates or check the Board Meeting Calendar online at **www.emwd.org/BoardMeetings**.

For more information on this report, contact: **Water Quality (951) 928-3777, extension 3327** or visit **www.emwd.org/WaterQuality**.

Why You Should Read This Report

THIS YEAR'S DRINKING WATER QUALITY REPORT…

- Examines how EMWD ensures your drinking water is safe, high quality, and reliable.
- Provides science-based data and facts about the sources, quality, and safety of your drinking water.
- Explains how customers can always choose how they wish to receive future water quality reports.

Would You Like to Receive This Report in Spanish?

IF YOU WOULD LIKE TO OBTAIN THIS INFORMATION IN SPANISH, VISIT WWW.EMWD.ORG/CCR AND SELECT "ESPAÑOL" OR CALL (951) 928-3777 EXTENSION 4326 FOR A SPANISH COPY BY MAIL.

ESTE INFORME CONTIENE INFORMACIÓN IMPORTANTE CON SOBRE LA CALIDAD DE SU AGUA. SI USTED DESEA OBTENER INFORMACIÓN EN ESPAÑOL, VISITA WWW.EMWD.ORG/CCR Y SELECCIONE "ESPAÑOL" O LLAME (951) 928-3777, EXTENSIÓN 4326 PARA SOLICITAR UNA COPIA POR CORREO.

Notice: IMPORTANT LIMITATIONS and YOUR LIABILITY

Reliance on information in Report: This report DOES NOT replace a full Phase I Environmental Site Assessment but is solely intended to be used as database review of environmental records.

License for use of information in Report: No page of this report can be used without this cover page, this notice and the project property identifier. The information in Report(s) may not be modified or re-sold.

Your Liability for misuse: Using this Service and/or its reports in a manner contrary to this Notice or your agreement will be in breach of copyright and contract and ERIS may obtain damages for such mis-use, including damages caused to third parties, and gives ERIS the right to terminate your account, rescind your license to any previous reports and to bar you from future use of the Service.

No warranty of Accuracy or Liability for ERIS: The information contained in this report has been produced by ERIS Information Inc. ("ERIS") using various sources of information, including information provided by Federal and State government departments. The report applies only to the address and up to the date specified on the cover of this report, and any alterations or deviation from this description will require a new report. This report and the data contained herein does not purport to be and does not constitute a guarantee of the accuracy of the information contained herein and does not constitute a legal opinion nor medical advice. Although ERIS has endeavored to present you with information that is accurate, ERIS disclaims, any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence, negligence or otherwise, and for any consequences arising therefrom. Liability on the part of ERIS is limited to the monetary value paid for this report.

Trademark and Copyright: You may not use the ERIS trademarks or attribute any work to ERIS other than as outlined above. This Service and Report (s) are protected by copyright owned by ERIS Information Inc. Copyright in data used in the Service or Report(s) (the "Data") is owned by ERIS or its licensors. The Service, Report(s) and Data may not be copied or reproduced in whole or in any substantial part without prior written consent of ERIS.

Violations

Violation Date:	08/22/2024	**Violation Source:**	CERS
Violation Program:	HMRRP	**Violation Division:**	Riverside County Department of Env Health
Citation:	HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)		
Violation Notes:			

Returned to compliance on 01/30/2025. OBSERVATION: The most recent business plan submission in the statewide information management system (CERS) failed to contain a chemical inventory description page for Quikrete Cement and Quikrete Anchoring Cement. Facility had roughly 1,350 lbs of Quikrete Anchoring Cement and roughly 3,150 lbs of Quikrete Cement. In addition facility has spools of Arc welding wire in reportable quantities (>500lbs). Material is a flammable solid that during its use and introduction to water and heat releases flammable gas. This will also need to be added to the Facilities inventory list. CORRECTIVE ACTION: Owner/operator shall complete a chemical inventory page for all reportable hazardous materials on site and submit to the statewide information management system (e.g. CERS) at http://cers.calepa.ca.gov.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violations

Violation Date:	08/22/2024	**Violation Source:**	CERS
Violation Program:	HMRRP	**Violation Division:**	Riverside County Department of Env Health
Citation:	HSC 6.95 25505(a)(4) - California Health and Safety Code, Chapter 6.95, Section(s) 25505(a)(4)		
Violation Notes:			

Returned to compliance on 01/30/2025. OBSERVATION: No training records observed/provided during inspection. Operator stated that the individual who manages this documentation was currently not in the office. CORRECTIVE ACTION: Owner/operator shall provide training to all employees. Documentation shall be retained and be made available for inspection for a minimum period of 3 years from the date of the training. Facility shall provide documentation of training for employees as it pertains to hazard materials for 2022, 2023, 2024. Documentation may be emailed to inspector at SaCunningham@RivCo.org.

Violation Description:

Failure to provide initial and annual training to all employees in safety procedures in the event of a release or threatened release of a hazardous material or failure to document and maintain training records for a minimum of three years.

Violations

Violation Date: 09/23/2021
Violation Source: CERS
Violation Program: HMRRP
Violation Division: Riverside County Department of Env Health
Citation: HSC 6.95 25508.1(a)-(f) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(f)
Violation Notes:

Returned to compliance on 02/03/2022. OBSERVATION: A previously undisclosed material was brought on site more than 30 days prior to the inspection. Observed two 55 gallon drums of Plasma Queen on site for the plasma cutting machine. CORRECTIVE ACTION: Owner/operator shall update and submit a new hazardous material inventory page in the statewide information management system (e.g. CERS) at https://cers.calepa.ca.gov for each chemical stored on site at or above threshold quantities.

Violation Description:

Failure to electronically update business plan within 30 days of any one of the following events:
A 100 percent or more increase in the quantity of a previously disclosed material.
Any handling of a previously undisclosed hazardous materials at or above reportable quantities.
A change of business address, business ownership, or business name.
A substantial change in the handler's operations that requires modification to any portion of the business plan.

Evaluations

Eval Date: 09/23/2021
Violations Found: Yes
Eval General Type: Compliance Evaluation Inspection
Eval Type: Routine done by local agency
Eval Division: Riverside County Department of Env Health
Eval Program: HMRRP
Eval Source: CERS
Eval Notes:

Facility is a metal fabrication shop that handles propane, CO2, argon, oxygen, acetylene, acetone, paint, and coolant. Note: Facility utilizes a new plasma cutting machine. Machine utilizes coolant, cuts are made above the coolant and the excess steel falls into the coolant to cool. Coolant is then drained, excess steel is removed and recycled, coolant is pumped back in. No waste stream from process. Informed facility if process eventually ends in a sludge, or any other non-recyclable byproduct, to ensure it is containerized and tested for hazardous properties.; Note: data in [EVAL Notes] field for some records is truncated from the source.

CORRECTIVE ACTION: Owner/operator shall ensure all hazardous materials containers are properly labeled. Label bulk container number 5 "Empty." If the container holds any material in the future it shall be labeled with the product name and an appropriate NFPA sign. Submit photos to this department at darios@rivco.org

Violation Description:

Business Plan Program - Operations/Maintenance - General Local Ordinance

Violations

Violation Date: 05/25/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Riverside County Department of Env Health
Citation: 22 CCR 11 66261.7 - California Code of Regulations, Title 22, Chapter 11, Section(s) 66261.7
Violation Notes:

Returned to compliance on 05/25/2023. OBSERVATION: Observed a fiberglass storage container on a trailer behind the maintenance shop which was empty and not labeled properly. Site manager placed label on tank by end of inspection. Violation corrected on-site. CORRECTIVE ACTION: Owner/operator shall properly label all empty containers larger than 5 gallons with the dates they were emptied.

Violation Description:

Failure to manage empty containers greater than 5 gallons in capacity that previously held a hazardous material/waste in accordance with 22 CCR 11 66261.7 including but not limited to the following:

(e)(2)By reclaiming its scrap value onsite or shipping the container or inner liner to a person who reclaims its scrap value; or

(3) By reconditioning or re manufacturing the container or inner liner onsite for subsequent reuse, or shipping the container or inner liner to a person who reconditions or re-manufactures the container or inner liner; or

(4) By shipping the container or inner liner to a supplier or to another intermediate collection location for accumulation prior to managing the container or inner liner pursuant to subsections (e)(2) or (e)(3) of 22 CCR 11 66261.7; or

(i) By shipping the container or inner liner back to the supplier for the purpose of being refilled.

(f) A container or an inner liner removed from a container larger than five gallons in capacity which is managed pursuant to subsection (e) of 22 CCR 11 66261.7 shall be marked with the date it has been emptied and shall be managed within one year of being emptied.

43	1 of1	NE	0.99 / 5,240.41	1,537.91 / 10	San Jacinto High School Expansion Site 500 Idyllwild Drive San Jacinto CA 92583	SCH

Envirostor ID: 60000229
Site History:

The Site consists of a 5-acre portion of the existing San Jacinto High School
that had been historically used for dry land farming. The Site is bordered by vacant land and residential use. Currently the Site consists of approximately 20 buildings, various athletic courts, a portion of a parking lot, and a portion of the agriculture department's livestock area utilized by San Jacinto High School students. The District is proposing to demolish three buildings and replace with facilities including a two-story, 32-classroom building, construct a new gymnasium, add temporary modular buildings, reconfigure athletic courts, expand a staff parking lot and construct a concrete parking lot.

44	1 of1	NW	1.00 / 5,262.94	1,509.62 / -19	Lyon Ave. New Elementary & Middle Schools 425 North Lyon Avenue San Jacinto CA 92582	SCH

Envirostor ID: 60001838
Site History:

The Site is proposed for the construction of an elementary and a middle school. The Site (within Assessor's Parcel Number 436-280-010) is approximately 39 acres of vacant land (located at 425 N. Lyon Avenue in San Jacinto, Riverside County, California) previously occupied by a rural residential dwelling, located near the southwest corner of the parcel, and historic agricultural use. The site is surrounded by residential development to the north and east. Warneke Park is adjacent to the site along the northeast boundary. Vacant agricultural land is located to the south. San Jacinto Reservoir is located to the northwest across Lyon Avenue. The site is assessable from Lyon Avenue and is bordered by dirt access roads along the northern and southern site boundaries. The site is east of 215 Freeway and west of State Street.

The proposed school site was used primarily as pasture land from the early 1900s through the mid-1960s. The historic residence was constructed in the late 1940s near the southwestern portion of the proposed school site and was demolished prior to 2005. The site was historically used for pasture but based on a review of historic aerial photographs the site was used for irrigated agriculture during the mid to late 1960s.

1938 – The site is vacant undeveloped land with some trees located along Lyon Avenue. No structures are seen.

1953 – The residence is now seen located near the southwestern portion of the site. The remainder of the site appears relatively unchanged in comparison with the 1938 aerial photograph.

1967 - The southern area of the site appears to be irrigated agriculture. The trees along Lyon Avenue are no longer seen.

1980 - The site appears to no longer being used for agriculture. The remainder of the site appears relatively unchanged in comparison with the 1967 aerial photograph.

1989 - The site appears relatively unchanged in comparison to the 1980 aerial photograph.

2002 - The residential structure does not appear to be present. The site appears relatively unchanged in comparison to the 1989 aerial photograph.

2006 – The site appears relatively unchanged in comparison to the 2002 aerial photograph.

During the PEA, the Site soil was investigated for residual pesticides from historic agricultural use and possible termiticides and lead from lead-based paint near the former structure/residence.

Based on SSI Report review (approved on March 18, 2014) and a site visit that was conducted on November 6, 2013, a release or threatened release of hazardous material or the presence of a naturally occurring hazardous material, which would pose a threat to public health or the environment under unrestricted land use, was indicated at the Site. Therefore, DTSC concurs with the conclusion of the SSI Report that a response action for the Site is required and hereby approves the SSI Report. The response should include a Removal Action Workplan (RAW) to mitigate the Site for chlordane.

Per the e-mail response received from the District on July 31, 2014, the Site is put on hold until further notice.

04/10/2018: District sent letter, dated 04/10/18, requesting reactivation of Site in order to implement the response action for the Site.

DTSC is in the process of scheduling a Scoping meeting with the District and the consultant.

On April 11, 2018, the District notified DTSC of its intent to proceed with Site activity. Based on the SSI, a RAW was conducted at the Site. The RAW was approved by DTSC on September 5, 2018, which proposed excavation and offsite disposal of impacted soil. The Removal Action Completion Report (RACR) describes the remediation of chlordane impacted soil at the Site. A total of approximately 140 cubic yards of impacted soil was excavated from the Site.

DTSC processed Certification of the Site on January 21, 2020

Unplottable Summary

Total: 0 Unplottable sites

DB	Company Name/Site Name	Address	City	Zip	ERIS ID

No unplottable records were found that may be relevant for the search criteria.

Unplottable Report

No unplottable records were found that may be relevant for the search criteria.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13 and E1527-21, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Standard Environmental Record Sources

Federal

National Priority List: NPL

The U.S. Environmental Protection Agency (EPA)'s National Priorities List (NPL) includes the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program, based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action. This data includes NPL sites represented as polygons, where available, that can be sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS), and is limited to those sites where the NPL Status reflects the site is 'Currently on the Final NPL (F)' and/or the 'Site is Part of NPL Site (A)'. These site boundaries represent the footprint of a whole site, the sum of all the Operable Units (OUs) and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. As site investigation and remediation progress, OUs may be added, modified or refined. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Sep 6, 2025

National Priority List - Proposed: PROPOSED NPL

Sites proposed by the U.S. Environmental Protection Agency (EPA), the state agency, or concerned citizens for addition to the National Priorities List (NPL) due to contamination by hazardous waste and identified by the EPA as a candidate for cleanup because it poses a risk to human health and/or the environment. Sites represented as polygons, where available, can be sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS). These site boundaries represent the footprint of a whole site, the sum of all the Operable Units (OUs) and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Sep 6, 2025

Deleted NPL: DELETED NPL

Sites deleted from the U.S. Environmental Protection Agency (EPA)'s National Priorities List (NPL). The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. Sites represented as polygons, where available, can be sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS). These site boundaries represent the footprint of a whole site, the sum of all the Operable Units (OUs) and the current understanding of the full extent of contamination; for Federal Facility sites, the total site polygon may be the Facility boundary. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Sep 6, 2025

SEMS List 8R Active Site Inventory: SEMS

The U.S. Environmental Protection Agency's (EPA) Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted. This data includes SEMS sites from the List 8R Active file as well as applicable sites from the EPA's Facility Registry Service map tool. This data may also include applicable sites represented as polygons sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS), and is limited to those sites where the NPL Status reflects the site is 'Not on the NPL (N)' , 'Removed from Proposed (R)', and/or 'Pre-Proposal Site (S)'. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Aug 27, 2025

Inventory of Open Dumps, June 1985: ODI

The Resource Conservation and Recovery Act (RCRA) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

Government Publication Date: Jun 1985

SEMS List 8R Archive Sites: SEMS ARCHIVE

The U.S. Environmental Protection Agency's (EPA) Superfund Enterprise Management System (SEMS) Archived Site Inventory displays site and location information at sites archived from SEMS. An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. This data includes sites from the List 8R Archived site file. This data may also include applicable sites represented as polygons sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS), and is limited to those sites where the NPL Status reflects the site is 'Not on the NPL (N)' , 'Removed from Proposed (R)', and/or 'Pre-Proposal Site (S)'. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes. Where there is no polygon boundary data available for a given site, the site is represented as a point.

Government Publication Date: Aug 27, 2025

Comprehensive Environmental Response, Compensation and Liability Information System - CERCLIS: CERCLIS

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

Government Publication Date: Oct 25, 2013

EPA Report on the Status of Open Dumps on Indian Lands: IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

CERCLIS - No Further Remedial Action Planned: CERCLIS NFRAP

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens: CERCLIS LIENS

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA). This database was provided by the United States Environmental Protection Agency (EPA). Refer to SEMS LIEN as the current data source for Superfund Liens.

Government Publication Date: Jan 30, 2014

RCRA CORRACTS-Corrective Action: RCRA CORRACTS

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. At these sites, the Corrective Action Program ensures that cleanups occur. EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

Government Publication Date: Nov 30, 2025

RCRA non-CORRACTS TSD Facilities: RCRA TSD

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. This database includes Non-Corrective Action sites that have indicated engagement in the treatment, storage, or disposal of hazardous waste which requires a RCRA hazardous waste permit.

Government Publication Date: Nov 30, 2025

RCRA Generator List: RCRA LQG

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Large Quantity Generators (LQGs) generate 1,000 kilograms per month or more of hazardous waste or more than one kilogram per month of acutely hazardous waste. This list also includes RCRAInfo sites that have notified as LQGs that do not have a registered Site Manager or Certifier in RCRAInfo.

Government Publication Date: Nov 30, 2025

RCRA Small Quantity Generators List: RCRA SQG

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Small Quantity Generators (SQGs) generate more than 100 kilograms, but less than 1,000 kilograms, of hazardous waste per month. This list also includes RCRAInfo sites that have notified as SQGs that do not have a registered Site Manager or Certifier in RCRAInfo.

Government Publication Date: Nov 30, 2025

RCRA Very Small Quantity Generators List: RCRA VSQG

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Very Small Quantity Generators (VSQG) generate 100 kilograms or less per month of hazardous waste, or one kilogram or less per month of acutely hazardous waste. Additionally, VSQG may not accumulate more than 1,000 kilograms of hazardous waste at any time.

Government Publication Date: Nov 30, 2025

RCRA Non-Generators: RCRA NON GEN

RCRA Info is the U.S. Environmental Protection Agency's (EPA) comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Non-Generators do not presently generate hazardous waste.

Government Publication Date: Nov 30, 2025

RCRA Sites with Controls: RCRA CONTROLS

List of Resource Conservation and Recovery Act (RCRA) facilities with institutional controls in place. RCRA gives the U.S. Environmental Protection Agency (EPA) the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA also set forth a framework for the management of non-hazardous solid wastes. The 1986 amendments to RCRA enabled EPA to address environmental problems that could result from underground tanks storing petroleum and other hazardous substances.

Government Publication Date: Nov 30, 2025

Federal Engineering Controls-ECs: FED ENG

List of Engineering controls (ECs) made availabe by the United States Environmental Protection Agency (EPA). ECs encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. The EC listing includes remedy component data from Superfund decision documents for applicable sites on the final or deleted on the National Priorities List (NPL); and sites with a Superfund Alternative Approach (SAA) Agreement in place. The only sites included that are not on the NPL; proposed for NPL; or removed from proposed NPL, are those with an SAA Agreement in place.

Government Publication Date: Nov 28, 2025

Federal Institutional Controls- ICs: FED INST

List of Institutional controls (ICs) made available by the United States Environmental Protection Agency (EPA). ICs are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site. The IC listing includes remedy component data from Superfund decision documents for applicable sites on the final or deleted on the National Priorities List (NPL); and sites with a Superfund Alternative Approach (SAA) Agreement in place. The only sites included that are not on the NPL; proposed for NPL; or removed from proposed NPL, are those with an SAA Agreement in place.

Government Publication Date: Nov 28, 2025

Land Use Controls Information System: LUCIS

The Land Use Controls Information System (LUCIS) database is sourced from the U.S. Department of the Navy (DON). This data contains information for former Base Realignment and Closure (BRAC) properties across the United States. DON's BRAC office was tasked with tracking certain base closures while requiring the prevention of risks to human health and the environment of those properties with LUCs in place. Regarding currently available LUC Sites data, the sites listing is limited to centroid point locations for the overall installation property boundaries. Formerly obtained LUC Sites data may reflect site details that applied previously for a BRAC property.

Government Publication Date: Jun 13, 2024

Institutional Control Boundaries at NPL sites: NPL IC

These boundaries of Institutional Control areas at sites on the U.S. Environmental Protection Agency's (EPA) National Priorities List (NPL), or as Proposed or Deleted, are sourced from the EPA NPL Superfund Site Boundaries dataset, refreshed by the Shared Enterprise Geodata and Services (SEGS). The EPA's NPL includes the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. Institutional controls are non-engineered instruments such as administrative and legal controls that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Data provided by external parties is not independently verified by EPA. This boundary data is made available to the public strictly for informational purposes.

Government Publication Date: Sep 6, 2025

Emergency Response Notification System: ERNS 1982 TO 1986

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1982-1986

Emergency Response Notification System: ERNS 1987 TO 1989

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1987-1989

Emergency Response Notification System: ERNS

Database of oil and hazardous substances spill reports made available by the United States Coast Guard National Response Center (NRC). The NRC fields initial reports for pollution and railroad incidents and forwards that information to appropriate federal/state agencies for response. These data contain initial incident data that has not been validated or investigated by a federal/state response agency.

Government Publication Date: Sep 7, 2025

The Assessment, Cleanup and Redevelopment Exchange System (ACRES) Brownfield Database: FED BROWNFIELDS

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands. This data is provided by the United States Environmental Protection Agency (EPA) and includes Brownfield sites from the Cleanups in My Community (CIMC) web application.

Government Publication Date: Sep 8, 2025

FEMA Underground Storage Tank Listing: FEMA UST

The Federal Emergency Management Agency (FEMA) of the Department of Homeland Security maintains a list of FEMA owned underground storage tanks.

Government Publication Date: Dec 31, 2017

Facility Response Plan: FRP

This listing contains facilities that have submitted Facility Response Plans (FRPs) to the U.S. Environmental Protection Agency (EPA). Facilities that could reasonably be expected to cause "substantial harm" to the environment by discharging oil into or on navigable waters are required to prepare and submit FRPs. Harm is determined based on total oil storage capacity, secondary containment and age of tanks, oil transfer activities, history of discharges, proximity to a public drinking water intake or sensitive environments. The list includes FRP facilities sourced from the EPA FOIA office and from previously available Homeland Infrastructure Foundation-Level Data (HIFLD) file/s. Disclaimer: Per the EPA FOIA Office, the verification process for current requested FRP data is undergoing review and revision, and any similar reporting will be made public in Fiscal Year 2026. For this reason, the latest available FOIA file may be incomplete.

Government Publication Date: Jun 1, 2025

Delisted Facility Response Plans: DELISTED FRP

Facilities that once appeared in - and have since been removed from - the list of facilities that have submitted Facility Response Plans (FRP) to EPA. Facilities that could reasonably be expected to cause "substantial harm" to the environment by discharging oil into or on navigable waters are required to prepare and submit Facility Response Plans (FRPs). Harm is determined based on total oil storage capacity, secondary containment and age of tanks, oil transfer activities, history of discharges, proximity to a public drinking water intake or sensitive environments.

Government Publication Date: Jun 1, 2025

Historical Gas Stations: HIST GAS STATIONS

This historic directory of service stations is provided by the Cities Service Company. The directory includes Cities Service filling stations that were located throughout the United States in 1930.

Government Publication Date: Jul 1, 1930

Petroleum Refineries: REFN

This list of petroleum refineries is sourced from the U.S. Energy Information Administration (EIA), Refinery Capacity Report. The listing includes operating and idle petroleum refineries (including new refineries under construction) and refineries shut down during the previous year. The geographic area the report covers is the 50 States, the District of Columbia, Puerto Rico, the U.S. Virgin Islands, Guam, and other U.S. possessions. Per the EIA, the facility location data represents the approximate location based on research of publicly available information from sources such as Federal agencies, company websites, and satellite images on public websites.

Government Publication Date: Oct 31, 2024

Petroleum Product and Crude Oil Rail Terminals: BULK TERMINAL

A list of petroleum product and crude oil rail terminals from the U.S. Energy Information Administration (EIA), as well as petroleum terminals sourced from Oak Ridge National Laboratory hosted by the Homeland Infrastructure Foundation-Level Database. Data includes operable bulk petroleum product terminals with a total bulk shell storage capacity of 50,000 barrels or more, and/or the ability to receive volumes from tanker, barge, or pipeline; also rail terminals handling the loading and unloading of crude oil with activity between 2017 and 2018. EIA petroleum product terminal data comes from the EIA-815 Bulk Terminal and Blender Report, which includes working, shell in operation, and shell idle for several major product groupings.

Government Publication Date: Jun 5, 2025

LIEN on Property: SEMS LIEN

The U.S. Environmental Protection Agency's (EPA) Superfund Enterprise Management System (SEMS) provides Lien details on applicable properties, such as the Superfund lien on property activity, the lien property information, and the parties associated with the lien.

Government Publication Date: Aug 27, 2025

Superfund Decision Documents: SUPERFUND ROD

This database contains a list of decision documents for Superfund sites. Decision documents serve to provide the reasoning for the choice of (or) changes to a Superfund Site cleanup plan. The decision documents include completed Records of Decision (ROD), ROD Amendments, Explanations of Significant Differences (ESD) for active and archived sites stored in the Superfund Enterprise Management System (SEMS), along with other associated memos and files. This information is maintained and made available by the U.S. Environmental Protection Agency.

Government Publication Date: Oct 30, 2025

State

State Response Sites: RESPONSE

A list of identified confirmed release sites where the Department of Toxic Substances Control (DTSC) is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk. This database serves a purpose similar to that of the federal NPL, functioning as a state-level counterpart for prioritizing cleanup efforts at hazardous substance release sites.

Government Publication Date: Oct 2, 2025

EnviroStor Database: ENVIROSTOR

The EnviroStor Data Management System is made available by the Department of Toxic Substances Control (DTSC). Includes Corrective Action sites, Tiered Permit sites, Historical Sites and Evaluation/Investigation sites. This database serves a purpose similar to that of the federal Superfund Enterprise Management System (SEMS), functioning as a state-level counterpart for tracking potential hazardous substance release sites.

Government Publication Date: Oct 2, 2025

Delisted State Response Sites: DELISTED ENVS

Sites removed from the list of State Response Sites made available by the EnviroStor Data Management System, Department of Toxic Substances Control (DTSC).

Government Publication Date: Oct 2, 2025

Solid Waste Information System (SWIS): SWF/LF

The Solid Waste Information System (SWIS) database made available by the Department of Resources Recycling and Recovery (CalRecycle) contains information on solid waste facilities, operations, and disposal sites throughout the State of California. The types of facilities found in this database include landfills, transfer stations, material recovery facilities, composting sites, transformation facilities, waste tire sites, and closed disposal sites.

Government Publication Date: Nov 30, 2025

Solid Waste Disposal Sites with Waste Constituents Above Hazardous Waste Levels: SWRCB SWF

This is a list of solid waste disposal sites identified by California State Water Resources Control Board with waste constituents above hazardous waste levels outside the waste management unit.

Government Publication Date: Sep 20, 2006

Waste Management Unit Database: WMUD

The Waste Management Unit Database System tracks and inventories waste management units. CCR Title 27 contains criteria stating that Waste Management Units are classified according to their ability to contain wastes. Containment shall be determined by geology, hydrology, topography, climatology, and other factors relating to the ability of the Unit to protect water quality. Water Code Section 13273.1 requires that operators submit a water quality solid waste assessment test (SWAT) report to address leak status. The WMUDS was last updated by the State Water Resources control board in 2000.

Government Publication Date: Jan 1, 2000

EnviroStor Hazardous Waste Facilities: HWP

A list of hazardous waste facilities including permitted, post-closure and historical facilities found in the Department of Toxic Substances Control (DTSC) EnviroStor database.

Government Publication Date: Oct 2, 2025

Sites Listed in the Solid Waste Assessment Test (SWAT) Program Report: SWAT

In a 1993 Memorandum of Understanding, the State Water Resources Control Board (SWRCB) agreed to submit a comprehensive report on the Solid Waste Assessment Test (SWAT) Program to the California Integrated Waste Management Board (CIWMB). This report summarizes the work completed to date on the SWAT Program, and addresses both the impacts that leakage from solid waste disposal sites (SWDS) may have upon waters of the State and the actions taken to address such leakage.

Government Publication Date: Dec 31, 1995

Construction and Demolition Debris Recyclers: C&D DEBRIS RECY

This listing of Construction and Demolition Debris Recyclers is maintained by the California Intergrated Waste Management Board-common C&D materials include lumber, drywall, metals, masonry (brick, concrete, etc.), carpet, plastic, pipe, rocks, dirt, paper, cardboard, or green waste related to land development.

Government Publication Date: Jun 20, 2018

Recycling Centers: RECYCLING

This list of Certified Recycling Centers that are operating under the state of California's Beverage Container Recycling Program is maintained by the California Department of Resources Recycling and Recovery.

Government Publication Date: Nov 16, 2025

Listing of Certified Processors: PROCESSORS

This list of Certified Processors that are operating under the state of California's Beverage Container Recycling Program is maintained by the California Department of Resources Recycling and Recovery.

Government Publication Date: Nov 16, 2025

Listing of Certified Dropoff, Collection, and Community Service Programs: CONTAINER RECY

This list of Certified Dropoff, Collection, and Community Service Programs (non-buyback) operating under the state of California's Beverage Container Recycling Program is maintained by the California Department of Resources Recycling and Recovery.

Government Publication Date: Jul 18, 2025

Land Disposal Sites: LDS

Land Disposal Sites in GeoTracker, the State Water Resources Control Board (SWRCB)'s data management system. The Land Disposal program regulates of waste discharge to land for treatment, storage and disposal in waste management units. Waste management units include waste piles, surface impoundments, and landfills.

Government Publication Date: Aug 11, 2025

Leaking Underground Fuel Tank Reports: LUST

List of Leaking Underground Storage Tanks within the Cleanup Sites data in GeoTracker database. GeoTracker is the State Water Resources Control Board's (SWRCB) data management system for managing sites that impact groundwater, especially those that require groundwater cleanup (Underground Storage Tanks, Department of Defense and Site Cleanup Program) as well as permitted facilities such as operating Underground Storage Tanks. The Leak Prevention Program that overlooks LUST sites is the SWRCB in California's Environmental Protection Agency.

Government Publication Date: Aug 11, 2025

Delisted Leaking Storage Tanks: DELISTED LST

List of Leaking Underground Storage Tanks (LUST) cleanup sites removed from GeoTracker, the State Water Resources Control Board (SWRCB)'s database system, as well as sites removed from the SWRCB's list of UST Case closures.

Government Publication Date: Oct 3, 2025

Permitted Underground Storage Tank (UST) in GeoTracker: UST

List of Permitted Underground Storage Tank (UST) sites made available by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency (EPA).

Government Publication Date: Nov 17, 2025

Proposed Closure of Underground Storage Tank Cases: UST CLOSURE

This listing includes Proposed Closure of Underground Storage Tank (UST) Cases which are being considered for closure by either the State Water Resources Control Board at a Future Board Meeting or the Executive Director that have been posted for a 60-day public comment period, and Closure of UST Cases with Closure Denials and Approved Orders. The lists are provided by the California Water Boards.

Government Publication Date: Oct 3, 2025

Historical Hazardous Substance Storage Information Database: HHSS

The Historical Hazardous Substance Storage database contains information collected in the 1980s from facilities that stored hazardous substances. The information was originally collected on paper forms, was later transferred to microfiche, and recently indexed as a searchable database. When using this database, please be aware that it is based upon self-reported information submitted by facilities which has not been independently verified. It is unlikely that every facility responded to the survey and the database should not be expected to be a complete inventory of all facilities that were operating at that time. This database is maintained by the California State Water Resources Control Board's (SWRCB) Geotracker.

Government Publication Date: Aug 27, 2015

Statewide Environmental Evaluation and Planning System: UST SWEEPS

The Statewide Environmental Evaluation and Planning System (SWEEPS) is a historical listing of active and inactive underground storage tanks made available by the California State Water Resources Control Board (SWRCB).

Government Publication Date: Oct 1, 1994

Aboveground Storage Tanks: AST

A statewide list from 2009 of aboveground storage tanks (ASTs) made available by the Cal FIRE Office of the State Fire Marshal (OSFM). This list is no longer maintained or updated by the Cal FIRE OSFM.

Government Publication Date: Aug 31, 2009

SWRCB Historical Aboveground Storage Tanks: AST SWRCB

A list of aboveground storage tanks made available by the California State Water Resources Control Board (SWRCB). Effective January 1, 2008, the Certified Unified Program Agencies (CUPAs) are vested with the responsibility and authority to implement the Aboveground Petroleum Storage Act (APSA).

Government Publication Date: Dec 1, 2007

Oil and Gas Facility Tanks: TANK OIL GAS

Locations of oil and gas tanks that fall under the jurisdiction of the Geologic Energy Management Division of the California Department of Conservation (CalGEM) (CCR 1760). CalGEM was formerly the Division of Oil, Gas, and Geothermal Resources (DOGGR).

Government Publication Date: Nov 4, 2025

Delisted Storage Tanks: DELISTED TNK

This database contains a list of storage tank sites that were removed by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency (EPA) and the Cal FIRE Office of State Fire Marshal (OSFM).

Government Publication Date: Nov 17, 2025

California Environmental Reporting System (CERS) Tanks: CERS TANK

List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the Aboveground Petroleum Storage and Underground Storage Tank regulatory programs. The CalEPA oversees the statewide implementation of the Unified Program which applies regulatory standards to protect Californians from hazardous waste and materials. This data also includes military underground storage tank sites sourced from the CalEPA's Water Boards' GeoTracker system.

Government Publication Date: Jan 12, 2026

Delisted California Environmental Reporting System (CERS) Tanks: DELISTED CTNK

This database contains a list of Aboveground Petroleum Storage and Underground Storage Tank sites that were removed from in the California Environmental Protection Agency (CalEPA) Regulated Site Portal.

Government Publication Date: Jan 12, 2026

Historical Hazardous Substance Storage Container Information - Facility Summary: HIST TANK

The State Water Resources Control Board maintained the Hazardous Substance Storage Containers listing and inventory in th 1980s. This facility summary lists historic tank sites where the following container types were present: farm motor vehicle fuel tanks; waste tanks; sumps; pits, ponds, lagoons, and others; and all other product tanks. This set, published in May 1988, lists facility and owner information, as well as the number of containers. This data is historic and will not be updated.

Government Publication Date: May 27, 1988

Site Mitigation and Brownfields Reuse Program Facility Sites with Land Use Restrictions: LUR

The Department of Toxic Substances Control (DTSC) Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents land use restrictions that are active. Some sites have multiple land use restrictions.

Government Publication Date: Oct 2, 2025

CALSITES Database: CALSITES

This historical database was maintained by the Department of Toxic Substance Control (DTSC) for more than a decade. CALSITES contains information on Brownfield properties with confirmed or potential hazardous contamination. In 2006, DTSC introduced EnviroStor as the latest Brownfields site database.

Government Publication Date: May 1, 2004

Hazardous Waste Management Program Facility Sites with Deed / Land Use Restrictions: HLUR

The Department of Toxic Substances Control (DTSC) Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Government Publication Date: Feb 18, 2021

Deed Restrictions and Land Use Restrictions: DEED

List of Deed Restrictions, Land Use Restrictions and Covenants in GeoTracker made available by the State Water Resources Control Board (SWRCB) in California's Environmental Protection Agency. A deed restriction (land use covenant) may be required to facilitate the remediation of past environmental contamination and to protect human health and the environment by reducing the risk of exposure to residual hazardous materials.

Government Publication Date: Sep 13, 2025

Voluntary Cleanup Program: VCP

List of sites in the Voluntary Cleanup Program made available by the Department of Toxic Substances and Control (DTSC). The Voluntary Cleanup Program was designed to respond to lower priority sites. Under the Voluntary Cleanup Program, DTSC enters site-specific agreements with project proponents for DTSC oversight of site assessment, investigation, and/or removal or remediation activities, and the project proponents agree to pay DTSC's reasonable costs for those services.

Government Publication Date: Oct 2, 2025

GeoTracker Cleanup Program Sites: CLEANUP SITES

A list of Cleanup Program sites in the state of California made available by The State Water Resources Control Board (SWRCB) of the California Environmental Protection Agency (EPA). SWRCB tracks leaking underground storage tank cleanups as well as other water board cleanups.

Government Publication Date: Aug 11, 2025

Delisted Cleanup Program Sites: DELISTED CLEANUP

A list of Cleanup Program sites which were once included - and have since been removed from - the list of Cleanup Program Sites in GeoTracker. GeoTracker is the State Water Resource Control Boards' data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

Government Publication Date: Sep 13, 2025

Delisted County Records: DELISTED COUNTY

Records removed from county or CUPA databases. Records may be removed from the county lists made available by the respective county departments because they are inactive, or because they have been deemed to be below reportable thresholds.

Government Publication Date: Jan 12, 2026

Delisted County Tanks: DELISTED COUNTY TANK

Storage Tank records removed from county or CUPA databases. Records may be removed from the county lists made available by the respective county departments because they are inactive, or because they have been deemed to be below reportable thresholds.

Government Publication Date: Dec 23, 2025

Delisted County Leaking Tanks: DELISTED COUNTY LTANK

Leaking Storage tank records removed from county or CUPA databases.

Government Publication Date: Dec 3, 2025

Tribal

Leaking Underground Storage Tanks on Tribal/Indian Lands: INDIAN LUST

This list of leaking underground storage tanks (LUSTs) on Tribal/Indian Lands in Region 9, which includes California, is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Nov 21, 2025

Underground Storage Tanks on Tribal/Indian Lands: INDIAN UST

This list of underground storage tanks (USTs) on Tribal/Indian Lands in Region 9, which includes California, is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Nov 21, 2025

Delisted Tribal Leaking Storage Tanks: DELISTED INDIAN LST

Leaking Underground Storage Tank (LUST) facilities which once appeared on - and have since been removed from - the Regional Tribal/Indian LUST lists made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Nov 21, 2025

Delisted Tribal Underground Storage Tanks: DELISTED INDIAN UST

Underground Storage Tank (UST) facilities which once appeared on - and have since been removed from - the Regional Tribal/Indian UST lists made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Nov 21, 2025

County

Riverside County - Local Oversight Program List: LOP RIVERSIDE

A list of Leaking Underground Storage Tank (LUST) facilities in Riverside County. This list is made available by Riverside County Department of Environmental Health. Environmental Cleanup Program provides oversight of assessments and cleanups at properties that have been, or may have been, contaminated with hazardous substances from LUSTs or releases associated with other commercial/industrial use.

Government Publication Date: Feb 6, 2024

Riverside County - Underground Storage Tanks List: UST RIVERSIDE

A list of registered Underground Storage Tank (UST) sites in Riverside County. This list is made available by Riverside County Department of Environmental Health. The Hazardous Materials Management Branch (HMMB) regulates and oversees the inspections of constructions, repairs, upgrades, system operation and removal of UST systems.

Government Publication Date: Oct 1, 2025

Additional Environmental Record Sources

Federal

PFAS Greenhouse Gas Emissions Data: PFAS GHG

The U.S. Environmental Protection Agency's (EPA) Greenhouse Gas Reporting Program (GHGRP) collects Greenhouse Gas (GHG) data from large emitting facilities (25,000 metric tons of carbon dioxide equivalent (CO2e) per year), and suppliers of fossil fuels and industrial gases that results in GHG emissions when used. This dataset is sourced from the EPA's PFAS Analytic Tools, and it includes GHG emissions data for facilities that emit or have emitted since 2010 chemicals identified as PFAS based on EPA's CompTox Chemicals Dashboard lists of PFAS with defined and undefined structures. PFAS emissions data has been identified for facilities engaged in the following industrial processes: Aluminum Production (GHGRP Subpart F), HCFC-22 Production and HFC-23 Destruction (Subpart O), Electronics Manufacturing (Subpart I), Fluorinated Gas Production (Subpart L), Magnesium Production (Subpart T), Electrical Transmission and Distribution Equipment Use (Subpart DD), and Manufacture of Electric Transmission and Distribution Equipment (Subpart SS). Over time, other industrial processes with required GHGRP reporting may include PFAS emissions data and the list of reportable gases may change over time. Note that some regulatory programs have specified chemical structure requirements that define PFAS differently than the lists in EPA's CompTox Chemicals Dashboard.

Government Publication Date: Oct 7, 2025

On-Scene Coordinator Response Sites: OSC RESPONSE

This list of On-Scene Coordinator (OSC) Response Sites is provided by the U.S. Environmental Protection Agency (EPA). OSCs are the federal officials responsible for monitoring or directing responses to all oil spills and hazardous substance releases reported to the federal government. OSCs coordinate all federal efforts with, and provide support and information to local, state, and regional response communities. An OSC is an agent of either EPA or the U.S. Coast Guard (USCG), depending on where the incident occurs. EPA's OSCs have primary responsibility for spills and releases to inland areas and waters. USCG OSCs have responsibility for coastal waters and the Great Lakes. In general, an OSC has the following key responsibilities during and after a response: Assessment, Monitoring, Response Assistance, and Evaluation.

Government Publication Date: Oct 8, 2025

Facility Registry Service/Facility Index: FINDS/FRS

The Facility Registry Service (FRS) is a centrally managed database that identifies facilities, sites, or places subject to environmental regulations or of environmental interest. FRS creates high-quality, accurate, and authoritative facility identification records through rigorous verification and management procedures that incorporate information from program national systems, state master facility records, and data collected from EPA's Central Data Exchange registrations and data management personnel. This list is made available by the U.S. Environmental Protection Agency (EPA).

Government Publication Date: Oct 10, 2025

Toxics Release Inventory (TRI) Program: TRIS

The U.S. Environmental Protection Agency's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of toxic chemicals from U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment. There are currently 770 individually listed chemicals and 33 chemical categories covered by the TRI Program. Facilities that manufacture, process or otherwise use these chemicals in amounts above established levels must submit annual reporting forms for each chemical. Note that the TRI chemical list does not include all toxic chemicals used in the U.S. One of TRI's primary purposes is to inform communities about toxic chemical releases to the environment. This database includes TRI Reporting Data for calendar years 1987 through 2021 and Preliminary Data for 2022.

Government Publication Date: Sep 20, 2023

PFOA/PFOS Contaminated Sites: PFAS NPL

This list of Superfund Sites with Per- and Polyfluoroalkyl Substances (PFAS) detections is made available by the U.S. Environmental Protection Agency (EPA) in their PFAS Analytic Tools data, previously the list was obtained by EPA FOIA requests. EPA's Office of Land and Emergency Management and EPA Regional Offices maintain what is known about site investigations, contamination, and remedial actions under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) where PFAS is present in the environment. Limitations: Detections of PFAS at National Priorities List (NPL) sites do not mean that people are at risk from PFAS, are exposed to PFAS, or that the site is the source of the PFAS. The information in the Superfund NPL and Superfund Alternative Agreement (SAA) PFAS detection site list is years old and may not be accurate today. Site information such as site name, site ID, and location has been confirmed for accuracy; however, PFAS-related information such as media sampled, drinking water being above the health advisory, or mitigation efforts has not been verified. For Federal Facilities data, the other Federal agencies (OFA) are the lead agency for their data and provided them to EPA.

Government Publication Date: Dec 29, 2025

Federal Agency Locations with Known or Suspected PFAS Detections: PFAS FED SITES

This list of federal agency locations with known or suspected detections of Per- and Polyfluoroalkyl Substances (PFAS) is made available by the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools data. The EPA outlines that these data are gathered from several federal entities, such as the federal Superfund program, Department of Defense (DOD), National Aeronautics and Space Administration (NASA), Department of Transportation (DOT), and Department of Energy (DOE). The dates this data was extracted for the PFAS Analytic Tools range from 2022 to 2025 per agency entity dataset. Sites on this list do not necessarily reflect the source/s of PFAS contamination and detections do not indicate level of risk or human exposure at the site. Agricultural notifications in this data are limited to DOD sites only. At this time, the EPA is aware that this list is not comprehensive of all Federal agencies.

Government Publication Date: May 30, 2025

SSEHRI PFAS Contamination Sites: PFAS SSEHRI

This PFAS Contamination Site Tracker database is compiled by the PFAS Project Lab, part of the Social Science Environmental Health Research Institute (SSEHRI) at Northeastern University. According to the SSEHRI, the database records qualitative and quantitative data from each known site of PFAS contamination, including timeline of discovery, sources, levels, health impacts, community response, and government response. The goal of this database is to compile information and support public understanding of the rapidly unfolding issue of PFAS contamination. All data presented was extracted from government websites, news articles, or publicly available documents. Locations for the Known PFAS Contamination Sites are sourced from the PFAS Sites and Community Resources Map by the PFAS-REACH team, credited to PFAS Project Lab, Silent Spring Institute, and PFAS Exchange. Disclaimer: The source conveys the data undergoes regular updates as new information becomes available, some sites may be missing and/or contain information that is incorrect or outdated, as well as their information represents all contamination sites SSEHRI is aware of, not all possible contamination sites. This data is not intended to be used for legal purposes. Access the following source link for the most current information: https://pfasproject.com/pfas-sites-and-community-resources/

Government Publication Date: Aug 1, 2025

National Response Center PFAS Spills: PFAS ERNS

This Per- and Poly-Fluoroalkyl Substances (PFAS) Spills dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The National Response Center (NRC), operated by the U.S. Coast Guard, is the designated federal point of contact for reporting all oil, chemical, and other discharges into the environment, for the United States and its territories. This dataset contains NRC spill information from 1990 to the present that is restricted to records associated with PFAS and PFAS-containing materials. Incidents are filtered to include only records with a "Material Involved" or "Incident Description" related to Aqueous Film Forming Foam (AFFF). The keywords used to filter the data included "AFFF," "Fire Fighting Foam," "Aqueous Film Forming Foam," "Fire Suppressant Foam, "PFAS," "PERFL," "PFOA," "PFOS," and "Genx." Limitations: The data from the NRC website contains initial incident data that has not been validated or investigated by a federal/state response agency. Keyword searches may misidentify some incident reports that do not contain PFAS. This dataset should also not be considered to be exhaustive of all PFAS spills/release incidents.

Government Publication Date: Dec 1, 2025

PFAS NPDES Discharge Monitoring: PFAS NPDES

This list of National Pollutant Discharge Elimination System (NPDES) permitted facilities with required monitoring for Per- and Polyfluoroalkyl (PFAS) Substances is made available via the U.S. Environmental Protection Agency (EPA)'s PFAS Analytic Tools. Any point-source wastewater discharger to waters of the United States must have a NPDES permit, which defines a set of parameters for pollutants and monitoring to ensure that the discharge does not degrade water quality or impair human health. This list includes NPDES permitted facilities associated with permits that monitor for Per- and Polyfluoroalkyl Substances (PFAS), limited to the years 2007 - present. EPA further advises the following regarding these data: currently, fewer than half of states have required PFAS monitoring for at least one of their permittees, and fewer states have established PFAS effluent limits for permittees. For states that may have required monitoring, some reporting and data transfer issues may exist on a state-by-state basis.

Government Publication Date: Dec 16, 2024

Perfluorinated Alkyl Substances (PFAS) from Toxic Release Inventory: PFAS TRI

List of Toxics Release Inventory (TRI) facilities at which the reported chemical is a per- or polyfluoroalkyl (PFAS) substance included in the U.S. Environmental Protection Agency's (EPA) consolidated PFAS Master List of PFAS Substances. Encompasses Toxics Release Inventory records included in the EPA PFAS Analytic Tools. The EPA's TRI database currently tracks information on disposal or releases of 770 individually listed toxic chemicals and 33 chemical categories from thousands of U.S. facilities and details about how facilities manage those chemicals through recycling, energy recovery, and treatment. This listing includes TRI Reporting Data for calendar years 1987 through 2021 and Preliminary Data for 2022.

Government Publication Date: Sep 20, 2023

PFAS Water Quality Portal Sampling Data: PFAS WATER

This Per- and Poly-Fluoroalkyl Substances (PFAS) Environmental Media Sampling Data is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The Water Quality Portal (WQP), as a cooperative service sponsored by the United States Geological Survey, the EPA, and the National Water Quality Monitoring Council, is part of a modernized repository storing ambient sampling data for all environmental media and tissue samples. A wide range of federal, state, tribal and local governments, academic and non-governmental organizations, and individuals submit project details and sampling results to this public repository. Limitations: EPA did not carry out the sampling or testing of a majority of the data in the WQP PFAS dataset. EPA can only speak to the accuracy and completeness of the data from projects like the National Aquatic Resource Surveys for which EPA is the data owner/organization. Data may exist within the file on Quality Assurance Project Plans (QAPPs) and the approving agency of the QAPP, if a QAPP is entered.

Government Publication Date: Jul 21, 2025

PFAS TSCA Manufacture and Import Facilities: PFAS TSCA

The U.S. Environmental Protection Agency (EPA) issued the Chemical Data Reporting (CDR) Rule under the Toxic Substances Control Act (TSCA) and requires chemical manufacturers and facilities that manufacture or import chemical substances to report data to EPA. This list is specific only to TSCA Manufacture and Import Facilities with reported per- and poly-fluoroalkyl (PFAS) substances. Data file is sourced from EPA's PFAS Analytic Tools TSCA dataset which includes CDR/Inventory Update Reporting data from 1998 up to 2020. Disclaimer: This data file includes production and importation data for chemicals identified in EPA's CompTox Chemicals Dashboard list of PFAS without explicit structures and list of PFAS structures in DSSTox. Note that some regulations have specific chemical structure requirements that define PFAS differently than the lists in EPA's CompTox Chemicals Dashboard. Reporting information on manufactured or imported chemical substance amounts should not be compared between facilities, as some companies claim Chemical Data Reporting Rule data fields for PFAS information as Confidential Business Information.

Government Publication Date: Jan 5, 2023

PFAS Waste Transfers from RCRA e-Manifest: PFAS E-MANIFEST

This Per- and Poly-Fluoroalkyl Substances (PFAS) Waste Transfers dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. Every shipment of hazardous waste in the U.S. must be accompanied by a shipment manifest, which is a critical component of the cradle-to-grave tracking of wastes mandated by the Resource Conservation and Recovery Act (RCRA). According to the EPA, currently no Federal Waste Code exists for any PFAS compounds. To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: • PFAS • PFOA • PFOS • PERFL • AFFF • GENX • GEN-X (plus the Vermont state-specific waste codes). Limitations: Amount or concentration of PFAS being transferred cannot be determined from the manifest information. Keyword searches may misidentify some manifest records that do not contain PFAS. This dataset should also not be considered to be exhaustive of all PFAS waste transfers.

Government Publication Date: Nov 29, 2025

PFAS Industry Sectors: PFAS IND

This Per- and Poly-Fluoroalkyl Substances (PFAS) Industry Sectors dataset is made available via the U.S. Environmental Protection Agency's (EPA) PFAS Analytic Tools. The EPA developed the dataset from various sources that show which industries may be handling PFAS including: EPA's Enforcement and Compliance History Online (ECHO) records restricted to potential PFAS-handling industry sectors; ECHO records for Fire Training Sites identified where fire-fighting foam may have been used in training exercises; and 14 CFR Part 139 Airports compiled from historic and current records from the FAA Airport Data and Information Portal. Since July 2006, all certificated Part 139 Airports are required to have fire-fighting foam onsite that meet certain military specifications, which to date have been fluorinated (Aqueous Film Forming Foam). Limitations: Inclusion in this dataset does not indicate that PFAS are being manufactured, processed, used, or released by the facility. Listed facilities potentially handle PFAS based on their industrial profile, but are unconfirmed by the EPA. Keyword searches in ECHO for Fire Training sites may misidentify some facilities and should not be considered to be an exhaustive list of fire training facilities in the U.S.

Government Publication Date: Dec 1, 2025

Hazardous Materials Information Reporting System: HMIRS

The Hazardous Materials Incident Reporting System (HMIRS) database contains unintentional hazardous materials release information reported to the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration.

Government Publication Date: May 28, 2025

National Clandestine Drug Labs: NCDL

The U.S. Department of Justice ("the Department"), Drug Enforcement Administration (DEA), provides this data as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy.

Government Publication Date: Nov 30, 2023

Toxic Substances Control Act: TSCA

The U.S. Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule. The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI). EPA CDR collections occur approximately every four years and reporting requirements change per collection.

Government Publication Date: May 12, 2022

Hist TSCA: HIST TSCA

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.
The 2006 IUR data summary report includes information about chemicals manufactured or imported in quantities of 25,000 pounds or more at a single site during calendar year 2005. In addition to the basic manufacturing information collected in previous reporting cycles, the 2006 cycle is the first time EPA collected information to characterize exposure during manufacturing, processing and use of organic chemicals. The 2006 cycle also is the first time manufacturers of inorganic chemicals were required to report basic manufacturing information.

Government Publication Date: Dec 31, 2006

FTTS Administrative Case Listing: FTTS ADMIN

An administrative case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

FTTS Inspection Case Listing: FTTS INSP

An inspection case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

Potentially Responsible Parties List: PRP

Early in the site cleanup process, the U.S. Environmental Protection Agency (EPA) conducts a search to find the Potentially Responsible Parties (PRPs). The EPA looks for evidence to determine liability by matching wastes found at the site with parties that may have contributed wastes to the site. This listing contains PRPs, Noticed Parties, at sites in the EPA's Superfund Enterprise Management System (SEMS).

Government Publication Date: Dec 26, 2025

State Coalition for Remediation of Drycleaners Listing: SCRD DRYCLEANER

The State Coalition for Remediation of Drycleaners (SCRD) was established in 1998, with support from the U.S. Environmental Protection Agency (EPA) Office of Superfund Remediation and Technology Innovation. Coalition members are states with mandated programs and funding for drycleaner site remediation. Current members are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin. Since 2017, the SCRD no longer maintains this data, refer to applicable state source data where available.

Government Publication Date: Nov 08, 2017

Integrated Compliance Information System (ICIS): ICIS

The Integrated Compliance Information System (ICIS) database contains integrated enforcement and compliance information across most of U.S. Environmental Protection Agency's (EPA) programs. The vision for ICIS is to replace EPA's independent databases that contain enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions and a subset of the Permit Compliance System (PCS), which supports the National Pollutant Discharge Elimination System (NPDES). This information is maintained by the EPA Headquarters and at the Regional offices. A future release of ICIS will completely replace PCS and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities that support compliance and enforcement programs, including incident tracking, compliance assistance, and compliance monitoring.

Government Publication Date: Oct 18, 2025

Drycleaner Facilities: FED DRYCLEANERS

A list of drycleaner facilities from Enforcement and Compliance History Online (ECHO) data as made available by the U.S. Environmental Protection Agency (EPA), sourced from the ECHO Exporter file. This EPA source file tracks facilities that possess NAICS and SIC codes that classify businesses as drycleaner establishments.

Government Publication Date: Oct 18, 2025

Delisted Drycleaner Facilities: DELISTED FED DRY

List of sites which once appeared on - and have since been removed from - the list of drycleaner facilities included in Enforcement and Compliance History Online (ECHO) data as made available by the U.S. Environmental Protection Agency (EPA), sourced from the ECHO Exporter file. This EPA source file tracks facilities that possess NAICS and SIC codes that classify businesses as drycleaner establishments.

Government Publication Date: Oct 18, 2025

Formerly Used Defense Sites: FUDS

Formerly Used Defense Sites (FUDS) are properties that were formerly owned by, leased to, or otherwise possessed by and under the jurisdiction of the Secretary of Defense prior to October 1986, where the Department of Defense (DOD) is responsible for an environmental restoration. The FUDS Annual Report to Congress (ARC) is published by the U.S. Army Corps of Engineers (USACE). This data is compiled from the USACE's Geospatial FUDS data layers and Homeland Infrastructure Foundation-Level Data (HIFLD) FUDS dataset which applies to the Fiscal Year 2021 FUDS Inventory.

Government Publication Date: May 15, 2023

FUDS Munitions Response Sites: FUDS MRS

Boundaries of Munitions Response Sites (MRS), published with the Formerly Used Defense Sites (FUDS) Annual Report to Congress (ARC) by the U.S. Army Corps of Engineers (USACE). An MRS is a discrete location within a Munitions response area (MRA) that is known to require a munitions response. An MRA means any area on a defense site that is known or suspected to contain unexploded ordnance (UXO), discarded military munitions (DMM), or munitions constituents (MC). This data is compiled from the USACE's Geospatial MRS data layers and Homeland Infrastructure Foundation-Level Data (HIFLD) MRS dataset.

Government Publication Date: May 15, 2023

Former Military Nike Missile Sites: FORMER NIKE

This information was taken from report DRXTH-AS-IA-83A016 (Historical Overview of the Nike Missile System, 12/1984) which was performed by Environmental Science and Engineering, Inc. for the U.S. Army Toxic and Hazardous Materials Agency Assessment Division. The Nike system was deployed between 1954 and the mid-1970's. Among the substances used or stored on Nike sites were liquid missile fuel (JP-4); starter fluids (UDKH, aniline, and furfuryl alcohol); oxidizer (IRFNA); hydrocarbons (motor oil, hydraulic fluid, diesel fuel, gasoline, heating oil); solvents (carbon tetrachloride, trichloroethylene, trichloroethane, stoddard solvent); and battery electrolyte. The quantities of material a disposed of and procedures for disposal are not documented in published reports. Virtually all information concerning the potential for contamination at Nike sites is confined to personnel who were assigned to Nike sites. During deactivation most hardware was shipped to depot-level supply points. There were reportedly instances where excess materials were disposed of on or near the site itself at closure. There was reportedly no routine site decontamination.

Government Publication Date: Dec 2, 1984

PHMSA Pipeline Safety Flagged Incidents: PIPELINE INCIDENT

This list of flagged pipeline incidents is made available by the U.S. Department of Transportation (US DOT) Pipeline and Hazardous Materials Safety Administration (PHMSA). PHMSA regulations require incident and accident reports for five different pipeline system types. Accidents reported on hazardous liquid gravity lines (§195.13) and reporting-regulated-only hazardous liquid gathering lines (§195.15) and incidents reported on Type R gas gathering (§192.8(c)) are not included in the flagged incident file data.

Government Publication Date: Jul 10, 2025

Material Licensing Tracking System (MLTS): MLTS

A list of sites that store radioactive material subject to the Nuclear Regulatory Commission (NRC) licensing requirements. This list is maintained by the NRC. As of September 2016, the NRC no longer releases location information for sites. Site locations were last received in July 2016.

Government Publication Date: May 11, 2021

Historic Material Licensing Tracking System (MLTS) sites: HIST MLTS

A historic list of sites that have inactive licenses and/or removed from the Material Licensing Tracking System (MLTS). In some cases, a site is removed from the MLTS when the state becomes an "Agreement State". An Agreement State is a State that has signed an agreement with the Nuclear Regulatory Commission (NRC) authorizing the State to regulate certain uses of radioactive materials within the State.

Government Publication Date: Jan 31, 2010

Mines Master Index File: MINES

The Master Index File (MIF) is provided by the United States Department of Labor, Mine Safety and Health Administration (MSHA). This file, which was originally created in the 1970's, contained many Mine-IDs that were invalid. MSHA removes invalid IDs from the MIF upon discovery. MSHA applicable data includes the following: all Coal and Metal/Non-Metal mines under MSHA's jurisdiction since 1/1/1970; mine addresses for all mines in the database except for Abandoned mines prior to 1998 from MSHA's legacy system (addresses may or may not correspond with the physical location of the mine itself); violations that have been assessed penalties as a result of MSHA inspections beginning on 1/1/2000; and violations issued as a result of MSHA inspections conducted beginning on 1/1/2000.

Government Publication Date: Aug 8, 2025

Surface Mining Control and Reclamation Act Sites: SMCRA

This inventory of land and water impacted by past mining (primarily legacy coal mining operations) is maintained by the U.S. Department of the Interior's Office of Surface Mining Reclamation and Enforcement (OSMRE), as it provides information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). This inventory contains information on the type and extent of Abandoned Mine Land (AML) Problems, as well as information on the cost associated with the reclamation of those problems. The data is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed. Disclaimer: Per the OSMRE, States and tribes who enter their data into e-AMLIS (AML Inventory System) may truncate their latitude and longitude so the precise location of usually dangerous AMLs is not revealed in an effort to protect the public from searching for these AMLs, most of which are on private property. If more precise location information is needed, please contact the applicable state/tribe of interest.

Government Publication Date: Oct 30, 2025

Mineral Resource Data System: MRDS

The Mineral Resource Data System (MRDS) is a collection of reports describing metallic and nonmetallic mineral resources throughout the world. Included are deposit name, location, commodity, deposit description, geologic characteristics, production, reserves, resources, and references. This database contains the records previously provided in the Mineral Resource Data System (MRDS) of USGS and the Mineral Availability System/Mineral Industry Locator System (MAS/MILS) originated in the U.S. Bureau of Mines, which is now part of USGS. The USGS has ceased systematic updates of the MRDS database with their focus more recently on deposits of critical minerals while providing a well-documented baseline of historical mine locations from USGS topographic maps.

Government Publication Date: Mar 15, 2016

DOE Legacy Management Sites: LM SITES

The U.S. Department of Energy (DOE) Office of Legacy Management (LM) currently manages radioactive and chemical waste, environmental contamination, and hazardous material at over 100 sites across the U.S. The LM manages sites with diverse regulatory drivers (statutes or programs that direct cleanup and management requirements at DOE sites) or as part of internal DOE or congressionally-recognized programs, such as but not limited to: Formerly Utilized Sites Remedial Action Program (FUSRAP), Uranium Mill Tailings Radiation Control Act (UMTRCA Title I, Tile II), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Resource Conservation and Recovery Act (RCRA), Decontamination and Decommissioning (D&D), Nuclear Waste Policy Act (NWPA). The intent of the site location is to provide a general reference point to the site on a national scale. The coordinates of each site point can be the location of a site monument, the centroid of the site boundary, or a general location of the site. This site listing includes data exported from the DOE Office of LM's Geospatial Environmental Mapping System (GEMS). GEMS Data disclaimer: The DOE Office of LM makes no representation or warranty, expressed or implied, regarding the use, accuracy, availability, or completeness of the data presented herein.

Government Publication Date: Nov 6, 2025

Alternative Fueling Stations: ALT FUELS

This list of alternative fueling stations is sourced from the Alternative Fuels Data Center (AFDC). The U.S. Department of Energy's Office of Energy Efficiency & Renewable Energy launched the AFDC in 1991 as a repository for alternative fuel vehicle performance data, which provides a wealth of information and data on alternative and renewable fuels, advanced vehicles, fuel-saving strategies, and emerging transportation technologies. The data includes Biodiesel (B20 and above), Compressed Natural Gas (CNG), Electric, Ethanol (E85), Hydrogen, Liquefied Natural Gas (LNG), Propane (LPG), and Renewable Diesel (R20 and above) fuel type locations.

Government Publication Date: Aug 1, 2025

Superfunds Consent Decrees: CONSENT DECREES

This list of Superfund consent decrees is provided by the Department of Justice, Environment & Natural Resources Division (ENRD) through a Freedom of Information Act (FOIA) applicable file. This listing includes Cases filed since 2010 limited to the following: Consent Decrees for CERCLA or Superfund Sites filed and/or as proposed within the ENRD's Case Management System (CMS); and applicable ENRD's Environmental Defense Section (EDS) CERCLA Cases with "Consent" in History Note. CMS may not reflect the latest developments in a case, nor can the agency guarantee the accuracy of the data. ENRD Disclaimer: Congress excluded three discrete categories of law enforcement and national security records from the requirements of the FOIA; response is limited to those records that are subject to the requirements of the FOIA; however, this should not be taken as an indication that excluded records do, or do not, exist.

Government Publication Date: Jun 26, 2024

Air Facility System: AFS

This EPA retired Air Facility System (AFS) dataset contains emissions, compliance, and enforcement data on stationary sources of air pollution. Regulated sources cover a wide spectrum; from large industrial facilities to relatively small operations such as dry cleaners. AFS does not contain data on facilities that are solely asbestos demolition and/or renovation contractors, or landfills. ECHO Clean Air Act data from AFS are frozen and reflect data as of October 17, 2014; the EPA retired this system for Clean Air Act stationary sources and transitioned to ICIS-Air.

Government Publication Date: Oct 17, 2014

Registered Pesticide Establishments: SSTS

This national list of active EPA-registered foreign and domestic pesticide and/or device-producing establishments is based on data from the Section Seven Tracking System (SSTS). The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Section 7 requires that each producing establishment must place its EPA establishment number on the label or immediate container of each pesticide, active ingredient or device produced. An EPA establishment number on a pesticide product label identifies the EPA registered location where the product was produced. The list of establishments is made available by the U.S. Environmental Protection Agency (EPA).

Government Publication Date: Sep 26, 2025

Polychlorinated Biphenyl (PCB) Transformers: PCBT

Locations of Transformers Containing Polychlorinated Biphenyls (PCBs) registered with the United States Environmental Protection Agency. PCB transformer owners must register their transformer(s) with EPA. Although not required, PCB transformer owners who have removed and properly disposed of a registered PCB transformer may notify EPA to have their PCB transformer de-registered. Data made available by EPA.

Government Publication Date: Oct 15, 2019

Polychlorinated Biphenyl (PCB) Notifiers: PCB

Facilities included in the national list of facilities that have notified the United States Environmental Protection Agency (EPA) of Polychlorinated Biphenyl (PCB) activities. Any company or person storing, transporting or disposing of PCBs or conducting PCB research and development must notify the EPA and receive an identification number.

Government Publication Date: May 23, 2024

Power Plants: POWER PLANTS

This list of power plants is provided by the U.S. Energy Information Administration (EIA). The listing includes operable electric generating plants in the United States by energy source, originating from the EIA-860, Annual Electric Generator Report; EIA-860M, Monthly Update to the Annual Electric Generator Report; and EIA-923, Power Plant Operations Report. It includes all operable plants by energy source with a combined nameplate capacity of 1 megawatt or more that are operating, are on standby, or out of service for short- or long-term.

Government Publication Date: Jun 5, 2025

Historical Business Activity Risk: HIST RISK

Proprietary list of sites identified as potentially having engaged in business activity that poses a higher-than-normal risk of contamination. Records originate from historical city directories, and are included in this list based on broad business categories Potentially Hazardous Chemical Users and Fuel and Automotive, including but not limited to Dry Cleaners and Fuel Stations, Garages, etc. Inclusion in this listing does not indicate that there is or ever has been contamination; rather, sites are included in this list due to their potential for having engaged in a business activity presenting an elevated risk of contamination. The list was compiled from various city directories including Polks, Millers, Mullin Kille, Interstate Directory, and State Directory Co; spanning roughly 1920s through 1960 depending on information available by city.

Government Publication Date: Jan 1, 1960

State

PFAS Sampling Locations: PFAS SAMPLING

This data is sourced from the State Water Board's GeoTracker Per- and Polyfluoroalkyl Substances (PFAS) Map tool which contains individual sampling points (i.e., soil boring, groundwater monitoring well, drinking water well for municipal drinking water systems, etc.) or a site location with PFAS analytical data. Includes analytical results that are finalized and submitted electronically by the Responsible Parties via GeoTracker's Electronic Submittal of Information Portal, and after it's accepted by a Regional Water Quality Control Board.

Government Publication Date: Dec 21, 2025

Dry Cleaning Facilities: DRYCLEANERS

A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial, linen supply, commercial laundry, dry cleaning and pressing machines - Coin Operated Laundry and Dry Cleaning. This is provided by the Department of Toxic Substance Control.

Government Publication Date: Dec 20, 2021

Delisted Drycleaners: DELISTED DRYCLEANERS

Sites removed from the list of drycleaner related facilities that have EPA ID numbers, made available by the California Department of Toxic Substance Control.

Government Publication Date: Aug 3, 2023

Non-Toxic Dry Cleaning Incentive Program: DRYC GRANT

This list of past Non-Toxic Dry Cleaning Incentive Program grant award recipients is provided by the California Air Resources Board (CARB). The program provided grants to eligible dry cleaning businesses to assist them in transitioning away from perchloroethylene (Perc) machines to alternative non-toxic and non-smog forming technologies such as water-based and CO2 cleaning systems. Per the CARB, this program ended in January 2023 and the information is historical.

Government Publication Date: Aug 3, 2023

PFAS GeoTracker Cleanup Sites: PFAS GT CLEANUPS

A list of applicable cleanup sites from the State Water Resources Control Board's (SWRCB) GeoTracker data management system where one or more of the potential contaminants of concern are identified in the PFAS Structure List and/or PFAS Chemicals Without Explicit Structure List made available by the United States Environmental Protection Agency (US EPA).

Government Publication Date: Sep 13, 2025

PFOA/PFOS Groundwater: PFAS GW

A list of water wells from the Groundwater Ambient Monitoring and Assessment Program (GAMA) Groundwater Information System with the groundwater chemical perfluorooctanoic acid (PFOA) (NL = 0.014 UG/L) or perfluorooctanoic sulfonate (PFOS) (NL = 0.013 UG/L). The GAMA Groundwater Information System search is made available by California Water Boards.

Government Publication Date: Oct 20, 2025

PFAS Investigations: PFAS INVEST

This list of potential Per- and Polyfluoroalkyl Substance (PFAS) sites is compiled from the California State Water Resources Control Board's (SWRCB) PFAS Investigations Map tool. The SWRCB issued investigative orders, per California Water Code (CWC) Section 13267 and/or 13383, to these sites. Orders were also issued to the public water systems to sample wells in the vicinity of these locations. Military facilities have been identified by the Department of Defense (DOD) as part of their efforts to investigate PFAS per the Defense Environmental Restoration Program (DERP) under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The data includes locations for Airports, Chrome Plating Facilities, Landfills, Publicly Owned Treatment Works, Refineries and Bulk Terminals, DOD Facilities, and Monitored Drinking Water Wells being investigated for potential PFAS.

Government Publication Date: Jan 23, 2024

Hazardous Waste and Substances Site List - Site Cleanup: HWSS CLEANUP

The Hazardous Waste and Substances Sites (Cortese) List is a planning document used by the State, local agencies and developers to comply with the California Environmental Quality Act requirements in providing information about the location of hazardous materials release sites. This list is published by California Department of Toxic Substance Control.

Government Publication Date: Mar 15, 2023

Toxic Pit Cleanup Act Sites: TOXIC PITS

The Toxic Pits Cleanup Act (TPCA) list identifies sites suspected of containing hazardous substances where cleanup has not yet been completed. This list was maintained by the State Water Resources Control Board (SWRCB), is not longer maintained, and updates are not planned.

Government Publication Date: Jul 1, 1995

List of Hazardous Waste Facilities Subject to Corrective Action: DTSC HWF

This is a list of hazardous waste facilities identified in Health and Safety Code (HSC) § 25187.5. These facilities are those where Department of Toxic Substances Control (DTSC) has taken or contracted for corrective action because a facility owner/operator has failed to comply with a date for taking corrective action in an order issued under HSC § 25187, or because DTSC determined that immediate corrective action was necessary to abate an imminent or substantial endangerment.

Government Publication Date: Jul 18, 2016

EnviroStor Inspection, Compliance, and Enforcement: INSP COMP ENF

A list of permitted facilities with inspections and enforcements tracked by the California Department of Toxic Substance Control's (DTSC) EnviroStor data management system.

Government Publication Date: Sep 19, 2025

School Property Evaluation Program Sites: SCH

A list of sites registered with The Department of Toxic Substances Control (DTSC) School Property Evaluation and Cleanup (SPEC) Division. SPEC is responsible for assessing, investigating and cleaning up proposed school sites. The Division ensures that selected properties are free of contamination or, if the properties were previously contaminated, that they have been cleaned up to a level that protects the students and staff who will occupy the new school.

Government Publication Date: Oct 2, 2025

California Hazardous Material Incident Report System (CHMIRS): CHMIRS

A list of reported hazardous material incidents, spills, and releases from the California Hazardous Material Incident Report System (CHMIRS). This listing has been made available by the California Governor's Office of Emergency Services (Cal OES).

Government Publication Date: Jul 11, 2025

Historical California Hazardous Material Incident Report System (CHMIRS): HIST CHMIRS

A list of reported hazardous material incidents, spills, and releases from the California Hazardous Material Incident Report System (CHMIRS) prior to 1993. This list has been made available by the California Office of Emergency Services (OES).

Government Publication Date: Jan 1, 1993

Handlers from Hazardous Waste Manifest Data: HAZNET

A list of handlers not otherwise classified as Treatment, Storage, Disposal facilities (TSDF) or generators from the facilities and manifests data made available by the California Department of Toxic Substances Control (DTSC) in their Hazardous Waste Tracking System (HWTS).

Government Publication Date: Feb 20, 2025

Generators from Hazardous Waste Manifest Data: HAZ GEN

List of handlers listed as having generated waste from the facilities and manifests data made available by the California Department of Toxic Substances Control (DTSC) in their Hazardous Waste Tracking System (HWTS).

Government Publication Date: Feb 20, 2025

TSDF from Hazardous Waste Manifest Data: HAZ TSD

List of Treatment, Storage, and Disposal Facilities (TSDFs) from the facilities and manifests data made available by the California Department of Toxic Substances Control (DTSC) in their Hazardous Waste Tracking System (HWTS).

Government Publication Date: Feb 20, 2025

Historical Hazardous Waste Manifest Data: HIST MANIFEST

A list of historic hazardous waste manifests received by the Department of Toxic Substances Control (DTSC) from year the 1980 to 1992. The volume of manifests is typically 900,000 - 1,000,000 annually, representing approximately 450,000 - 500,000 shipments.

Government Publication Date: Dec 31, 1992

DTSC Registered Hazardous Waste Transporters: HW TRANSPORT

The California Department of Toxic Substances Control (DTSC) maintains this list of Registered Hazardous Waste Transporters.

Government Publication Date: Nov 30, 2025

Registered Waste Tire Haulers: WASTE TIRE

This list of registered waste tire haulers is maintained by the California Department of Resources Recycling and Recovery.

Government Publication Date: Jan 11, 2026

California Medical Waste Management Program Facility List: MEDICAL WASTE

This list of Medical Waste Management Program Facilities is maintained by the California Department of Public Health. The Medical Waste Management Program (MWMP) regulates the generation, handling, storage, treatment, and disposal of medical waste by providing oversight for the implementation of the Medical Waste Management Act (MWMA). The MWMP permits and inspects all medical waste off-site treatment facilities, medical waste transporters, and medical waste transfer stations. This list contains transporters, treatment, and transfer facilities.

Government Publication Date: Nov 5, 2025

Historical Cortese List: HIST CORTESE

List of sites which were once included on the Cortese list. The Hazardous Waste and Substances Sites (Cortese) List is a planning document used by the State, local agencies and developers to comply with the California Environmental Quality Act requirements for providing information about the location of hazardous sites.

Government Publication Date: Nov 13, 2008

Cease and Desist Orders and Cleanup and Abatement Orders: CDO/CAO

The California Environment Protection Agency "Cortese List" of active Cease and Desist Orders (CDO) and Cleanup and Abatement Orders (CAO). This list contains many CDOs and CAOs that do NOT concern the discharge of wastes that are hazardous materials. Many of the listed orders concern, as examples, discharges of domestic sewage, food processing wastes, or sediment that do not contain hazardous materials, but the Water Boards' database does not distinguish between these types of orders.

Government Publication Date: Dec 6, 2021

California Environmental Reporting System (CERS) Hazardous Waste Sites: CERS HAZ

List of sites in the California Environmental Protection Agency (CalEPA) Regulated Site Portal which fall under the following regulatory programs: Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, RCRA LQ HW Generator. The CalEPA oversees the statewide implementation of the Unified Program which applies regulatory standards to protect Californians from hazardous waste and materials.

Government Publication Date: Jan 12, 2026

Delisted Environmental Reporting System (CERS) Hazardous Waste Sites: DELISTED HAZ

This database contains a list of sites that were removed from the California Environmental Protection Agency (CalEPA) in the following regulatory programs: Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, RCRA LQ HW Generator.

Government Publication Date: Nov 29, 2018

Sites in GeoTracker: GEOTRACKER

GeoTracker is the State Water Resource Control Boards' data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater. This is a list of sites in GeoTracker that aren't otherwise categorized as LUST, Land Disposal Sites (LDS), Cleanup Sites, or sites having Waste Discharge Requirements (WDR). This listing includes program types such as Underground Injection Control (UIC), Confined Animal Facilities (CAF), Irrigated Lands Regulatory Program, plans, and non-case information.

Government Publication Date: Aug 11, 2025

Mines Listing: MINE

This list includes mine site locations extracted from the Mines Online database, maintained by the California Department of Conservation. Mines Online (MOL) is an interactive web map designed with GIS features that provide information such as the mine name, mine status, commodity sold, location, and other mine specific data. Please note: Mine location information is provided to assist experts in determining the location of mine operators in accordance with California Civil Code section 1103.4 and reflects information reported by mine operators in annual reports provided under Public Resources Code section 2207. While the Division of Mine Reclamation (DMR) attempts to populate MOL with accurate location information, the DMR cannot guarantee the accuracy of operator reported location information.

Government Publication Date: Oct 25, 2025

Recorded Environmental Cleanup Liens: LIEN

The California Department of Toxic Substance Control (DTSC) maintains this list of liens placed upon real properties. A lien is utilized by the DTSC to obtain reimbursement from responsible parties for costs associated with the remediation of contaminated properties.

Government Publication Date: Apr 10, 2025

Waste Discharge Requirements: WASTE DISCHG

List of sites in California State Water Resources Control Board (SWRCB) Waste Discharge Requirements (WDRs) Program in California, made available by the SWRCB via GeoTracker. The WDR program regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

Government Publication Date: Aug 11, 2025

Toxic Pollutant Emissions Facilities: EMISSIONS

A list of criteria and toxic pollutant emissions data for facilities in California made available by the California Environmental Protection Agency - Air Resources Board (ARB). Risk data may be based on previous inventory submittals. The toxics data are submitted to the ARB by the local air districts as requirement of the Air Toxics "Hot Spots" Program.

Government Publication Date: Dec 31, 2021

Clandestine Drug Lab Sites: CDL

The Department of Toxic Substances Control (DTSC) maintains a listing of drug lab sites. DTSC is responsible for removal and disposal of hazardous substances discovered by law enforcement officials while investigating illegal/clandestine drug laboratories.

Government Publication Date: Dec 21, 2022

Tribal

No Tribal additional environmental record sources available for this State.

County

Riverside County - Hazardous Waste Generator Sites List: HWG RIVERSIDE

A list of Hazardous Waste Generator Sites in the County of Riverside. This list is made available by Riverside County Department of Environmental Health which has been designated as the CUPA for the County.

Government Publication Date: Oct 1, 2025

Riverside County - Disclosure Facility List: HZH RIVERSIDE

A list of facilities disclosed to Riverside County Department of Environmental Health (DEH). This list is made available by Riverside County DEH which has been designated as the CUPA for the County. A business is required to establish and submit a Business Plan if the facility handles hazardous material equal to or greater than 55 gallons, 500 pounds or 200 cubic feet at any time during the year.

Government Publication Date: Oct 3, 2025

Riverside County - Medical Waste Facilities: MED WST RIVERSIDE

This list of active and inactive medical waste facilities is maintained by the County of Riverside Department of Environmental Health.

Government Publication Date: Oct 6, 2025

Riverside County - California Accidental Release Prevention Program Sites: RMP RIVERSIDE

This list of Riverside County California Accidental Release Prevention Program sites is maintained by the County of Riverside Department of Environmental Health. AB 3777 was enacted in 1986 to minimize potential emergencies involving acutely hazardous materials by requiring facilities which handle these materials to submit Risk Management Prevention Plans. The Riverside County Department of Environmental Health Hazardous Materials Branch began implementation of this Program County-wide in January 1991. All cities within Riverside County are included in this list.

Government Publication Date: Feb 6, 2024

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

The ERIS ***Physical Setting Report - PSR*** provides comprehensive information about the physical setting around a site and includes a complete overview of topography and surface topology, in addition to hydrologic, geologic and soil characteristics. The location and detailed attributes of oil and gas wells, water wells, public water systems and radon are also included for review.

The compilation of both physical characteristics of a site and additional attribute data is useful in assessing the impact of migration of contaminants and subsequent impact on soils and groundwater.

Disclaimer

This Report does not provide a full environmental evaluation for the site or adjacent properties. Please see the terms and disclaimer at the end of the Report for greater detail.

Special Flood Hazard Areas – High Risk

Special Flood Hazard Areas represent the area subject to inundation by 1-percent-annual chance flood. Structures located within the SFHA have a 26-percent chance of flooding during the life of a standard 30-year mortgage. Federal floodplain management regulations and mandatory flood insurance purchase requirements apply in these zones.

ZONE	DESCRIPTION
A	Areas subject to inundation by the 1-percent-annual-chance flood event. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown.
AE, A1-A30	Areas subject to inundation by the 1-percent-annual-chance flood event determined by detailed methods. BFEs are shown within these zones. (Zone AE is used on new and revised maps in place of Zones A1–A30.)
AH	Areas subject to inundation by 1-percent-annual-chance shallow flooding (usually areas of ponding) where average depths are 1–3 feet. BFEs derived from detailed hydraulic analyses are shown in this zone.
AO	Areas subject to inundation by 1-percent-annual-chance shallow flooding (usually sheet flow on sloping terrain) where average depths are 1–3 feet. Average flood depths derived from detailed hydraulic analyses are shown within this zone.
AR	Areas that result from the decertification of a previously accredited flood protection system that is determined to be in the process of being restored to provide base flood protection.
A99	Areas subject to inundation by the 1-percent-annual-chance flood event, but which will ultimately be protected upon completion of an under-construction Federal flood protection system. These are areas of special flood hazard where enough progress has been made on the construction of a protection system, such as dikes, dams, and levees, to consider it complete for insurance rating purposes. Zone A99 may be used only when the flood protection system has reached specified statutory progress toward completion. No BFEs or flood depths are shown.

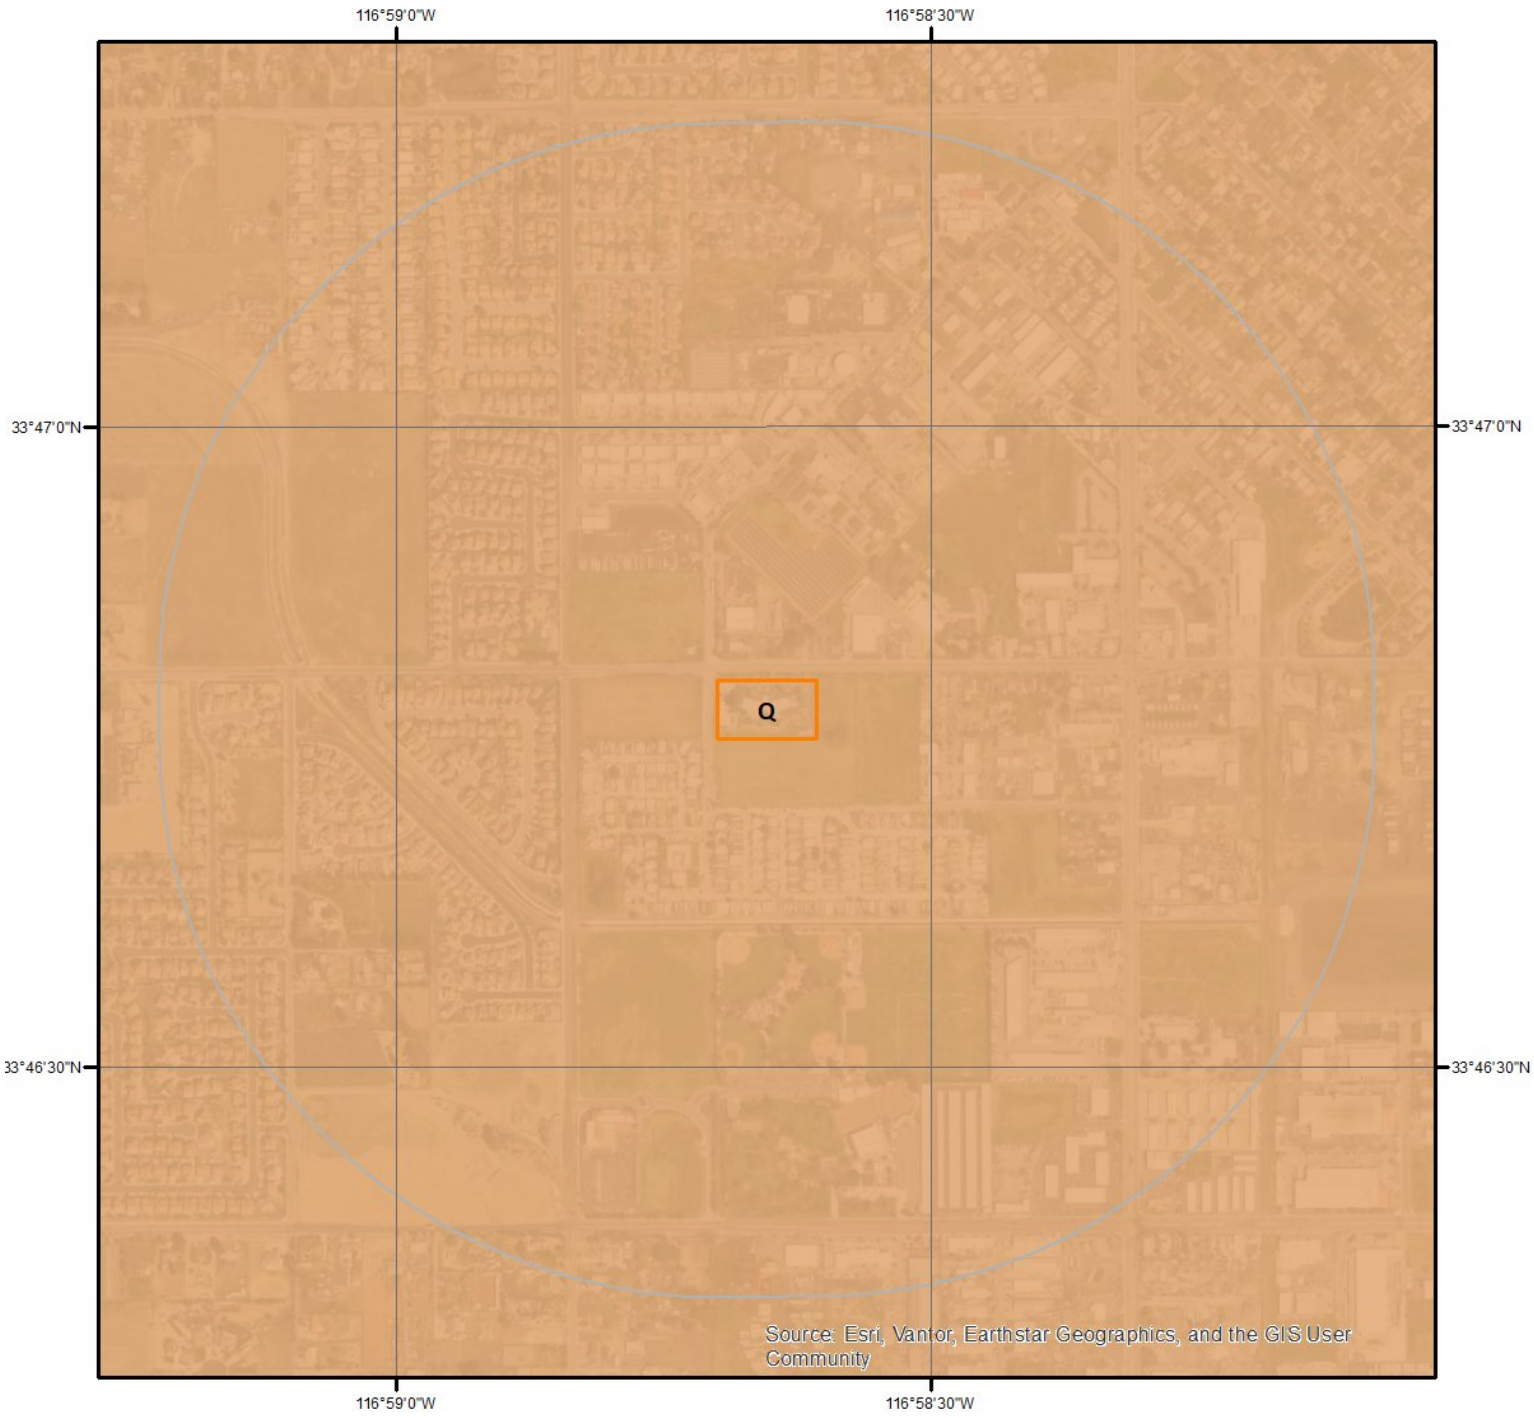
Coastal High Hazard Areas – High Risk

Coastal High Hazard Areas (CHHA) represent the area subject to inundation by 1-percent-annual chance flood, extending from offshore to the inland limit of a primary front al dune along an open coast and any other area subject to high velocity wave action from storms or seismic sources. Structures located within the CHHA have a 26-percent chance of flooding during the life of a standard 30-year mortgage. Federal floodplain management regulations and mandatory purchase requirements apply in these zones.

ZONE	DESCRIPTION
V	Areas along coasts subject to inundation by the 1-percent-annual-chance flood event with additional hazards associated with storm-induced waves. Because detailed coastal analyses have not been performed, no BFEs or flood depths are shown.
VE, V1-V30	Areas along coasts subject to inundation by the 1-percent-annual-chance flood event with additional hazards due to storm-induced velocity wave action. BFEs derived from detailed hydraulic coastal analyses are shown within these zones. (Zone VE is used on new and revised maps in place of Zones V1–V30.)

Hydrologic Information

Moderate and Minimal Risk Areas



Areas of moderate or minimal hazard are studied based upon the principal source of flood in the area. However, buildings in these zones could be flooded by severe, concentrated rainfall coupled with inadequate local drainage systems. Local stormwater drainage systems are not normally considered in a community's flood insurance study. The failure of a local drainage system can create areas of high flood risk within these zones. Flood insurance is available in participating communities, but is not required by regulation in these zones. Nearly 25-percent of all flood claims filed are for structures located within these zones.

ZONE	DESCRIPTION
B, X (shaded)	Moderate risk areas within the 0.2-percent-annual-chance floodplain, areas of 1-percent-annual-chance flooding where average depths are less than 1 foot, areas of 1-percent-annual-chance flooding where the contributing drainage area is less than 1 square mile, and areas protected from the 1-percent-annual-chance flood by a levee. No BFEs or base flood depths are shown within these zones. (Zone X (shaded) is used on new and revised maps in place of Zone B.)
C, X (unshaded)	Minimal risk areas outside the 1-percent and .2-percent-annual-chance floodplains. No BFEs or base flood depths are shown within these zones. (Zone X (unshaded) is used on new and revised maps in place of Zone C.)

Undetermined Risk Areas

ZONE	DESCRIPTION
D	Unstudied areas where flood hazards are undetermined, but flooding is possible. No mandatory flood insurance purchase requirements apply, but coverage is available in participating communities.

Geologic Information

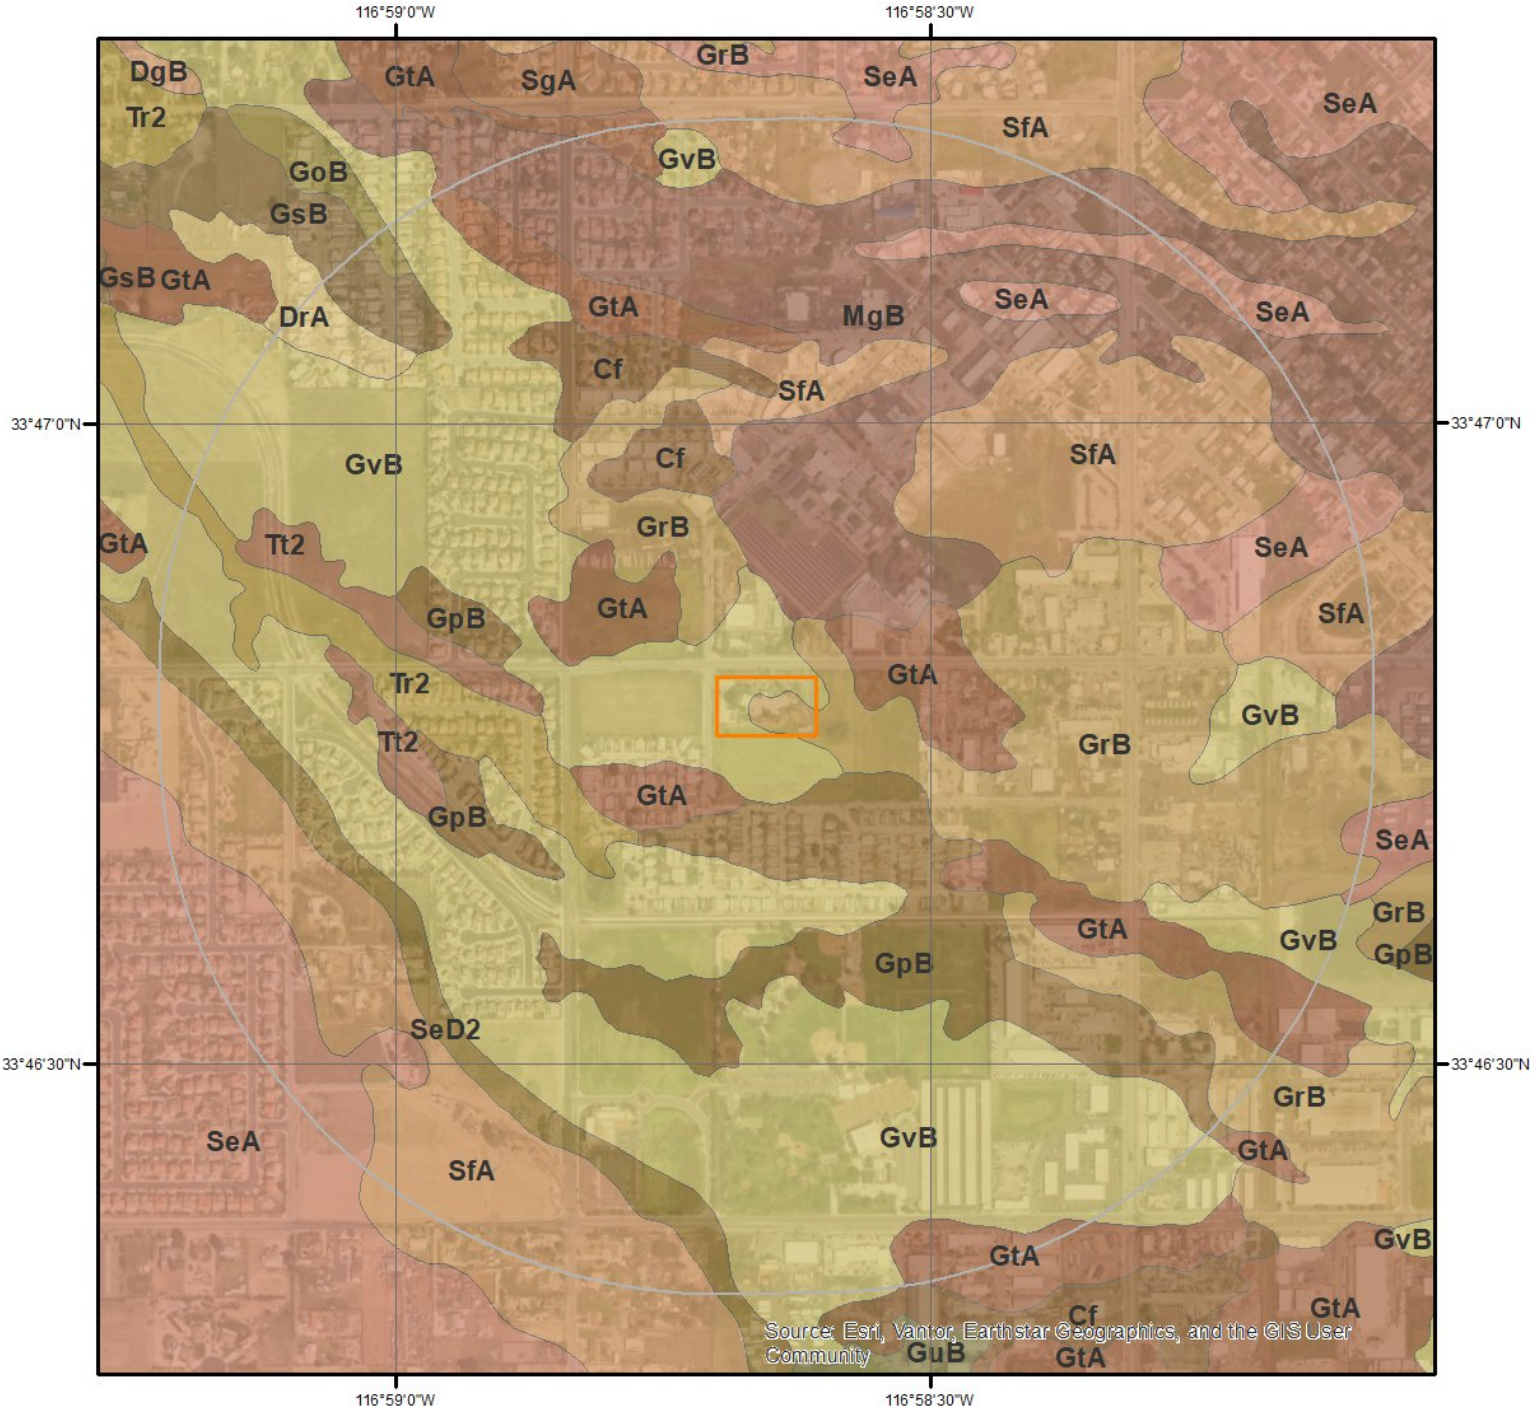
Geologic Units

This maps shows geologic units in the area. Please refer to the report for detailed descriptions.

N

0 0.125 0.25 Miles

ERIS



Geologic Information

The previous page shows USGS geology information. Detailed information about each unit is provided below.

Geologic Unit Q

Unit Name:	Quaternary alluvium and marine deposits
Unit Age:	Pleistocene to Holocene
Primary Rock Type:	Coarse-detrital
Secondary Rock Type:	
Unit Description:	Alluvium, lake, playa, and terrace deposits; unconsolidated and semi-consolidated. Mostly nonmarine, but includes marine deposits near the coast.

0 0.125 0.25 Miles

This maps shows SSURGO soil units around the target property. Please refer to the report for detailed soil descriptions.

ERIS

Soil Information

The previous page shows a soil map using SSURGO data from USDA Natural Resources Conservation Service. Detailed information about each unit is provided below.

Map Unit Cf (0.42%)

Map Unit Name:	Chino silt loam, drained, saline-alkali
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	0cm
Drainage Class - Dominant:	Somewhat poorly drained
Hydrologic Group - Dominant:	C/D - These soils have moderately high runoff potential when drained and high runoff potential when undrained.

Major components are printed below

Chino(85%)

horizon H1(0cm to 36cm)	Silt loam
horizon H2(36cm to 69cm)	Silty clay loam
horizon H3(69cm to 152cm)	Silty clay loam

Component Description:

Minor map unit components are excluded from this report.

Map Unit: Cf - Chino silt loam, drained, saline-alkali

Component: Chino (85%)
The Chino component makes up 85 percent of the map unit. Slopes are 0 to 2 percent. This component is on flood plains. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is somewhat poorly drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is moderate. This soil is rarely flooded. It is not ponded. A seasonal zone of water saturation is at 0 inches during January, February, March. Organic matter content in the surface horizon is about 2 percent. This component is in the R019XD068CA Silty Basin ecological site. Nonirrigated land capability classification is 4w. Irrigated land capability classification is 3w. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. The soil has a moderately saline horizon within 30 inches of the soil surface.

Component: Unnamed (5%)
Generated brief soil descriptions are created for major soil components. The Unnamed soil is a minor component.

Component: Chino (5%)
Generated brief soil descriptions are created for major soil components. The Chino soil is a minor component.

Component: Unnamed (3%)
Generated brief soil descriptions are created for major soil components. The Unnamed soil is a minor component.

Component: Unnamed (2%)
Generated brief soil descriptions are created for major soil components. The Unnamed soil is a minor component.

Map Unit DrA (0.1%)

Map Unit Name:	Dello loamy fine sand, gravelly substratum, 0 to 2 percent slopes
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	0cm
Drainage Class - Dominant:	Somewhat poorly drained
Hydrologic Group - Dominant:	A/D - These soils have low runoff potential when drained and high runoff potential when undrained.

Major components are printed below

Dello(85%)

horizon H1(0cm to 20cm)	Loamy fine sand

horizon H2(20cm to 91cm)	Sand
horizon H3(91cm to 152cm)	Gravelly coarse sand

Component Description:

Minor map unit components are excluded from this report.

Map Unit: DrA - Dello loamy fine sand, gravelly substratum, 0 to 2 percent slopes

Component: Dello (85%)
The Dello component makes up 85 percent of the map unit. Slopes are 0 to 2 percent. This component is on flood plains. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is somewhat poorly drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. A seasonal zone of water saturation is at 0 inches during January, February, March, December. Organic matter content in the surface horizon is about 1 percent. This component is in the R019XD035CA Sandy (1975) ecological site. Nonirrigated land capability classification is 4w. Irrigated land capability classification is 3w. This soil does not meet hydric criteria. There are no saline horizons within 30 inches of the soil surface.

Component: Hanford (5%)
Generated brief soil descriptions are created for major soil components. The Hanford soil is a minor component.

Component: Grangeville (5%)
Generated brief soil descriptions are created for major soil components. The Grangeville soil is a minor component.

Component: Tujunga (5%)
Generated brief soil descriptions are created for major soil components. The Tujunga soil is a minor component.

Map Unit GoB (0.06%)

Map Unit Name:	Grangeville loamy fine sand, drained, 0 to 5 percent slopes
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	0cm
Drainage Class - Dominant:	Moderately well drained
Hydrologic Group - Dominant:	A/D - These soils have low runoff potential when drained and high runoff potential when undrained.

Major components are printed below

Grangeville(85%)

horizon H1(0cm to 43cm)	Loamy fine sand
horizon H2(43cm to 152cm)	Sandy loam

Component Description:

Minor map unit components are excluded from this report.

Map Unit: GoB - Grangeville loamy fine sand, drained, 0 to 5 percent slopes

Component: Grangeville (85%)
The Grangeville component makes up 85 percent of the map unit. Slopes are 0 to 5 percent. This component is on alluvial fans. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. A seasonal zone of water saturation is at 0 inches during January, February, March, December. Organic matter content in the surface horizon is about 4 percent. This component is in the R019XD070CA Sandy Basin ecological site. Nonirrigated land capability classification is 3w. Irrigated land capability classification is 2s. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. There are no saline horizons within 30 inches of the soil surface.

Component: Dello (5%)
Generated brief soil descriptions are created for major soil components. The Dello soil is a minor component.

Component: Traver (5%)
Generated brief soil descriptions are created for major soil components. The Traver soil is a minor component.

Soil Information

Component: Unnamed (3%)
Generated brief soil descriptions are created for major soil components. The Unnamed soil is a minor component.

Component: Unnamed (2%)
Generated brief soil descriptions are created for major soil components. The Unnamed soil is a minor component.

Map Unit GpB (0.65%)

Map Unit Name:	Grangeville sandy loam, drained, saline-alkali, 0 to 5 percent slopes
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	0cm
Drainage Class - Dominant:	Moderately well drained
Hydrologic Group - Dominant:	A/D - These soils have low runoff potential when drained and high runoff potential when undrained.

Major components are printed below

Grangeville(85%)

horizon H1(0cm to 43cm)	Sandy loam
horizon H2(43cm to 152cm)	Sandy loam

Component Description:

Minor map unit components are excluded from this report.

Map Unit: GpB - Grangeville sandy loam, drained, saline-alkali, 0 to 5 percent slopes

Component: Grangeville (85%)
The Grangeville component makes up 85 percent of the map unit. Slopes are 0 to 2 percent. This component is on alluvial fans. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. A seasonal zone of water saturation is at 0 inches during January, February, March, December. Organic matter content in the surface horizon is about 4 percent. This component is in the R019XD070CA Sandy Basin ecological site. Nonirrigated land capability classification is 3w. Irrigated land capability classification is 3s. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. The soil has a slightly saline horizon within 30 inches of the soil surface.

Component: Dello (10%)
Generated brief soil descriptions are created for major soil components. The Dello soil is a minor component.

Component: Traver (5%)
Generated brief soil descriptions are created for major soil components. The Traver soil is a minor component.

Map Unit GrB (1.46%)

Map Unit Name:	Grangeville sandy loam, sandy substratum, drained, 0 to 5 percent slopes
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	0cm
Drainage Class - Dominant:	Moderately well drained
Hydrologic Group - Dominant:	A/D - These soils have low runoff potential when drained and high runoff potential when undrained.

Major components are printed below

Grangeville(85%)

horizon H1(0cm to 91cm)	Sandy loam
horizon H2(91cm to 152cm)	Sandy loam

Component Description:

Minor map unit components are excluded from this report.

Soil Information

Map Unit: GrB - Grangeville sandy loam, sandy substratum, drained, 0 to 5 percent slopes

Component: Grangeville (85%)
The Grangeville component makes up 85 percent of the map unit. Slopes are 0 to 5 percent. This component is on alluvial fans. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. A seasonal zone of water saturation is at 0 inches during January, February, March, December. Organic matter content in the surface horizon is about 4 percent. This component is in the R019XD070CA Sandy Basin ecological site. Nonirrigated land capability classification is 3w. Irrigated land capability classification is 3s. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. There are no saline horizons within 30 inches of the soil surface.

Component: Dello (10%)

San Emigdio(85%)

horizon A(0cm to 20cm)	Fine sandy loam
horizon C1(20cm to 102cm)	Fine sandy loam
horizon C2(102cm to 152cm)	Stratified fine sandy loam to silt loam

Soil Information

Component Description:

Minor map unit components are excluded from this report.

Map Unit: SeA - San Emigdio fine sandy loam, 0 to 2 percent slopes, occassional frost

Component: San Emigdio (85%)
The San Emigdio component makes up 85 percent of the map unit. Slopes are 0 to 2 percent. This component is on alluvial fans, alluvial plains. The parent material consists of residuum weathered from sedimentary rock. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R019XD029CA Loamy (1975) ecological site. Nonirrigated land capability classification is 3c. Irrigated land capability classification is 1 This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. There are no saline horizons within 30 inches of the soil surface.

Component: Metz (10%)
Generated brief soil descriptions are created for major soil components. The Metz soil is a minor component.

Component: San Timoteo (5%)
Generated brief soil descriptions are created for major soil components. The San Timoteo soil is a minor component.

Map Unit SeD2 (0.51%)

Map Unit Name:	San Emigdio fine sandy loam, 8 to 15 percent slopes, eroded
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	null
Drainage Class - Dominant:	Well drained
Hydrologic Group - Dominant:	A - Soils in this group have low runoff potential when thoroughly wet. Water is transmitted freely through the soil.

Major components are printed below

San Emigdio(85%)

horizon H1(0cm to 20cm)	Fine sandy loam
horizon H2(20cm to 102cm)	Fine sandy loam
horizon H3(102cm to 152cm)	Stratified sandy loam to silt loam

Component Description:

Minor map unit components are excluded from this report.

Map Unit: SeD2 - San Emigdio fine sandy loam, 8 to 15 percent slopes, eroded

Component: San Emigdio (85%)
The San Emigdio component makes up 85 percent of the map unit. Slopes are 8 to 15 percent. This component is on alluvial fans. The parent material consists of residuum weathered from sedimentary rock. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R019XD029CA Loamy (1975) ecological site. Nonirrigated land capability classification is 4e. Irrigated land capability classification is 3e. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. There are no saline horizons within 30 inches of the soil surface.

Component: Metz (10%)
Generated brief soil descriptions are created for major soil components. The Metz soil is a minor component.

Map Unit Tr2 (0.27%)

Map Unit Name:	Traver loamy fine sand, saline-alkali, eroded
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	null
Drainage Class - Dominant:	Moderately well drained
Hydrologic Group - Dominant:	B - Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.

Major components are printed below

Traver(85%)

horizon H1(0cm to 33cm)	Loamy fine sand
horizon H2(33cm to 97cm)	Fine sandy loam
horizon H3(97cm to 152cm)	Stratified fine sandy loam to silty clay loam

Component Description:

Minor map unit components are excluded from this report.

Map Unit: Tr2 - Traver loamy fine sand, saline-alkali, eroded

Component: Traver (85%)
The Traver component makes up 85 percent of the map unit. Slopes are 0 to 5 percent. This component is on basins, valley floors. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. There is

no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R019XD070CA Sandy Basin ecological site. Nonirrigated land capability classification is 4s. Irrigated land capability classification is 3s. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. The soil has a moderately saline horizon within 30 inches of the soil surface. The soil has a maximum sodium adsorption ratio of 1 within 30 inches of the soil surface.

Component: Waukena (5%)
Generated brief soil descriptions are created for major soil components. The Waukena soil is a minor component.

Component: Grangeville (5%)
Generated brief soil descriptions are created for major soil components. The Grangeville soil is a minor component.

Component: Dello (5%)
Generated brief soil descriptions are created for major soil components. The Dello soil is a minor component.

Map Unit Tt2 (0.14%)

Map Unit Name:	Traver fine sandy loam, strongly saline-alkali, eroded
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	null
Drainage Class - Dominant:	Moderately well drained
Hydrologic Group - Dominant:	B - Soils in this group have moderately low runoff potential when thoroughly wet. Water transmission through the soil is unimpeded.

Major components are printed below

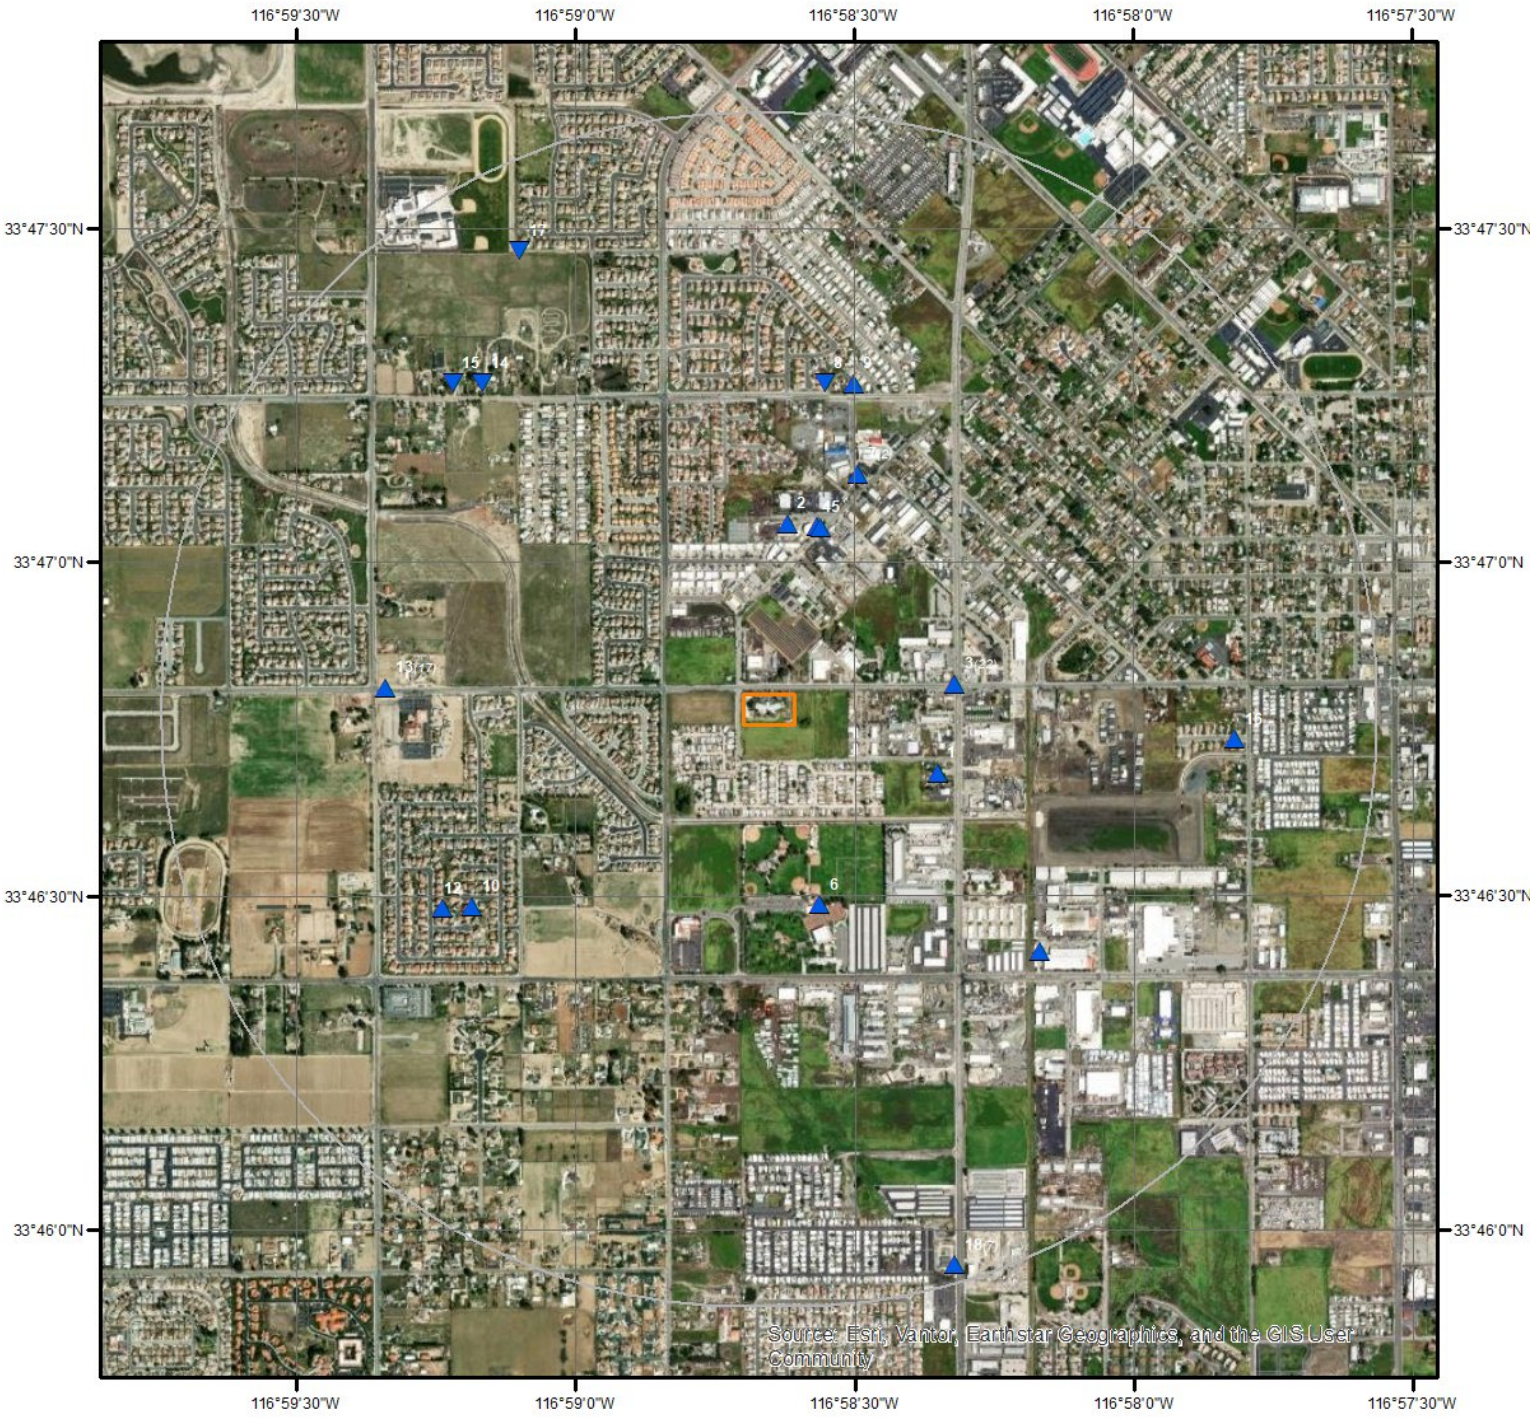
Traver(85%)

horizon H1(0cm to 51cm)	Fine sandy loam
horizon H2(51cm to 152cm)	Stratified fine sandy loam to silty clay loam

Component Description:

Minor map unit components are excluded from this report.

Map Unit: Tt2 - Traver fine sandy loam, strongly saline-alkali, eroded



Component: Traver (85%)
The Traver component makes up 85 percent of the map unit. Slopes are 0 to 5 percent. This component is on basins, valley floors. The parent material consists of alluvium derived from granite. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is rarely flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R019XD070CA Sandy Basin ecological site. Nonirrigated land capability classification is 7s. Irrigated land capability classification is 4s. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 3 percent. The soil has a moderately saline horizon within 30 inches of the soil surface. The soil has a maximum sodium adsorption ratio of 1 within 30 inches of the soil surface.

Component: Waukena (5%)
Generated brief soil descriptions are created for major soil components. The Waukena soil is a minor component.

Component: Grangeville (5%)
Generated brief soil descriptions are created for major soil components. The Grangeville soil is a minor component.

Component: Dello (5%)
Generated brief soil descriptions are created for major soil components. The Dello soil is a minor component.

Radon Information

This section lists any relevant radon information found for the target property.

Federal EPA Radon Zone for *RIVERSIDE* County: **2**

Zone 1: Counties with predicted average indoor radon screening levels greater than 4 pCi/L
Zone 2: Counties with predicted average indoor radon screening levels from 2 to 4 pCi/L
Zone 3: Counties with predicted average indoor radon screening levels less than 2 pCi/L

Federal Area Radon Information for *RIVERSIDE* County

No Measures/Homes:	24
Geometric Mean:	0.3
Arithmetic Mean:	0.3
Median:	0.5
Standard Deviation:	0.8
Maximum:	1.7
% >4 pCi/L:	0
% >20 pCi/L:	0
Notes on Data Table:	TABLE 1. Screening indoor radon data from the EPA/State Residential Radon Survey of California conducted during 1989-90. Data represent 2-7 day charcoal canister measurements from the lowest level of each home tested.

Appendix

Federal Sources

FEMA National Flood Hazard Layer — **FEMA FLOOD**

The National Flood Hazard Layer (NFHL) data incorporates Flood Insurance Rate Map (FIRM) databases published by the Federal Emergency Management Agency (FEMA), and any Letters Of Map Revision (LOMRs) that have been issued against those databases since their publication date. The FIRM Database is the digital, geospatial version of the flood hazard information shown on the published paper FIRMs. The FIRM Database depicts flood risk information and supporting data used to develop the risk data. The FIRM Database is derived from Flood Insurance Studies (FISs), previously published FIRMs, flood hazard analyses performed in support of the FISs and FIRMs, and new mapping data, where available.

Indoor Radon Data — **INDOOR RADON**

Indoor radon measurements tracked by the Environmental Protection Agency(EPA) and the State Residential Radon Survey.

Public Water Systems Violations and Enforcement Data — **PWSV**

This list of drinking water violations and enforcement actions is sourced from the U.S Environmental Protection Agency's (EPA) Enforcement and Compliance History Online (ECHO) system that incorporates Public Water Systems data from EPA's Safe Drinking Water Information System (SDWIS) database, as part of the national download of Safe Drinking Water Act (SDWA) data. SDWIS contains information on public water systems from the Public Water System Supervision (PWSS) Program, including monitoring, enforcement, and violation data related to requirements established by the SWDA. Address information provided in SWDIS may correspond either with the physical location of the water system, or with a contact address.

Radon Zone Level — **RADON ZONE**

Areas showing the level of Radon Zones (level 1, 2 or 3) by county. This data is maintained by the Environmental Protection Agency (EPA).

Safe Drinking Water Information System (SDWIS) — **SDWIS**

This national download of Safe Drinking Water Act (SDWA) data is sourced from the U.S Environmental Protection Agency's (EPA) Enforcement and Compliance History Online (ECHO) system that incorporates Public Water Systems data from EPA's Safe Drinking Water Information System (SDWIS) database. SDWIS contains information on public water systems from the Public Water System Supervision (PWSS) Program related to requirements established by the Safe Drinking Water Act (SDWA). Address information provided in SWDIS may correspond either with the physical location of the water system, or with a contact address.

Soil Survey Geographic database — **SSURGO**

The Soil Survey Geographic database (SSURGO) contains information about soil as collected by the National Cooperative Soil Survey at the Natural Resources Conservation Service (NRCS). Soil maps outline areas called map units. The map units are linked to soil properties in a database. Each map unit may contain one to three major components and some minor components.

U.S. Fish & Wildlife Service Wetland Data — **US WETLAND**

The U.S. Fish & Wildlife Service Wetland layer represents the approximate location and type of wetlands and deepwater habitats in the United States.

USGS Current Topo — **US TOPO**

US Topo topographic maps are produced by the National Geospatial Program of the U.S. Geological Survey (USGS). The project was launched in late 2009, and the term "US Topo" refers specifically to quadrangle topographic maps published in 2009 and later.

USGS Geology — **US GEOLOGY**

Seamless maps depicting geological information provided by the United States Geological Survey (USGS).

USGS National Water Information System — **FED USGS**

The U.S. Geological Survey's (USGS) National Water Information System (NWIS) is the nation's principal repository of water resources data. The data includes comprehensive information of well-construction details, time-series data for gage height, streamflow, groundwater level, and precipitation and water use data. This NWIS database information is obtained through the Water Quality Data Portal (WQP). The WQP

is a cooperative service sponsored by the USGS, the Environmental Protection Agency (EPA), and the National Water Quality Monitoring Council (NWQMC).

State Sources

Oil and Gas Wells **OGW**

The California Department of Conservation, Geologic Energy Management Division (CalGEM) provides this oil and gas wells dataset. CalGEM makes no warranties, whether expressed or implied, and the data is for informational purposes.

Periodic Groundwater Level Measurement Locations **MONITOR WELLS**

Locations of groundwater level monitoring wells in the Department of Water Resources (DWR)'s Periodic Groundwater Levels dataset. The DWR Periodic Groundwater Levels dataset contains seasonal and long-term groundwater level measurements collected by the Department of Water Resources and cooperating agencies.

Well Completion Reports **WATER WELLS**

List of wells from the Well Completion Reports data made available by the California Department of Water Resources' (DWR) Online System for Well Completion Reports (OSWCR). Please note that the majority of well completion reports have been spatially registered to the center of the 1x1 mile Public Land Survey System section that the well is located in.

Liability Notice

Reliance on information in Report: The Physical Setting Report (PSR) DOES NOT replace a full Phase I Environmental Site Assessment but is solely intended to be used as a review of environmental databases and physical characteristics for the site or adjacent properties.

License for use of information in Report: No page of this report can be used without this cover page, this notice and the project property identifier. The information in Report(s) may not be modified or re-sold.

Your Liability for misuse: Using this Service and/or its reports in a manner contrary to this Notice or your agreement will be in breach of copyright and contract and ERIS may obtain damages for such mis-use, including damages caused to third parties, and gives ERIS the right to terminate your account, rescind your license to any previous reports and to bar you from future use of the Service.

No warranty of Accuracy or Liability for ERIS: The information contained in this report has been produced by ERIS Information Inc. ("ERIS") using various sources of information, including information provided by Federal and State government departments. The report applies only to the address and up to the date specified on the cover of this report, and any alterations or deviation from this description will require a new report. This report and the data contained herein does not purport to be and does not constitute a guarantee of the accuracy of the information contained herein and does not constitute a legal opinion nor medical advice. Although ERIS has endeavored to present you with information that is accurate, ERIS Information Inc. disclaims, any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence, negligence or otherwise, and for any consequences arising therefrom. Liability on the part of ERIS is limited to the monetary value paid for this report.

Trademark and Copyright: You may not use the ERIS trademarks or attribute any work to ERIS other than as outlined above. This Service and Report(s) are protected by copyright owned by ERIS Information Inc. Copyright in data used in the Service or Report(s) (the "Data") is owned by ERIS or its licensors. The Service, Report(s) and Data may not be copied or reproduced in whole or in any substantial part without prior written consent of ERIS.

APPENDIX D: QUALIFICATIONS/INSURANCE

PARTNER

James Erwin
Project Geologist

Education

Bachelor of Science, Geology and Environmental Geology, California State University San Bernardino, CA

Highlights

Phase I Environmental Site Assessments
Transaction Screening Assessments
Phase II Subsurface Investigations
Soil, Soil Vapor, Groundwater, and Indoor Air Sampling
Groundwater Monitoring

Experience Summary

James Erwin is based in southern California as a Project Geologist for the environmental segment of Partner Engineering and Science, Inc. (Partner). In this role he works with clients and property owners on Environmental Due Diligence projects, Subsurface Investigations, and Indoor Air Investigations. Mr. Erwin's experience in conducting these types of environmental assessments and investigations brings the knowledge to help clients navigate difficult site-specific concerns and environmental issues, a careful attention to detail, and an emphasis on environmental law and proper sampling procedures.

Mr. Erwin has prepared technical reports and project proposals for Phase I Environmental Site Assessments, subsurface investigation reports, soil excavation and underground storage tank removal reports, soil vapor extraction reports, and groundwater remediation and monitoring reports. Projects have included assessments and investigations at gas stations, dry cleaners, industrial manufacturing facilities, former refineries, machine shops, and automotive repair garages. Additionally, he has provided expertise and guidance to clients and stakeholders for environmental regulations, permitting requirements, and compliance strategies. In completed these projects, he has used a variety of specialized equipment and techniques to sample soil, water, vapor, and indoor air, while adhering to regulatory standards and protocols. Each of these projects required the balance of multiple project schedules, deadlines, and budgets to ensure all project deliverables met client expectations.

Project Experience

Eastern Tank Farm Parcel of the Former Sunland Refinery, Bakersfield, CA, 2022. A high-profile Phase I ESA for a reinvestment plan by the current property of the former Sunland Refinery. The refinery site is continuing to undergo subsurface investigation and remedial system operations to remediate soil, soil vapor, and shallow and deep groundwater contamination due to long-term oil refining operations. The eastern parcel of the Sunland Refinery was not used for oil refining, but for commercial office and bulk petroleum storage operations, and remedial efforts had all but concluded for that portion of the site. By reviewing the overall cleanup efforts for the multiple parcels of the refinery site, it was determined that historical contamination at the site had been controlled and the eastern parcel could be redeveloped with property use restrictions put in place and proper implementation of a Soils Managements Plan during redevelopment.

Former Pamarco Global Graphics Chrome Plating, Orange CA, 2022. Project Manager for a Phase I ESA and subsequent Phase II Subsurface Investigation for a former print roller refurbishment facility that utilized hexavalent chromium for plating and solvent based cleaning operations. Past investigations determined the

subsurface soil was impacted with hexavalent chromium due to the use of a compromised concrete sump, that was excavated to the maximum extent possible, with some contamination left in place. The site obtained closure and property use restrictions were put in place from the remaining contaminated soil. Environmental concerns were identified based on the outdated analytical methods used to rule out soil vapor impacts at the time of closure. A Phase II was recommended and conducted at the site which determined PCE in soil vapor was above regulatory screening levels, with predicted indoor air concentrations based on the site-specific attenuation factor anticipated to be well above the indoor air screening level for PCE. An indoor air investigation and further delineation of soil vapor impacts was recommended as a result.

Former Fleetwood Machine Products, North Hollywood, CA, 2022. Conducted a Phase I ESA for a property owner of a former machine shop that was previously investigated as a Potential Responsible Party (PRP) to the regional groundwater contamination within the Burbank Operable Unit of the San Fernando Valley Area. The property owner was facing a lawsuit from the primary PRP for the Burbank Operable Unit for the recovery of cleanup costs, and sought guidance on how to prove the property was not a PRP. Past sampling and remedial activates showed no direct pathway to groundwater, and it was determined the site was not likely a PRP during closure of the release case at the site. A review of difficult to obtain agency records was used as the primary justification to determine the magnitude of the release at the site was not large enough and there was no evidence to suggest site operations had ever impacted groundwater.

American Electronics, Orange County North Basin NPL RP, Fullerton, CA, 2022. Oversaw the installation of groundwater monitoring wells, in addition to initial development and sampling for an open cleanup case at a responsible party site for the Orange County North Basin Superfund Area. Chlorinated solvents had been utilized at the property for a long period of time in large quantities that resulted in soil, soil vapor, and groundwater impacts at the site. Groundwater and soil vapor extraction were utilized to achieve a no further action determination for soil, and subsequently groundwater despite elevated concentrations of chlorinated solvents remaining in soil and groundwater. In 2019 the cased was reopened by the agencies overseeing the cleanup of the North Basin NPL comingled groundwater contamination plume base on new data obtained for the site and surrounding sites. Groundwater monitoring operations continue at this property.

Miller Avenue and Whiteside Street, Los Angeles, CA, 2022. Supervised the installation, development, and sampling of groundwater monitoring wells at a property following an initial Phase II that determined soil vapor and groundwater contamination across the site which was slated for demolition of the existing buildings and redevelopment. The site was used for heavy industrial manufacturing since the 1920's and contaminants of concern determine to be impacting soil and groundwater included PCE, hexavalent chromium, TPH, and PFAS. The property owner was seeking a No Further Action determination to redevelop the site after conducting groundwater monitoring with the hope show the contamination was related to an offsite, up-gradient source.

jerwin@partneresi.com

PARTNER

Laura Mohlenkamp
Project Manager

Education
BS, Environmental Science, University of Nevada, Reno

Training
OSHA 40 Hour Hazwoper

Highlights
Ms. Mohlenkamp qualifies as an Environmental Professional with more than 5 years of environmental consulting and project management experience including preparing, reviewing, and managing all aspects of Phase I Environmental Site Assessments (ESAs) in commercial real estate transactions and large scale commercial and residential developments following the current ASTM (AAI) guidelines.

Experience Summary
Specializing in high volume and large-scale projects, Ms. Mohlenkamp has experience in all stages of environmental projects including Phase I ESAs and Phase II analysis. Ms. Mohlenkamp's technical skills include maintaining and meeting project scope and financial responsibilities; client management and communication; coordinating with professional staff, regulatory agencies, and subcontractors; reviewing and evaluating environmental data; preparing and reviewing technical writing documents; preparing project proposals; preparing presentations; and communicating with senior and junior staff.

- Project Management
- Environmental Due Diligence (Phase I ESA)
- Risk and Data Evaluation
- Client Relations and Business Development

Project Experience
Ms. Mohlenkamp's experience includes agricultural properties, industrial manufacturing facilities, plating facilities, fueling and automobile repair facilities, chemical distribution facilities, aerospace engineering facilities, former military bases, medical facilities, hotels and resorts, multi-family apartment complexes, and multi-tenant retail shopping centers with dry cleaning facilities.

PARTNER

Mark Lambson
Principal

Education

Bachelor of Arts Degree, Public Administration & Economics, San Diego State University
Executive MBA Program, 2000-2003

Highlights

Over 25 years of experience in the environmental and engineering consulting industry.
Deep understanding of the Commercial Real Estate business process.
Nationwide capabilities and expertise.
Vast experience in managing and delivering multi-site portfolio projects.

Experience Summary

Mark Lambson is a true veteran of the commercial real estate services industry. He has over 25 years of experience managing and performing environmental and engineering consulting projects on a national level. Mr. Lambson serves as a Principal for PARTNER and is located in PARTNER's San Diego County office. Mr. Lambson's team currently provides client management and consulting to a nationwide client base and specializes in advising "Equity" clients during the acquisition phase of commercial property transactions in the U.S., Mexico, and Canada.

Mr. Lambson has assisted clients on over 25,000 commercial real estate transactions throughout his career. His due diligence resume includes experience at all levels. This includes advising REITs, developers, property managers, retail companies, commercial real estate brokers, mortgage brokers, attorneys, lenders, universities, and real estate investment groups with the following nationwide services:

- Property Condition Assessments (PCAs)
- Individual Building System Inspections for Roof, Mechanical Electrical Plumbing + Fire/Life Safety (MEP+FLS), Elevator, Structure, Façade, Building Technology, and ADA/Accessibility
- Facility Condition Assessments (FCAs)
- Phase I Environmental Site Assessments (ESAs)
- Phase II Subsurface Investigations (Soil, soil-vapor, and groundwater sampling and analysis)
- Phase III Environmental Remediation Services & Cost Estimates
- Asbestos, Lead, Radon, Mold Sampling
- Seismic Risk Assessments and Structural Assessments (Seismic PMLs)
- Energy Audits, Benchmarking, ESG, and LEED-related services
- Hydrology, Water Conservation and Efficiency
- Fannie Mae / Freddie Mac / HUD Due Diligence
- Geotechnical and Soils Reports
- Construction Services (Doc & Cost Review, Progress Monitoring, Funds Control)
- Zoning Reports
- ALTA Surveys

Building Sciences
The One, Bel Air, California – Performed Geotechnical/Soils, Engineering, Environmental and Land Surveying for record-setting 74,000 square foot mega-mansion development that listed for $500 million. The highest residential price tag in Los Angeles County history.

Class A Office Campus Acquisition in the San Francisco Bay Area – Performed Property Condition Assessment, MEP+FLS Report, Roof Report, Elevator Report, Structural and Seismic Assessment.

National Bank Branch Locations - ADA Compliance and Accessibility Reviews.

Environmental Assessments
Phase I and Phase II Environmental Site Assessments for a 75-acre aerospace facility in the Northwest U.S.
Over 500 Phase I Environmental Site Assessments for a national fast-food chain
Dry Cleaner Remediation projects in California, Washington, Hawaii, Arizona, Texas, Nevada, and Florida.
Environmental consulting for over 2 million acres of desert land in California, Nevada, and Arizona

Land Surveys
ALTA Surveys for 2400-unit apartment portfolio in the Midwest

Multi-Site Portfolios
113-site office portfolio acquisition for a national REIT
122-site hotel portfolio for a national lending institution
77-site grocery-anchored shopping center portfolio for prominent retail chain
55-site hotel portfolio acquisition for a private investment group
68-site healthcare portfolio acquisition for a national REIT
50-site country club/golf course portfolio acquisition for a private investment group

Energy and Water Efficiency
Energy Efficiency & Water-use consulting for a national property owner that operates and manages 30 retail and office centers on the West Coast and Texas

Affiliations

National Association of Real Estate Investment Trusts (NAREIT)
International Council of Shopping Centers (ICSC)
U.S Green Building Council (USGBC)
Society of Industrial and Office Realtors, San Diego County (SIOR)
National Association of Industrial & Office Parks, Southern California (NAIOP)
San Diego Habitat Conservancy, Board of Directors. 2010 - 2014

Speaking

Bisnow Conference, Panel Moderator, La Jolla, CA, October 2014. Moderated panel on Southern California Real Estate Trends.

Globestreet, ICSC Western States Conference, San Diego, CA May 2013. Video interview regarding retail real estate trends and due diligence.

Publications

Shopping Centers Today, 2010. Authored article on LEED applications for shopping centers and retail assets.

Original Date Prepared: 3/16/2026

Revision Date(s): TBD

Prepared for Compliance with
Regional Board Order No. **R8-2010-0033**

OWNER'S CERTIFICATION

This Project-Specific Water Quality Management Plan (WQMP) has been prepared for Generations Healthcare by GUIDE-ENGINEER, (JARED BROWN) for the BRADLEY GARDENS ADDITION project.(PROJ25-018/PWQMP26-0026)

This WQMP is intended to comply with the requirements of the City of San Jacinto Ordinance No. 13. which includes the requirement for the preparation and implementation of a Project-Specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation and funding of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. In addition, the property owner accepts responsibility for interim operation and maintenance of Stormwater BMPs until such time as this responsibility is formally transferred to a subsequent owner. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity. The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under the City of San Jacinto Water Quality Ordinance (Municipal Code Section 14.12.315).

"I, the undersigned, certify under penalty of law that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

Section A: Project and Site Information

The project is Bradley Gardens Addition, on approximately 2.9 acre location at the southeast corner of S. Grand Avenue and W. 7th Street in San Jacinto, CA. The development includes building an addition to existing care facility and parking lot. There are three existing buildings on the site these buildings will remain with an addition to the large central building. The parking lot along 7th street will be renovated and repaved. This parking lot area along with a portion of the building is DMA-1 and will have 1093 sf of pervious concrete that this drainage area will drain into. This DMA-1 area is a total of 41,010 sf it will have 8,059 SF of new constructed surface with 426 sf of new lancscaping, 2,235 sf of new building area and 9,370 sf of concrete or pavement. The total area of DMA-1 is 41,010 sf with a total of 13,345 new developed surface. DMA-2 is on the south this area includes additional building expansion and a fire access road along the south and east side of the property and associated landscaping between building and new fire access. The south area is very flat with the buildings sitting slightly higher than the fire lane within the fire lane there will be 3,000 sf of pervious concrete this section of pervious concrete will support the 80,000 lb fire truck load. DMA-2 has 15,129 sf of new building area, 14,228 sf of concrete or pavement, and 6,624 sf of landscaping. This DMA-2 area is a total of 85,512 sf with 38,981 sf of new developed area. The entire area of the project is 126,522 sf with a total of 52,326 sf of new development with a total developed area of 41%. The project site has been evaluated and tested by the project Geotech who has determined the design infiltration rate of 1.97 in/hr. This exceeds the required 1.6 in/hr.

There is a trash enclosure at the northeast corner of the site close to W. 7th Street, this trash enclosure is covered. The landscaping to the south and west is already in place this landscaping includes a basketball court, courtyards, walking paths, grass, and other vegetations this area will not be modified. There will be adjustments to the parking area which include curbs gutters and accessible sidewalks with new storm drain system. There is an existing kitchen that will continue to provide food for the patients and there will be an additional kitchen and dining area. There will be no additional biological waste due to the addition. The site will have no medical Waste Containers.

PROJECT INFORMATION	
Type of Project:	INSTITUTIONAL (SENIOR CARE FACILITY)
Watershed Area:	Watershed – San Jacinto
Community Name:	San Jacinto
Development Name:	Bradley Gardens Addition
PROJECT LOCATION	
Latitude & Longitude (DMS): 33D47’00” N, 116D58’00” W	
Project Watershed and Sub-Watershed: Santa Ana; Santa Ana River, San Jacinto Valley	
APN(s): 435-330-003	
Total Acres=2.96 Acres	
Map Book and Page No.: BK 8, PG 357	
PROJECT CHARACTERISTICS	
Proposed or Potential Land Use(s)	Skilled Nursing Facility

Proposed or Potential SIC Code(s)	8051
Area of Impervious Project Footprint (SF)	91,824
Total Area of proposed Impervious Surfaces within the Project Limits (SF)/or Replacement	91,824
Does the project consist of offsite road improvements?	☐ Y ☒ N
Does the project propose to construct unpaved roads?	☐ Y ☒ N
Is the project part of a larger common plan of development (phased project)?	☐ Y ☒ N
EXISTING SITE CHARACTERISTICS	
Total area of existing Impervious Surfaces within the project limits (SF)	Insert text here.
Is the project located within any MSHCP Criteria Cell?	☐ Y ☒ N
If so, identify the Cell number:	Insert text here.
Are there any natural hydrologic features on the project site?	☐ Y ☒ N
Is a Geotechnical Report attached?	☒ Y ☐ N
If no Geotech. Report, list the NRCS soils type(s) present on the site (A, B, C and/or D)	N/a
What is the Water Quality Design Storm Depth for the project?	0.70 INCHES

A.1 Maps and Site Plans

Appendix 1 includes a map of the local vicinity and existing site. In addition, WQMP Site Plan, located in Appendix 1, includes the following:

- Drainage Management Areas
- Proposed Structural BMPs
- Drainage Path
- Drainage Infrastructure, Inlets, Overflows
- Source Control BMPs
- Buildings, Roof Lines, Downspouts
- Impervious Surfaces
- Standard Labeling

A.2 Receiving Waters

In order of upstream to downstream, the receiving waters that the project site is tributary to are as follows. A map of the receiving waters is included in Appendix 1.

Table A.1 Identification of Receiving Waters

Receiving Waters	Hydrologic Unit	EPA Approved 303(d) List Impairments	Designated Beneficial Uses	Proximity to RARE Beneficial Use
San Jacinto River	801.21	Nutrients, Aluminum, (limited Reaches) Pathogens (potential)	AGR, GWR, REC1, REC2, WARM, WILD	N/A
Canyon Lake	801.27	Nutrients (Nitrogen, Phosphorus), Organic Enrichment/ Low DO	AGR. GWR. REC1, REC2, WARM, WILD	N/A
Lake Elsinore	801.27	Nutrients (Nitrogen, Phosphorus), Pathogens, Organic Enrichment/ Low DO, Sedimentation/ Siltation	MUN, AGR, GWR, REC1, REC2, WARM, WILD	N/A

A.3 Additional Permits/Approvals required for the Project:

Section B: Optimize Site Utilization (LID Principles)

Site Optimization

Does the project identify and preserve existing drainage patterns? If so, how? If not, why?

This project will continue to drain towards the north and east. The frontage of the property currently drains in a ditch this will be replaced with a storm drain pipe system.

Does the project identify and protect existing vegetation? If so, how? If not, why?

The project frontage will be expanded this will remove existing landscaping in addtion the east side of the facility will be expanded and the parking lot will be updated. The landscaping at the rear of the facility and in the center of the facility remain

Does the project identify and preserve natural infiltration capacity? If so, how? If not, why?

The proposed site includes a fire access that is on the east and the south of the project. This access will be provided with pervious concrete. The Parking lot will include pervious concrete. The Soils report indicates an infiltration rate of at least 1.98 – 5.95 inches per hour to . (in a 24 hour event the site can drain up to 12 inches of runoff). Per the attached GSI Supplemental Infiltration Feasibility Testing the design infiltration rate is 1.97 in/hr which includes the factor of safety of 3.0.

Does the project identify and minimize impervious area? If so, how? If not, why?

The project will include pervious concrete to allow for infiltration. The project will also include disconected downspouts that will release runnof into the landscaping for infiltration.

Does the project identify and disperse runoff to adjacent pervious areas? If so, how? If not, why?

The front parking lot drains into a concrete pavement area at the north side of the parking lot. The project will also release roof drainage into landcaping.

Section C: Delineate Drainage Management Areas (DMAs)

Table C.1 DMA Classifications

DMA Name or ID	Surface Type(s)	Area (Sq. Ft.)	DMA Type
DMA 1	Build, AC, CONC.	11,605 SF	Infiltration Pervious Concrete
	Pervious Conc.	1093 SF	Infiltration
DMA 2	Build, AC, CONC.	29,357 SF	Infiltration Pervious Concrete

Section D: Implement LID BMPs

D.1 Infiltration Applicability

Is there an approved downstream 'Highest and Best Use' for stormwater runoff (ref: Chapter 2.4.4 of the WQMP Guidance Document)? ☐ Y ☒ N

Geotechnical Report

A Geotechnical Report is required by the City of Riverside to confirm present and past site characteristics that may affect the use of Infiltration BMPs, see Appendix 3.

Is this project classified as a small project consistent with the requirements of Chapter 2 of the WQMP Guidance Document? ☐ Y ☒ N

Infiltration Feasibility

Table D.1 Infiltration Feasibility

Does the project site…	YES	NO
…have any DMAs with a seasonal high groundwater mark shallower than 10 feet?		
If Yes, list affected DMAs:		No
…have any DMAs located within 100 feet of a water supply well?		
If Yes, list affected DMAs:		No
…have any areas identified by the geotechnical report as posing a public safety risk where infiltration of stormwater could have a negative impact?		
If Yes, list affected DMAs:		No
…have measured in-situ infiltration rates of less than 1.6 inches / hour?		
If Yes, list affected DMAs:		No
…have significant cut and/or fill conditions that would preclude in-situ testing of infiltration rates at the final infiltration surface?		
If Yes, list affected DMAs:		No
…geotechnical report identify other site-specific factors that would preclude effective and safe infiltration?		
Describe here:		No

D.2 Harvest and Use Assessment

The following conditions apply*:*

☐ Reclaimed water will be used for the non-potable water demands for the project.

☐ Downstream water rights may be impacted by Harvest and Use as approved by the Regional Board (verified with the City of Riverside).

☐ The Design Capture Volume will be addressed using Infiltration Only BMPs. (Harvest and Use BMPs are still encouraged, but are not required as the Design Capture Volume will be infiltrated or evapotranspired).

☐ None of the above.

Irrigation Use Feasibility

Step 1: Identify the total area of irrigated landscape on the site, and the type of landscaping used.

Total Area of Irrigated Landscape: 0.47 acres

Type of Landscaping (Conservation Design or Active Turf): Grass, bushes, tees

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for irrigation use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: 0.80 Acres

Step 3: Cross reference the Design Storm depth for the project site (see Exhibit A of the WQMP Guidance Document) with the left column of Table 2-3 in Chapter 2 to determine the minimum area of Effective Irrigated Area per Tributary Impervious Area (EIATIA).

The project EIATIA factor: Enter your EIATIA Factor

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum irrigated area that would be required.

Minimum required irrigated area: Insert Area (Acres)

Step 5: Determine if harvesting stormwater runoff for irrigation use is feasible for the project by comparing the total area of irrigated landscape (Step 1) to the minimum required irrigated area (Step 4).

Minimum required irrigated area (Step 4)	Available Irrigated Landscape (Step 1)
Insert Area (Acres)	Insert Area (Acres)

Toilet Use Feasibility

Step 1: Identify the projected total number of daily toilet users during the wet season, and account for any periodic shut downs or other lapses in occupancy:

Projected Number of Daily Toilet Users: Number of daily Toilet Users

Project Type: Enter 'Residential', 'Commercial', 'Industrial' or 'Schools'

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for toilet use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: Insert Area (Acres)

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-1 in Chapter 2 to determine the minimum number or toilet users per tributary impervious acre (TUTIA).

The project TUTIA factor: Enter your TUTIA Factor

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum number of toilet users that would be required.

Minimum number of toilet users: Required number of toilet users

Step 5: Determine if harvesting stormwater runoff for toilet flushing use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

Minimum required Toilet Users (Step 4)	**Projected number of toilet users (Step 1)**
Insert Area (Acres)	Insert Area (Acres)

Other Non-Potable Use Feasibility

Are there other non-potable uses for stormwater runoff on the site (e.g. industrial use)? See Chapter 2 of the Guidance for further information. If yes, describe below. If no, write N/A.

Insert narrative description here.

Step 1: Identify the projected average daily non-potable demand, in gallons per day, during the wet season and accounting for any periodic shut downs or other lapses in occupancy or operation.

Average Daily Demand: Projected Average Daily Use (gpd)

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for the identified non-potable use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

Total Area of Impervious Surfaces: Insert Area (Acres)

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-3 in Chapter 2 to determine the minimum demand for non-potable uses per tributary impervious acre.

The project factor: Enter Value from Table 2-3

Step 4: Multiply the unit value obtained from Step 4 by the total of impervious areas from Step 3 to develop the minimum number of gallons per day of non-potable use that would be required.

Minimum required use: Minimum use required (gpd)

Step 5: Determine if harvesting stormwater runoff for other non-potable use is feasible for the project by comparing the Average Daily non-potable demand (Step 1) to the minimum required non-potable use (Step 4).

Minimum required non-potable use (Step 4)	**Projected average daily use (Step 1)**
Minimum use required (gpd)	Projected Average Daily Use (gpd)

D.3 Bioretention and Biotreatment Assessment

Other LID Bioretention and Biotreatment BMPs as described in Chapter 2.4.7 of the WQMP Guidance Document are feasible on nearly all development sites with sufficient advance planning.

For the project, the following applies:

☐ LID Bioretention/Biotreatment BMPs will be used for some or all DMAs of the project as noted below in Section D.4 (note the requirements of Section 3.4.2 in the WQMP Guidance Document).

☐ A site-specific analysis demonstrating the technical infeasibility of all LID BMPs has been performed and is included in Appendix 5.

☐ None of the above.

D.4 Feasibility Assessment Summaries

Table D.2 LID Prioritization Summary Matrix

DMA Name/ID	LID BMP Hierarchy				No LID (Alternative Compliance)

[E] is obtained from Exhibit A of the WQMP Guidance Document

[G] is obtained from LID BMP design procedure sheet, placed in Appendix 6

Section E: Alternative Compliance (LID Waiver Program)

LID BMPs are expected to be feasible on virtually all projects. Where LID BMPs have been demonstrated to be infeasible as documented in Section D, other Treatment Control BMPs must be used (subject to confirmation of LID waiver approval by the Regional Board). For the project, the following applies:

☒ LID Principles and LID BMPs have been incorporated into the site design to fully address all Drainage Management Areas. No alternative compliance measures are required for this project and thus this Section is not required to be completed.

- *Or* -

☐ The following Drainage Management Areas are unable to be addressed using LID BMPs. A site-specific analysis demonstrating technical infeasibility of LID BMPs has been approved by the Regional Board and included in Appendix 5. Additionally, no downstream regional and/or sub-regional LID BMPs exist or are available for use by the project. The alternative compliance measures on the following pages are being implemented to ensure that any pollutant loads expected to be discharged by not incorporating LID BMPs, are fully mitigated.

E.1 Pollutants of Concern

Table E.1 Potential Pollutants by Land Use Type

Priority Development Project Categories and/or Project Features (check those that apply)	General Pollutant Categories							
	Bacterial Indicators	Metals	Nutrients	Pesticides	Toxic Organic Compounds	Sediments	Trash & Debris	Oil & Grease
☐ Detached Residential Development	P	N	P	P	N	P	P	P

						Design Storm Depth (in)	*Minimum Design Capture Volume or Design Flow Rate (cubic feet or cfs)*	*Total Storm Water Credit % Reduction*	*Proposed Volume or Flow on Plans (cubic feet or cfs)*
	A_T = Σ[A]				Σ= [D]	[E]	$[F] = \frac{[D]x[E]}{[G]}$	[F] X (1-[H])	[I]

[B], [C] is obtained as described in Section 2.3.1 from the WQMP Guidance Document

[E] is obtained from Exhibit A in the WQMP Guidance Document

[G] is for Flow-Based Treatment Control BMPs [G] = 43,560, for Volume-Based Control Treatment BMPs, [G] = 12

[H] is from the Total Credit Percentage as Calculated from Table E.2 above

[I] as obtained from a design procedure sheet from the BMP manufacturer and should be included in Appendix 6

E.4 Treatment Control BMP Selection

Treatment Control BMPs typically provide proprietary treatment mechanisms to treat potential pollutants in runoff, but do not sustain significant biological processes. Treatment Control BMPs must have a removal efficiency of a medium or high effectiveness as quantified below:

- **High**: equal to or greater than 80% removal efficiency
- **Medium**: between 40% and 80% removal efficiency

Table E.4 Treatment Control BMP Selection

Selected Treatment Control BMP Name or ID[1]	Priority Pollutant(s) of Concern to Mitigate[2]	Removal Efficiency Percentage[3]
N/A		

[1] Treatment Control BMPs must not be constructed within Receiving Waters. In addition, a proposed Treatment Control BMP may be listed more than once if they possess more than one qualifying pollutant removal efficiency.

[2] Cross Referenced from Table E.1 above.

[3] As documented in a Co-Permittee Approved Study and provided in Appendix 6.

Section F: Hydromodification

F.1 Hydrologic Conditions of Concern (HCOC) Analysis

The project does not create a Hydrologic Condition of Concern, meeting the criteria for HCOC Exemption as shown below:

HCOC EXEMPTION 1: The Priority Development Project disturbs less than one acre. The City of Riverside has the discretion to require a Project-Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The disturbed area calculation should include all disturbances associated with larger common plans of development.

Does the project qualify for this HCOC Exemption? ☒ Y ☐ N

HCOC EXEMPTION 2: The volume and time of concentration[1] of storm water runoff for the post-development condition is not significantly different from the pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant) using one of the following methods to calculate:

- Riverside County Hydrology Manual
- Technical Release 55 (TR-55): Urban Hydrology for Small Watersheds (NRCS 1986), or derivatives thereof, such as the Santa Barbara Urban Hydrograph Method
- Other methods acceptable to the City of Riverside

Does the project qualify for this HCOC Exemption? ☒ Y ☐ N

Results included in Table F.1 below and hydrologic analysis included in Appendix 7.

Table F.1 Hydrologic Conditions of Concern Summary

	2 year – 24 hour		
	Pre-condition	**Post-condition**	**% Difference**
Time of Concentration	12:10	12:05	-0.69%
Flow (CFS)	2.1 CFS	2.28 CFS	8.2%
Volume (Cubic Feet)	5149 CF	4393 CF	-15.8%

[1] Time of concentration is defined as the time after the beginning of the rainfall when all portions of the drainage basin are contributing to flow at the outlet.

HCOC EXEMPTION 3: All downstream conveyance channels to an adequate sump (Prado Dam, Santa Ana River) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will be adversely affected; or are not identified on the Co-Permittees Hydromodification Sensitivity Maps.

Does the project qualify for this HCOC Exemption? ☒ Y ☐ N

F.2 HCOC Mitigation

As an alternative to the HCOC Exemption Criteria above, HCOC criteria is considered mitigated if the project meets one of the following conditions, as indicated:

☐ a. Additional LID BMPS are implemented onsite or offsite to mitigate potential erosion or habitat impacts as a result of HCOCs. This can be conducted by an evaluation of site-specific conditions utilizing accepted professional methodologies published by entities such as the California Stormwater Quality Association (CASQA), the Southern California Coastal Water Research Project (SCCRWP), or other Co-Permittee approved methodologies for site-specific HCOC analysis.

☐ b. The project is developed consistent with an approved Watershed Action Plan that addresses HCOC in Receiving Waters.

☐ c. Mimicking the pre-development hydrograph with the post-development hydrograph, for a 2-year return frequency storm. Generally, the hydrologic conditions of concern are not significant, if the post-development hydrograph is no more than 10% greater than pre-development hydrograph. In cases where excess volume cannot be infiltrated or captured and reused, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow.

☒ d. None of the above.

Section G: Source Control BMPs

The following table identifies the potential sources of runoff pollutants for this project and specifies how they are addressed through permanent controls and operational BMPs:

Table G.1 Permanent and Operational Source Control Measures

Potential Sources of Runoff pollutants	Permanent Structural Source Control BMPs	Operational Source Control BMPs
On-site storm drain inlets	Mark all inlets with words "Only Rain Down the Storm Drain" or similar. Catch Basin Markers may be available from Riverside County Flood Control and Water Conservation District, call 951-955-1200 to verify.	Maintain and periodically repaint or replace inlet markings. Provide stormwater pollution prevention information to new site owners, lessees, or operators. See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance
Interior Storm Drains	Interior floor drains shall be plumbed to sanitary sewer.	Inspect and Maintain drains to prevent blockages and overflow.
Need for future indoor & structural pest control	Building design features including sealants barriers and fully closing windows and doors have been included to discourage entry of pests.	Integrated Pest management(IPM) information to be provided to owners, lessees, and operators.
Landscape/outdoor pesticide use	Final Landscape Plans will accomplish the following: Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions. Consider using pest-resistant plants, especially adjacent to hardscape. To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	Maintain landscaping using minimum or no pesticides. Prevent erosion of slopes by planting fast-growing, dense ground covering plants. Plant native begetation to reduce the amount of water fertilizers, and pesticides applied to the landscape. Do not overwater. Use irrigation practices such as drip irrigation, soaker hoses or micro-spray systems. Periodically inspect and fix leaks and misdirected sprinklers. Do not rake or blow leaves, clippings, or pruning waste into the street, gutter, or storm drain. Instead, dispose of green waste by composting, hauling it to a permitted landfill, or recycling through your city's program. Integrated Pest Management (IPM) information to be provided to owners, lessees, and operators.

Refuse Areas	Site design features dumpster enclosures. Signs will be posted on or near dumpsters with the words “Do not dump hazardous materials here” or similar.	Periodic inspections for leaky, overfilled, uncovered, or other problematic conditions will occur. Corrective action will be made upon detection, as circumstances permit. Dumping of liquid or hazardous wastes will be prohibited. Spill control materials will be available on-site. All wastes to properly stored and disposed of in accordance with all applicable Local, State and Federal regulations
Building Downspouts	Downspouts shall be disconnected with splash pads.	Annually clean rain gutters and clean downspouts prior to fall season or first rain event.
Pervious Concrete	Remove any debris from concrete surface and remove any soil debris or weed vegetation.	Keep concrete aera clean swept and free of any fine particles that can clog or fill concrete pores. Pressure wash surfaces every year prior to first flush event.

Section H: Construction Plan Checklist

TO BE COMPLETED AT TIME OF FINAL WQMP

Section I: Operation, Maintenance and Funding

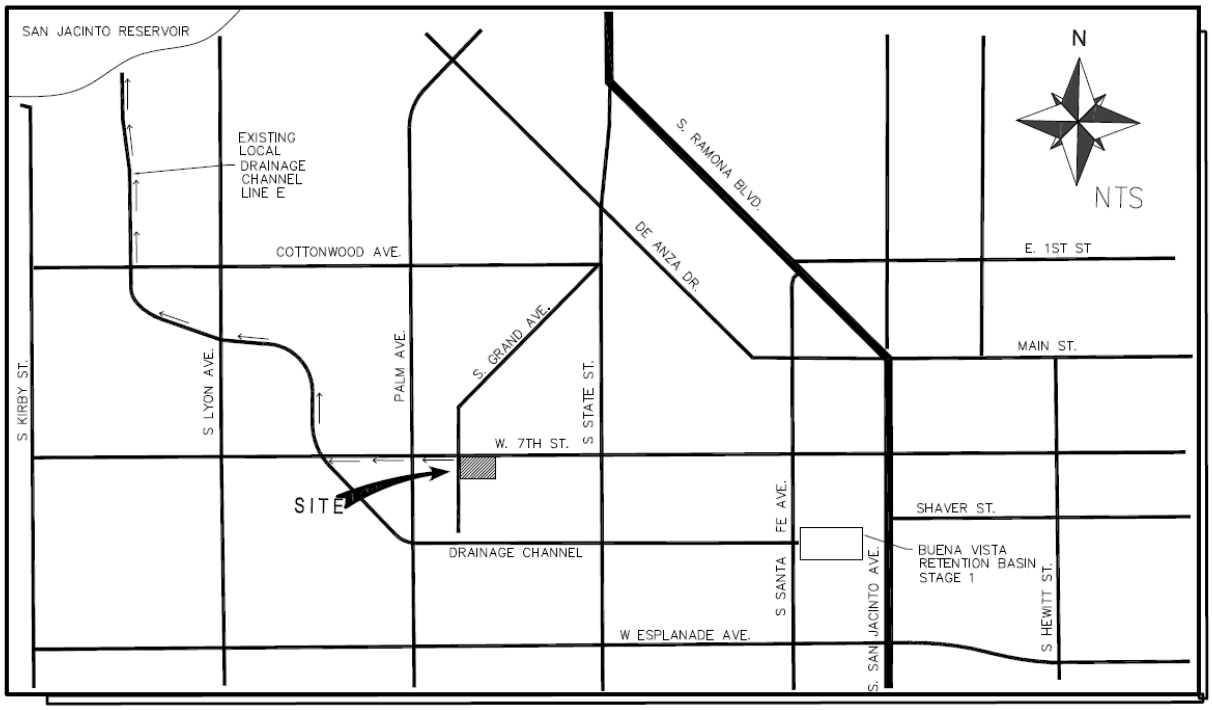
As required by the City of Riverside, the following Operation, Maintenance and Funding details are provided as summarized:

1. A means to finance and implement facility maintenance in perpetuity, including replacement cost.
2. Acceptance of responsibility for maintenance from the time the BMPs are constructed until responsibility for operation and maintenance is legally transferred.
3. An outline of general maintenance requirements for the Stormwater BMPs selected.
4. Figures delineating and designating pervious and impervious areas, location, and type of Stormwater BMP, and tables of pervious and impervious areas served by each facility.
5. A separate list and location of self-retaining areas or areas addressed by LID Principles that do not require specialized O&M or inspections but will require typical landscape maintenance as noted in Chapter 5, pages 85-86, in the WQMP Guidance.

See Appendix 9 for a detailed Stormwater BMP Operation and Maintenance Plan that sets forth a maintenance schedule for each of the Stormwater BMPs built on site, and an agreement assigning responsibility for maintenance and providing for inspections and certification.

Maintenance Mechanism: See Appendix 9

Will the proposed BMPs be maintained by a Home Owners' Association (HOA) or Property Owners Association (POA)?



☐ Y ☒ N

Operation and Maintenance Plan and Maintenance Mechanism is included in Appendix 9. Educational materials for those personnel that will be maintaining the proposed BMPs within this Project-Specific WQMP are included in Appendix 10.

Note: To be completed at the time of the FWQMP.

Attention: Ms. Kim Corcoran

Subject: Preliminary Geotechnical Investigation, Proposed Bradley Gardens Skilled Nursing Facility Building Addition, 980 W. 7th Street, City of San Jacinto, Riverside County, California 92582 (APN 435-330-003)

Dear Ms. Corcoran:

In accordance with your request and authorization, GeoSoils, Inc. (GSI), has performed a preliminary geotechnical investigation of the subject site. The purpose of our study was to evaluate the general geologic and geotechnical conditions at the existing skilled nursing facility, relative to the currently proposed development thereon, and to present preliminary recommendations for grading and the design, and construction of foundations, earth retaining structures, pavements, and hardscape from a geotechnical viewpoint.

Our evaluation primarily focuses on the proposed 43-bed skilled nursing facility (Building A1) depicted on the overall site plan, dated September 18, 2025, prepared by Gregg Maedo & Associates ([GMA], 2025 [see Appendix A]). It is our understanding that the existing office building renovation into a 16-bed facility (Building C) is still being contemplated, and based on the type of construction (building renovation) is not specifically addressed herein. If necessary, geotechnical recommendations for the proposed building renovation can be provided, once the planning for the proposed renovation is better understood.

Proposed Building A1 on the east side of the existing facility will be constructed in the open area, and will include demolition of a building in the southeast corner of the site. The need for retaining walls is unknown at this time; however, GSI has included recommendations for conventional retaining walls herein, if needed.

EXECUTIVE SUMMARY

Based on our review of the available data (see Appendix A), field exploration, laboratory testing, geologic and geotechnical engineering analyses, as well as our past experience on nearby sites, the proposed development of the skilled nursing facility building addition appears to be feasible from a geotechnical viewpoint, provided the recommendations presented in the

text of this report are properly incorporated into the design and construction of the project. Based on the existing body of geotechnical data accumulated during our recent subsurface exploration and laboratory testing, and from previous geotechnical work on nearby projects, the most significant elements of this study are summarized below:

- The subsurface data obtained, and regional geologic mapping by Dibblee (2003) indicate that the site is mantled by a thin layer of topsoil and disturbed fill, which is underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas (Qa). The topsoil and disturbed fill thickness was relatively thin (approximately 2 to 3 feet). Underlying the topsoil and disturbed fill, Quaternary-age (Holocene- to late Pleistocene-age) alluvial sand and clay of valley areas extend to the depths explored (between 30 and 60 feet below existing grades), although no significant clay layers were encountered during our subsurface investigation. Provided that the recommended remedial earthwork techniques are incorporated into the proposed development plans, the support of new fills and settlement-sensitive improvements by the onsite earth materials is considered feasible. However, proposed settlement-sensitive improvements that do not receive mitigation in the form of remedial earthwork may be subject to ground deformations and associated distress.

- No groundwater was encountered during our site exploration to a depth in excess of 60 feet below the ground surface (bgs). Based on our review of the California Department of Water Resources Water Data Library (CDWR; 2025), nearby well measurements reviewed appear to be regional groundwater measurements at depths of approximately 170 and 155 feet (State Well No. 04S01W27P005S [March 7, 1991], and Site Code No. 337748N1169760W001 [December 6, 2011], respectively) at sites with similar ground surface elevations. However, our review of historic groundwater measurements in the San Jacinto and Temecula basins (U.S. Geological Survey, 1919, Water Supply Paper 429) indicates groundwater in the basin may have been as shallow as 40 feet bgs. Groundwater conditions are subject to change as a result of climatic variations, rainfall, up-gradient irrigation practices, broken or damaged underground utilities.

- While site soils are potentially erodible, based on the flat laying nature of the site the presence of landslide deposits, slumps, or other significant forms of mass wasting were not observed within the proposed development area during fieldwork nor during our geologic map reviews.

- The site is situated in an area of active faults. The nearby San Jacinto and Casa Loma fault zones are considered active and are included within Alquist-Priolo Earthquake Fault Zones. Our review of published data indicates that there are no known active faults crossing the site (Jennings and Bryant, 2010), and the site is not located within an Alquist-Priolo Earthquake Fault Zone (California Geological Survey [CGS], 2018). In

addition, our review of the Riverside County Information Technology (RCIT) Map My County website (2025) indicates no County faults are mapped onsite and site is not located within a County fault zone. Therefore, surface fault rupture to adversely affect the proposed development is considered low. Due to the proximity of regional faults with documented Holocene movement, the proposed development could experience moderate to strong ground motions over its design life, as with all development in southern California. Therefore, the seismic ground motion values and design parameters provided herein should be incorporated into project planning. Further discussions of our fault activity review and photolineament analysis are presented herein.

- Our review indicates that the subject site is susceptible to secondary seismic hazards, including ground deformations from seismically-induced liquefaction or densification. Our review of the RCIT (2025) Map My County website indicates the site is mapped within an area designated as having a "moderate" potential for liquefaction, and is located in a zone of "Active" subsidence (RCIT, 2025). As such, liquefaction and settlement analyses were conducted, and are further discussed herein. However, these secondary seismic hazards can be mitigated to acceptable levels through the proposed site earthwork and foundation design recommended herein.

- Site soils are considered to exhibit a very low expansion potential (Expansion Index [E.I.] ranging between 0 and 20). The design of building foundations and other proposed site improvements should consider these expansive characteristics of the onsite soils.

- GSI conducted sampling of the near-surface onsite earth materials for general soil corrosivity testing. The corrosivity testing included the evaluation of pH, soluble sulfates, chlorides, and saturated resistivity. The test results indicate that the tested sample is moderately alkaline with respect to soil acidity or alkalinity, are is moderately corrosive to ferrous metals when saturated, presents negligible sulfate exposure to concrete (Exposure Class "S0" per Table 19.3.1.1 of American Concrete Institute [ACI] 318-14), and exhibits relatively low concentrations of soluble chlorides. On a preliminary basis, reinforced concrete mix design should minimally conform to Exposure Classes "S0," "C1," and "W0" outlined in Table 19.3.2.1 of ACI 318-14, as the foundations would likely be exposed to moisture. It should be noted that GSI does not practice in the field of corrosion engineering. Therefore, additional recommendations may be obtained from a qualified corrosion engineer should corrosion mitigation be necessary, as determined by the project architect, civil engineer, or structural engineer, as warranted.

- The underlying alluvium has some potential to consolidate due to foundation and fill loading during a seismic event based on historic groundwater levels. Our evaluation of settlement potential (both static and seismic), has considered settlement due to structural loads on footings, subsurface geometry, and historic groundwater levels.

- The minimum depth of remedial earthwork excavations across the area of proposed development are anticipated to be on the order of 5 to 7 feet. The actual depth of remedial grading excavations would be based on the conditions exposed inside the excavation during remedial grading. In areas to receive proposed ancillary surface improvements, such as pavements and flatwork, a minimum 2-foot thick layer of recompacted fill should be provided beneath these improvements. In addition, all footings should be supported by at least 3 feet of recompacted fill, which can be further evaluated once the proposed structural loads are provided for GSI's review.

- Assuming wall loads of 1 to 3 kips/foot, and column loads of 20 to 100 kips, the use of a structural mat foundation, or other foundation designed to tolerate the site's soil conditions and seismic settlement potential may be used. These assumptions should be revisited once the final plans and structural loads are made available to GSI.

- Recommendations for Portland cement concrete (PCC) and asphaltic concrete (AC) pavements are provided herein. Due to the relatively sandy nature of the near-surface soils onsite , pavement subgrades composed of these earth materials are anticipated to perform adequately under anticipated traffic loads.

- Temporary slopes for excavations less than 10 feet deep should not be constructed steeper than a 1:1 horizontal to vertical (h:v) gradient, provided that running sands or groundwater seepage are not present. Based on the proximity of existing building improvements, which will remain in-service adjacent to recommended remedial grading, the use of slot-cutting techniques or localized shoring may be necessary. All temporary slopes should be observed by GSI prior to workers entering excavations.

- The recommendations presented herein should be incorporated into the design and construction considerations of the project.

The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to contact our office.

Respectfully submitted,

GeoSoils, Inc.

PRELIMINARY GEOTECHNICAL INVESTIGATION
PROPOSED BRADLEY GARDENS SKILLED NURSING FACILITY
BUILDING ADDITION, 980 W. 7TH STREET
CITY OF SAN JACINTO, RIVERSIDE COUNTY
CALIFORNIA 92582 (APN 435-330-003)

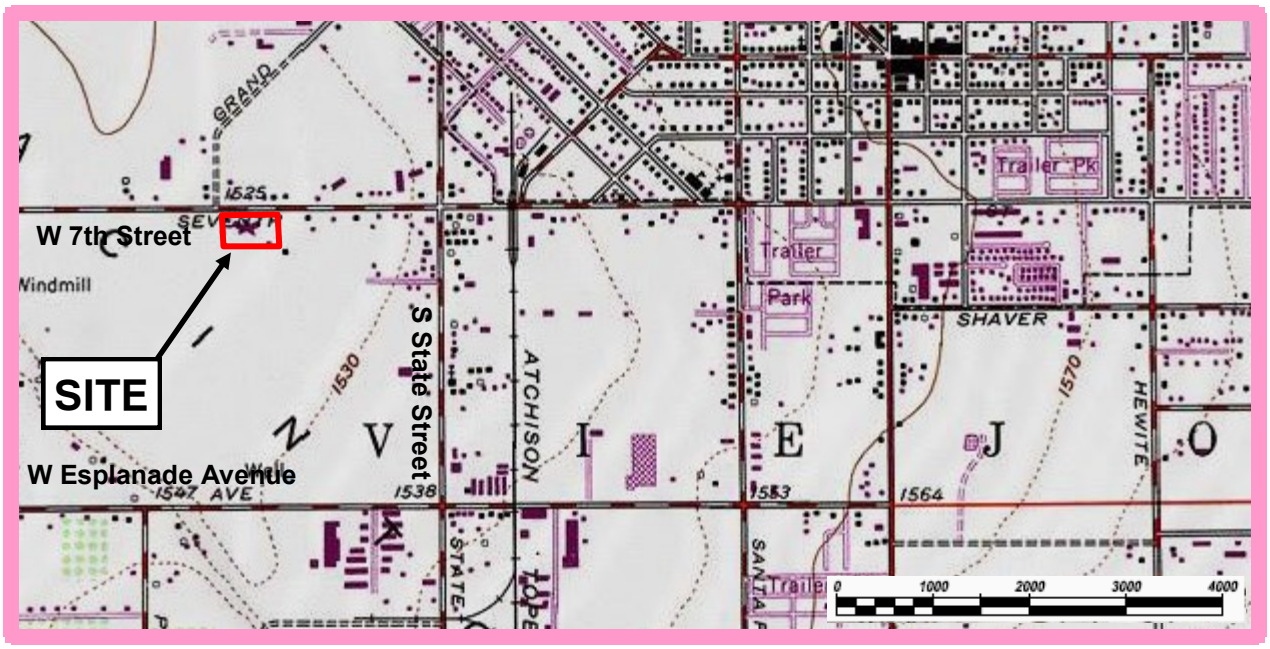
SCOPE OF SERVICES

The scope of our services has included the following:

1. Review of in-house geologic and geotechnical literature, maps, and aerial photos of the site and vicinity (text and Appendix A).

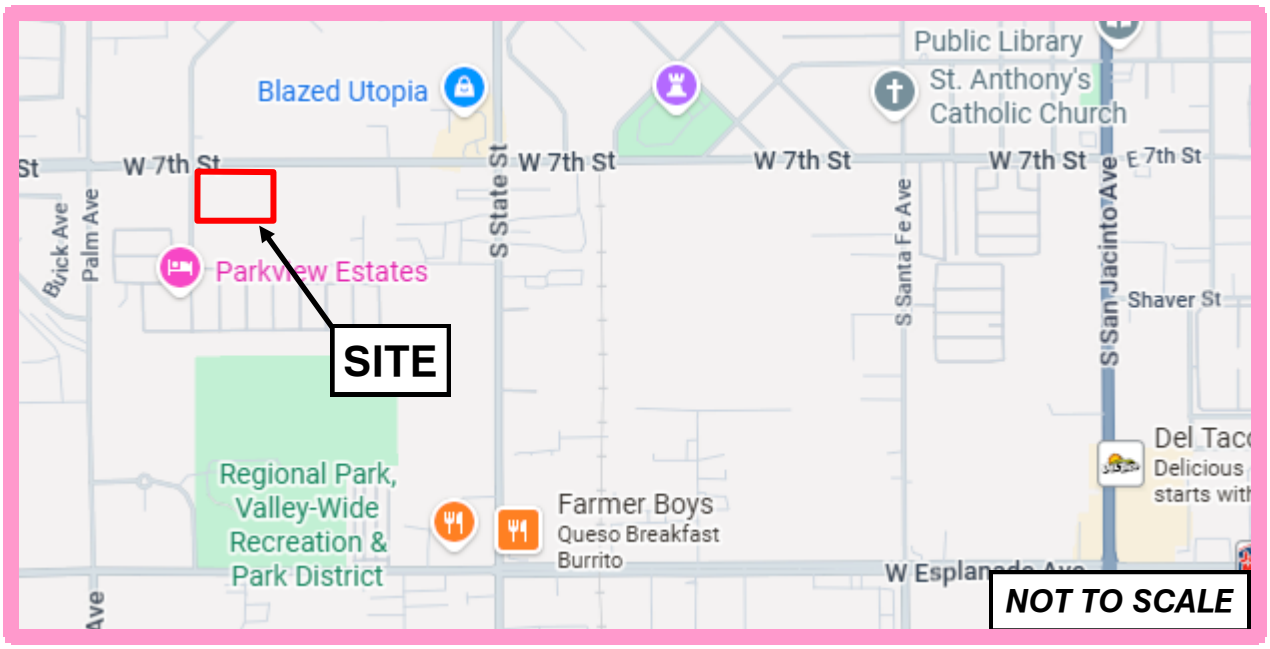
2. Geologic reconnaissance mapping and subsurface exploration consisting of the advancement of four (4) exploratory hollow-stem auger borings (B-1 through B-4), with a truck-mounted drill rig, and four (4) Cone Penetration Test (CPT) soundings (CPT-1 through CPT-4), for geotechnical logging and soil sampling (text and Appendix B).

3. Evaluation of geologic, seismic hazards and regional seismicity (text and Appendix C).



4. Appropriate laboratory testing of representative bulk and relatively undisturbed soil samples collected during our subsurface exploration program (text and Appendix D).

5. Engineering and geologic analyses of data collected (text and Appendix E).



6. Preparation of this geotechnical report, accompaniments, and general grading guidelines (text and Appendix F).

SITE DESCRIPTION AND PROPOSED DEVELOPMENT

The overall site consists of an approximately 2.98-acre, rectangular-shaped area of developed land. The proposed Building A1 is located on the east side of the existing health care facility. The site is located on the southeast corner of the intersection of W 7th Street and S. Grand Avenue, in the City of San Jacinto, Riverside County, California (see Figure 1 - Site Location Map). The physical address of the existing facility is 980 W. 7th Street, City of San Jacinto, Riverside County, California 92582. As discussed herein, the overall care facility is referred to as site, project site, or property.

SITE LOCATION MAP

Figure 1

The geographic coordinates of the approximate centroid of Building A1 is at a latitude of 33.77956 degrees and a longitude of -116.97718 degrees. The property is bounded by undeveloped land on the south, east and west, by residential development to the southwest, and commercial development to the north, across W 7th Street. In general, the site is flat-lying to very gently sloping in a southeasterly direction. According to Google Earth Pro (GEP, 2025), site elevations vary between approximately 1,527 and 1,525 feet Mean Sea Level (MSL), for an overall relief of about 2 feet. The site is sparsely vegetated and has shrubs and trees surrounding the existing facility. Within the proposed building footprint, the western margin is currently used for an exercise yard by the patients. Elsewhere, it is earthen or covered with gravel (driveway area).

Existing site improvements primarily consist of several single-story buildings with an asphaltic concrete (AC) parking lot to the north. A U-shaped drive aisle exists near the entrance to the site from W 7th Street. Existing underground utilities are present beneath the pavements. There are also improvements in the area of the proposed building which consist of various sidewalks, a basketball court, and exercise yard fences. The proposed development (Building A1) is planned to be a single-story health care building with an improved fire access lane and small parking lot. Building loads are assumed to be typical for these types of structures. Sewage disposal is proposed to tie into the regional municipal system.

BACKGROUND

The facility was first approved to provide Medicare and Medicaid services on May 29, 1968 (Nursing Home Report, 2025). Existing onsite buildings appear to be primarily wood-frame construction and stucco exteriors, with shallow concrete slabs and foundations. The exercise yard area was added sometime between 2011 and 2012. Since that time, the site has been maintained and slightly modified to its current configuration. Construction records of the existing facility were not available at the time of this report and it is believed that most of the single-story facility buildings were constructed upon relatively shallow fill soils (less than 3 feet in thickness). Records of the initial grading on this site were not available for GSI's review. Given the age of the existing development (circa 1968), it is unlikely that a geotechnical report for the development of this site is currently available.

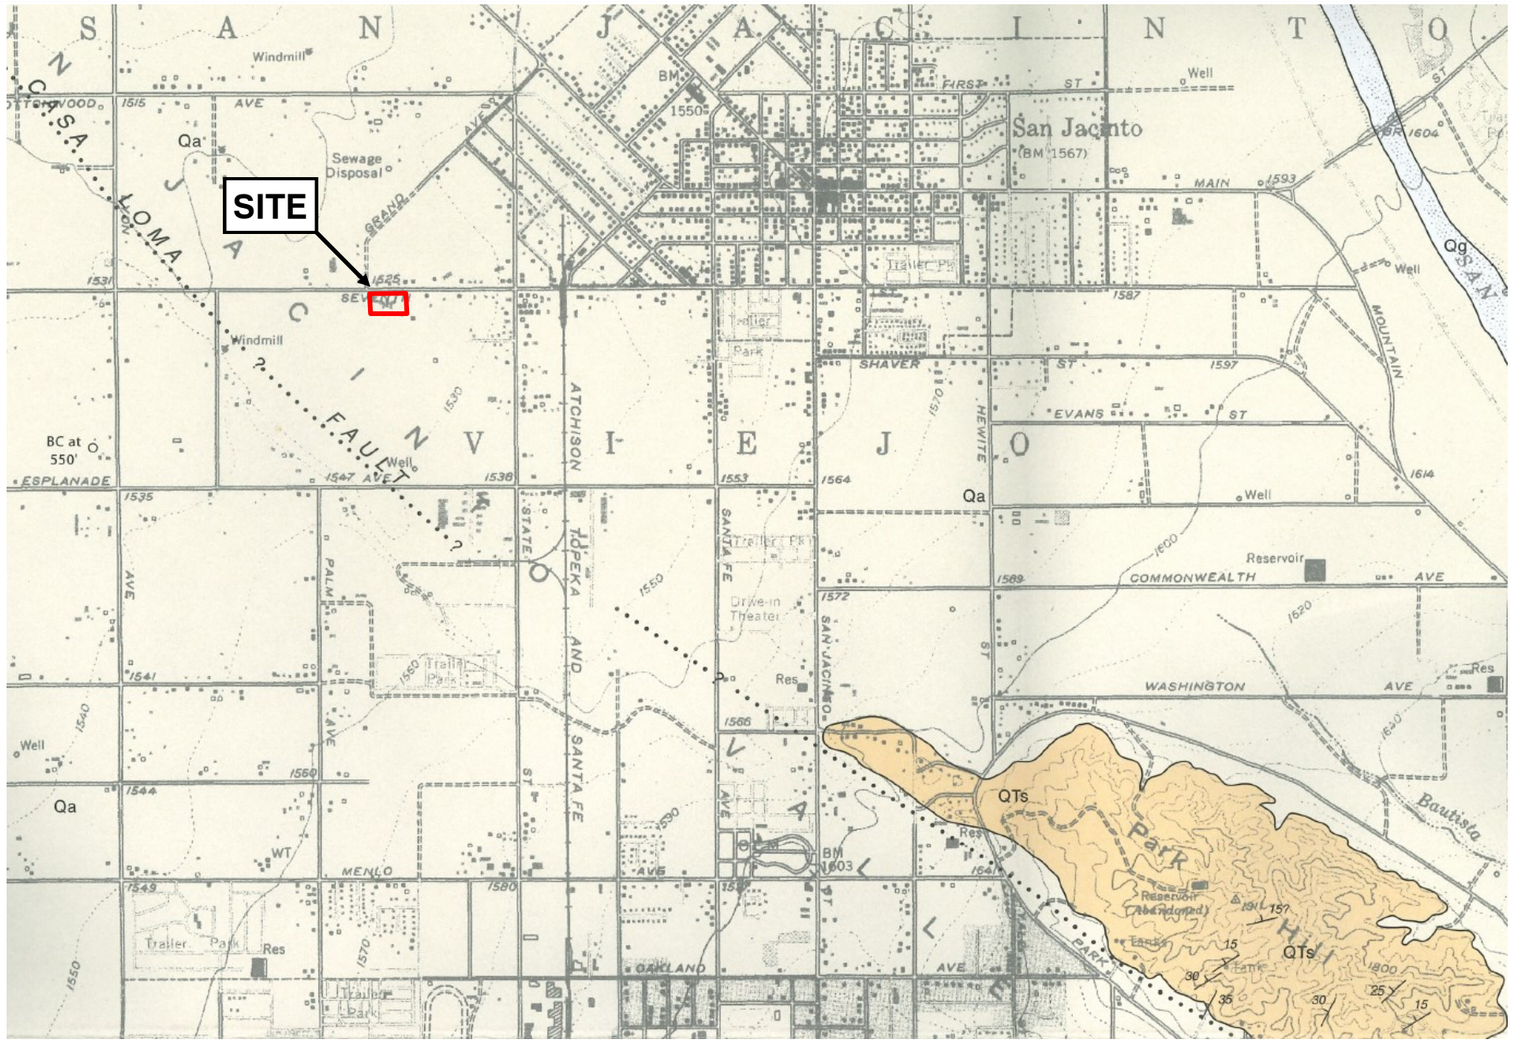
SITE EXPLORATION

Surface observations and subsurface explorations were performed by GSI representatives on November 26, 2025. Near-surface soil and geologic conditions were explored with four (4) exploratory hollow-stem auger borings (B-1 through B-4), advanced with a truck-mounted drill rig. In addition, four (4) supplemental Cone Penetration Test (CPT) soundings (CPT-1 through CPT-4) were also advanced in the footprint of Building A1. The borings and CPT soundings were logged or observed by a geologist from this office who also

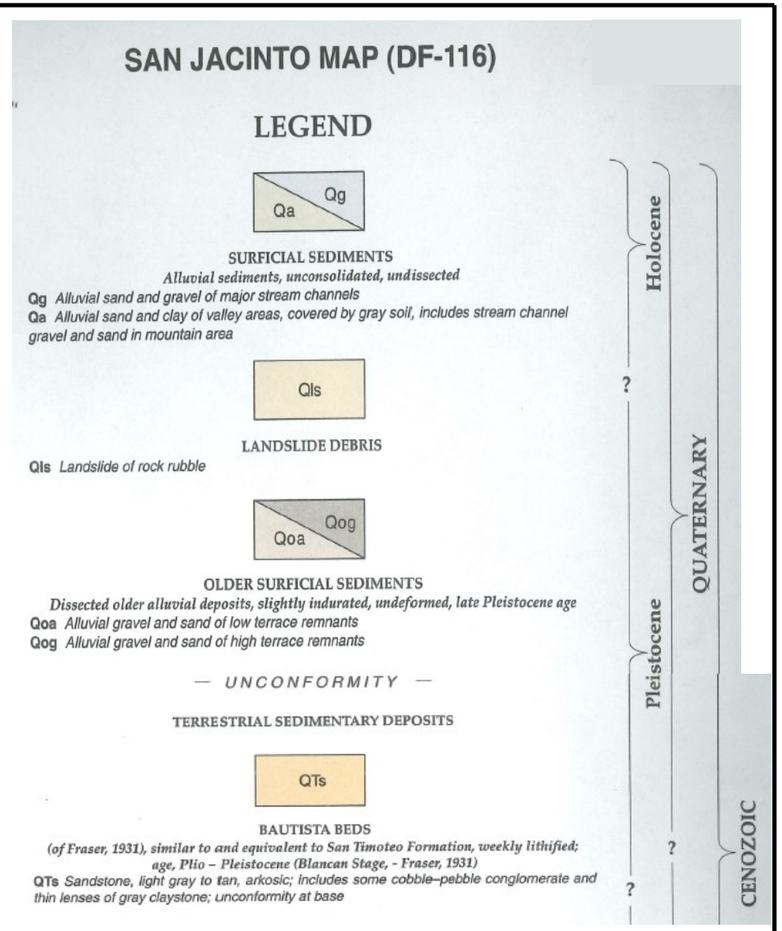
collected representative bulk and relatively undisturbed soil samples for appropriate laboratory testing. Logs of the borings and CPT soundings are presented in Appendix B. The approximate locations of the borings and CPT soundings are shown on the attached Geotechnical Map (see Plate 1), which uses the overall site plan by GMA (2025) as a base.

GEOLOGY

Regional Geologic Setting



The property is situated near the northeastern margin of the Perris Block, a portion of a prominent natural geomorphic province in southwestern California known as the Peninsular Ranges. The Peninsular Ranges are characterized by steep, elongated ranges and valleys that trend northwesterly. The Peninsular Ranges extend north to the base of the San Gabriel Mountains and south into Baja California, Mexico. The Perris Block is a stable structural block bounded on the west by the Elsinore fault zone and on the east by the San Jacinto fault zone. The province is bounded on the north and northeast by the Transverse Ranges, on the south and southeast by the Colorado Desert geomorphic province. This province is typified by plutonic and metamorphic rocks (bedrock) which comprise the majority of the mountain masses, with relatively thin volcanic and sedimentary deposits discontinuously overlying the bedrock, and with Plio/Pleistocene-age (Quaternary-age) alluvial fan deposits filling in the valleys and younger alluvium filling in the incised drainages. The alluvial deposits are derived from the waterborne deposition of the products of weathering and erosion of the bedrock. Regional geologic mapping by Dibblee (2003) indicates the site is underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas (Qa), although no significant clay layers were encountered during our subsurface investigation. The regional geology of the site and near-vicinity is shown on Figure 2, which uses Dibblee (2003) as a base.



Site Geology

The site geologic units encountered or observed during our subsurface investigation and site reconnaissance included near surface topsoil and disturbed fill, underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas at depth. The earth materials are generally described below from the youngest to the oldest. The distribution of these materials is shown on Plate 1. The relationship of the geological units is shown in profile on Geologic Cross Sections A-A' and B-B' (Plate 2).

Topsoil and Disturbed Fill (Not Mapped)

Topsoil and disturbed fill were encountered in all the borings advanced onsite. The topsoil and disturbed fill generally consist of brown, moist, loose to medium dense silty sands with some occasional roots and rootlets. Based on the available data, the thickness of the topsoil and disturbed fill was relatively thin (approximately 2 to 3 feet). Due to the low relative densities

and potential for adverse settlements, all of the existing topsoil and disturbed fill should be removed and recompacted during site grading activities. The removed topsoil and disturbed fill may be reused for compacted fills, provided it has been cleansed of deleterious materials (e.g., weeds, grasses, and concentrations of organic matter) prior to placement onsite as engineered fill.

Quaternary-Age Alluvial Sand and Clay of Valley Areas (Map Symbol - Qa)

In general, the topsoil and disturbed fill is underlain by relatively young (Holocene- to late Pleistocene-age) alluvial deposits, described by Dibblee (2003) as alluvial sand and clay of valley areas. However, as encountered during our subsurface investigation the site soils were generally sandy with minor silt layers encountered at depth. The alluvial deposits generally consist of light brown and dark gray, grayish brown, and light gray, medium dense, silty sand and silt with a few minor sandy layers. The alluvium is generally damp to moist and locally wet to saturated. The observed alluvial deposits extend to depths beyond 60 feet, and are estimated to be hundreds of feet in thickness based on the data reviewed. The near surface alluvial deposits (upper 5 to 7 feet) should be removed and recompacted during site grading. In-place low density alluvial deposits should be removed to competent materials (e.g., greater than or equal to 105 pcf or greater than or equal to 85 percent compaction). The removed alluvial deposits may be reused for compacted fills, provided that they have been cleansed of deleterious materials prior to placement onsite as engineered fill.

GROUNDWATER

No groundwater or seepage were encountered during our field exploration in Borings B-1 through B-4 nor CPTs 1 through 4, at depths ranging between approximately 30 and 60 feet bgs. As such, groundwater is not expected to be a factor during construction of the proposed project. Based on our review of the California Department of Water Resources Water Data Library (CDWR; 2025), nearby well measurements reviewed appear to be regional groundwater measurements at depths of approximately 170 and 155 feet (State Well No. 04S01W27P005S [March 7, 1991], and Site Code No. 337748N1169760W001 [December 6, 2011], respectively) at sites with similar ground surface elevations. However, our review of historic groundwater measurements in the San Jacinto and Temecula basins (U.S. Geological Survey, 1919, Water Supply Paper 429) indicates groundwater near the center of the basin may have been as shallow as 40 feet bgs. However, in California, the legislature passed the Sustainable Groundwater Management Act (SGMA), creating a statewide framework for groundwater regulation. The Eastern Municipal Water District (EMWD), and several other water purveyors, have been actively managing the San Jacinto basin as part of a voluntary Assembly Bill 3030 effort passed in 1992. As such, it is unlikely the groundwater will reach historic levels as the basin is now adjudicated.

However, there is a potential for perched water to occur both during and following site development along zones of contrasting permeability (e.g., fill lifts, sandy and clayey bedding, or discontinuities). Sources of perched water may include infiltrated rain water, over-irrigation, or damaged underground utilities. These observations reflect site conditions at the time of our investigation and do not preclude future changes in local groundwater conditions that were not obvious at the time of our investigation.

FAULTING AND REGIONAL SEISMICITY

Our review indicates that there are no known active faults crossing this site (Jennings and Bryant, 2010), and the site is not within an Alquist-Priolo Earthquake Fault Zone (California Geological Survey [CGS], 2018). In addition, our review of the RCIT Map My County website (2025) indicates no County faults are mapped onsite and site is not located within a County fault zone. However, the site is situated in a region of active faulting, as is all of southern California. These faults include, but are not limited to: the San Andreas fault; the San Jacinto fault; and the Elsinore fault zone.

The closest known active fault is the San Jacinto fault, located at an approximate distance of 2.0 miles (3.2 kilometers) to the east-northeast. However, the nearby San Andreas fault, and design fault for the subject site, is located at an approximate distance of 17.1 miles (27.5 kilometers) to the northeast.

Portions of the San Jacinto and San Andreas faults have demonstrated movement in the Holocene Epoch (last 11,700 years); and therefore, are considered active and located within Alquist-Priolo Earthquake Fault Zones (CGS, 2018). Cao, et al. (2003) indicates that the San Andreas fault is an "A" fault with a slip rate of 24.0 ($\pm$6.0) millimeters per year, and is capable of producing a maximum magnitude (M_w) 7.5 earthquake. The location of the San Andreas and San Jacinto faults, and other major faults that could have an effect on the site in the form of moderate to strong ground motions, are shown on the Regional Fault Map (see Figure 3). In addition, the Riverside County Information Technology (RCIT) fault hazard mapping in the site vicinity is shown on the County Fault Map (see Figure 4).

Fault Activity Review (Alquist-Priolo Fault Zones)

Based on our review of available fault hazard mapping (CGS, 2025 and 2018 and RCIT, 2025) a small splay of the San Jacinto fault projects towards the subject property. This fault trace is described as the "Casa Loma" segment of the San Jacinto fault zone.

Our fault activity review included reviews of previous fault-finding and geotechnical investigations by Gary S. Rasmussen & Associates (GR&A, 1986, County Geo. No. 409), Lewis S. Lohr & Associates (LSL&A, 1991, County Geo. No. 790) and by Leighton & Associates (L&A, 2003, County Geo. No. 1189). These previous investigations, just northwest of the site, found no evidence of offsets or active faulting within the trench exposures evaluated. As such, it appears the small fault splay dies-out before reaching the

site proximity. A map showing the Alquist-Priolo earthquake zones of required investigation (CGS, 2025) is provided on Figure 5. A map showing the nearby Alquist-Priolo site investigation reports reviewed (GR&A, 1986, LSL&A, 1991, and L&A, 2003) is provided on Figure 6.

Aerial-photographic Lineament Analysis

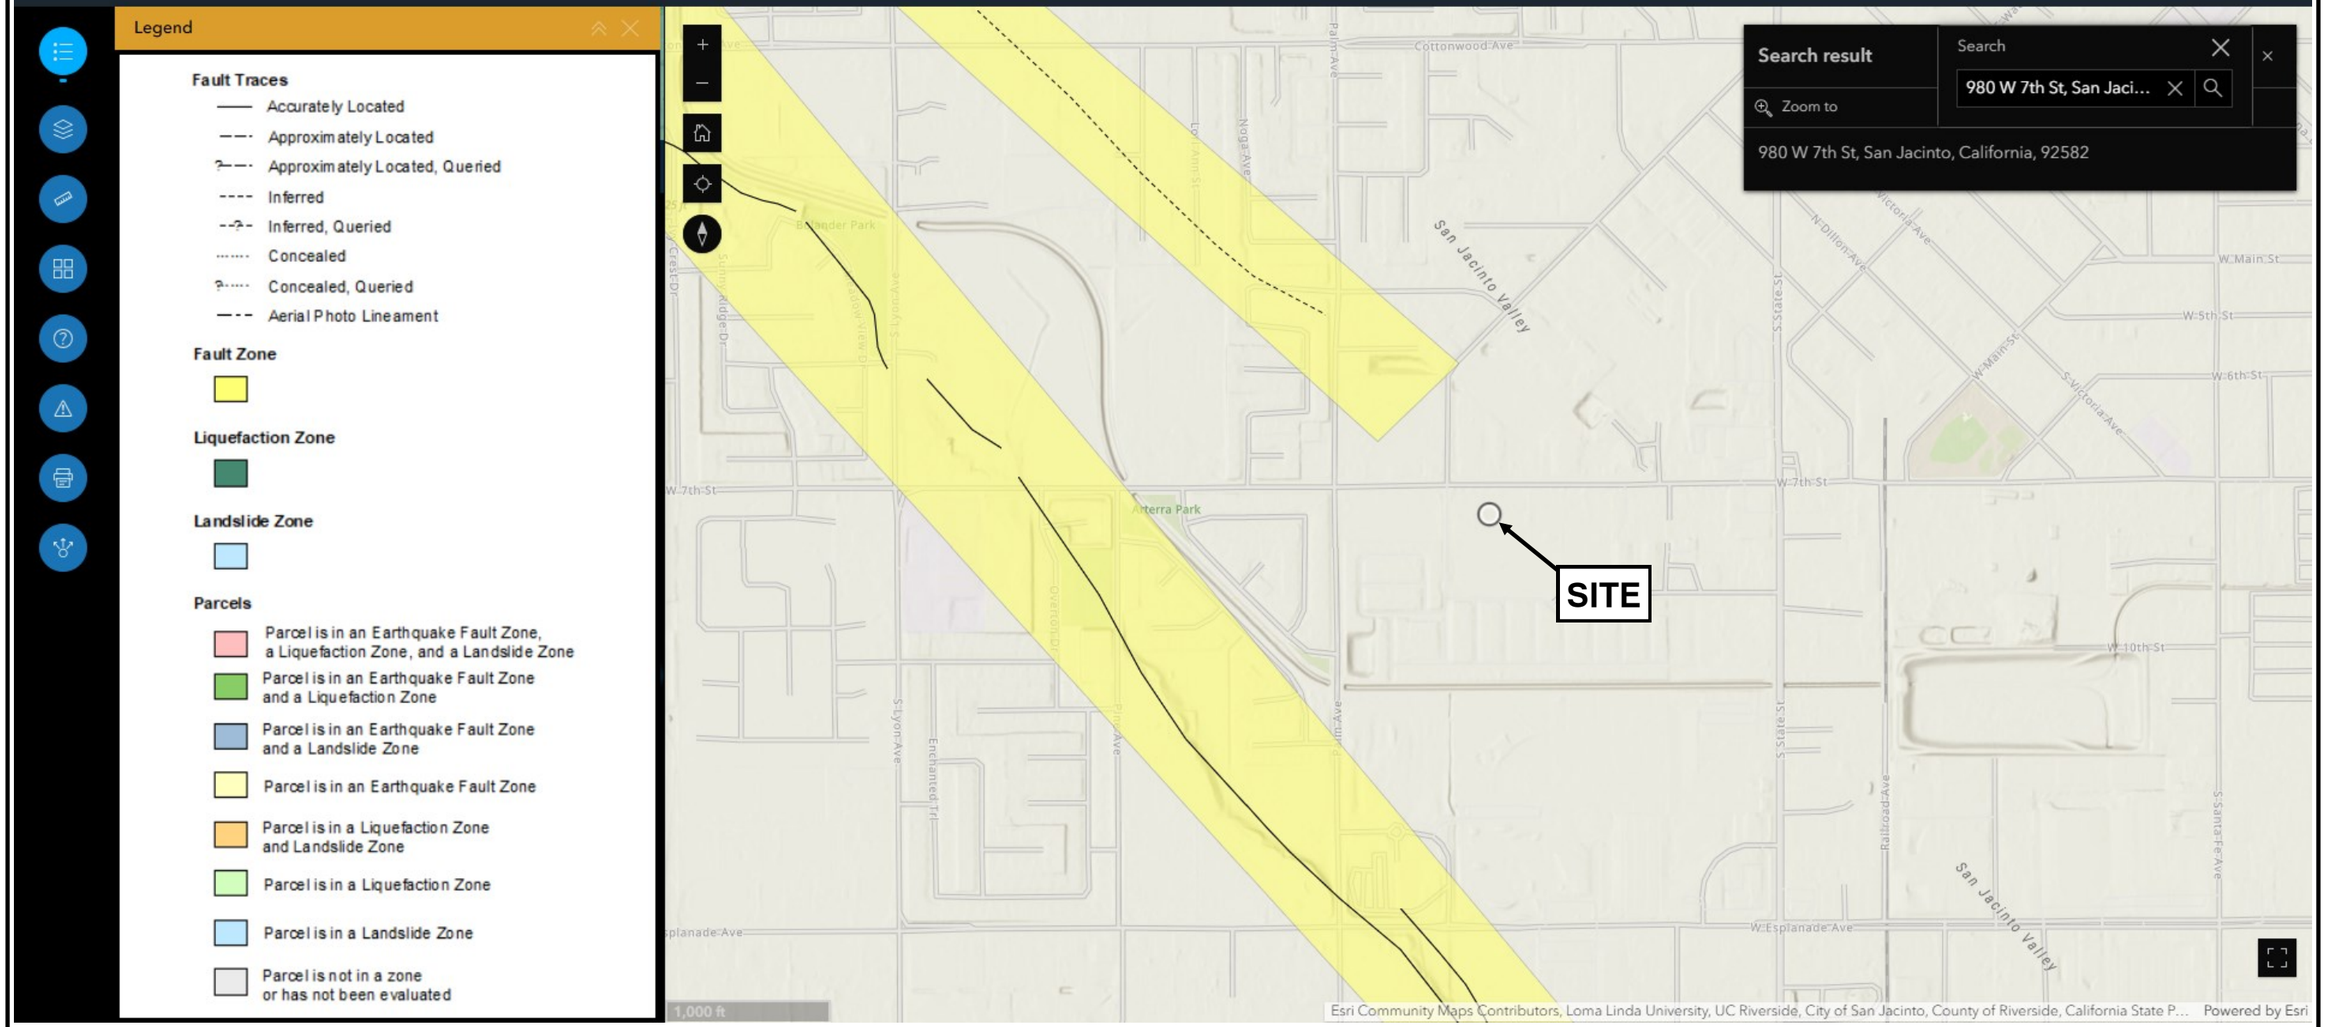
In order to identify possible unmapped faults and to evaluate topographic expressions of published fault traces in the proximity, a lineament analysis was performed using stereoscopic black-and-white aerial photographs (United States Department of Agriculture [USDA], 1980). Lineaments were generally classified as strong, moderate, or weak. A strong lineament is a well-defined feature that can be continuously traced several hundred feet to a few thousand feet. A moderate lineament is less well-defined, somewhat discontinuous, and can be traced for only a few hundred feet. A weak lineament is discontinuous, poorly defined, and can be traced for a few hundred feet or less. Based on our review and analysis, a moderate photolineament was noted west- northwest of the site, and correlates well with the mapped location of the Casa Loma segment of the San Jacinto fault zone. No lineaments specifically cross or project toward the project site. Furthermore, the site is not transected by geomorphic features indicative of active faulting.

Regional Seismicity

General

The subject site is located within a seismically active region, subject to moderate to strong earthquakes occurring along many active fault splays. The possibility of ground motions at the site, may be considered as approximately similar to the southern California region as a whole.

Historical Site Earthquake Records



Historical site seismicity was evaluated with the USGS website application "Search Earthquake Catalog" (https://earthquake.usgs.gov/earthquakes/search/). This program performs a search of the historical earthquake records for magnitude 5.0 to greater than 7.0 seismic events within a search area, between the years of January, 1800 through December, 2025. A historical earthquake epicenter map is generated from the historical data, and is presented on Figure 7. Our research of regional geologic and seismic data did not reveal any known instances of ground failure within the site associated with regional seismic activity.

Seismic Ground Motion Values

Using a latitude of 33.77956 degrees and a longitude of -116.97718, a Risk Category of III (provided by the architect) and based on the site conditions, the following table summarizes the design criteria obtained from the 2022 CBC, Chapter 16 Structural Design, Section 1613, Earthquake Loads. The ASCE Hazard Tool (ASCE Hazard Tool) has been used to aid in

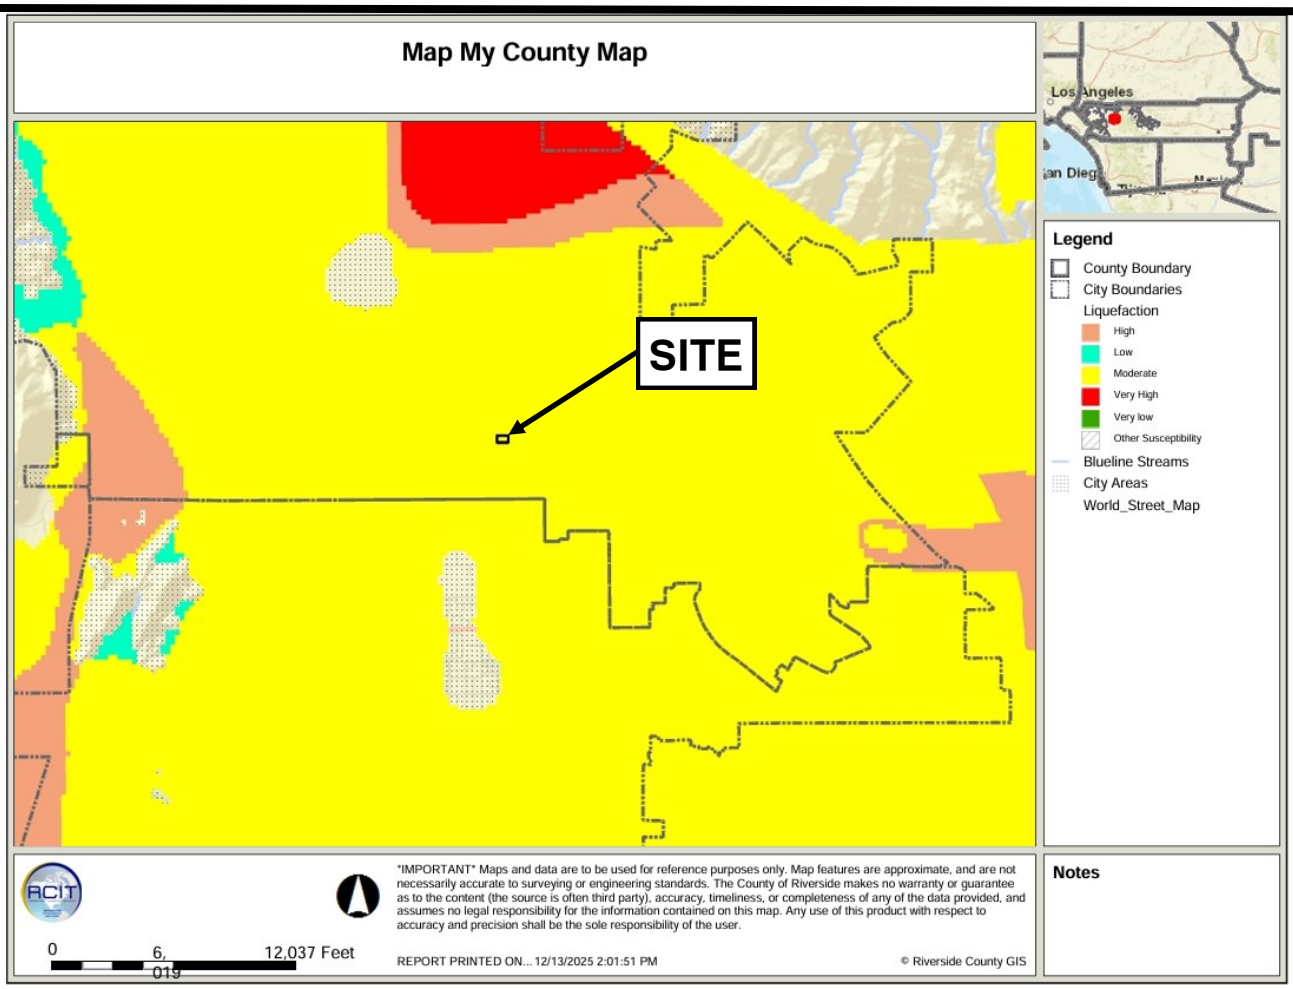
design. As the site is potentially liquefiable, the site may be classified as Site Class F. However, as we assume that the fundamental period of the proposed structure is less than 0.5 seconds, the site is classified as D (Appendix C). Since site class is D, a site-specific procedure would be required, but it is not performed as we follow the Exception of Section 11.4.8.1, ASCE 7-16, Supplement 3. A printout of the ASCE Design Hazards Report is presented in Appendix C.



2022 CBC SEISMIC GROUND MOTIONS		
PARAMETER	VALUE	2022 CBC OR REFERENCE
Risk Category	III	Table 1604.5
Site Class	D	Chapter 20, ASCE 7-16
MCE_R spectral acceleration - (0.2 sec), S_s	2.161 g	Section 1613.2.1

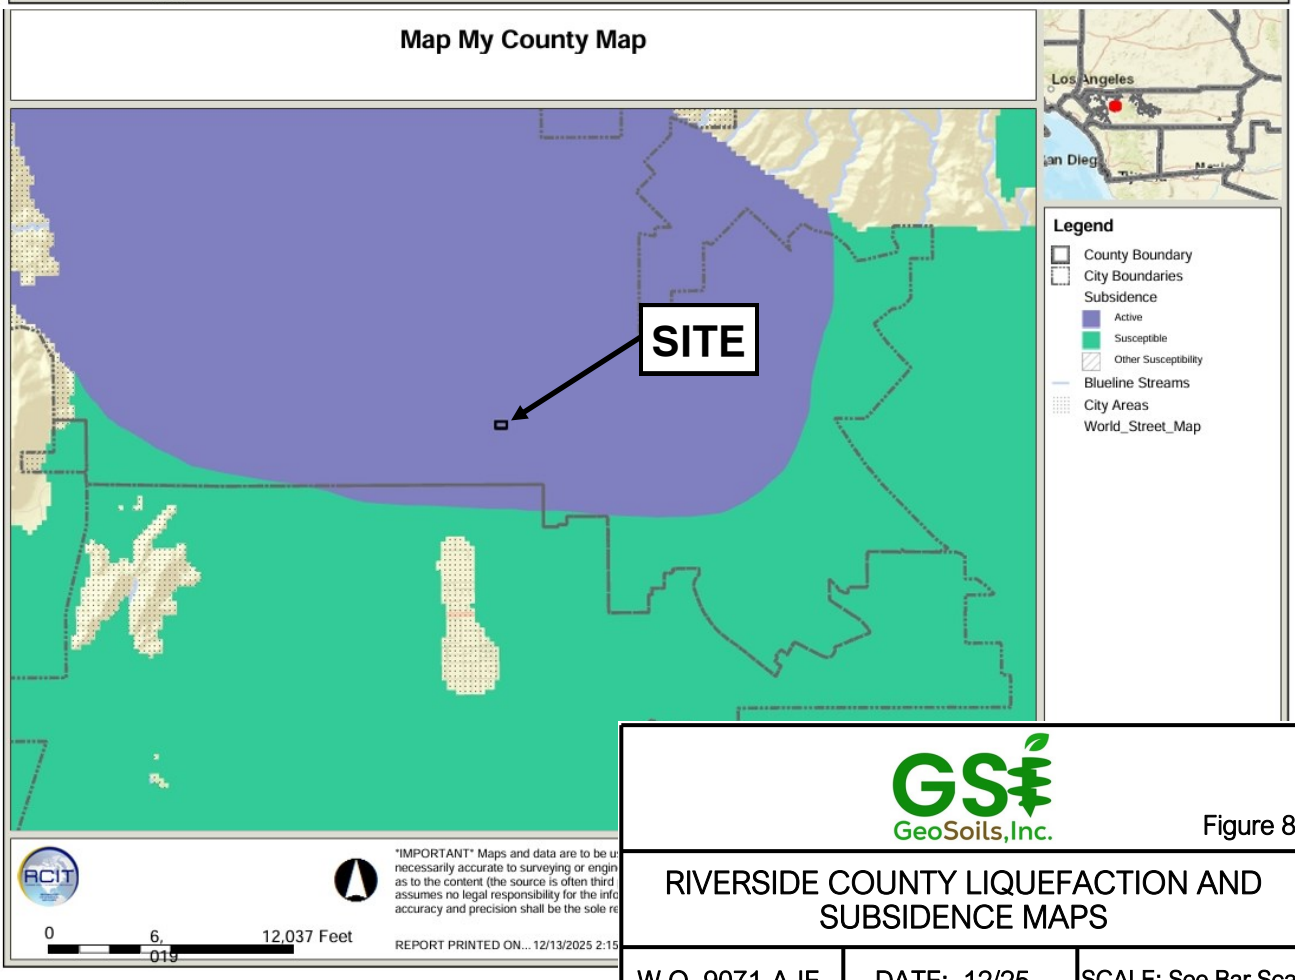
Site Coefficient, F_a	1.0	ASCE 7-16, Supplement 3
Site Coefficient, F_v	1.7	ASCE 7-16, Supplement 3
MCE_R spectral acceleration (0.2 sec), S_{MS}	2.161 g	Section 1613.2.3
MCE_R spectral acceleration (1.0 sec), S_{M1}	2.231 g	ASCE 7-16, Supplement 3
Design spectral acceleration (0.2 sec), S_{DS}	1.441 g	Section 1613.2.4
Design spectral acceleration (1.0 sec), S_{D1}	1.488 g	ASCE 7-16, Supplement 3
PGA_M	1.074 g	ASCE 7-16, Section 11.8.3
Seismic Design Category	E	Section 1613.2.5



Conformance to the criteria above for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur in the event of a large earthquake. The primary goal of seismic design is to protect life, not to eliminate all damage, since such design may be economically prohibitive. Cumulative effects of seismic events are not addressed in the 2022 CBC (CBSC, 2022) and regular maintenance and repair following locally significant seismic events will likely be necessary, as is the case in all southern California.

LIQUEFACTION POTENTIAL

General

Based on our review, the CGS has not prepared Seismic Hazard Mapping for the San Jacinto Quadrangle. However, our review of the RCIT (2025) Map My County website indicates the site is mapped within an area designated as having a "moderate" potential for liquefaction (RCIT, 2025 [see Figure 8, Riverside County Liquefaction and Subsidence Maps]). As such, liquefaction and seismic settlement analyses were conducted, and are discussed below.

GeoSoils, Inc.

Figure 8

RIVERSIDE COUNTY LIQUEFACTION AND SUBSIDENCE MAPS

W.O. 9071-A-IE	DATE: 12/25	SCALE: See Bar Scale

Figures Adapted from: Riverside County Information Technology (RCIT), Map My County Website, 2025

Liquefaction

Liquefaction is a phenomenon where earthquake- induced ground motions increase the pore pressure in saturated, sand-like soils until it is equal to the overburden pressure. When this occurs, the soil can completely lose its shear strength and enter a liquefied state. The possibility of liquefaction is dependent upon grain size, relative density, fines consistency, confining pressure, saturation of the soils, and intensity and duration of seismic ground motions. In order for liquefaction to occur, three criteria must be met: underlying loose, sand-like soils, a groundwater depth of less than about 50 feet, and a potential for seismic ground motions from nearby large-magnitude earthquakes.

Following a review of the subsurface borings, CPT data and laboratory testing, the CPT data was evaluated for liquefaction potential within the site. For the analyses, GSI used a groundwater depth of 40 feet below the existing grade to account for potential historic groundwater levels, although unlikely, at the time of the seismic event for the currently planned development.

The liquefaction analysis was performed, based on the CPT data obtained (CPT-1 through CPT-4) and was conducted using the commercially available CPT liquefaction assessment software, CLiq v.3.5.4.2 (Geologismiki, 2025). We used the soil information from the CPT data, and seismic parameters PGA_M = 1.074g and magnitude M= 8.1 earthquake. This magnitude was calculated from deaggregation analysis using the USGS Tool interactive website (Appendix C). Calculations of liquefaction potential indicate that sandy layers below the ground water table could be potentially liquefiable. No bearing capacity failure, sand boils, or lateral spreading are anticipated, based on the available data. Computer printouts from the analysis are presented in Appendix E.

Seismic Densification

Seismic densification is a phenomenon that typically occurs in low relative density granular soils (e.g., USCS classified as SP, SW, and SM) that are above the groundwater table and are significantly dry of optimum moisture content. During the seismic-induced ground shaking, these natural sediments deform under loading and volumetrically strain, resulting in ground surface settlements. These unsaturated granular soils are susceptible if left in their original density (unmitigated), and are significantly drier than the optimum water content (as defined by the ASTM D 1557). Seismic densification phenomenon has a low, to perhaps moderate potential to affect planned site improvements; however, will be mitigated by recommended remedial grading and appropriate foundation design. Calculations of seismically induced settlements are presented in Appendix E.

We estimate approximately 3-inch of total seismically induced ground settlement may occur at the site. The seismic total settlements at each of the CPT locations, including dry (above GWT) and wet (below GWT) are presented in the Table below.

CPT No.	Dry settlement (in)	Wet settlement (in)	Total Settlement (in)
1	0.62	1.12	1.74
2	1.05	1	2.05
3	3.14	1.21	4.35
4	3.16	0.75	3.91
		Average =	3.01

The differential settlements were calculated using the total settlement at each CPT location and the horizontal distances between them. The angular distortions (Δ/L) are consistent with ASCE 7-16, Chapter 12.13.9. These calculations are presented in the Table below.

CPT No.		Differential Settlement, Δ (in.)	Distance, L (ft)	Δ/L
1	2	0.31	50	0.001
1	3	2.61	87	0.003
1	4	2.17	119	0.002
2	3	2.3	109	0.002
2	4	1.86	152	0.001
3	4	0.44	55	0.001

Lateral Spreading

Lateral spread phenomenon is described as the lateral movement of stiff, surficial, mostly intact blocks of sediment or compacted fill displaced downslope towards a free face along a shear zone that has formed within the liquefied sediment. The resulting ground deformation typically has extensional fissures at the head of the failure, shear deformations along the side margins, and compression or buckling of the soil at the toe. Given, the location and flat laying nature of the site, the potential for lateral spreading to directly affect the site is considered low, based on the available data.

SUBSIDENCE POTENTIAL

Subsidence and Ground Fissures

Our review of the RCIT (2025) Map My County website indicates the site is located in a zone of "Active" subsidence (RCIT, 2025 [see Figure 8, Riverside County Liquefaction and Subsidence Maps]). The effects of areal subsidence and ground fissures generally occur at the transition or boundaries between low-lying areas and adjacent hillside terrain, where materials of substantially different engineering properties (e.g., alluvium vs. bedrock) are present.

Subsidence and ground fissures may also occur due to groundwater or fluid withdrawal and regional tectonics. Documented subsidence within the basin roughly corresponds to the limits of the bounding Casa Loma and San Jacinto fault zones (Lofgren, 1976). There is historical evidence that subsidence has occurred within the San Jacinto basin and the site area, including as much as 0.26 feet (Lofgren, 1976), occurring north of the site during the period of 1964 to 1973. Thus, the subsidence has been attributed to withdrawal of groundwater and regional tectonics along bounding fault zones. However, subsidence has eased appreciably, as a result of the groundwater basin being adjudicated.

The most significant ground fissures are located in the northwestern part of the valley adjacent to and immediately west of the Casa Loma fault, north and northwest of Lakeview (Morton, 1994). Ground fissures in the immediate site vicinity have not been documented.

As such, subsidence and ground fissures at the subject site due to groundwater withdrawal and regional tectonics should be no greater than other nearby already developed areas. As discussed previously, California regulations have been enacted by the Sustainable Groundwater Management Act (SGMA) to mitigate the subsidence potential from the withdraw of groundwater. Provided the SGMA guidelines are properly implemented, the potential for areal subsidence or ground fissures from subsidence owing to groundwater withdrawal, is considered low, but may not be entirely precluded.

OTHER SECONDARY SEISMIC HAZARDS

The following list includes other secondary seismic related hazards that have been considered during our evaluation of the site. The hazards listed are considered negligible or mitigated as a result of site location, soil characteristics, and typical site development procedures indicated herein:

- Lateral spreads
- Ground Lurching or Shallow Ground Rupture
- Tsunami
- Seiche and Dam Inundation

Following implementation of remedial earthwork and design of foundations described herein, this potential would be no greater than that for other existing structures and improvements in the immediate vicinity that comply with current and adopted building standards. Other geologic hazard considerations are addressed below.

Other Geologic Hazard Considerations

The California Geological Survey Note 48 (2022) identifies a number of exceptional geologic hazards that can occur at individual sites, but do not occur statewide. An evaluation of these exceptional conditions is referred to as a Conditional Geologic Assessment by Note 48. Specific assessment items listed in Note 48 are addressed in the table below.

Conditional Geologic Assessment

HAZARD	ASSESSMENT	REFERENCE
Methane Gas, Hydrogen-Sulfide Gas, or Tar Seeps	Not applicable, site is not located with an identified oil field.	California Geological Energy Management Division (CalGEM) Well Finder Program, and DOGGR Online Mapping System (DOMS, 2025).
Volcanic Eruption	Not applicable, site is not in a known hazard area for volcanic eruptions.	U.S. Geological Survey Bulletin 1847 and Geologic mapping by Dibblee (2003).
Flooding and Dam Inundation	The proposed project is located within FEMA Flood Zone X, not located within a County Flood zone, and not located within a dam inundation area.	FEMA Flood Maps, Map My County Website, and Division of Safety of Dams (DSOD).
Tsunami and Seiche Inundation	Not Applicable	See above Sections.
Radon-222 Gas	Not Applicable, typically a concern in the California Coast Ranges.	California Radon Survey (1990) and Nagda (1994).
Naturally Occurring Asbestos	Not Applicable, site is not within an area more likely to contain naturally occurring asbestos.	Churchill and Hill, 2000 (Open-File Report OFR-2000-19)
Hydrocollapse Due to Anthropic Use of Water	Drilling, CPT, and groundwater data indicate that soils are not likely to experience hydrocollapse.	See Groundwater Section.
Regional Subsidence	Our review of Lofgren (1976) and the Map My County Website indicates the site is located within an “Active” zone of subsidence.	Lofgren (1976) and Map My County Website. See above Sections.
Clays and Cyclic Softening	Soils underlying the site are predominately granular. No plastic clays encountered onsite.	See Appendix B and below sections.

LABORATORY TESTING

General

Laboratory testing was performed on representative onsite earth materials in order to evaluate their physical characteristics. The test procedures used and laboratory results obtained are presented below.

Classification

Soils were classified visually according to the Unified Soils Classification System (per ASTM D 2488). The soil classifications are shown on the Boring Logs in Appendix B.

Moisture-Density Relations

The field moisture contents and dry unit weights were measured for relatively undisturbed samples in the laboratory in general accordance with ASTM D 2937 and ASTM D 2216. The dry unit weight was calculated in pounds per cubic foot (pcf), and the field moisture content was calculated as a percentage of the dry unit weight. The results of these tests are indicated on the Boring Logs in Appendix B.

Laboratory Standard

The maximum dry density and optimum moisture content were evaluated for a representative bulk sample of the near-surface soil. The laboratory standard used was ASTM D 1557. The moisture-density relationship obtained for this soil is shown below:

SAMPLE LOCATION AND DEPTH (FT)	SOIL TYPE	MAXIMUM DRY DENSITY (PCF)	OPTIMUM MOISTURE CONTENT (%)
B-2 @ 0-5'	Silty Sand (SM)	113.6	13.1

Expansion Potential

A representative bulk sample of the near-surface soil was evaluated for expansion potential. The Expansion Index (E.I.) test was performed in accordance with ASTM Standard D 4829. The results of the expansion testing are presented in the following table.

SAMPLE LOCATION AND DEPTH (FT)	LABORATORY EXPANSION INDEX (E.I.)	EXPANSION POTENTIAL*
B-1 @ 0-5'	7	Very Low

Direct Shear Tests

Shear testing was performed on relatively undisturbed samples of site soil encountered in the borings. Shear tests were performed in general accordance with ASTM Test Method D 3080 in a Direct Shear Machine of the strain control type. The shear test results are presented in Appendix D, and summarized in the following table:

SAMPLE LOCATION AND DEPTH (FT)	PEAK		RESIDUAL	
	COHESION (PSF)	FRICTION ANGLE (DEGREES)	COHESION (PSF)	FRICTION ANGLE (DEGREES)
B-1 @ 7.5 (undisturbed)	38	36	22	33
B-4 @ 15 (undisturbed)	224	37	87	34

Saturated Resistivity, pH, and Soluble Sulfates

GSI conducted sampling of onsite earth materials for general soil corrosivity testing. The testing included evaluation of soil pH, soluble sulfates, soluble chlorides, and saturated resistivity. These preliminary data should be used by the project structural engineer (or corrosion engineer) in their evaluation of site corrosivity mitigation measures. The soluble sulfate and corrosion potential results are shown as follows, and are presented in Appendix D:

LOCATION AND DEPTH (FT)	SOLUBLE SULFATES PERCENTAGE BY WEIGHT	pH	CHLORIDE (mg/kg)	RESITIVITY (OHMS-CM)
B-1 @ 0-5	0.005	8.0	21	3,500

For preliminary planning purposes, and based upon the soluble sulfate test results and the American Concrete Institute (ACI, 2014), the soluble sulfate content is listed as Exposure Class “S0” (<0.10 Water-Soluble Sulfate in soil, percentage by weight), per the ACI, 2014 (Table 19.3.1.1). Based on the results of the resistivity and pH testing, the onsite soils are

generally considered moderately alkaline (a pH of 7.9 to 8.4 is considered moderately alkaline), and are considered moderately corrosive to ferrous metals in a saturated state (2,000 to 10,000 ohm-cm is considered moderately corrosive). Chlorides are generally low and below action levels.

Although the site soils are categorized as being moderately corrosive to ferrous metals in a saturated state, it is our understanding that ferrous metals embedded in properly poured and formed concrete with the proper mix should be adequately protected from these conditions. As stated above, the soluble sulfate content is listed as Exposure Class "S0" (ACI, 2014). However, reinforced concrete mix design for foundations, slab-on-grade floors, and pavements should also conform to Exposure Classes "S0," "W0," and "C1" in Table 19.3.1.1 of ACI 318-14, as concrete would likely be exposed to moisture. Based upon the laboratory test results obtained, a consulting corrosion engineer may be retained to provide specific recommendations for foundations, utility piping, or other subsurface structures, as warranted.

Resistance Value (R-Value)

Resistance value, or R-Value testing, was performed on a representative soil sample in accordance with CalTrans Test Method 301, and yielded a test result of R=31. The results of R-Value testing are presented in Appendix D. Based on the testing results obtained, preliminary pavement design recommendations are presented herein.

Conformance Testing for Expansion, Corrosion and Concrete Mix Design

Upon completion of grading, additional laboratory testing should be performed on representative samples of soil exposed near pad grade to evaluate its corrosive effects on concrete and steel, and expansion characteristics. Additional comments may be obtained from a qualified corrosion engineer at that time based on the level of corrosion protection required by the project architect, structural engineer, or civil engineer. It is assumed that the need for corrosion protection of steel reinforcement will be further evaluated by the project structural engineer or project architect.

PRELIMINARY CONCLUSIONS AND RECOMMENDATIONS

General

Based on our review of the existing body of near-site geotechnical data, and our field exploration, laboratory testing, and geotechnical engineering analysis, it is our opinion that the project site appears suitable to receive the proposed development from a geotechnical engineering and geologic viewpoint, provided that the recommendations presented in the following sections are incorporated into the design and construction phases of site development. The primary geotechnical concerns with respect to the proposed development are:

1. The presence of existing near-surface topsoil and disturbed fills, and the presence of underlying near-surface loose to medium dense sandy to silty young alluvial deposits.

2. The static and seismic settlement potential of underlying alluvial soils.

3. The depth to competent bearing material below existing grades.

4. The corrosion potential of onsite soils.

5. Regional seismic activity.

The recommendations presented herein consider these as well as other aspects of the site. The engineering analyses, performed, concerning site preparation and the recommendations presented herein have been completed using the information provided and obtained during our field work. In the event that any significant changes are made to proposed site development, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and the recommendations of this report are evaluated or modified in writing by this office. Foundation design parameters are considered preliminary until the foundation design, layout, and structural loads are provided to this office for review.

1. Owing to the presence of potentially compressible existing topsoil and disturbed fill, and near-surface alluvial deposits there will be a potential for distress to settlement-sensitive improvements, absent mitigation. Thus, the near-surface layers of existing topsoil and disturbed fill, and near-surface alluvial deposits should be removed and recompacted to current industry standards and Code as recommended herein within the building footprint. Remedial removals should be conducted to approximately 5 to 7 feet below existing grades. Proposed parking areas and fire access lanes should be graded and recompacted within the upper 2 feet of the existing finish surface.

2. Geotechnical engineering, observation, and testing services should be provided by GSI during grading to aid the contractor in removing unsuitable soils and in their effort to compact the fill. Geologic observations should also be performed during grading to observe and further evaluate site geologic conditions. Although unlikely, if adverse geologic features are encountered, supplemental recommendations and earthwork may be warranted.

3. The near-surface existing topsoil and disturbed fill, and near-surface alluvial deposits (Qa) is considered potentially compressible; and therefore, unsuitable for the support of settlement-sensitive improvements in its present condition, based on current industry standards. In order to reduce the effects of settlement, remedial earthwork should be performed within the areas of proposed development. Remedial grading should be performed to at least 5 feet outside the proposed building footprint, where

feasible. Removals on the order of 2 feet are recommended for other areas supporting settlement-sensitive improvements (e.g., parking lot and fire access lane).

4. Our expansion index test indicates very low expansive soils underlie the site in the near-surface. Preliminary foundation design and construction recommendations are provided herein for these soil conditions.

5. Building foundations will need to be designed to tolerate the soil conditions, and the potential settlements discussed herein. Based on the potential for seismic settlement, the use of a conventional foundation system (e.g., shallow spread and continuous footings) does not appear practical for the proposed building. As such, recommendations for building foundations, including mat slabs, are provided herein.

6. The seismic ground motion values provided herein should be considered during the design and construction of the proposed development.

7. General Earthwork and Grading Guidelines are provided at the end of this report as Appendix F. Specific recommendations are provided in the following sections.

EARTHWORK CONSTRUCTION RECOMMENDATIONS

General

All earthwork should conform to the guidelines presented in the 2022 CBC (CBSC, 2022), the requirements of the City of San Jacinto or County of Riverside, and the General Earthwork and Grading Guidelines presented in Appendix F, except where specifically superseded in the text of this report. Prior to earthwork, a GSI representative should be present at the preconstruction meeting to provide additional earthwork guidelines, if needed, and review the earthwork schedule. GSI should be notified in advance of any fill placement, supplemental regrading of the site, or backfilling underground utility trenches and retaining walls after rough earthwork has been completed. This includes grading for driveway approaches, driveways, and exterior hardscape.

During earthwork construction, all site preparation and the general grading procedures of the contractor should be observed and the fill selectively tested by a representative(s) of GSI. If unusual or unexpected conditions are exposed in the field, they should be reviewed by GSI and, if warranted, modified or additional recommendations will be offered. All applicable requirements of local and national construction and general industry safety orders, the Occupational Safety and Health Act (OSHA), and the Construction Safety Act should be met. It is the onsite general contractor's and individual subcontractors' responsibility to provide a safe working environment for our field staff who are onsite. GSI does not consult in the area of safety engineering.

Site Preparation

All existing improvements (e.g., underground utilities or foundations, if present), vegetation and deleterious debris should be removed from the site prior to the start of construction.

Treatment of Existing Ground

1. Removal of all topsoil and disturbed fill, and near surface weathered alluvial deposits will be necessary prior to fill placement, in areas proposed for settlement-sensitive improvements. The near surface deposits should be removed to competent materials (e.g., greater than or equal to 85 percent compaction, or greater than or equal to 105 pcf for in-place native materials, as evaluated by a GSI representative), if not removed by proposed excavation within areas proposed for settlement-sensitive improvements. For preliminary planning purposes, these depths are estimated to be on the order of 5 to 7 feet across the majority of the site. Variations from these thicknesses should be anticipated. A minimum of 3 feet of 90 percent compaction fill should underlie the proposed foundation. The foundation area shall be defined as the area extending from the edge of the mat for a distance of 5 feet. Actual depths of removals will be evaluated in the field during grading by GSI.

2. After the above removals, the upper 6 inches of the exposed subsoils should be scarified, brought to at least optimum moisture content, and recompacted to a minimum relative compaction of 90 percent of the laboratory standard

3. The existing onsite soils may be reused as compacted fill provided that any significant concentrations of vegetation and miscellaneous trash and debris are removed prior to or during fill placement.

4. Localized deeper removal may be necessary due to buried drainage channel meanders or dry porous materials. The project geotechnical consultant or geologist should observe all removal areas during the grading.

Fill Placement

1. Fill materials should be cleansed of major vegetation and debris prior to placement.

2. Fill materials should be brought to at least optimum moisture, placed in thin 6- to 8-inch lifts and mechanically compacted to obtain a minimum relative compaction of 90 percent of the laboratory standard (ASTM D 1557).

3. Any import materials should be observed and evaluated suitable by GSI prior to placement on the site. Foundation designs may be altered if import materials have a greater sulfate or expansion values than the onsite materials encountered during our preliminary investigation.

Temporary Slopes

Temporary slopes may be constructed at a gradient of 1:1 (h:v) of flatter (Cal-OSHA Type "B" soil), up to 15 feet in height, provided no seepage, groundwater, or running sands are encountered, and no equipment or stockpiles are located within a distance of "H" from the top of the temporary slope, where "H" is the height of the slope. All temporary slopes should be observed by GSI prior to the entry of unprotected workers, as needed. Although not anticipated, should any adverse conditions be exposed, temporary slopes may need to be inclined to flatter gradients or receive shoring. Shored excavations would be recommended if property lines or existing improvements that need to remain in serviceable use do not allow for the temporary slope gradient recommended herein.

Slot-Cut Grading

Due to the necessity for completing removals immediately adjacent to existing foundations that will remain in place, remedial earthwork adjacent to the existing health care facility may need to use "alternating slot" excavation methodology, also referred to as the "A-B-C" slot-cutting method, so that the existing foundation system is not adversely undermined and exposed to an elevated potential for distress. On a preliminary basis, slot widths should not exceed 5 to 6 linear feet. Consultation with the structural engineer is recommended prior to implementing slot excavations near the existing structure, that are above a 1:1 (h:v) projection from the outboard limits of remedial grading excavations. The structural engineer should evaluate if the recommended width of the slots will adversely affect bearing support of the existing improvements. The width of the slots may need to be reduced based on the results of the structural engineer's evaluation. Pre-construction surveys and survey monitoring should be performed in conjunction with site grading and shoring (if used), as necessary. If considered necessary, recommendations for temporary shoring are provided below.

TEMPORARY SHORING RECOMMENDATIONS

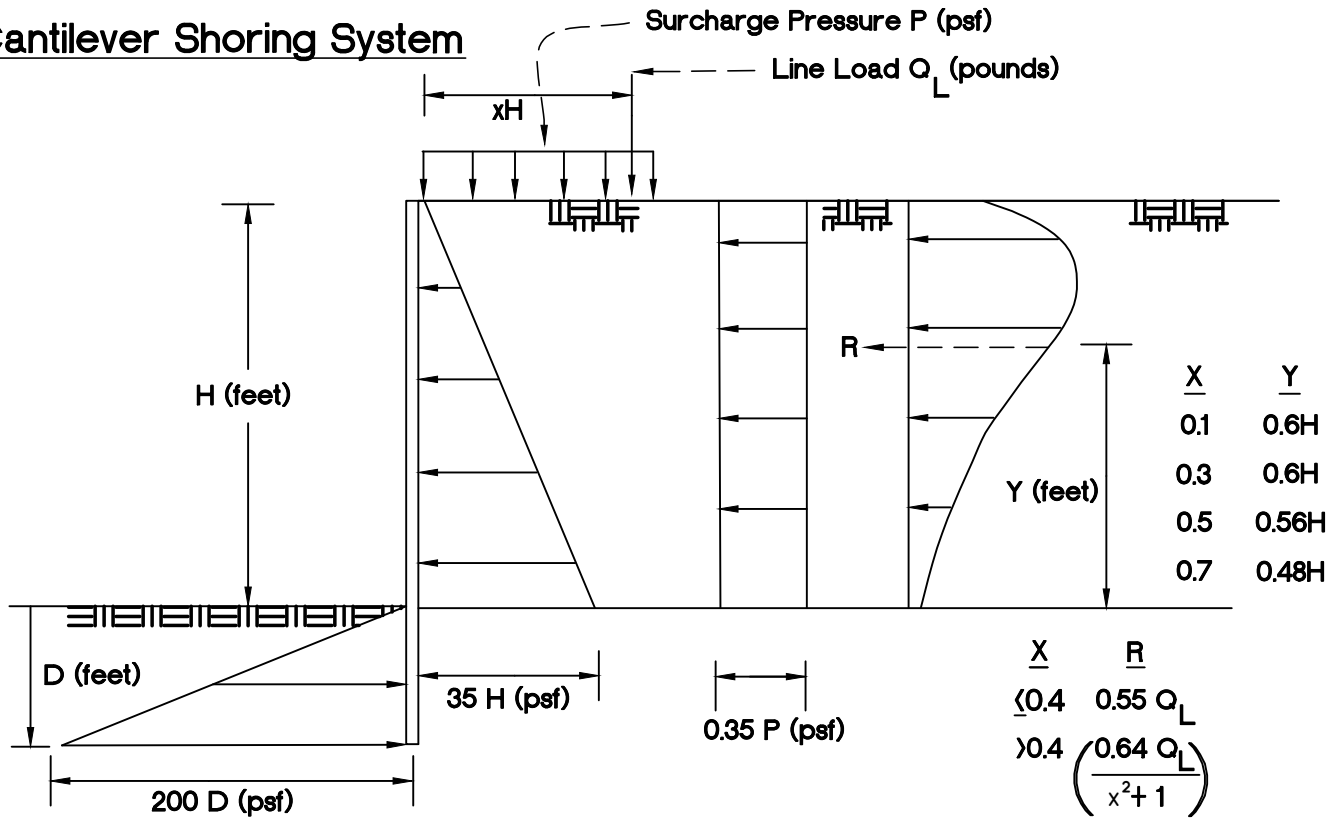
If needed, based on the anticipated remedial grading, the following temporary shoring recommendations are provided.

Lateral Earth Pressures for Temporary Shoring Design

1. Pressure diagrams showing the recommended application of active and passive earth pressures, and uniform and live load surcharges on temporary shoring systems are illustrated in Figure 9.

2. The active pressure to be used for temporary shoring design may be computed by the triangular pressure distribution shown in Figure 9.

3. Passive pressure for the design of temporary shoring may be computed as an equivalent fluid as shown in Figure 9.

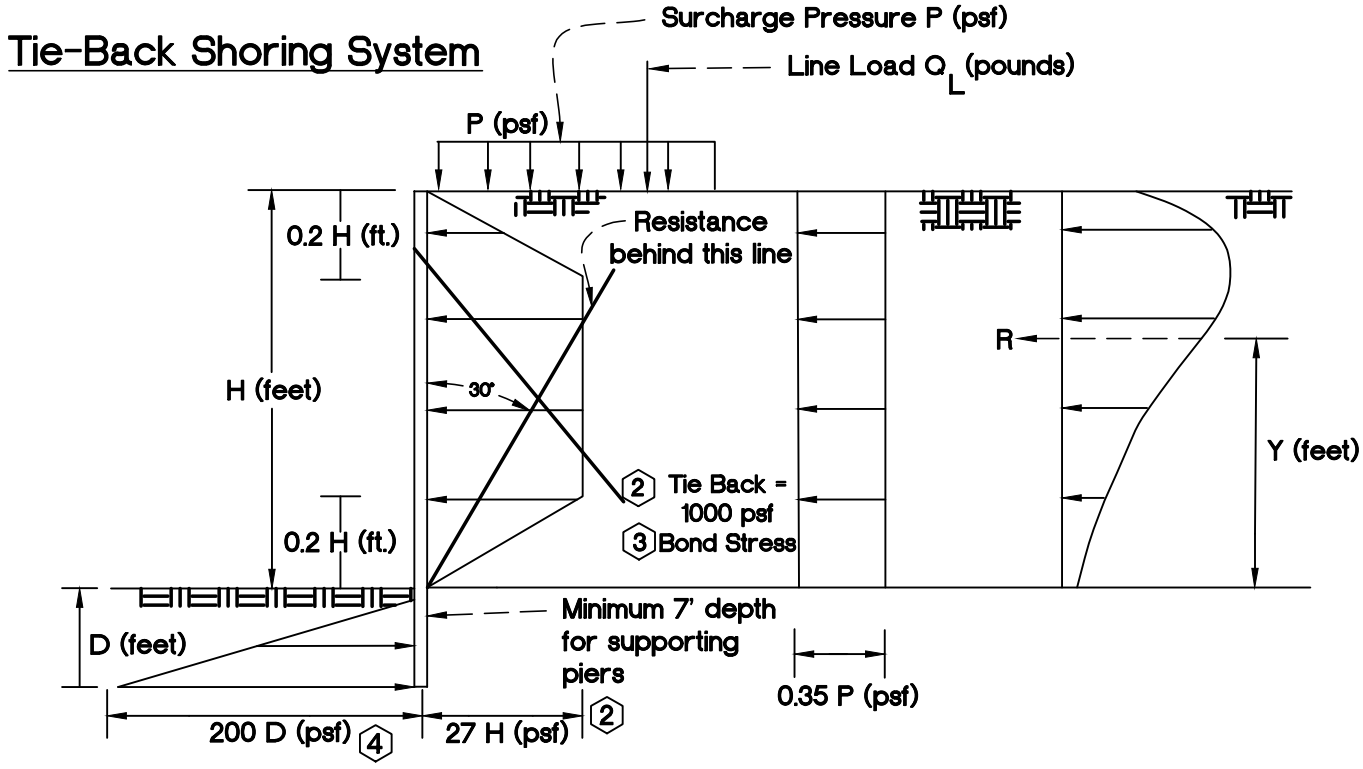


4. The above criteria assume the absence of soils with an E.I. > 20 behind the shoring and that hydrostatic pressure is not allowed to accumulate behind the shoring.

5. These recommendations are for a temporary shoring system with retained soil heights up to approximately 15 feet. Restraining elements, bracing, or the use of walers or rakers would likely be necessary for shoring of greater heights. The use of lateral resisting elements such as tiebacks or soil nails may be infeasible.

6. An empirical equivalent fluid pressure approach may be used to compute the horizontal pressure against the shoring. Appropriate fluid unit weights are provided for specific slope gradients of the retained material (see Figure 9). These do not include other superimposed loading imparted by traffic, structures, earthquakes, or adverse geologic conditions. Traffic surcharge for shoring should be modeled as a minimum 100 psf/ft load for light passenger vehicle traffic and at least 300 psf/ft for heavy (HS20) axle loads in the upper 5 feet of the shoring. These surcharges would apply if traffic will occur within "H" of the back of the shoring (where "H" equals the height of the retained earth). It is not recommended to allow sloping surcharge (other than level backfill) within a distance of "H" behind the shoring system from either stockpiled soils, stockpiled building materials, or temporary or permanent graded slopes, where "H" equals the height of the retained earth. Steeper slope gradients (more than level) will increase the equivalent fluid pressure for shoring design, significantly, and increase shoring costs. Regrading, if possible, is recommended prior to shoring installation to reduce the potential for sloping surcharge.

7. The shoring system should be designed such that the maximum lateral deformation at the top or bottom of the soldier pile does not exceed the value recommended by the shoring designer.



Cantilever Shoring System

X	Y
0.1	0.6H
0.3	0.6H
0.5	0.56H
0.7	0.48H

X	R
<0.4	$0.55\ Q_L$
>0.4	$\left(\frac{0.64\ Q_L}{x^2+1}\right)$

Tie-Back Shoring System

NOTES

1. Include groundwater effects below groundwater level.
2. Include water effects below groundwater level.
3. Grouted length greater than 7 feet; field test anchor strength.
4. Neglect passive pressure below base of excavation to a depth of one pier diameter.

GeoSoils, Inc.

Figure 9

LATERAL EARTH PRESSURES FOR TEMPORARY SHORING SYSTEMS

W.O. 9071-A-IE	DATE: 12/25	SCALE: None

8. The design of restraining elements, walers, bracing, and rakers should be provided by the project structural consultant or shoring designer, if necessary.

Shoring Construction Recommendations

1. The excavation and installation of the soldier piles should be observed and documented by the project geotechnical consultant to further evaluate the geologic conditions within the influence of the shoring and to ensure the soldier pile construction conforms to the requirements of the shoring plan.

2. Drilled excavations for soldier piles should be straight and plumb. The contractor should periodically recheck the drilled excavation for plumbness, especially when oversized rock constituents and debris are encountered.

3. Although not anticipated based on the available subsurface data, casing should be provided in drilled excavations if excessive groundwater or caving conditions are encountered. The bottom of the casing should be at least 4 feet below the top of the concrete as the concrete is placed and the casing is withdrawn. This should be considered during project planning. The exact tip elevation of the soldier piles should be clearly indicated on the shoring plans.

4. All concrete should be delivered through a tremie immediately after the approval of the drilled excavation and steel placement. Care should be taken to prevent striking the walls of the excavations with the tremie during concrete placement. Concrete should not be allowed to free fall more than 5 feet. “Tailgating” concrete is not recommended.

5. The height of exposed soils during vertical excavation should not exceed 4 feet. The entire excavation should receive lagging prior to the end of each workday. Alternatively, loose soil may be used as a temporary buttress located below a 1:1 (h:v) plane projected down and toward the excavation from the top of the unsupported soils. No excavation should be left unsupported overnight.

6. A complete and accurate record of all soldier pile locations, depths, concrete, strengths, quantity of concrete per pile, and other information should be maintained by the special inspector and geotechnical consultant. The shoring design engineer should be notified of any unusual conditions encountered during installation.

Excavation Observation and Monitoring

When excavations are made adjacent to an existing structure (e.g., building or underground utilities) there is a risk of some damage to that improvement, even if a well-designed system of excavation or shoring (if used), is planned and installed. Therefore, we recommend that a

systematic program of observations be made before, during, and after construction to evaluate the effects (if any) of construction on the existing structures.

Monitoring should include the measurement of any horizontal and vertical movements of both the existing structures and any shoring or bracing (if used). If shoring will be included in the proposed development, as determined by the designer, the locations and the type of the monitoring devices should be selected as soon as the total shoring system is designed and approved.

Reference points on the existing structures or improvements should be placed as low as possible on the exterior walls of buildings, adjacent to the excavation. Exact locations may be dictated by critical points within the structure, such as bearing walls or columns for buildings; and surface points on roadways and sidewalks near the top of the excavation. The points on a shoring system (if used) should be placed under or very near the points on the structures.

For a survey monitoring system, an accuracy of a least 0.01 foot should be required. Reference points should be installed and read initially prior to grading or excavation. The readings should continue until all construction below ground has been completed and the backfill has been brought up to final grade.

The frequency of readings will depend upon the results of previous readings and the rate of grading. Weekly readings could be assumed throughout the duration of grading with daily readings during rapid excavation near the bottom and at critical times during slot-cutting or installation of shoring for support. The reading should be plotted by the Surveyor and then reviewed by the Geotechnical Engineer and shoring designer (if used). Video or photographic documentation should be taken, where necessary.

Embankment Factors and Rippability

Embankment factors (shrinkage or bulking) for the site have been estimated based upon our experience with other sites in the general vicinity, and review of laboratory density testing of near-surface soils. It is apparent that shrinkage would vary with depth and with areal extent over the site, based on previous site use and the loose to medium dense nature of the existing topsoil and disturbed fill and native alluvial deposits. Variables include previous vegetation, weed control, discing, and previous filling or exporting. However, all these factors are difficult to define in a three-dimensional fashion, and the contractor's compaction efforts may also contribute some variance. Therefore, the information presented below represents average shrinkage and bulking values, using the following assumptions.

Undocumented Artificial Fill (Afu) ..... 10% to 15% shrinkage
Alluvium Deposits (Qoa) ..... 7% to 10% shrinkage

Rippability

All site soil is anticipated to be readily removed and re-graded with well-working earth moving equipment suitable for the scope of grading.

PRELIMINARY RECOMMENDATIONS - FOUNDATIONS

General

Preliminary recommendations for foundation design and construction are provided in the following sections. These preliminary recommendations have been developed from our understanding of the currently planned site development, site observations, subsurface exploration, laboratory testing, and engineering analyses. Foundation design should be re-evaluated at the conclusion of site grading or remedial earthwork for the as-graded soil conditions. Although not anticipated, revisions to these recommendations may be necessary. In the event that the information concerning the proposed development plan is not correct, or any changes in the design, location or loading conditions of the proposed buildings are made, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and conclusions of this report are modified or approved in writing by this office. We anticipate that the wall loads of 1 to 3 kips/foot, and column loads of 20 to 100 kips will be used. Based on the loads and subgrade conditions, we recommend the use of a structural mat foundation, or other stiffened foundation system designed to tolerate the onsite alluvial deposits and estimated settlement deformations. These assumptions should be revisited once the final plans and structural design are provided for GSI review.

The information and recommendations presented in this section are not meant to supersede design by the project structural engineer or civil engineer specializing in structural design. Upon request, GSI could provide additional input or consultation regarding soil parameters, as related to foundation design. From a geotechnical viewpoint, foundation design and construction should minimally conform to the following:

Structural Mat Foundations - Proposed Health Care Building

A structural mat-type foundation may be considered for the proposed healthcare building, considering the anticipated seismic settlement potential, and the underlying soil conditions.

For a mat foundation uniformly bearing on properly compacted engineered fill, a maximum allowable net bearing capacity of 2,000 psf and a minimum depth of 18 inches below the lowest adjacent grade may be used in the design. These values may be increased by one-third for short-term loads including wind or seismic. Mat-type slab foundations should be designed in accordance with 2022 CBC (CBSC, 2022) criteria for the soil conditions prevalent

onsite. Mat-type foundation may be either ribbed or uniform thickness (UTF) with a perimeter beam.

The passive earth pressure may be computed as an equivalent fluid having a density of 150 pcf, with a maximum earth pressure of 2,000 psf. The upper 6 inches of passive pressure should be neglected if not confined by slabs or pavement. For lateral sliding resistance, a 0.25 coefficient of friction may be utilized for concrete in contact with approved structural fill derived from the onsite soils, when multiplied by the dead load. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

A vertical modulus of subgrade reaction (K_s) of 100 pounds per cubic inch (pci) may be used in the design of mat foundations bearing on approved structural fill soils that are very low expansive. The modulus of subgrade reaction is a unit value for a 1-foot square footing and should be scaled in accordance with the following equation when used with the design of larger foundations. This assumes that the foundation and slab is underlain with properly compacted structural fill with an average relative compaction of 90 percent of the laboratory standard (per ASTM D 1557).

$$K_R = K_S \left[\frac{B+1}{2B} \right]^2$$

where: K_S = unit subgrade modulus
K_R = scaled subgrade modulus
B = foundation width (in feet)

Mat slabs may be uniform thickness foundations (UTF) or may incorporate the use of edge footings for moisture cut-off barriers. The recommendations for a mat type of foundation assume that the soils below the slab are compacted fill.

PRELIMINARY SETTLEMENT EVALUATION

GSI has estimated the potential magnitudes of seismic total settlement, differential settlement, and angular distortion for the project. The analyses were based on laboratory test results and subsurface data collected from borings and CPT completed in preparation of this study. Site specific conditions affecting the magnitude of settlement include earth material types, depth of remedial grading (e.g., thickness of planned fills), left-in-place compressible earth materials, moisture content, and density.

Static Settlement

The maximum expected static settlement is on the order of 1 inch with differential settlement on the order of ½ inch in a 30-foot span (e.g., angular distortion of approximately 1/720).

Assuming that remedial earthwork is completed in accordance with the recommendations provided herein, the majority of the foundation settlement on the underlying soils should occur at the end of construction.

Seismic Settlement

We calculated a total seismic settlement of 3 inch and a differential settlement of 0.003L. The seismic settlements have been discussed in the Liquefaction section of this report.

SOIL MOISTURE CONSIDERATIONS

GSI has evaluated the potential for vapor or water transmission through the concrete floor slabs, in light of typical floor coverings and improvements. Please note that slab moisture emission rates range from about 2 to 27 lbs/24 hours/1,000 square feet from a typical slab (Kanare, 2005), while floor covering manufacturers generally recommend about 3 lbs/24 hours as an upper limit. The recommendations in this section are not intended to preclude the transmission of water or vapor through the foundation or slabs.

Foundation systems and slabs shall not allow water or water vapor to enter into the structures so as to cause damage to another building component or to limit the installation of the type of flooring materials typically used for the particular application (State of California, 2025). These recommendations may be exceeded or supplemented by a "water proofing" specialist, the architect, or structural consultant. Thus, the Client or architect will need to evaluate the following in light of a cost vs. benefit analysis, along with disclosure to all interested or affected parties. It should also be noted that vapor transmission will occur in new slab-on-grade floors as a result of chemical reactions taking place within the curing concrete. Vapor transmission through concrete floor slabs as a result of concrete curing has the potential to adversely affect sensitive floor coverings depending on the thickness of the concrete floor slab, and the floor covering. It is possible that a slab moisture sealant may be needed prior to the placement of sensitive floor coverings if a thick mat slab is used and the time frame between concrete and floor covering placement is relatively short.

Considering the E.I. test results, anticipated typical water vapor transmission rates, and floor coverings and improvements (to be chosen by the client or architect) that can tolerate those rates without distress, the following alternatives are provided:

1. Concrete slab should be thicker.

2. Concrete slab underlayment should consist of a 15-mil vapor retarder, or equivalent, with all laps sealed per the 2022 CBC (CBSC, 2022) and the manufacturer's recommendation. The vapor retarder should comply with the ASTM E 1745 - Class A criteria, and be installed in accordance with ACI 302.1R-04, and ASTM D 1643.

3. The 15-mil vapor retarder (ASTM E 1745 - Class A) shall be installed per the recommendations of the manufacturer, including all penetrations (e.g., pipe, ducting, or rebar).

4. The vapor retarder should be underlain with 2 inches of sand (SE>30), and should be overlain by a 2-inch thick layer of sand (SE>30).

5. Concrete should have a maximum water/cement ratio of 0.50. This shall not supersede ACI 318-14 guidelines for corrosion or other corrosive requirements. Additional concrete mix design recommendations should be provided by the project structural consultant or waterproofing specialist. Concrete finishing and workability should be addressed by the project structural consultant and a waterproofing specialist.

6. Where floor slab water to cement ratios are as indicated above, or admixtures used, the Project Structural Consultant should also make changes to the concrete in the grade beams and footings in kind, so that the concrete used in the foundation and slabs are designed or treated for more uniform moisture protection.

7. The owner should be specifically advised which areas are suitable for tile flooring, wood flooring, or other types of water-vapor sensitive flooring.

8. Additional recommendations regarding water or vapor transmission should be provided by the structural engineer or foundation designer and should be consistent with the specified floor coverings indicated by the architect.

Regardless of the mitigation, some limited moisture or moisture vapor transmission through the foundation and floor slab should be anticipated, and areas potentially using moisture sensitive floor coverings or moisture sensitive storage, should be identified. construction crews may require special training for installation of certain product(s), as well as concrete finishing techniques. The use of specialized product(s) should be approved by the slab designer and water-proofing consultant.

PRELIMINARY RETAINING WALL DESIGN PARAMETERS

General

Recommendations for the design and construction of conventional masonry retaining walls are provided herein, if needed. Recommendations for specialty walls (e.g., crib, earthstone, or geogrid) can be provided upon request, and would be based on site specific conditions. If walls allow water to accumulate in the backfill, the water should be conveyed via a non-erosive device to an appropriate inlet, per the recommendations of the design civil engineer.

Conventional Retaining Walls

The design parameters provided below assume native onsite materials with an expansion index up to an E.I. of 20 are used to backfill any retaining wall. The type of backfill, should be specified by the wall designer, and clearly shown on the plans. Building walls, below grade, should be water-proofed. Waterproofing should also be provided for site retaining walls in order to reduce the potential for efflorescence staining.

Preliminary Retaining Wall Foundation Design

The preliminary foundation design for conventional retaining walls should incorporate the following recommendations:

Minimum Footing Embedment - 18 inches below the lowest adjacent grade (excluding landscape layer [upper 6 inches]).

Minimum Footing Width - 24 inches.

Allowable Bearing Pressure - An allowable vertical bearing pressure of 2,000 pcf may be used in the preliminary design of retaining wall foundations provided that the footing maintains a minimum width of 24 inches and extends at least 18 inches into approved engineered fill overlying dense formational materials. This pressure may be increased by one-third for short-term wind and seismic loads.

Passive Earth Pressure - A passive earth pressure of 150 pcf with a maximum earth pressure of 2,250 psf may be used in the preliminary design of retaining wall foundations provided the foundation is embedded into properly compacted silty to clayey sand fill.

Lateral Sliding Resistance - A 0.25 coefficient of friction may be used for a concrete to soil contact when multiplied by the dead load. When combining passive pressure and frictional resistance, the passive pressure component should be reduced by one-third.

Backfill Soil Density - A soil density of 120 to 130 pcf may be used in the design of retaining wall foundations. This assumes an average engineered fill compaction of at least 90 percent of the laboratory standard (ASTM D 1557).

Footing Setbacks - All retaining wall footing setbacks from slopes should comply with Figure 1808.7.1 of the 2022 CBC. GSI recommends a minimum horizontal setback distance of 7 feet, as measured from the bottom, outboard edge of the footing to the face to the 2:1 (h:v) slope face.

Any retaining wall footings near the perimeter of the site, or not within areas of placed compacted fills will likely need to be deepened into unweathered dense formational materials for adequate vertical and lateral bearing support.

Restrained Walls

Any retaining wall that will be restrained prior to placing and compacting backfill material or retaining walls that have re-entrant or male corners, should be designed for an at-rest equivalent fluid pressure (EFP) of 57 pcf. The design should include any applicable surcharge loading. For areas of male or re-entrant corners, the restrained wall design should extend a minimum distance of twice the height of the wall (2H) laterally from the corner.

Cantilevered Walls

The recommendations presented below are for cantilevered retaining walls with retained soil heights up to 10 feet. Design parameters for retaining walls less than 3 feet in height may be superseded by the Riverside County regional standard design. Active earth pressure may be used for retaining wall design, provided the top of the wall is not restrained from minor deflections. An equivalent fluid pressure approach may be used to compute the horizontal pressure against the wall. Appropriate fluid unit weights are given below for specific slope gradients of the retained material. These do not include other superimposed loading conditions due to traffic, structures, seismic events, or adverse geologic conditions. When wall configurations are finalized, the appropriate loading conditions for superimposed loads can be provided upon request.

For preliminary planning purposes, the structural consultant or wall designer should incorporate the surcharge of traffic on the back of retaining walls, if traffic will occur within a horizontal distance of "H" from the backside of the retaining walls, where "H" equals the retained soil height. The traffic surcharge may be taken as 100 psf/ft in the upper 5 feet of the wall for light passenger vehicle traffic (e.g., cars, vans, or pick-up trucks). This does not include the surcharge of parked vehicles which should be evaluated at a higher surcharge to account for the effects of seismic loading. Equivalent fluid pressures for the design of cantilevered retaining walls are provided in the following table:

SURFACE SLOPE OF RETAINED MATERIAL (HORIZONTAL:VERTICAL)	EQUIVALENT FLUID WEIGHT P.C.F.
Level	37
2:1 (h:v)	54

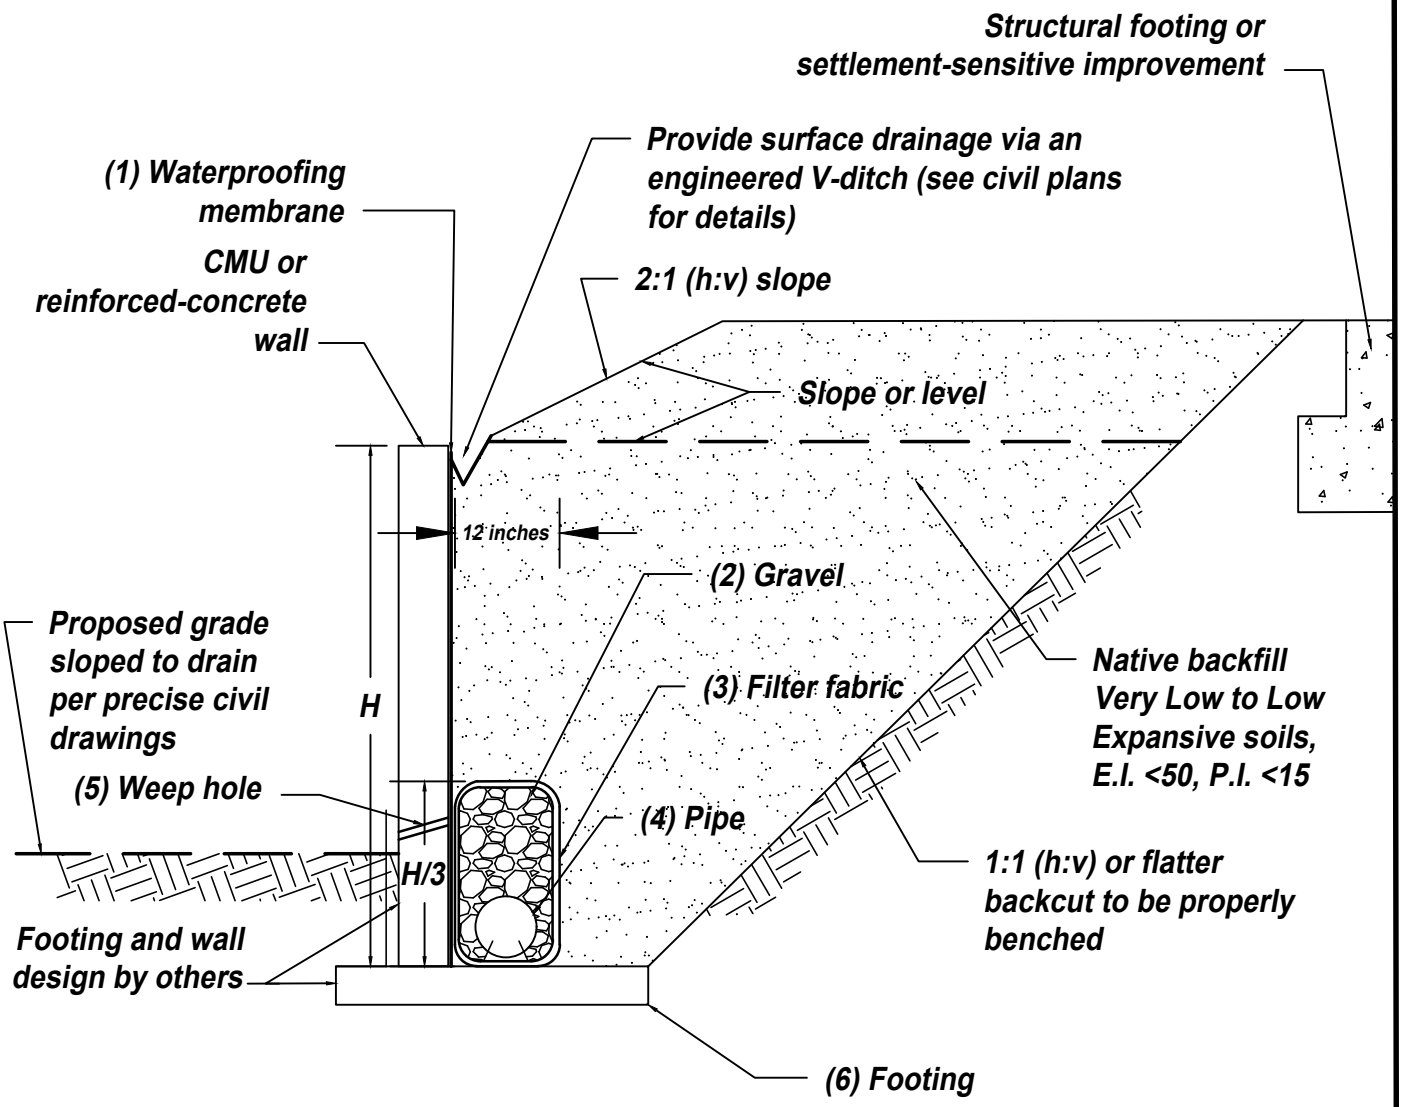
Seismic Surcharge

The Mononobe-Okabe method is commonly utilized for calculating seismically induced active and passive lateral earth pressures and is based on the limit equilibrium Coulomb theory for static stress conditions. This method entails three fundamental assumptions (e.g., Seed and Whitman, 1970): Wall movement is sufficient to ensure either active or passive conditions, the driving soil wedge inducing the lateral earth pressures is formed by a planar failure surface starting at the heel of the wall and extending to the free surface of the backfill, and the driving

soil wedge and the retaining structure act as rigid bodies, and therefore, experiences uniform accelerations throughout the respective bodies (U.S. Army Corps of Engineers, 2003, Engineering and Design - Stability Analysis of Concrete Structures).

- Seismic Lateral Earth Pressure = 39 pcf (equivalent fluid weight).

The seismic lateral earth pressure given above is a triangle increasing with depth, and the resultant of this pressure is an increment of force which should be applied to the back of the wall at 1/3 of the wall height from the wall base. The seismic increment of earth pressure should be added to the static active earth pressure. Even for the at-rest (Ko) condition, the seismic increment of earth pressure should be added to the static active earth pressure, not to the at-rest static earth pressure (SEAOC Seismology Committee, 2019).



Per 2022 CBC Section 1803.5.12 dynamic seismic lateral earth pressures shall be applied to foundation walls and retaining walls supporting more than 6 feet of backfill. Dynamic seismic lateral earth pressures may also be applied to shorter walls at the discretion of the structural engineer.

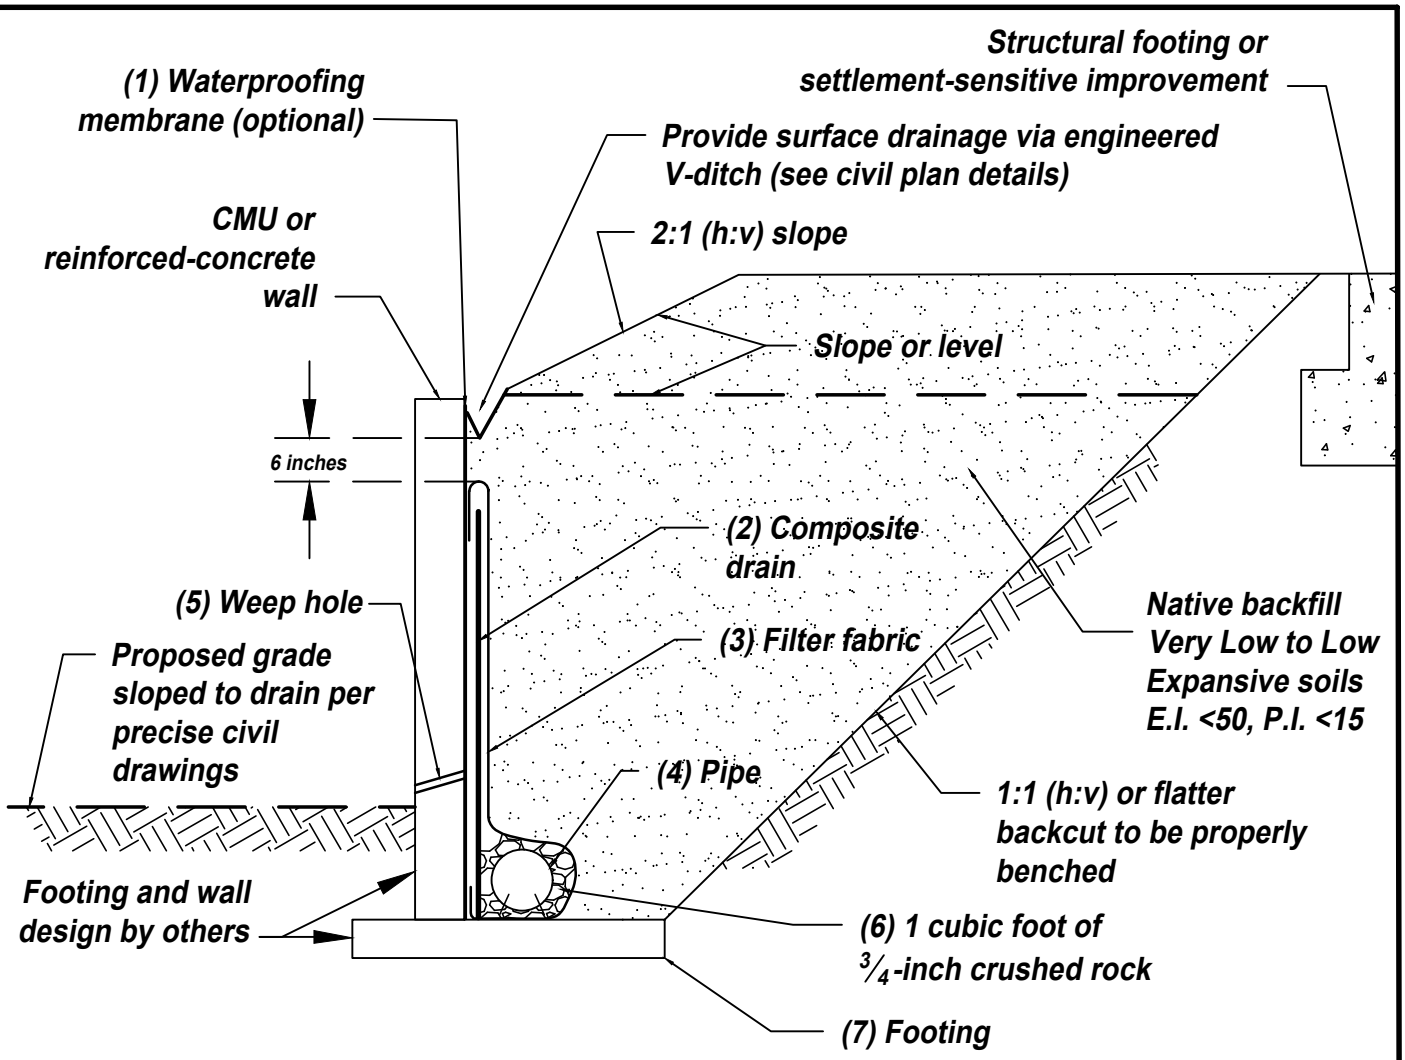
Retaining Wall Backfill and Drainage

Positive drainage must be provided behind all retaining walls in the form of gravel wrapped in geofabric and outlets. A backdrain system is considered necessary for retaining walls that are 2 feet or greater in height. Details 1, 2, and 3, present the backdrainage options discussed below. Backdrains should consist of a 4-inch diameter perforated PVC or ABS pipe encased in either Class 2 permeable filter material or ¾-inch to 1½-inch gravel wrapped in approved filter fabric (Mirafi 140 or equivalent). The filter material should extend a minimum of 1 horizontal foot behind the base of the walls and upward at least 1 foot. For limited access and confined areas, (panel) drainage behind the wall may be constructed in accordance with Detail 2 (Retaining Wall Backfill and Subdrain Detail Geotextile Drain).

Materials with an expansion index (E.I.) potential of greater than 20 should not be used as backfill for retaining walls. Retaining wall backfill materials should be moisture conditioned and mixed to achieve the soil's optimum moisture content, placed in relatively thin lifts (6 to 8 inches) with relatively light equipment, and compacted to at least 90 percent relative compaction.

Outlets should consist of a 4-inch diameter solid PVC or ABS pipe spaced no greater than approximately 100 feet apart, with a minimum of two outlets, one on each end. The use of weep holes, only, in walls higher than 2 feet, is not recommended. The surface of the backfill should be sealed by pavement or the top 18 inches compacted with native soil (E.I. ≤ 20).

(1) Waterproofing membrane.



(2) Gravel: Clean, crushed, ¾ to 1½ inch.

(3) Filter fabric: Mirafi 140N or approved equivalent.

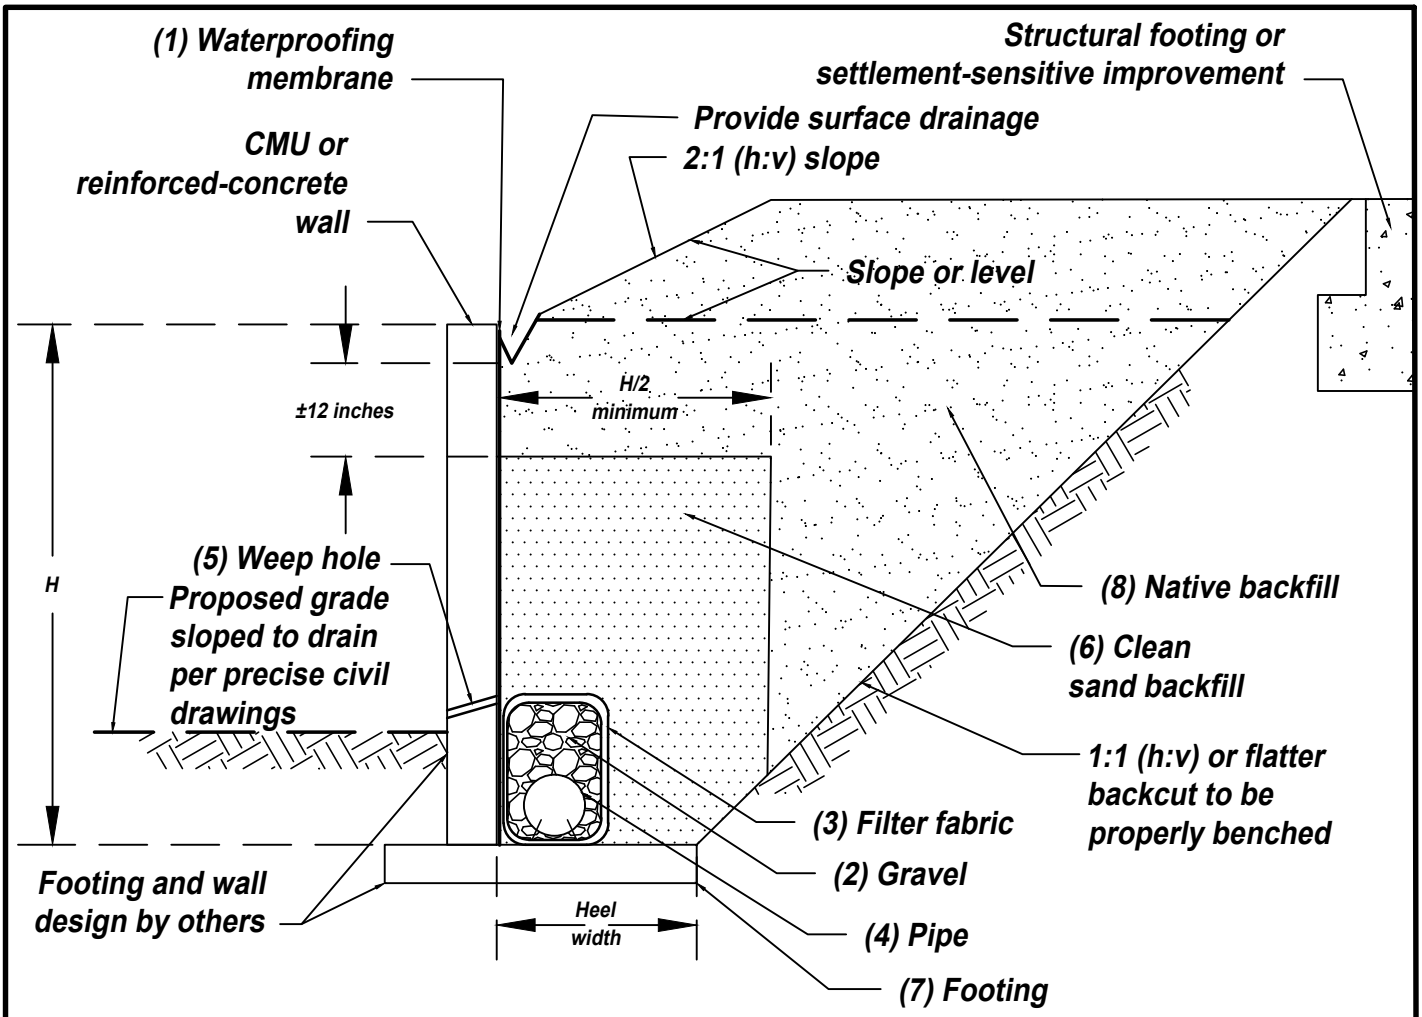
(4) Pipe: 4-inch-diameter perforated PVC, Schedule 40, or approved alternative with minimum of 1 percent gradient sloped to suitable, approved outlet point (perforations down).

(5) Weep holes: For CMU walls, Omit grout every other block, at or slightly above finished surface. For reinforced concrete walls, minimum 2-inch diameter weep holesspaced at 20 foot centers along the wall and placed 3 inches above finished surface. Design civil engineer to provide drainage at toe of wall. No weep holes for below-grade walls.

(6) Footing: If bench is created behind the footing greater than the footing width using level fill or cut natural earth materials, an additional "heel" drain will likely be required by geotechnical consultant.

(1) Waterproofing membrane (optional): Liquid boot or approved mastic equivalent.

(2) Drain: Miradrain 6000 or J-drain 200 or equivalent for non-waterproofed walls; Miradrain 6200 or J-drain 200 or equivalent for waterproofed walls (all perforations down).



(3) Filter fabric: Mirafi 140N or approved equivalent; place fabric flap behind core.

(4) Pipe: 4-inch-diameter perforated PVC, Schedule 40, or approved alternative with minimum of 1 percent gradient to proper outlet point (perforations down).

(5) Weep holes: For CMU walls, Omit grout every other block, at or slightly above finished surface. For reinforced concrete walls, minimum 2-inch diameter weep holesspaced at 20 foot centers along the wall and placed 3 inches above finished surface. Design civil engineer to provide drainage at toe of wall. No weep holes for below-grade walls.

(6) Gravel: Clean, crushed, ¾ to 1½ inch.

(7) Footing: If bench is created behind the footing greater than the footing width using level fill or cut natural earth materials, an additional "heel" drain will likely be required by geotechnical consultant.

(1) Waterproofing membrane: Liquid boot or approved masticequivalent.

(2) Gravel: Clean, crushed, ¾ to 1½ inch.

(3) Filter fabric: Mirafi 140N or approved equivalent.

(4) Pipe: 4-inch-diameter perforated PVC, Schedule 40, or approved alternative with minimum of 1 percent gradient to proper outlet point (perforations down).

(5) Weep hole: For CMU walls, Omit grout every other block, at or slightly above finished surface. For reinforced concrete walls, minimum 2-inch diameter weep holesspaced at 20 foot centers along the wall and placed 3 inches above finished surface. Design civil engineer to provide drainage at toe of wall. No weep holes for below-grade walls.

(6) Clean sand backfill: Must have sand equivalent value (S.E.) of 35 or greater; can be densified by water jetting upon approval by geotechnical engineer.

(7) Footing: If bench is created behind the footing greater than the footing width using level fill or cut natural earth materials, an additional "heel" drain will likely be required by geotechnical consultant.

(8) Native backfill: If E.I. <21 and S.E. ≥35 then all sand requirements also may not be required and will be reviewed by the geotechnical consultant.

Proper surface drainage should also be provided. For additional mitigation, consideration should be given to applying a water-proof membrane to the back of all retaining structures. The use of a waterstop should be considered for all concrete and masonry joints.

Wall and Retaining Wall Footing Transitions

Site walls are anticipated to be founded on footings designed in accordance with the recommendations in this report. Should wall footings transition from cut to fill, the structural consultant or wall designer may specify either:

a) A minimum of a 2-foot overexcavation and recompaction of cut materials for a distance of 2H, from the point of transition, where "H" equals the wall height.

b) Increase the amount of reinforcing steel and wall detailing (e.g., expansion joints or crack control joints) such that an angular distortion of 1/360 for a distance of 2H on either side of the transition may be accommodated. Expansion joints should be placed no greater than 20 feet on-center, in accordance with the structural engineer's or wall designer's recommendations, regardless of whether or not a transition condition exists. Expansion joints should be sealed with a flexible, non-shrink grout.

c) Embed the footings entirely into suitable native formational material (e.g., deepened footings).

If transitions from cut to fill transect the wall footing alignment at an angle of less than 45 degrees (plan view), then the designer should follow recommendation "a" (above) and until such transition is between 45 and 90 degrees to the wall alignment.

STORM WATER INFILTRATION KSAT RATE EVALUATION AND DISCUSSION

U.S. Department of Agricultural (USDA) Review

A review of the United States Department of Agriculture database ([USDA]; 2025 and 1993) indicates that the surficial soils units mapped at the site consist of the Grangeville sandy loam, 0 to 5 percent slopes (GrB) and the Grangeville fine sandy loam, 0 to 5 percent slopes (GvB). The USDA (2025) indicates that the capacity of the most limiting layer to transmit water (Ksat) within the Grangeville sandy loam, is high (1.98 to 5.95 inches per hour [in/hr]) and falls into hydrologic soil groups (HSGs) "A/D." The USDA (2025) also indicates that capacity of most limiting layer to transmit water (Ksat) within the Grangeville fine sandy loam is moderately high to high (0.57 to 1.98 in/hr) and falls into hydrologic soil groups (HSGs) "B/D." Infiltration into HSG "D" soils are considered potentially feasible with some limitations. However, infiltration into HSG "A and B" soils is potentially feasible.

Infiltration Basin Siting Requirements

Our review of the general infiltration basin siting requirements and limitations (CASQA, 2003), indicates sites characterized as belonging to Hydrologic Soil Group "A," "B," and "C" may be suitable for infiltration, requiring a minimum soil infiltration rate of 0.5 inches/hour (CASQA, 2003). However, the County of Riverside water pollution prevention Water Quality Management Plan (WQMP, 2012), guidance document for the Santa Ana Region states: "the minimum long-term post-development infiltration rate must be at least 0.83 inches per hour."

The design engineer will need to review basin siting requirements by the WQMP (2012) and CASQA (2003) with respect to any proposed water quality BMP system. The recommendations proved herein are based on WQMP (2012), State criteria (CASQA, 2003), and our experience on nearby sites with similar geologic conditions. Based on our review of the USDA data and our subsurface explorations, similar conditions likely prevail throughout the site, including sandy fine-grained surficial soils.

Onsite Storm Water Quality Best Management Practice (BMP) Systems

Should onsite infiltration-systems be planned for Best Management Practices (BMP's) or Low Impact Development (LID) principles for the project, certain guidelines must be followed in the planning, design, and construction of such systems. Such systems, if improperly designed or implemented without consideration of the geotechnical aspects of site conditions, can contribute to flooding, saturation of bearing materials beneath site improvements, slope instability, and possible concentration and contribution of pollutants into the groundwater or storm drain or utility trench systems.

A key factor in these systems is the infiltration rate (often referred to as the percolation rate) which can be ascribed to, or determined for, the earth materials within which these systems are installed. Additionally, the infiltration rate of the designed system (which may include gravel, sand, mulch and topsoil, or other amendments) will need to be considered. Locally, relatively impermeable formations include: clayey surficial soils, igneous and metamorphic bedrock, as well as future fine grained fill soils.

Some of the methods which are used for onsite infiltration include percolation basins, dry wells, bio-swale or bio-retention, permeable pavers and pavement, infiltration trenches, filter boxes and subsurface infiltration galleries or chambers. Some of these systems are constructed using native and import soils, perforated piping, and filter fabrics while others employ structural components such as stormwater infiltration chambers and filters or separators. Every site will have characteristics which should lend themselves to one or more of these methods, but not every site is suitable for BMPs. In practice, BMPs are usually initially designed by the project design civil engineer. Applicable governing agency requirements should be reviewed and included in design considerations.

The following geotechnical guidelines should be considered when designing onsite BMP systems:

- It is not good engineering practice to allow water to saturate soils, especially near slopes or improvements; however, the controlling agency may now require the use of stormwater BMPs.

- Areas adjacent to, or within, the BMP that are subject to inundation should be properly protected against scouring, undermining, and erosion, in accordance with the recommendations of the design engineer.

- Where infiltration BMP systems are located near buildings or improvements, impermeable liners and subdrains should be used along the bottom or sides of bioretention swales or basins located within the influence of structures. Impermeable liners used in conjunction with BMP basins should consist of a 30-mil polyvinyl chloride (PVC) membrane that is covered by a minimum of 12 inches of clean soil, free from rocks and debris, with a maximum 4:1 (h:v) slope inclination, or flatter, and meets the following minimum specifications:

  Solid Soils Specific Gravity (ASTM D792): 1.2 (g/cc, min.); Tensile (ASTM D 882): 73 (lb/in-width, min); Elongation at Break (ASTM D882): 380 (%, min); Modulus (ASTM D882): 32 (lb/in-width, min.); and Tear Strength (ASTM D1004): 8 (lb/in, min); Seam Shear Strength (ASTM D882) 58.4 (lb/in, min); Seam Peel Strength (ASTM D882) 15 (lb/in, min).

- Subdrains should consist of at least 4-inch diameter Schedule 40 or SDR 35 drain pipe with perforations oriented down. The drain pipe should be sleeved with a filter sock.

- Storm drain, standpipes, and utilities that cross BMPs should be slurried with a 3-sack slurry mix, to 5 feet outside the structure.

- Infiltrations systems should not be installed within approximately 8 feet of building foundations utility trenches, and walls, or a 1:1 (horizontal to vertical [h:v]) slope (down and away) from the bottom elements of these improvements. Alternatively, deepened foundations may be used.
- Infiltration systems should not be installed adjacent to pavement or hardscape improvements. Alternatively, deepened or thickened edges and curbs or impermeable liners may be used in areas adjoining the BMP.

- As with any infiltration BMP, localized ponding and groundwater seepage should be anticipated. The potential for seepage or perched groundwater to occur after site development should be disclosed to all interested or affected parties.

- Installation of infiltration BMP systems should avoid expansive soils (Expansion Index [E.I.] ≥51) or soils with a relatively high plasticity index (P.I. > 20).

- Infiltration BMP systems should not be installed where the vertical separation of the groundwater level is less than approximately 10 feet from the base of the system.

- Infiltration BMP systems should be designed using a suitable factor of safety (FOS) to account for uncertainties in the known infiltration rates (as generally required by the controlling authorities), and reduction in performance over time.

- As with any infiltration system, proper care will need to provided. Best management practices should be followed at all times, especially during inclement weather. Provisions for the management of any siltation, debris within the BMP, or overgrown vegetation (including root systems) should be considered. An appropriate inspection schedule will need to adopted and provided to all interested or affected parties.

- Any designed system will require regular and periodic maintenance, which may include rehabilitation or complete replacement of the filter media (e.g., sand, gravel, filter fabrics, topsoil, or mulch) or other components used in construction, so that the design life exceeds 15 years. Due to the potential for piping and adverse seepage conditions, a burrowing rodent control program should also be implemented onsite.

- Newly established vegetation or landscaping (including phreatophytes) may have root systems that will influence the performance of the BMP or nearby LID systems.

- The potential for surface flooding, in the case of system blockage, should be evaluated by the design civil engineer.

- Any proposed utility backfill materials (e.g., inlet or outlet piping or other subsurface utilities) located within or near the proposed area of the BMP may become saturated. This is due to the potential for piping, water migration, and seepage along the utility trench line backfill. If utility trenches cross or are proposed near the BMP, cut-off walls or other water barriers will need to be installed to mitigate the potential for piping and excess water entering the utility backfill materials. Planned or existing utilities may also be subject to piping of fines into open-graded gravel backfill layers unless separated from overlying or adjoining BMP by geotextiles or slurry backfill.

PRELIMINARY PAVEMENT DESIGN RECOMMENDATIONS

General

The governing agency may retain the authority to approve the final structural design sections after subgrade elevations and actual resistance values (R-values) have been obtained at the conclusion of earthwork. Based on a general review of pavement designs for other nearby projects, and for estimation and bidding purposes, the pavement sections provided herein should be considered for preliminary design. Typically, actual pavement sections will likely vary, therefore final pavement sections should be based on actual R-value testing performed during, or shortly after, the access driveway and parking area grading, and for any proposed exterior street and improvements.

Asphaltic Concrete (AC) Pavements

The preliminary design for Asphaltic Concrete (AC) was evaluated based on an R-value of R=31, and the use of concrete shoulders (curb or gutter) at the edge of pavement. The preliminary pavement sections presented are also based on the traffic indices likely for the project (to be assigned by the project civil engineer), County of Riverside roadway design requirements (Standard Plan No. 114), and the guidelines presented in the latest revision to the California Department of Transportation "Highway Design Manual," seventh edition. Based on an R-value of 31, the following preliminary pavement design sections are presented.

STREET CLASSIFICATION	TRAFFIC INDEX (T.I.)[1]	STANDARD PAVEMENT DESIGNS		
		R-VALUE	AC INCHES	CLASS 2 BASE ROCK[2] INCHES
Access Road or Local Street	5.5	31	3.0**	7.0
Enhanced Local Street	6.5	31	3.6**	8.5
Collector (Road)	7.0	31	4.0**	9.0

[1] T.I.s are taken from the County of Riverside Department of Transportation, Standard Plan No. 114, "Roadway Design Requirements" (2022).
[2] Assumed R-values for base rock R=78 - Greenbook or Cal-Trans standard Class 2 base rock.
** County of Riverside minimum Class 2 base or asphaltic concrete

The preliminary pavement sections provided above are intended as a minimum guideline. If thinner or highly variable pavement sections are constructed, increased maintenance and repair could be expected. Consideration should be given to the increased potential for distress from overuse of paved street areas by heavy equipment and construction related heavy traffic (e.g., concrete trucks or loaded supply trucks), particularly when the final section is not in place (e.g., topcoat). Best management construction practices should be followed at all times, especially during inclement weather.

Portland Concrete Cement (PCC) Pavement

The preliminary design for Portland Cement Concrete Pavement (PCCP) was evaluated using a subgrade R-value of 31. The preliminary PCCP sections are provided in the following table.

PORTLAND CONCRETE CEMENT PAVEMENTS (PCCP)*					
TRAFFIC AREAS	CONCRETE TYPE	PCP THICKNESS (INCHES)	TRAFFIC AREAS	CONCRETE TYPE	PCCP THICKNESS (INCHES)
Light Vehicles	520-C-2500	6.0	Dumpster Aprons (Trash Service)	520-C-2500	7.0
	560-C-3250	5.0		560-C-3250	6.0
NOTE: All PCCP is designed as un-reinforced and bearing directly on compacted subgrade. However, a 4-inch thick leveling course of compacted aggregate base, or crushed rock may be considered to improve performance. All PCCP should be properly detailed (jointing) per the industry standard. Pavements may be additionally reinforced with #4 reinforcing bars, placed 18 inches on center, each way, for improved performance. * To be re-evaluated based on exposed field conditions and R-values obtained following rough grading.					

The transition of the pavement from parking to traffic lanes should be made over a distance of 24 inches, with crack control joints (weaken plane) or contact joints at the end of the transition. A minimum 4-inch layer of base rock, in traffic and dumpster areas, should be considered to improve traffic lane performance. Base rock may consist of either ¾-inch crushed rock or Caltrans Class 2 aggregate base. Crushed rock may be compacted by vibratory methods. Aggregate base should be compacted to a minimum relative compaction of 95 percent.

Weakened Plane Joints

Transverse and longitudinal weakened plane joints may be constructed in accordance with County standards. Transverse weakened plane joints should be spaced no farther than 15 feet apart, and no closer than 5 feet. Longitudinal weakened plane joints should be spaced no farther than 20 feet apart, and no less than 5 feet.

Expansion Joints and Contact Joints

Transverse expansion joints should be constructed at 120-foot spacings, or in accordance with County standards. Transverse and longitudinal contact joints should be constructed in accordance with the recommendations of the design engineer. Within large slab areas, joint spacings should be no greater than 20 feet.

Slab Reinforcement

The preliminary PCC Pavements for this project are designed as unreinforced and should perform adequately, assuming proper construction. If additional control of internal slab stresses (e.g., curing shrinkage, thermal expansion and contraction), then the use of No. 4 reinforcing bars, 18 inches on center each way, should be considered.

The upper 12 inches of subgrade should be compacted to a minimum relative compaction of 95 percent of the minimum dry density (ASTM D 1557). Aggregate base compaction should be 95 percent of the maximum dry density (ASTM D 1557). If adverse conditions (e.g., wet or saturated ground) are encountered during preparation of subgrade, special construction methods may need to be employed. R-value testing and pavement design analysis should be performed upon completion of grading for the project.

PAVEMENT GRADING RECOMMENDATIONS

General

All section changes should be properly transitioned. If adverse conditions are encountered during the preparation of subgrade materials, special construction methods may need to be employed. A GSI representative should be present for the preparation of subgrade, base rock, and asphalt concrete.

Subgrade

Within access lanes and parking areas, all surficial deposits of loose soil material should be removed and recompacted as recommended. After the loose soils are removed, the bottom is to be scarified to a depth of at least 6 inches, moisture conditioned as necessary and compacted to 95 percent of the maximum laboratory density or the Riverside County minimum, as determined by test designation ASTM D 1557.

Deleterious material, excessively wet or dry pockets, concentrated zones of oversized rock fragments, and any other unsuitable materials encountered during grading should be removed. The compacted fill material should then be brought to the elevation of the proposed subgrade for the pavement. The subgrade should be proof-rolled in order to promote a uniform firm and unyielding surface. All grading and fill placement should be observed by GSI.

Crushed Aggregate Base Rock

Compaction tests are required for the recommended base section. Minimum relative compaction required will be 95 percent of the laboratory maximum density as determined by ASTM test method D 1557 or Caltrans Test Method Number California 216.

Paving

Prime coat may be omitted if all of the following conditions are met:

1. The asphalt pavement layer is placed within two weeks of completion of base and subbase course.

2. Traffic is not routed over completed base before paving.

3. Construction is completed during the dry season of May through October.

4. The base is kept free of debris prior to placement of asphaltic concrete.

If construction is performed during the wet season of November through April, prime coat may be omitted if no rain occurs between completion of base course and paving and the time between completion of base and paving is reduced to three days, provided the base is free of loose soil or debris. Where prime coat has been omitted and rain occurs, traffic is routed over base course, or paving is delayed, measures shall be taken to restore base course, and subgrade to conditions that will meet specifications as directed by the geotechnical consultant.

Drainage

Positive drainage should be provided for all surface water to drain towards the area swale, curb and gutter, or to an approved drainage channel. Positive site drainage should be maintained at all times. Water should not be allowed to pond or seep into the ground, such as from behind unprotected curbs, both during and after grading. If planters or landscaping are adjacent to paved areas, measures should be taken to minimize the potential for water to enter the pavement section, such as thickened edges, or enclosed planters. Also, best management construction practices should be strictly adhered to at all times to minimize the potential for distress during construction and roadway improvements.

Additional Considerations

To mitigate perched groundwater, consideration should be given to installation of subgrade separators (cut-offs) between pavement subgrade and landscape areas, although this is not a requirement from a geotechnical standpoint. Cut-offs, if used, should be 6 inches wide and at least 12 inches below the pavement subgrade contact or 12 inches below the crushed aggregate base rock, if used.

DRIVEWAY, CONCRETE APRONS, FLATWORK, AND OTHER IMPROVEMENTS

General

The soil materials on site are anticipated to be very low expansive. A GSI representative should be present for the preparation of driveway, aprons, and flatwork subgrade materials. The following recommendations are presented for all exterior flatwork:

1. The subgrade area for concrete slabs should be compacted to achieve a minimum 90 percent relative compaction, and then be presoaked to optimum moisture content, or greater. The moisture content of the subgrade should be proof tested within 72 hours prior to concrete placement.

2. Exterior concrete slabs should be cast over a non-yielding surface, consisting of a 4-inch layer of Class 2 base, crushed rock, gravel, or clean sand (or County minimum, whichever is greater), that should be compacted and level prior to placement of concrete. If very low expansive soils are present, the base, rock, gravel, or sand may be deleted. The layer or subgrade should be wet-down completely prior to placement of concrete, to minimize loss of concrete moisture to the surrounding earth materials.

3. Exterior pedestrian slabs should be a minimum of 4 inches thick. Driveway slabs and approaches should be a minimum of 5 inches thick additionally have a thickened edge (12 inches) adjacent to all landscape areas, to help impede infiltration of landscape water under the slab. Trash disposal (dumpster) area aprons should be a minimum of 6 inches thick and meet minimum County standards, as necessary.

4. The use of transverse and longitudinal control joints is recommended to help control slab cracking due to concrete shrinkage or expansion. Two ways to mitigate such cracking are: a) add a sufficient amount of reinforcing steel, increasing tensile strength of the slab; and, b) provide an adequate amount of control and expansion joints to accommodate anticipated concrete shrinkage and expansion. The exterior slabs should be scored or saw cut, ½ to ⅜ inches deep, often enough so that no section is greater than 10 feet by 10 feet. For sidewalks or narrow slabs, control joints should be provided at intervals of every 6 feet. The slabs should be separated from the foundations and sidewalks with expansion joint filler material.

5. No traffic should be allowed upon the newly placed concrete slabs until they have been properly cured to within 75 percent of design strength. Concrete compression strength should be a minimum of 2,500 psi.

6. Driveways, sidewalks, and patio slabs adjacent to the structure should be separated from the structure with thick expansion joint filler material. In areas directly adjacent to a continuous source of moisture (e.g., irrigation or planters), all joints should be additionally sealed with flexible mastic.

7. Planters and walls (sound walls or retaining walls) should not be tied to the structure.

8. Overhang structures should be supported on the slabs, or structurally designed with continuous footings tied in at least two directions.

9. Any masonry landscape or sound walls that are to be constructed throughout the property should be grouted and articulated in segments no more than 20 feet long. These segments should be keyed or doweled together.

10. If settlement concerns or expansive soils are present, utilities may be enclosed within a closed utilidor (vault) or designed with flexible connections to accommodate differential settlement or expansive soil conditions (if present).

11. Positive site drainage should be maintained at all times. Finish grade on the building pad should provide a minimum of 1 to 2 percent fall to the street, as indicated herein. Drainage reversals could occur, including post-construction settlement, if relatively flat drainage gradients are not periodically maintained by the owner and interested or affected parties.

12. Air conditioning (A/C) units should be supported by slabs that are incorporated into the building foundation or constructed on a rigid slab with flexible couplings for plumbing and electrical lines. A/C waste water lines should be drained to a suitable non-erosive outlet.

13. Shrinkage cracks could become excessive if proper finishing and curing practices are not followed. Finishing and curing practices should be performed per the California Nevada Cement Association (CNCA) guidelines. Mix design should incorporate rate of curing for climate and time of year, sulfate content of soils, corrosion potential of soils, and fertilizers used on site.

DEVELOPMENT CRITERIA

Drainage

Adequate surface drainage is a very important factor in reducing the likelihood of adverse performance of improvements and slopes. Surface drainage should be sufficient to mitigate ponding of water anywhere in the project area, and especially near pavements, and the tops of descending slopes. Surface drainage should be carefully taken into consideration during fine grading, landscaping, and building construction. Future landscaping or construction activities should not create adverse drainage conditions. Positive site drainage within the project area should be provided and maintained at all times. Drainage should not flow uncontrolled down any descending slope. Water should be directed away from foundations, pavements, and tops

of slopes, and not allowed to pond or seep into the ground. In general, the area within 5 feet around the proposed building should slope away from the structure and conform to Section 1804.4 of the 2022 CBC. Whenever possible, surface drainage should be above adjacent paved areas. Consideration should be given to avoiding construction of planters adjacent to structures. Building pad drainage should be directed toward approved drainage facilities. Down spouts, or drainage devices should outlet a minimum of 5 feet from the structure or into a subsurface drainage system. Areas of seepage may develop due to irrigation or heavy rainfall, and should be anticipated. Minimizing irrigation will lessen this potential. If areas of seepage develop, recommendations for reducing this effect could be provided upon request.

Erosion Control

Graded pads and any slopes will be subject to surficial erosion during and after grading. Onsite earth materials have a moderate to high erosion potential. Consideration should be given to providing hay bales and silt fences for the temporary control of surface water, from a geotechnical viewpoint.

Landscape Maintenance

Over-watering the landscape areas will adversely affect the proposed site improvements. We recommend that any proposed open-bottom planters adjacent to structures be eliminated for a minimum distance of 10 feet. As an alternative, closed-bottom type planters could be used. An outlet placed in the bottom of the planter could be installed to direct drainage away from the structure or any exterior concrete flatwork. If planters are constructed adjacent to the structure, the sides and bottom of the planter should be provided with a moisture barrier to prevent infiltration of irrigation water into the subgrade. Provisions should be made to drain the excess irrigation water from the planters without saturating the subgrade below or adjacent to the planters. Consideration should be given to the type of vegetation chosen and their potential effect upon surface improvements (e.g., some trees will have an effect on concrete flatwork with their extensive root systems). From a geotechnical standpoint leaching is not recommended for establishing landscaping. If the surface soils are processed for the purpose of adding amendments, they should be recompacted to at least 90 percent relative density.

Site Improvements

If any additional improvements (e.g., buildings, building additions, walls, pavements, swimming pool, or spa) are planned for the site, recommendations concerning the geological or geotechnical aspects of design and construction of said improvements could be provided upon request. This office should be notified in advance of any fill placement, grading of the site, or trench backfilling after rough grading has been completed. This includes any grading, underground utility trench backfill, pavement or flatwork construction.

Tile Flooring

Tile flooring can crack, reflecting cracks in the concrete slab below the tile, although small cracks in a conventional slab may not be significant. Therefore, the designer should consider additional steel reinforcement for concrete slabs-on-grade where tile will be placed. The tile installer should consider installation methods that reduce possible cracking of the tile such as slipsheets. Slipsheets or a vinyl crack isolation membrane (approved by the Tile Council of America or Ceramic Tile Institute) are recommended between tile and concrete slabs-on-grade.

Additional Grading

This office should be notified in advance of any fill placement, supplemental regrading of the site, or trench backfilling after rough grading has been completed. This includes grading for vehicular and pedestrian pavements and underground utility trench backfill.

Footing Trench Excavations

All footing excavations should be observed by a representative of this firm subsequent to trenching and prior to concrete form and steel reinforcement placement. The purpose of the observations is to evaluate that the excavations have been made into the recommended bearing material and to the minimum widths and depths recommended for construction. If loose or compressible earth materials are exposed within the footing excavation, a deeper footing or the removal and recompaction of the subgrade materials would be recommended at that time.

Underground Utility Trench Backfill

1. All underground utility trench backfill, including under-slab utility trench backfill, should be uniformly moisture conditioned to at least optimum moisture content and then be compacted to obtain a minimum relative density of 90 percent of the laboratory standard (per ASTM D 1557). Observation, selective probing, and field density testing should be provided to evaluate the desired results.

2. Exterior trenches adjacent to, and within areas extending below a 1:1 (h:v) plane projected down and away from the outside, bottom edges of the footings, and all trenches beneath hardscape features and in slopes, should be compacted to a relative density of at least 90 percent of the laboratory standard (per ASTM D 1557). Sand backfill, unless excavated from the trench, should not be used in these backfill areas. Compaction testing and observations, along with selective probing, should be accomplished to evaluate the desired results.

3. All trench excavations should conform to CAL/OSHA, state, federal, and local safety codes.

4. Underground utilities crossing grade beams, perimeter beams, or footings should either pass below the footing or grade beam using a hardened collar or foam spacer, or pass through the footing or grade beam in accordance with the recommendations of the structural engineer.

SUMMARY OF RECOMMENDATIONS REGARDING GEOTECHNICAL OBSERVATION AND TESTING

We recommend that observation and testing be performed by GSI at each of the following construction stages:

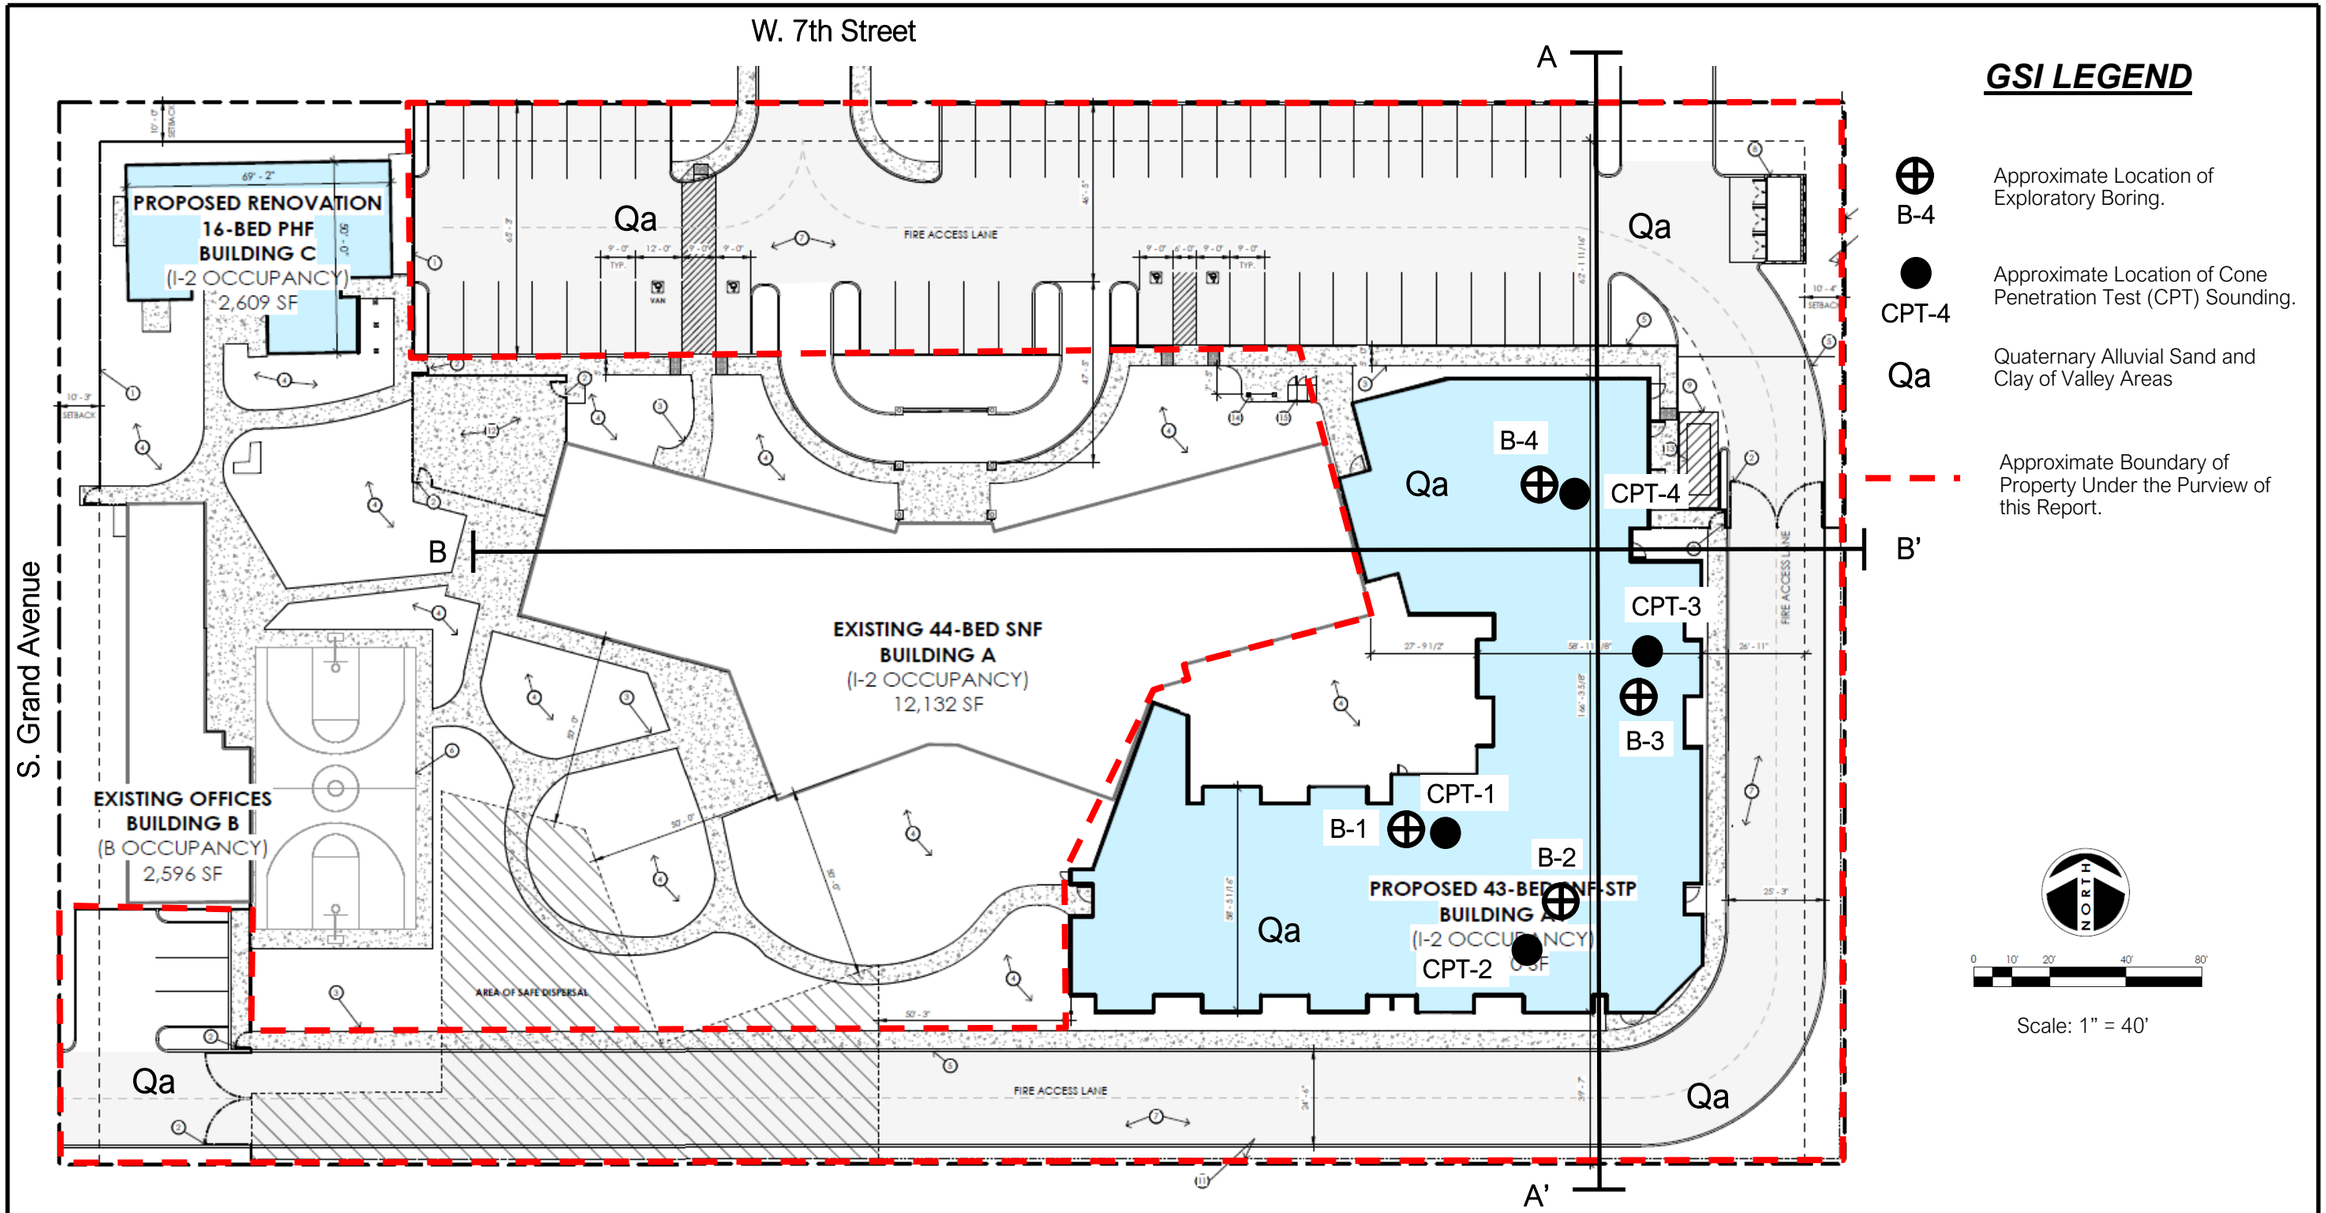
- During grading or pad recertification.
- During excavation greater than 4 feet.
- After excavation of the building foundation, retaining wall footings, and any free-standing wall footings, prior to the placement of reinforcing steel or concrete.
- Prior to placement of any concrete slabs-on-grade or flatwork, after presoaking of building pad and other flatwork subgrade, before the placement of concrete, reinforcing steel, capillary break (e.g., sand, pea-gravel, or gravel), or vapor retarders.
- During placement of backfill for area drain, interior (under-slab) plumbing, and underground utility trenches.
- During retaining wall subdrain construction and backfill.
- During vehicular and pedestrian pavement construction.
- When any unusual soil conditions are encountered during any construction operations, subsequent to the issuance of this report.
- When any owner improvements, such as flatwork, walls, pavements, or retaining walls are constructed, prior to construction.
- A report of geotechnical observation and testing should be provided at the conclusion of each of the above stages, in order to provide concise and clear documentation of site work, and to comply with code requirements.

OTHER DESIGN PROFESSIONALS AND CONSULTANTS

The design civil engineer, structural engineer, post-tension designer, architect, landscape architect, or wall designer should review the recommendations provided herein, incorporate those recommendations into all their respective plans, and by explicit reference, make this report part of their project plans. This report presents minimum design criteria for the design of slabs, foundations and other elements possibly applicable to the project. These criteria should not be considered as substitutes for actual designs by the structural engineer or designer. The recommendations contained herein are not intended to preclude the transmission of water or vapor through the slab or foundation. The structural engineer or foundation and slab designer should provide recommendations to not allow water or vapor to enter into the structure so as to cause damage to another building component, or so as to limit the installation of the type of flooring materials typically used for the particular application.

The structural engineer or designer should analyze actual soil-structure interaction and consider, as needed, bearing, expansive soil influence, and strength, stiffness and deflections in the various slab, foundation, and other elements in order to develop appropriate, design-specific details. As conditions dictate, it is possible that other influences will also have to be considered. The structural engineer or designer should consider all applicable codes and authoritative sources where needed. If analyses by the structural engineer or designer result in less critical details than are provided herein as minimums, the minimums presented herein should be adopted. It is considered likely that some, more restrictive details will be required.

If the structural engineer or designer have any questions or requires further assistance, they should not hesitate to call or otherwise transmit their requests to GSI. In order to mitigate potential distress, the foundation and improvement's designer should confirm to GSI and the governing agency, in writing, that the proposed foundations and improvements can tolerate the amount of differential settlement and expansion characteristics, and other design criteria specified herein.



PLAN REVIEW

Final project plans (grading, precise grading, foundation, retaining wall or landscaping), should be reviewed by this office prior to construction, so that construction is in accordance with the conclusions and recommendations of this report. Based on our review, supplemental recommendations or further geotechnical studies may be warranted.

LIMITATIONS

The materials encountered on the project site and used for our analysis are believed representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during mass grading. Site conditions may vary due to seasonal changes or other factors.

Inasmuch as our study is based upon our review and engineering analyses and laboratory data, the conclusions and recommendations are professional opinions. These opinions have been derived in accordance with current standards of practice, and no warranty, either express or implied, is given. Standards of practice are subject to change with time. GSI assumes no responsibility or liability for work or testing performed by others, or their inaction; or work performed when GSI is not requested to be onsite, to evaluate if our recommendations have been properly implemented. Use of this report constitutes an agreement and consent by the user to all the limitations outlined above, notwithstanding any other agreements that may be in place. In addition, this report may be subject to review by the controlling authorities. Thus, this report brings to completion our scope of services for this portion of the project. All samples will be disposed of after 30 days, unless specifically requested by the client, in writing.

BORING AND CPT LOGS

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions			Group Symbols	Typical Names
Coarse-Grained Soils More than 50% retained on No. 200 sieve	Gravels 50% or more of coarse fraction retained on No. 4 sieve	Clean Gravels	GW	Well-graded gravels and gravel-sand mixtures, little or no fines
			GP	Poorly graded gravels and gravel-sand mixtures, little or no fines
		Gravel with	GM	Silty gravels gravel-sand-silt mixtures
			GC	Clayey gravels, gravel-sand-clay mixtures
	Sands more than 50% of coarse fraction passes No. 4 sieve	Clean Sands	SW	Well-graded sands and gravelly sands, little or no fines
			SP	Poorly graded sands and gravelly sands, little or no fines
		Sands with Fines	SM	Silty sands, sand-silt mixtures
			SC	Clayey sands, sand-clay mixtures
Fine-Grained Soils 50% or more passes No. 200 sieve	Silts and Clays Liquid limit 50% or less		ML	Inorganic silts, very fine sands, rock flour, silty or clayey fine sands
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
			OL	Organic silts and organic silty clays of low plasticity
	Silts and Clays Liquid limit greater than 50%		MH	Inorganic silts, micaceous or diatomaceous fine sands or silts, elastic silts
			CH	Inorganic clays of high plasticity, fat clays
			OH	Organic clays of medium to high plasticity
Highly Organic Soils			PT	Peat, mucic, and other highly organic soils

CONSISTENCY OR RELATIVE DENSITY

CRITERIA

Standard Penetration Test

Penetration Resistance N (blows/ft)	Relative Density
0 - 4	Very loose
4 - 10	Loose
10 - 30	Medium
30 - 50	Dense
> 50	Very dense

Standard Penetration Test

Penetration Resistance N (blows/ft)	Consistency	Unconfined Compressive Strength (tons/ft^2)
<2	Very Soft	<0.25
2 - 4	Soft	0.25 - .050
4 - 8	Medium	0.50 - 1.00
8 - 15	Stiff	1.00 - 2.00
15 - 30	Very Stiff	2.00 - 4.00
>30	Hard	>4.00

3" 3/4" #4 #10 #40 #200 U.S. Standard Sieve

Unified Soil Classification	Cobbles	Gravel		Sand			Silt or Clay
		coarse	fine	coarse	medium	fine	

MOISTURE CONDITIONS

Dry	Absence of moisture: dusty, dry to the touch
Slightly Moist	Below optimum moisture content for compaction
Moist	Near optimum moisture content
Very Moist	Above optimum moisture content
Wet	Visible free water; below water table

MATERIAL QUANTITY

trace	0 - 5 %
few	5 - 10 %
little	10 - 25 %
some	25 - 45 %

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Bradley Gardens project located at 980 W. 7th Street in San Jacinto, California. The work was performed by Kehoe Testing & Engineering (KTE) on November 26, 2025. The scope of work was performed as directed by GeoSoils, Inc. (GSI) personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at four locations to determine the soil lithology. A summary is provided in **TABLE 2.1**.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-1	50	
CPT-2	50	
CPT-3	60	
CPT-4	50	

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm^2 cone with a cone net area ratio of 0.83. The following parameters were recorded at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At location CPT-3, shear wave measurements were obtained at approximately 10-foot intervals. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil behavior type on the CPT plots is derived from the attached CPT SBT plot (Robertson, "Interpretation of Cone Penetration Test…", 2009) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Steven P. Kehoe

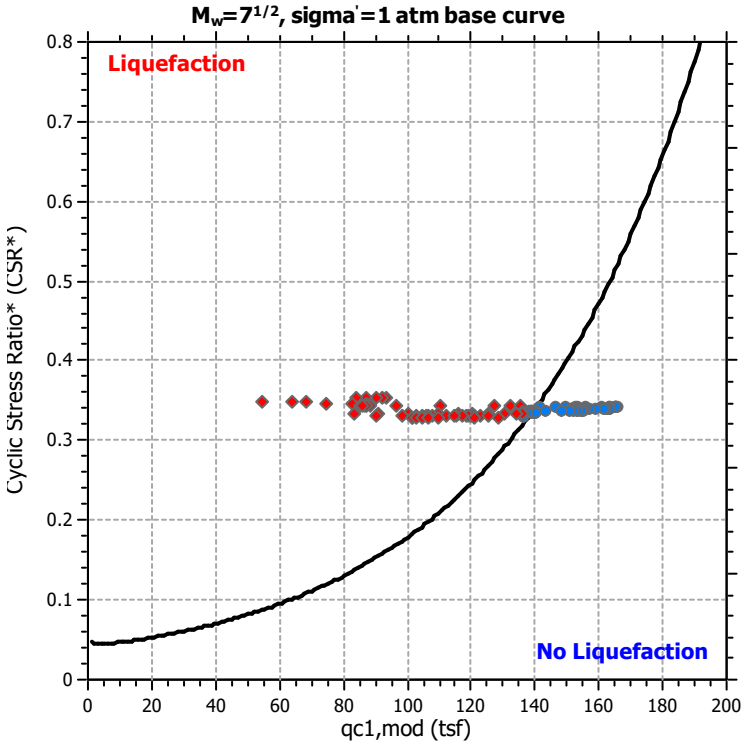
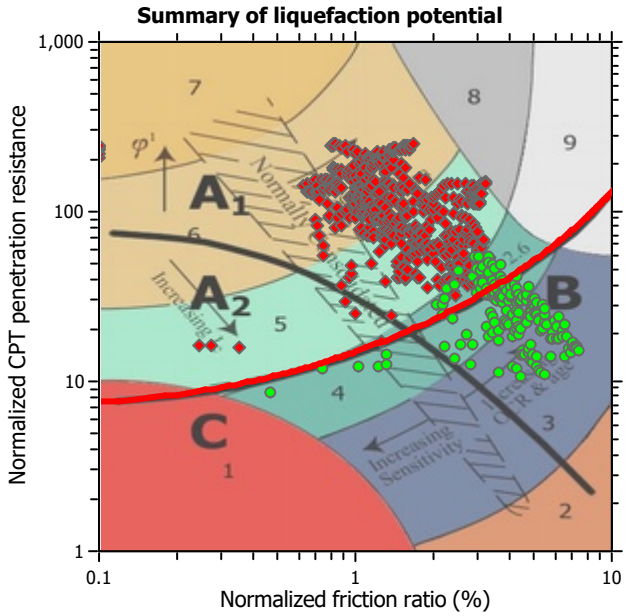
LIQUEFACTION ANALYSIS REPORT



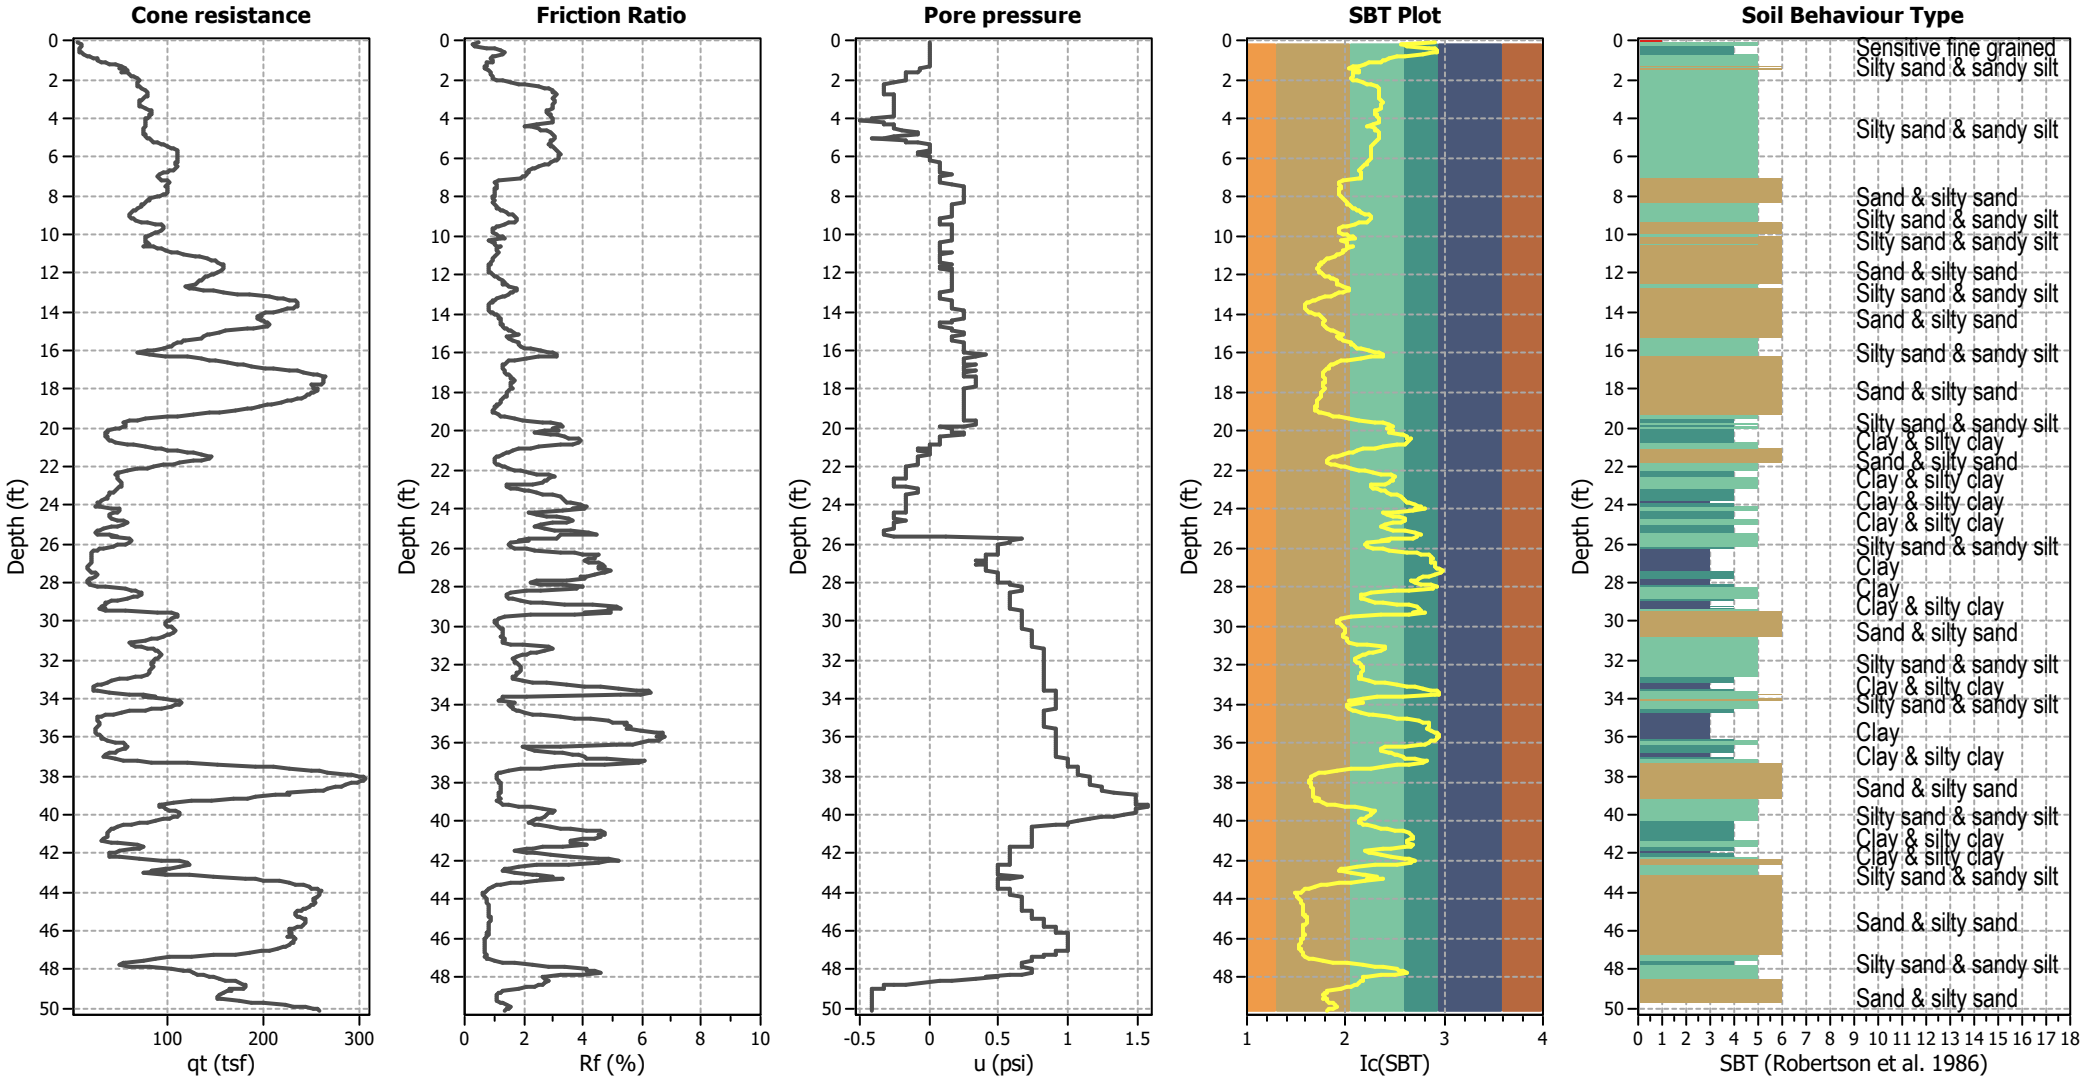
Project title : GeoSoils / Bradley Gardens **Location : 980 W. 7th St, San Jacinto, CA**



CPT file : CPT-1

Input parameters and analysis data

Analysis method:	Moss et al. (2006)	G.W.T. (in-situ):	100.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	Moss et al. (2006)	G.W.T. (earthq.):	40.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	1	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	8.10	Ic cut-off value:	2.60	Trans. detect. applied:	No	MSF method:	Method based
Peak ground acceleration:	1.07	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		



Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots

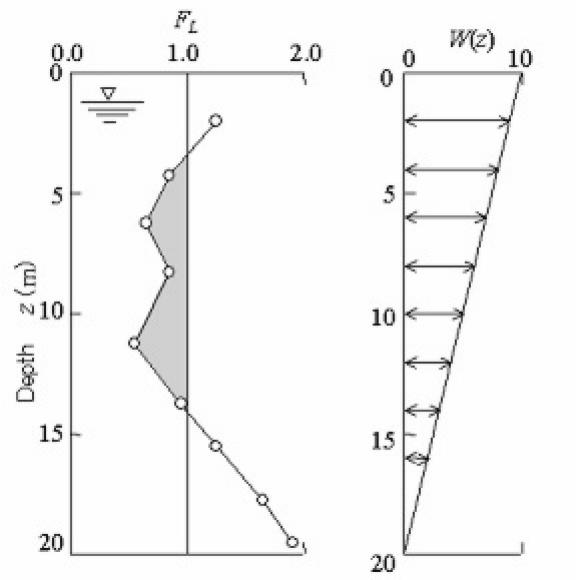
Liquefaction Potential Index (LPI) calculation procedure

Calculation of the Liquefaction Potential Index (LPI) is used to interpret the liquefaction assessment calculations in terms of severity over depth. The calculation procedure is based on the methology developed by Iwasaki (1982) and is adopted by AFPS.



To estimate the severity of liquefaction extent at a given site, LPI is calculated based on the following equation:

$$\mathbf{LPI} = \int_0^{20} (10 - 0{,}5z) \times F_L \times dz$$

where:
F_L = 1 - F.S. when F.S. less than 1
F_L = 0 when F.S. greater than 1
z depth of measurment in meters

Values of LPI range between zero (0) when no test point is characterized as liquefiable and 100 when all points are characterized as susceptible to liquefaction. Iwasaki proposed four (4) discrete categories based on the numeric value of LPI:

- LPI = 0 : Liquefaction risk is very low
- 0 < LPI <= 5 : Liquefaction risk is low
- 5 < LPI <= 15 : Liquefaction risk is high
- LPI > 15 : Liquefaction risk is very high

Graphical presentation of the LPI calculation procedure

Shear-Induced Building Settlement (Ds) calculation procedure

The shear-induced building settlement (Ds) due to liquefaction below the building can be estimated using the relationship developed by Bray and Macedo (2017):

$$Ln(Ds) = c1 + c2 * LBS + 0.58 * Ln\left(Tanh\left(\frac{HL}{6}\right)\right) + 4.59 * Ln(Q) - 0.42 * Ln(Q)^2 - 0.02 * B + 0.84 * Ln(CAVdp) + 0.41 * Ln(Sa1) + \varepsilon$$

where Ds is in the units of mm, c1= -8.35 and c2= 0.072 for LBS ≤ 16, and c1= -7.48 and c2= 0.014 otherwise. Q is the building contact pressure in units of kPa, HL is the cumulative thickness of the liquefiable layers in the units of m, B is the building width in the units of m, CAVdp is a standardized version of the cumulative absolute velocity in the units of g-s, Sa1 is 5%-damped pseudo-acceleration response spectral value at a period of 1 s in the units of g, and ε is a normal random variable with zero mean and 0.50 standard deviation in Ln units. The liquefaction-induced building settlement index (LBS) is:

$$LBS = \sum W * \frac{\varepsilon_{shear}}{z} dz$$

where z (m) is the depth measured from the ground surface > 0, W is a foundation-weighting factor wherein W = 0.0 for z less than Df, which is the embedment depth of the foundation, and W = 1.0 otherwise. The shear strain parameter (ε_shear) is the liquefaction-induced free-field shear strain (in %) estimated using Zhang et al. (2004). It is calculated based on the estimated Dr of the liquefied soil layer and the calculated safety factor against liquefaction triggering (FSL).

APPENDIX F

GENERAL EARTHWORK AND GRADING GUIDELINES AND PRELIMINARY CRITERIA

GENERAL EARTHWORK, GRADING GUIDELINES, AND PRELIMINARY CRITERIA

General

These guidelines present general procedures and requirements for earthwork and grading as shown on the approved grading plans, including preparation of areas to be filled, placement of fill, installation of subdrains, excavations, and appurtenant structures or flatwork. The recommendations contained in the geotechnical report are part of these earthwork and grading guidelines and would supersede the provisions contained hereafter in the case of conflict. Evaluations performed by the consultant during the course of grading may result in new or revised recommendations which could supersede these guidelines or the recommendations contained in the geotechnical report. Generalized details follow this text.

The contractor is responsible for the satisfactory completion of all earthwork in accordance with provisions of the project plans and specifications and latest adopted Code. In the case of conflict, the most onerous provisions shall prevail. The project geotechnical engineer and engineering geologist (geotechnical consultant), or their representatives, should provide observation and testing services, and geotechnical consultation during the duration of the project.

EARTHWORK OBSERVATIONS AND TESTING

Geotechnical Consultant

Prior to the commencement of grading, a qualified geotechnical consultant (soil engineer and engineering geologist) should be employed for the purpose of observing earthwork procedures and testing the fills for general conformance with the recommendations of the geotechnical report(s), the approved grading plans, and applicable grading codes and ordinances.

The geotechnical consultant should provide testing and observation so that an evaluation may be made that the work is being accomplished as specified. It is the responsibility of the contractor to assist the consultants and keep them apprised of anticipated work schedules and changes, so that they may schedule their personnel accordingly.

All remedial removals, clean-outs, prepared ground to receive fill, key excavations, and subdrain installation should be observed and documented by the geotechnical consultant prior to placing any fill. It is the contractor's responsibility to notify the geotechnical consultant when such areas are ready for observation.

Laboratory and Field Tests

Maximum dry density tests to determine the degree of compaction should be performed in accordance with American Standard Testing Materials test method ASTM designation D-1557. Random or representative field compaction tests should be performed in accordance with test methods ASTM designation D-1556, D-2937 or D-2922, and D-3017, at intervals of approximately ±2 feet of fill height or approximately every 1,000 cubic yards placed. These criteria would vary depending on the soil conditions and the size of the project. The location and frequency of testing would be at the discretion of the geotechnical consultant.

Contractor's Responsibility

All clearing, site preparation, and earthwork performed on the project should be conducted by the contractor, with observation by a geotechnical consultant, and staged approval by the governing agencies, as applicable. It is the contractor's responsibility to prepare the ground surface to receive the fill, to the satisfaction of the geotechnical consultant, and to place, spread, moisture condition, mix, and compact the fill in accordance with the recommendations of the geotechnical consultant. The contractor should also remove all non-earth material considered unsatisfactory by the geotechnical consultant.

Notwithstanding the services provided by the geotechnical consultant, it is the sole responsibility of the contractor to provide adequate equipment and methods to accomplish the earthwork in strict accordance with applicable grading guidelines, latest adopted Code or agency ordinances, geotechnical report(s), and approved grading plans. Sufficient watering apparatus and compaction equipment should be provided by the contractor with due consideration for the fill material, rate of placement, and climatic conditions. If, in the opinion of the geotechnical consultant, unsatisfactory conditions such as questionable weather, excessive oversized rock or deleterious material, insufficient support equipment, etc., are resulting in a quality of work that is not acceptable, the consultant will inform the contractor, and the contractor is expected to rectify the conditions, and if necessary, stop work until conditions are satisfactory.

During construction, the contractor shall properly grade all surfaces to maintain good drainage and prevent ponding of water. The contractor shall take remedial measures to control surface water and to prevent erosion of graded areas until such time as permanent drainage and erosion control measures have been installed.

SITE PREPARATION

All major vegetation, including brush, trees, thick grasses, organic debris, and other deleterious material, should be removed and disposed of off-site. These removals must be concluded prior to placing fill. In-place existing fill, soil, alluvium, colluvium, or rock materials, as evaluated by the geotechnical consultant as being unsuitable, should be removed prior to any fill placement. Depending upon the soil conditions, these materials may be reused as

compacted fills. Any materials incorporated as part of the compacted fills should be approved by the geotechnical consultant.

Any underground structures such as cesspools, cisterns, mining shafts, tunnels, septic tanks, wells, pipelines, or other structures not located prior to grading, are to be removed or treated in a manner recommended by the geotechnical consultant. Soft, dry, spongy, highly fractured, or otherwise unsuitable ground, extending to such a depth that surface processing cannot adequately improve the condition, should be overexcavated down to firm ground and approved by the geotechnical consultant before compaction and filling operations continue. Overexcavated and processed soils, which have been properly mixed and moisture conditioned, should be re-compacted to the minimum relative compaction as specified in these guidelines.

Existing ground, which is determined to be satisfactory for support of the fills, should be scarified (ripped) to a minimum depth of 6 to 8 inches, or as directed by the geotechnical consultant. After the scarified ground is brought to optimum moisture content, or greater and mixed, the materials should be compacted as specified herein. If the scarified zone is greater than 6 to 8 inches in depth, it may be necessary to remove the excess and place the material in lifts restricted to about 6 to 8 inches in compacted thickness.

Existing ground which is not satisfactory to support compacted fill should be overexcavated as required in the geotechnical report, or by the on-site geotechnical consultant. Scarification, disc harrowing, or other acceptable forms of mixing should continue until the soils are broken down and free of large lumps or clods, until the working surface is reasonably uniform and free from ruts, hollows, hummocks, mounds, or other uneven features, which would inhibit compaction as described previously.

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical [h:v]), the ground should be stepped or benched. The lowest bench, which will act as a key, should be a minimum of 15 feet wide and should be at least 2 feet deep into firm material, and approved by the geotechnical consultant. In fill-over-cut slope conditions, the recommended minimum width of the lowest bench or key is also 15 feet, with the key founded on firm material, as designated by the geotechnical consultant. As a general rule, unless specifically recommended otherwise by the geotechnical consultant, the minimum width of fill keys should be equal to ½ the height of the slope.

Standard benching is generally 4 feet (minimum) vertically, exposing firm, acceptable material. Benching may be used to remove unsuitable materials, although it is understood that the vertical height of the bench may exceed 4 feet. Pre-stripping may be considered for unsuitable materials in excess of 4 feet in thickness.

All areas to receive fill, including processed areas, removal areas, and the toes of fill benches, should be observed and approved by the geotechnical consultant prior to placement of fill. Fills may then be properly placed and compacted until design grades (elevations) are attained.

COMPACTED FILLS

Any earth materials imported or excavated on the property may be utilized in the fill provided that each material has been evaluated to be suitable by the geotechnical consultant. These materials should be free of roots, tree branches, other organic matter, or other deleterious materials. All unsuitable materials should be removed from the fill as directed by the geotechnical consultant. Soils of poor gradation, undesirable expansion potential, or substandard strength characteristics may be designated by the consultant as unsuitable and may require blending with other soils to serve as a satisfactory fill material.

Fill materials derived from benching operations should be dispersed throughout the fill area and blended with other approved material. Benching operations should not result in the benched material being placed only within a single equipment width away from the fill/bedrock contact.

Oversized materials defined as rock, or other irreducible materials, with a maximum dimension greater than 12 inches, should not be buried or placed in fills unless the location of materials and disposal methods are specifically approved by the geotechnical consultant. Oversized material should be taken offsite, or placed in accordance with recommendations of the geotechnical consultant in areas designated as suitable for rock disposal. GSI anticipates that soils to be utilized as fill material for the subject project may contain some rock. Appropriately, the need for rock disposal may be necessary during grading operations on the site. From a geotechnical standpoint, the depth of any rocks, rock fills, or rock blankets, should be a sufficient distance from finish grade. This depth is generally the same as any overexcavation due to cut-fill transitions in hard rock areas, and generally facilitates the excavation of structural footings and substructures. Should deeper excavations be proposed (i.e., deepened footings, utility trenching, swimming pools, spas, etc.), the developer may consider increasing the hold-down depth of any rocky fills to be placed, as appropriate. In addition, some agencies/jurisdictions mandate a specific hold-down depth for oversize materials placed in fills. The hold-down depth, and potential to encounter oversize rock, both within fills, and occurring in cut or natural areas, would need to be disclosed to all interested/affected parties. Once approved by the governing agency, the hold-down depth for oversized rock (i.e., greater than 12 inches) in fills on this project is provided as 10 feet, unless specified differently in the text of this report. The governing agency may require that these materials need to be deeper, crushed, or reduced to less than 12 inches in maximum dimension, at their discretion.

To facilitate future trenching, rock (or oversized material), should not be placed within the hold-down depth feet from finish grade, the range of foundation excavations, future utilities, or underground construction unless specifically approved by the governing agency, the geotechnical consultant, or the developer's representative.

If import material is required for grading, representative samples of the materials to be utilized as compacted fill should be analyzed in the laboratory by the geotechnical consultant to evaluate it's physical properties and suitability for use onsite. Such testing should be performed three (3) days prior to importation. If any material other than that previously tested is encountered during grading, an appropriate analysis of this material should be conducted by the geotechnical consultant as soon as possible.

Approved fill material should be placed in areas prepared to receive fill in near horizontal layers, that when compacted, should not exceed about 6 to 8 inches in thickness. The geotechnical consultant may approve thick lifts if testing indicates the grading procedures are such that adequate compaction is being achieved with lifts of greater thickness. Each layer should be spread evenly and blended to attain uniformity of material and moisture suitable for compaction.

Fill layers at a moisture content less than optimum should be watered and mixed, and wet fill layers should be aerated by scarification, or should be blended with drier material. Moisture conditioning, blending, and mixing of the fill layer should continue until the fill materials have a uniform moisture content at, or above, optimum moisture.

After each layer has been evenly spread, moisture conditioned, and mixed, it should be uniformly compacted to a minimum of 90 percent of the maximum density as evaluated by ASTM test designation D 1557, or as otherwise recommended by the geotechnical consultant. Compaction equipment should be adequately sized and should be specifically designed for soil compaction, or of proven reliability to efficiently achieve the specified degree of compaction.

Where tests indicate that the density of any layer of fill, or portion thereof, is below the required relative compaction, or improper moisture is in evidence, the particular layer or portion shall be re-worked until the required density and moisture content has been attained. No additional fill shall be placed in an area until the last placed lift of fill has been tested and found to meet the density and moisture requirements, and is approved by the geotechnical consultant.

In general, per the latest adopted Code, fill slopes should be designed and constructed at a gradient of 2:1 (h:v), or flatter. Compaction of slopes should be accomplished by over-building a minimum of 3 feet horizontally, and subsequently trimming back to the design slope configuration. Testing shall be performed as the fill is elevated to evaluate compaction as the fill core is being developed. Special efforts may be necessary to attain the specified compaction in the fill slope zone. Final slope shaping should be performed by trimming and removing loose materials with appropriate equipment. A final evaluation of fill slope compaction should be based on observation or testing of the finished slope face. Where compacted fill slopes are designed steeper than 2:1 (h:v), prior approval from the governing agency, specific material types, a higher minimum relative compaction, special reinforcement, and special grading procedures will be recommended.

If an alternative to over-building and cutting back the compacted fill slopes is selected, then special effort should be made to achieve the required compaction in the outer 10 feet of each lift of fill by undertaking the following:

1. An extra piece of equipment consisting of a heavy, short-shanked sheepsfoot should be used to roll (horizontal) parallel to the slopes continuously as fill is placed. The sheepsfoot roller should also be used to roll perpendicular to the slopes, and extend out over the slope to provide adequate compaction to the face of the slope.

2. Loose fill should not be spilled out over the face of the slope as each lift is compacted. Any loose fill spilled over a previously completed slope face should be trimmed off or be subject to re-rolling.

3. Field compaction tests will be made in the outer (horizontal) ±2 to ±8 feet of the slope at appropriate vertical intervals, subsequent to compaction operations.

4. After completion of the slope, the slope face should be shaped with a small tractor and then re-rolled with a sheepsfoot to achieve compaction to near the slope face. Subsequent to testing to evaluate compaction, the slopes should be grid-rolled to achieve compaction to the slope face. Final testing should be used to evaluate compaction after grid rolling.

5. Where testing indicates less than adequate compaction, the contractor will be responsible to rip, water, mix, and recompact the slope material as necessary to achieve compaction. Additional testing should be performed to evaluate compaction.

SUBDRAIN INSTALLATION

Subdrains should be installed in approved ground in accordance with the approximate alignment and details indicated by the geotechnical consultant. Subdrain locations or materials should not be changed or modified without approval of the geotechnical consultant. The geotechnical consultant may recommend and direct changes in subdrain line, grade, and drain material in the field, pending exposed conditions. The location of constructed subdrains, especially the outlets, should be recorded/surveyed by the project civil engineer. Drainage at the subdrain outlets should be provided by the project civil engineer.

EXCAVATIONS

Excavations and cut slopes should be examined during grading by the geotechnical consultant. If directed by the geotechnical consultant, further excavations or overexcavation and refilling of cut areas should be performed, or remedial grading of cut slopes should be performed. When fill-over-cut slopes are to be graded, unless otherwise approved, the cut portion of the slope should be observed by the geotechnical consultant prior to placement of materials for construction of the fill portion of the slope. The geotechnical consultant should observe all cut slopes, and should be notified by the contractor when excavation of cut slopes commences.

If, during the course of grading, unforeseen adverse or potentially adverse geologic conditions are encountered, the geotechnical consultant should investigate, evaluate, and make appropriate recommendations for mitigation of these conditions. The need for cut slope buttressing or stabilizing should be based on in-grading evaluation by the geotechnical consultant, whether anticipated or not.

Unless otherwise specified in geotechnical and geological report(s), no cut slopes should be excavated higher or steeper than that allowed by the ordinances of controlling governmental agencies. Additionally, short-term stability of temporary cut slopes is the contractor's responsibility.

Erosion control and drainage devices should be designed by the project civil engineer and should be constructed in compliance with the ordinances of the controlling governmental agencies, or in accordance with the recommendations of the geotechnical consultant.

COMPLETION

Observation, testing, and consultation by the geotechnical consultant should be conducted during the grading operations in order to state an opinion that all cut and fill areas are graded in accordance with the approved project specifications. After completion of grading, and after the geotechnical consultant has finished observations of the work, final reports should be submitted, and may be subject to review by the controlling governmental agencies. No further excavation or filling should be undertaken without prior notification of the geotechnical consultant or approved plans.

All finished cut and fill slopes should be protected from erosion and be planted in accordance with the project specifications or as recommended by a landscape architect. Such protection and planning should be undertaken as soon as practical after completion of grading.

JOB SAFETY

General

At GSI, getting the job done safely is of primary concern. The following is the company's safety considerations for use by all employees on multi-employer construction sites. On-ground personnel are at highest risk of injury, and possible fatality, on grading and construction projects. GSI recognizes that construction activities will vary on each site, and that site safety is the prime responsibility of the contractor; however, everyone must be safety conscious and responsible at all times. To achieve our goal of avoiding accidents, cooperation between the client, the contractor, and GSI personnel must be maintained.

In an effort to minimize risks associated with geotechnical testing and observation, the following precautions are to be implemented for the safety of field personnel on grading and construction projects:

Safety Meetings: GSI field personnel are directed to attend contractor's regularly scheduled and documented safety meetings.

Safety Vests: Safety vests are provided for, and are to be worn by GSI personnel, at all times, when they are working in the field.

Safety Flags: Two safety flags are provided to GSI field technicians; one is to be affixed to the vehicle when on site, the other is to be placed atop the spoil pile on all test pits.

Flashing Lights: All vehicles stationary in the grading area shall use rotating or flashing amber beacons, or strobe lights, on the vehicle during all field testing. While operating a vehicle in the grading area, the emergency flasher on the vehicle shall be activated.

If the contractor's representative observes any of our personnel who do not follow the above, we request that it be brought to the attention of our office.

Test Pits Location, Orientation, and Clearance

The technician is responsible for selecting test pit locations. A primary concern should be the technician's safety. Efforts will be made to coordinate locations with the grading contractor's authorized representative, and to select locations following or behind the established traffic pattern, preferably outside of current traffic. The contractor's authorized representative (supervisor, grade checker, dump man, operator, etc.) should direct excavation of the pit and safety during the test period. Of paramount concern should be the soil technician's safety, and obtaining enough tests to represent the fill.

Test pits should be excavated so that the spoil pile is placed away from oncoming traffic, whenever possible. The technician's vehicle is to be placed next to the test pit, opposite the spoil pile. This necessitates the fill be maintained in a drivable condition. Alternatively, the contractor may wish to park a piece of equipment in front of the test holes, particularly in small fill areas or those with limited access.

A zone of non-encroachment should be established for all test pits. No grading equipment should enter this zone during the testing procedure. The zone should extend approximately 50 feet outward from the center of the test pit. This zone is established for safety and to avoid excessive ground vibration, which typically decreases test results.

When taking slope tests, the technician should park the vehicle directly above or below the test location. If this is not possible, a prominent flag should be placed at the top of the slope. The contractor's representative should effectively keep all equipment at a safe operational distance (e.g., 50 feet) away from the slope during this testing.

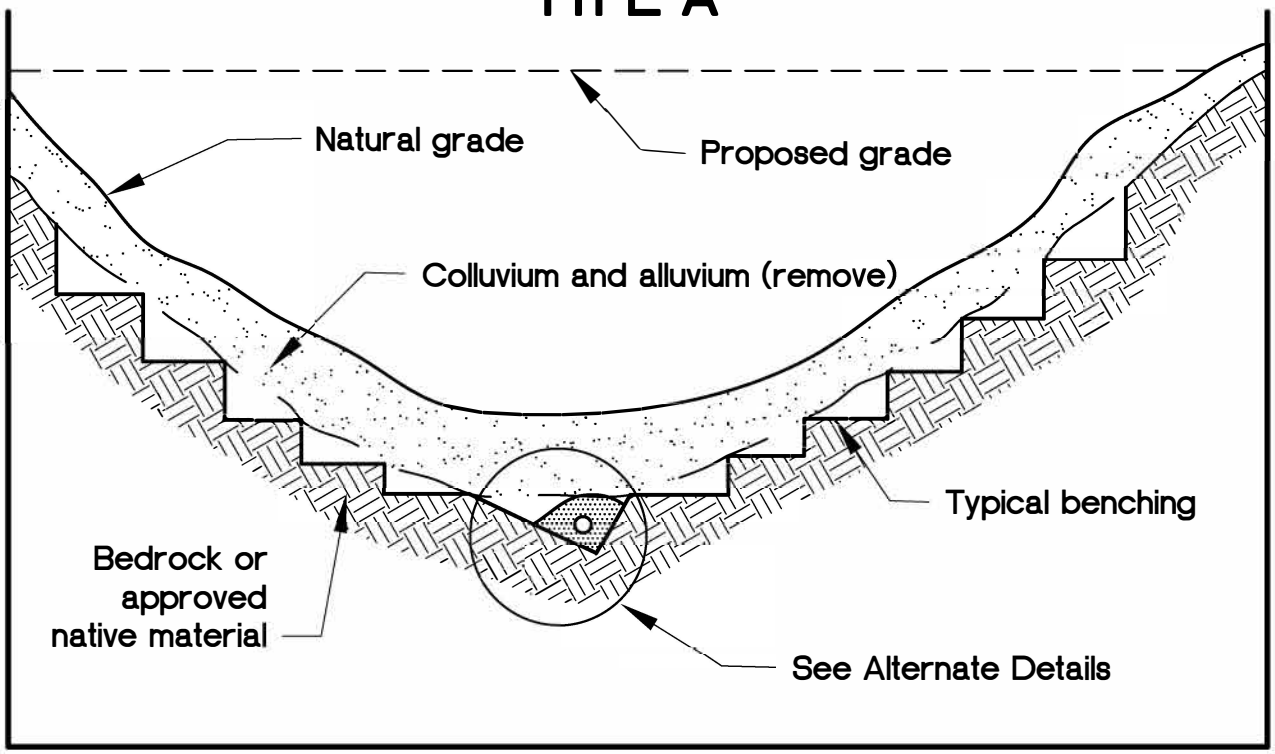
The technician is directed to withdraw from the active portion of the fill as soon as possible following testing. The technician's vehicle should be parked at the perimeter of the fill in a highly visible location, well away from the equipment traffic pattern. The contractor should inform our personnel of all changes to haul roads, cut and fill areas or other factors that may affect site access and site safety.

If the technician's safety is jeopardized or compromised because of the contractor's failure to comply with any of the above, the technician is required, by company policy, to immediately withdraw and notify his/her supervisor. The grading contractor's representative will be

contacted to affect a solution. However, in the interim, no further testing will be performed until the situation is rectified. Any fill placed can be considered unacceptable and subject to reprocessing, recompaction, or removal.

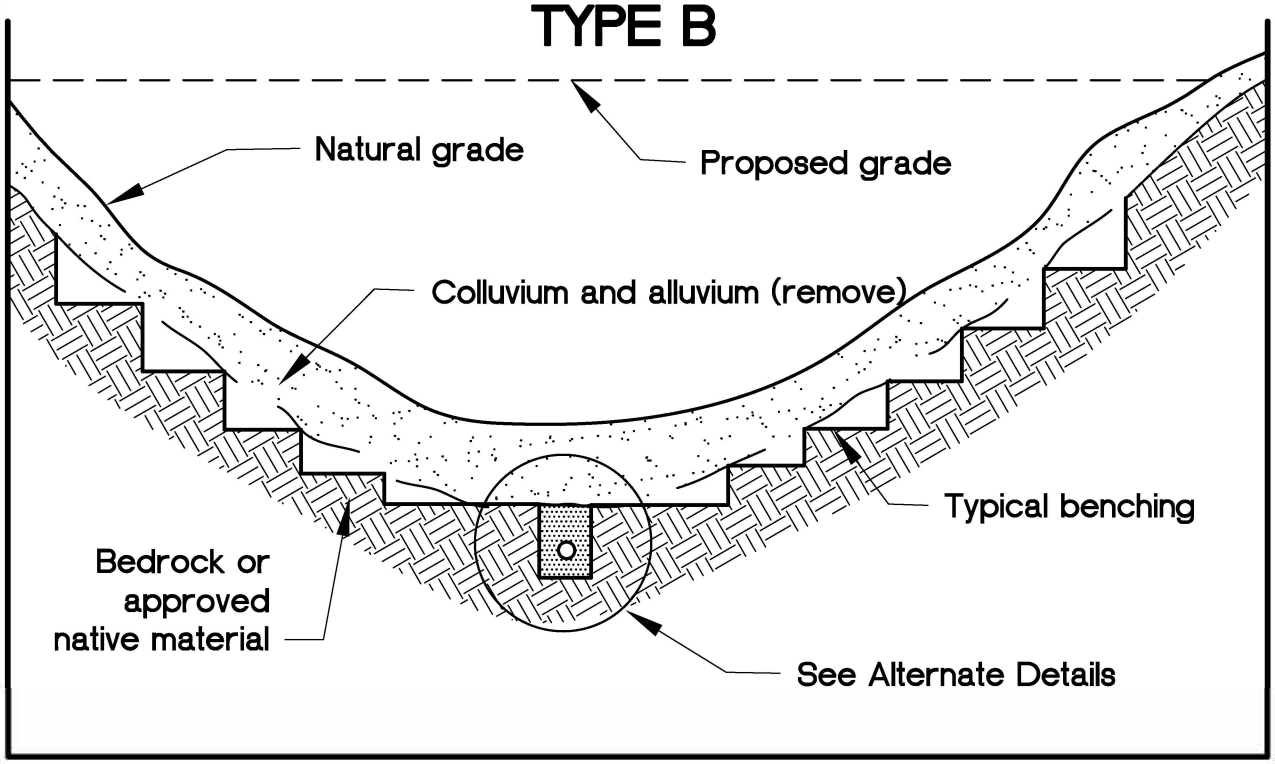
If the soil technician does not comply with the above or other established safety guidelines, we request that the contractor bring this to the technician's attention and notify this office. Effective communication and coordination between the contractor's representative and the soil technician is strongly encouraged to implement the above safety plan.

Trench and Vertical Excavation



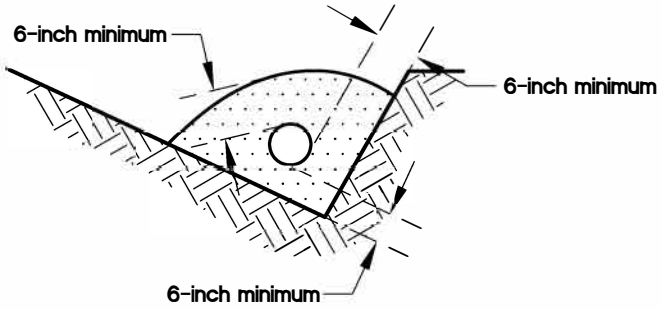
It is the contractor's responsibility to provide safe access into trenches where compaction testing is needed. Our personnel are directed not to enter any excavation or vertical cut which: 1) is 5 feet or deeper unless shored or laid back; 2) displays any evidence of instability, has any loose rock or other debris which could fall into the trench; or 3) displays any other evidence of any unsafe conditions regardless of depth.

All trench excavations or vertical cuts more than 5 feet deep, which any person enters, should be shored or laid back. Trench access should be provided in accordance with Cal/OSHA and/or state and local standards. Our personnel are directed not to enter any trench by being lowered or "riding down" on the equipment.

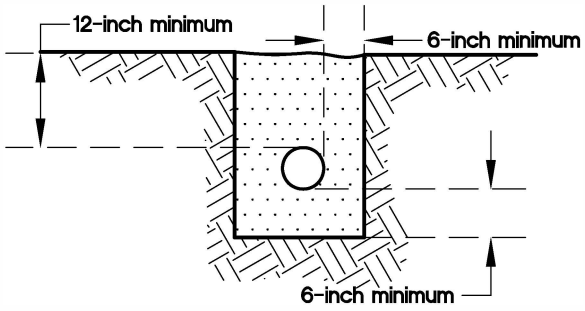


If the contractor fails to provide safe access to trenches for compaction testing, our company policy requires that the soil technician withdraw and notify his/her supervisor. The contractor's representative will be contacted to affect a solution. All backfill not tested due to safety concerns or other reasons could be subject to reprocessing and/or removal.

If GSI personnel become aware of anyone working beneath an unsafe trench wall or vertical excavation, we have a legal obligation to put the contractor and owner/developer on notice to immediately correct the situation. If corrective steps are not taken, GSI then has an obligation to notify Cal/OSHA and/or the proper controlling authorities.



TYPE A



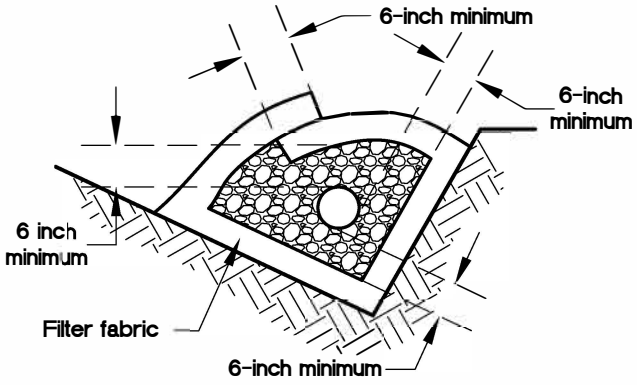
TYPE B

Selection of alternate subdrain details, location, and extent of subdrains should be evaluated by the geotechnical consultant during grading.

A-1

B-1

Filter material: Minimum volume of 9 cubic feet per lineal foot of pipe.



Perforated pipe: 6-inch-diameter ABS or PVC pipe or approved substitute with minimum 8 perforations (¼-inch diameter) per lineal foot in bottom half of pipe (ASTM D-2751, SDR-35, or ASTM D-1527, Schd. 40).

For continuous run in excess of 500 feet, use 8-inch-diameter pipe (ASTM D-3034, SDR-35, or ASTM D-1785, Schd. 40).

Attention: Ms. Kim Corcoran

Subject: Supplemental Infiltration Feasibility Testing, Proposed Bradley Gardens Skilled Nursing Facility Building Addition, 980 W. 7th Street, City of San Jacinto, Riverside County, California 92582 (APN 435-330-003)

Dear Ms. Corcoran:

In accordance with the City of San Jacinto review comments received, and your request and authorization, GeoSoils, Inc. (GSI) is presenting the results of our supplemental infiltration feasibility testing for the proposed Bradley Gardens skilled nursing facility in the City of San Jacinto, Riverside County, California. The purpose of this study was to further evaluate the onsite soils and geologic conditions and conduct feasibility infiltration testing within the areas of the proposed pervious paver access driveway onsite, for use in water quality Best Management Practice (BMP) design by the water quality engineer of record for the project.

The scope of our services has included a review of the referenced reports and documents (see Appendix A), the advancement of four (4) hand-excavated exploratory borings onsite, which were excavated to a depth of 2 feet below the existing surface (bgs), geologic logging (Appendix B), field infiltration testing (Appendix C), analysis of field test data obtained, and preparation of this summary infiltration feasibility testing report.

SITE DESCRIPTION AND CURRENT SITE CONDITIONS

The overall site consists of an approximately 2.98-acre, rectangular-shaped area of developed land. The site is located on the southeast corner of the intersection of W 7th Street and S. Grand Avenue, in the City of San Jacinto, Riverside County, California. The property is bounded by undeveloped land on the south, east and west, by residential development to the southwest, and commercial development to the north, across W 7th Street. In general, the site is flat-lying to very gently sloping in a southeasterly direction. According to Google Earth Pro (GEP, 2026), site elevations vary between approximately 1,527 and 1,525 feet Mean Sea Level (MSL), for an overall relief of about 2 feet. The site is sparsely vegetated and has localized shrubs and trees within and surrounding the existing facility.

PROPOSED DEVELOPMENT

Based on our review of the overall site plan, dated September 18, 2025, prepared by Gregg Maedo & Associates (GMA, 2025), we understand that continued development of the property would consist of the construction of a 43-bed skilled nursing facility (Building A1), as well as the installation of underground utility and roadway infrastructure. The newly provided storm water quality control plan by Guide Engineering (GE, 2026) indicates the development of a pervious paver access roadway on the east and south side of the project site. It is our understanding the pervious paver access roadway will be used as a relatively shallow water quality Best Management Practice (BMP) feature onsite.

SITE GEOLOGY

Based on our previous onsite preliminary geotechnical investigation (GSI, 2025) and published geologic mapping by Dibblee (2003), the site is underlain by Holocene- to late Pleistocene-age alluvial sand and clay of valley areas (Qa), although no significant clay layers were encountered during this, or our previous subsurface investigation (GSI, 2025). As encountered during our previous subsurface investigation the site soils were mostly sandy (e.g., silty sands) with minor silt layers encountered at depth. The observed alluvial deposits extend to depths beyond 60 feet, and are estimated to be hundreds of feet in thickness based on the data reviewed (GSI, 2025).

The near surface alluvial deposits encountered during this study generally consist of light brown silty sands that were generally loose to medium dense with depth, with the exception of hand auger P-4, near the dumpster area, which was medium dense to very dense with depth. The near surface soils were also found to be dry to damp, very fine to coarse grained sands, and somewhat to locally friable near the surface.

GROUNDWATER

Regional or perched groundwater was not encountered during this study or within the subsurface excavations (Borings and Cone Penetration Testing [CPT]), up to approximately 60 feet in depth, advanced during our previous field work (GSI, 2025). Likewise, seeps, springs, or other indications of a high groundwater level were not noted on the subject property during the time of this or our previous field investigation (GSI, 2025).

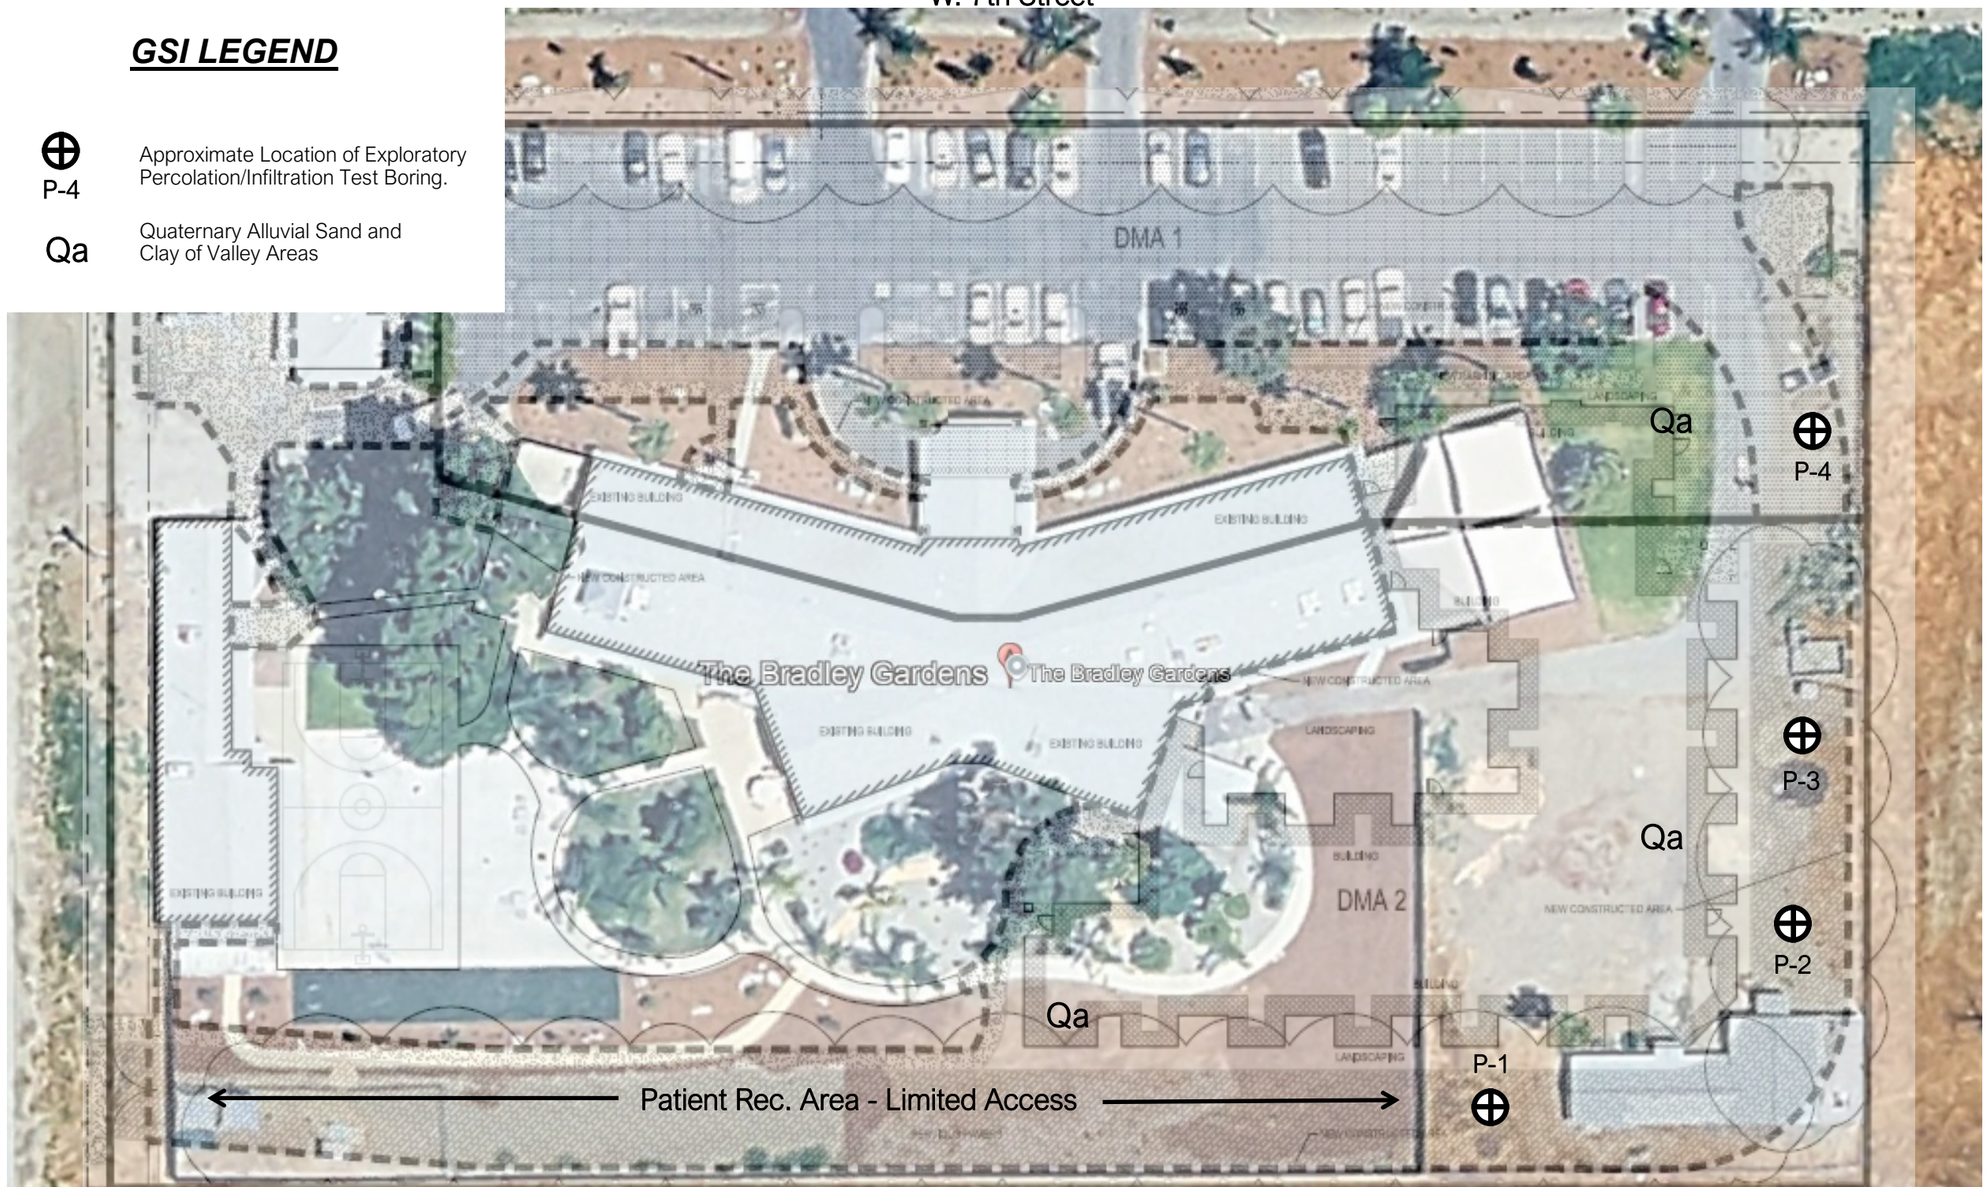
Based on our review of the California Department of Water Resources (CDWR) Water Data Library (2026), nearby well measurements reviewed appear to be regional groundwater measurements at depths of approximately 170 and 155 feet (State Well No. 04S01W27P005S [March 7, 1991], and Site Code No. 337748N1169760W001 [December 6, 2011], respectively) at sites with similar ground surface elevations. However,

our review of historic groundwater measurements in the San Jacinto and Temecula basins (U.S. Geological Survey, 1919, Water Supply Paper 429) indicates groundwater near the center of the basin may have been as shallow as 40 feet bgs. However, in California, the legislature passed the Sustainable Groundwater Management Act (SGMA), creating a statewide framework for groundwater regulation. The Eastern Municipal Water District (EMWD), and several other water purveyors, have been actively managing the San Jacinto basin as part of a voluntary Assembly Bill 3030 effort passed in 1992. As such, it is unlikely the groundwater will reach historic levels as the basin is now adjudicated. These observations reflect site conditions at the time of our field work and do not prevent future changes in local groundwater conditions from excessive irrigation, precipitation, or that were not evident at the time of this, or our original preliminary investigation (GSI, 2025).

INFILTRATION FEASIBILITY TESTING

In accordance with Riverside County Flood Control - Low Impact Development (LID) BMP Design Handbook (RCFC, 2011) guidelines for infiltration testing, four (4) tests were conducted within the proposed location of the pervious paver access driveway, as requested by the design engineer. The approximate locations of the infiltration tests for this study are provided on Figure 1 (Percolation-Infiltration Test Location Map). The infiltration testing was performed to further evaluate site conditions with respect to the proposed pervious paver BMP system that would retain and filter onsite storm water. The infiltration testing was performed in conformance with the RCFC (2011) design handbook for such testing. The infiltration testing was performed by a senior field technician under the direct supervision of a principal geologist from GSI. Logs of the borings advanced for this study are presented in Appendix B, and the Field Infiltration Data Sheets are presented in Appendix C. Procedures for testing are outlined briefly below:

Percolation Test Procedures



Test Borings:

1. Hand excavated to a depth of approximately 2 feet
2. Diameter - 8 inches.
3. After the removal of loose materials, 2 inches of gravel was placed on the bottom of each test boring.
4. A perforated pipe was then installed within each test boring to facilitate accurate field measurements and prevent caving during the pre-soak period and infiltration testing.

Figure 1

PERCOLATION/INFILTRATION TEST LOCATION MAP

W.O. 9071-A1-IE	DATE: 08/26	SCALE: NTS

Pre-Soaking: After the installation of the perforated pipes, the boring was filled with a minimum of 5-gallons of clear water. The test period for the percolation testing commenced immediately, as all the water seeped away while the tester was present and sandy soils were known to exist onsite.

Sandy Soil Test: Following the pre-soak period, sandy soil criteria testing was conducted. Two (2) consecutive measurements were made at each test location at intervals of approximately 25 minutes. Greater than 6 inches of water seeped away during each of the two (2) test measurements at each location, therefore the testing began using the criteria for "sandy soils" testing at all locations.

Testing: After required pre-soak period and sandy soil test periods, infiltration testing started at all locations. A column of clear water was re-established within each of the test locations. The drop in water level was measured from a fixed reference point, refilling after each test measurement. Within the test locations, a series of test measurements were taken for an additional hour, at time intervals of 10 minutes.

Precision: All test measurements were read to the nearest ¼-inch.

Test Results: Calculations from our field testing indicate percolation rates between approximately 0.97 and 0.42 minutes/inch. Per the RCFC (2011) guidelines, the percolation rates obtained were then converted to infiltration rates using the "Porchet Method," to be used by the design engineer for appropriate sizing of the BMP systems (RCFC, 2011). The converted infiltration rates obtained varied between approximately 5.9 inches/hour and 11.1 inches/hour. Typically, the lowest infiltration rate obtained is applied to the design; therefore, an unfactored (no factor of safety applied) infiltration rate (UIR) of 5.9 inches/hour was obtained. Using an appropriate Factor of Safety (FOS) of 3, per the RCFC (2011) guidelines, a Design Infiltration Rate of 1.97 inches/hour may be used for design. The converted infiltration rates, along with the formulas used are presented in Figure 2 (Percolation Rate to Infiltration Rate Conversion).

USDA Site Soil Group, Soil Units, and Ksat Values

Our review of the United States Department of Agriculture (USDA, 2026) Web Soil Survey (https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm), indicates that two (2) major soil units underlie the site. The Grangeville sandy loam, 0 to 5 percent slopes (GrB) and the Grangeville fine sandy loam, 0 to 5 percent slopes (GvB) are mapped onsite (USDA, 2026). The USDA (2026) indicates that the capacity of the most limiting layer to transmit water

Percolation Rate to Infiltration Rate Conversion

* $$\text{Infiltration Rate } (I_t) = \frac{\Delta H\ \pi r^2\ 60}{t(\pi r^2 + 2\pi r H_{av}} = \frac{\Delta H\ 60\ r}{\Delta t(r+2H_{avg})}$$

Where:
- I_t = tested infiltration rate, inches/hour
- ΔH = change in head over the time interval, inches
- Δt = time interval, minutes
- r = effective radius of test hole
- H_{avg} = average head over the time interval, inches

		Δt	Init Level	Fnl Level	ΔH	H_{avg}	I_t	
Infiltration Test Numbers	P-1	10	24	24	24	24	11.08	
	P-2	10	24	9	15	16 1/2	9.73	High = 12.70

								**UIR = 5.90

* Conversion per the "Porchet Method" (RCFC, 2011)

**UIR = Unfactored Infiltration Rate (Inches/Hour)

Factor of Safety (FOS) = 3.0 = 5.9/3.0 = **1.97** = DIR**

**DIR = Design Infiltration Rate (Inches/Hour)

W.O. 9071-A1-IE

Figure 2

(Ksat) within the Grangeville sandy loam, is high (1.98 to 5.95 inches per hour [in/hr]) and falls into hydrologic soil groups (HSGs) "A/D." The USDA (2026) also indicates that capacity of most limiting layer to transmit water (Ksat) within the Grangeville fine sandy loam is moderately high to high (0.57 to 1.98 in/hr) and falls into hydrologic soil groups (HSGs) "B/D." Based on our review, the results of our onsite infiltration feasibility testing appear to correlate well with the USDA (2026) Ksat values for the major soil units mapped onsite.

Infiltration Siting Requirements

Our review of the general infiltration siting requirements and limitations provided by the California Stormwater Quality Association (CASQA, 2003), indicates sites characterized as belonging to Hydrologic Soil Group "A," "B," and "C" may be suitable for infiltration, requiring a minimum soil infiltration rate of 0.5 inches/hour. However, the County of Riverside water pollution prevention Water Quality Management Plan (WQMP, 2012), guidance document for the Santa Ana Region states: "the minimum long-term post-development infiltration rate must be at least 0.83 inches per hour." Furthermore, based on our review of historic regional groundwater levels and our previous onsite subsurface investigation (GSI, 2025), a minimum 10-foot vertical separation from the bottom of the BMP systems to the top of historic high groundwater levels will be maintained.

The design engineer will need to review BMP requirements by the RCFC (2011) and the converted infiltration rates obtained during this study with respect to the proposed water quality BMP systems. An appropriate factor of safety (FOS), per the RCFC (2011) technical guidance document, has been applied herein. The design infiltration rates, general BMP design parameters, and recommendations provided herein are based on our experience with earth materials within the City of San Jacinto, RCFC (2011) and State criteria (CASQA, 2003), and our experience on adjacent sites with similar geologic conditions. Based on our review of the USDA data and our subsurface explorations, similar soil conditions prevail throughout the site, including sandy fine-grained surficial soils.

CONCLUSIONS AND RECOMMENDATIONS

Based on the onsite infiltration testing conducted, it is our opinion that the proposed commercial development and BMP development onsite is feasible from a geologic and geotechnical viewpoint, provided the recommendations presented herein, and within the previous report by GSI (2025) are properly implemented during project planning, design, and construction, as warranted. General recommendations for storm water quality BMP systems are presented in GSI (2025); however, for convenience are reiterated below.

Onsite Storm Water Quality Best Management Practice (BMP) Systems

Should onsite infiltration-systems be planned for Best Management Practices (BMP's) or Low Impact Development (LID) principles for the project, certain guidelines must be followed in the planning, design, and construction of such systems. Such systems, if improperly designed or implemented without consideration of the geotechnical aspects of site conditions, can contribute to flooding, saturation of bearing materials beneath site improvements, slope instability, and possible concentration and contribution of pollutants into the groundwater or storm drain or utility trench systems.

A key factor in these systems is the infiltration rate (often referred to as the percolation rate) which can be ascribed to, or determined for, the earth materials within which these systems are installed. Additionally, the infiltration rate of the designed system (which may include gravel, sand, mulch and topsoil, or other amendments) will need to be considered. Locally, relatively impermeable formations include: clayey surficial soils, igneous and metamorphic bedrock, as well as future fine grained fill soils.

Some of the methods which are used for onsite infiltration include percolation basins, dry wells, bio-swale or bio-retention, permeable pavers and pavement, infiltration trenches, filter boxes and subsurface infiltration galleries or chambers. Some of these systems are constructed using native and import soils, perforated piping, and filter fabrics while others employ structural components such as stormwater infiltration chambers and filters or separators. Every site will have characteristics which should lend themselves to one or more of these methods, but not every site is suitable for BMPs. In practice, BMPs are usually initially designed by the project design civil engineer. Applicable governing agency requirements should be reviewed and included in design considerations.

The following geotechnical guidelines should be considered when designing onsite BMP systems:

- It is not good engineering practice to allow water to saturate soils, especially near slopes or improvements; however, the controlling agency may now require the use of stormwater BMPs.

- Areas adjacent to, or within, the BMP that are subject to inundation should be properly protected against scouring, undermining, and erosion, in accordance with the recommendations of the design engineer.

- Where infiltration BMP systems are located near buildings or improvements, impermeable liners and subdrains should be used along the bottom or sides of bioretention swales or basins located within the influence of structures. Impermeable liners used in conjunction with BMP basins should consist of a 30-mil polyvinyl chloride (PVC) membrane that is covered by a minimum of 12 inches of clean soil, free from rocks and debris, with a maximum 4:1 (h:v) slope inclination, or flatter, and meets the following minimum specifications:

Solid Soils Specific Gravity (ASTM D792): 1.2 (g/cc, min.); Tensile (ASTM D 882): 73 (lb/in-width, min); Elongation at Break (ASTM D882): 380 (%, min); Modulus (ASTM D882): 32 (lb/in-width, min.); and Tear Strength (ASTM D1004): 8 (lb/in, min); Seam Shear Strength (ASTM D882) 58.4 (lb/in, min); Seam Peel Strength (ASTM D882) 15 (lb/in, min).

- Subdrains should consist of at least 4-inch diameter Schedule 40 or SDR 35 drain pipe with perforations oriented down. The drain pipe should be sleeved with a filter sock.

- Storm drain, standpipes, and utilities that cross BMPs should be slurried with a 3-sack slurry mix, to 5 feet outside the structure.

- Infiltrations systems should not be installed within approximately 8 feet of building foundations utility trenches, and walls, or a 1:1 (horizontal to vertical [h:v]) slope (down and away) from the bottom elements of these improvements. Alternatively, deepened foundations may be used.

- Infiltration systems should not be installed adjacent to rigid pavements or hardscape improvements. Alternatively, deepened or thickened edges and curbs or impermeable liners may be used in areas adjoining the BMP.

- As with any infiltration BMP, localized ponding and groundwater seepage should be anticipated. The potential for seepage or perched groundwater to occur after site development should be disclosed to all interested or affected parties.

- Installation of infiltration BMP systems should avoid expansive soils (Expansion Index [E.I.] ≥51) or soils with a relatively high plasticity index (P.I. > 20).

- Infiltration BMP systems should not be installed where the vertical separation of the groundwater level is less than approximately 10 feet from the base of the system.

- Infiltration BMP systems should be designed using a suitable factor of safety (FOS) to account for uncertainties in the known infiltration rates (as generally required by the controlling authorities), and reduction in performance over time.

- As with any infiltration system, proper care will need to be provided. Best management practices should be followed at all times, especially during inclement weather. Provisions for the management of any siltation, debris within the BMP, or overgrown vegetation (including root systems) should be considered. An appropriate inspection schedule will need to adopted and provided to all interested or affected parties.

- Any designed system will require regular and periodic maintenance, which may include rehabilitation or complete replacement of the filter media (e.g., sand, gravel, filter fabrics, topsoil, or mulch) or other components used in construction, so that the design life exceeds 15 years. Due to the potential for piping and adverse seepage conditions, a burrowing rodent control program should also be implemented onsite.

- Newly established vegetation or landscaping (including phreatophytes) may have root systems that will influence the performance of the BMP or nearby LID systems.

- The potential for surface flooding, in the case of system blockage, should be evaluated by the design civil engineer.

- Any proposed utility backfill materials (e.g., inlet or outlet piping or other subsurface utilities) located within or near the proposed area of the BMP may become saturated. This is due to the potential for piping, water migration, and seepage along the utility trench line backfill. If utility trenches cross or are proposed near the BMP, cut-off walls or other water barriers will need to be installed to mitigate the potential for piping and excess water entering the utility backfill materials. Planned or existing utilities may also be subject to piping of fines into open-graded gravel backfill layers unless separated from overlying or adjoining BMP by geotextiles or slurry backfill.

LIMITATIONS

The materials encountered on the project site and used for our analysis are believed representative of the area; however, soil and bedrock materials vary in character between excavations and natural outcrops or conditions exposed during mass grading. Site conditions may vary due to seasonal changes or other factors.

Inasmuch as our study is based upon our review and engineering analyses and field test data, the conclusions and recommendations are professional opinions. These opinions have been derived in accordance with current standards of practice, and no warranty, either express or implied, is given. Standards of practice are subject to change with time. GSI assumes no responsibility or liability for work or testing performed by others, or their inaction; or work performed when GSI is not requested to be onsite, to evaluate if our recommendations have been properly implemented. Use of this report constitutes an agreement and consent by the user to all the limitations outlined above, notwithstanding any other agreements that may be in place. In addition, this report may be subject to review by the controlling authorities. Thus, this report brings to completion our scope of services for this portion of the project.

The opportunity to be of service is sincerely appreciated. If you should have any questions, please do not hesitate to contact our office.

Respectfully submitted,

GeoSoils, Inc.

HAND AUGER BORING LOGS

UNIFIED SOIL CLASSIFICATION SYSTEM

Major Divisions			Group Symbols	Typical Names
Coarse-Grained Soils More than 50% retained on No. 200 sieve	Gravels 50% or more of coarse fraction retained on No. 4 sieve	Clean Gravels	GW	Well-graded gravels and gravel-sand mixtures, little or no fines
			GP	Poorly graded gravels and gravel-sand mixtures, little or no fines
		Gravel with	GM	Silty gravels gravel-sand-silt mixtures
			GC	Clayey gravels, gravel-sand-clay mixtures
	Sands more than 50% of coarse fraction passes No. 4 sieve	Clean Sands	SW	Well-graded sands and gravelly sands, little or no fines
			SP	Poorly graded sands and gravelly sands, little or no fines
		Sands with Fines	SM	Silty sands, sand-silt mixtures
			SC	Clayey sands, sand-clay mixtures
Fine-Grained Soils 50% or more passes No. 200 sieve	Silts and Clays Liquid limit 50% or less		ML	Inorganic silts, very fine sands, rock flour, silty or clayey fine sands
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
			OL	Organic silts and organic silty clays of low plasticity
	Silts and Clays Liquid limit greater than 50%		MH	Inorganic silts, micaceous or diatomaceous fine sands or silts, elastic silts
			CH	Inorganic clays of high plasticity, fat clays
			OH	Organic clays of medium to high plasticity
Highly Organic Soils			PT	Peat, mucic, and other highly organic soils

CONSISTENCY OR RELATIVE DENSITY

CRITERIA

Standard Penetration Test

Penetration Resistance N (blows/ft)	Relative Density
0 - 4	Very loose
4 - 10	Loose
10 - 30	Medium
30 - 50	Dense
> 50	Very dense

Standard Penetration Test

Penetration Resistance N (blows/ft)	Consistency	Unconfined Compressive Strength (tons/ft^2)
<2	Very Soft	<0.25
2 - 4	Soft	0.25 - .050
4 - 8	Medium	0.50 - 1.00
8 - 15	Stiff	1.00 - 2.00
15 - 30	Very Stiff	2.00 - 4.00
>30	Hard	>4.00

3" 3/4" #4 #10 #40 #200 U.S. Standard Sieve

Unified Soil Classification	Cobbles	Gravel		Sand			Silt or Clay
		coarse	fine	coarse	medium	fine	

MOISTURE CONDITIONS

Dry	Absence of moisture: dusty, dry to the touch
Slightly Moist	Below optimum moisture content for compaction
Moist	Near optimum moisture content
Very Moist	Above optimum moisture content
Wet	Visible free water; below water table

MATERIAL QUANTITY

trace	0 - 5 %
few	5 - 10 %
little	10 - 25 %
some	25 - 45 %

If the permeable pavement has been designed correctly, there should be no error messages on the spreadsheet.

Pollutant Sources/Source Control Checklist

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

How to use this worksheet (also see instructions in Section G of the WQMP Template):

1. Review Column 1 and identify which of these potential sources of stormwater pollutants apply to your site. Check each box that applies.
2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your WQMP Exhibit.
3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in your WQMP. Use the format shown in Table G.1on page 23 of this WQMP Template. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternative BMPs for those shown here.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
☒ A. **On-site storm drain inlets**	☑ **Locations of inlets.**	☒ **Mark all inlets with the words "Only Rain Down the Storm Drain" or similar. Catch Basin Markers may be available from the Riverside County Flood Control and Water Conservation District, call 951.955.1200 to verify.**	☑ **Maintain and periodically repaint or replace inlet markings.** ☒ **Provide stormwater pollution prevention information to new site owners, lessees, or operators.** ☒ **See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com** ☒ **Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."**
☐ B. **Interior floor drains and elevator shaft sump pumps**		☐ **State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.**	☐ **Inspect and maintain drains to prevent blockages and overflow.**
☐ C. **Interior parking garages**		☐ **State that parking garage floor drains will be plumbed to the sanitary sewer.**	☐ **Inspect and maintain drains to prevent blockages and overflow.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
☒ D1. **Need for future indoor & structural pest control**		☒ **Note building design features that discourage entry of pests.**	☒ **Provide Integrated Pest Management information to owners, lessees, and operators.**
☒ D2. **Landscape/ Outdoor Pesticide Use**	☐ **Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained.** ☒ **Show self-retaining landscape areas, if any.** ☐ **Show stormwater treatment and hydrograph modification management BMPs. (See instructions in Chapter 3, Step 5 and guidance in Chapter 5.)**	**State that final landscape plans will accomplish all of the following.** ☒ **Preserve existing native trees, shrubs, and ground cover to the maximum extent possible.** ☒ **Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution.** ☐ **Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions.** ☒ **Consider using pest-resistant plants, especially adjacent to hardscape.** ☒ **To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.**	☒ **Maintain landscaping using minimum or no pesticides.** ☐ **See applicable operational BMPs in "What you should know for…..Landscape and Gardening"** at http://rcflood.org/stormwater/**Error! Hyperlink reference not valid.** ☐ **Provide IPM information to new owners, lessees and operators.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
☐ E. **Pools, spas, ponds, decorative fountains, and other water features.**	☐ **Show location of water feature and a sanitary sewer cleanout in an accessible area within 10 feet. (Exception: Public pools must be plumbed according to County Department of Environmental Health Guidelines.)**	**If the Co-Permittee requires pools to be plumbed to the sanitary sewer, place a note on the plans and state in the narrative that this connection will be made according to local requirements.**	☐ **See applicable operational BMPs in** "Guidelines for Maintaining Your Swimming Pool, Jacuzzi and Garden Fountain" at http://rcflood.org/stormwater/
☒ F. **Food service**	☐ **For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment.** ☒ **On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer.**	☒ **Describe the location and features of the designated cleaning area.** ☒ **Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated.**	☒ **See the brochure, "**The Food Service Industry Best Management Practices for: Restaurants, Grocery Stores, Delicatessens and Bakeries" at http://rcflood.org/stormwater/ **Provide this brochure to new site owners, lessees, and operators.**
☒ G. **Refuse areas**	☒ **Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas.** ☒ **If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area.** ☐ **Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer.**	☒ **State how site refuse will be handled and provide supporting detail to what is shown on plans.** ☐ **State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar.**	☒ **State how the following will be implemented:** **Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ H. **Industrial processes.**	❑ **Show process area.**	❑ **If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system."**	❑ **See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com** See the brochure "Industrial & Commercial Facilities Best Management Practices for: Industrial, Commercial Facilities" at http://rcflood.org/stormwater/

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ I. **Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)**	❑ **Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area.** ❑ **Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults.** ❑ **Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.**	**Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains.** **Where appropriate, reference documentation of compliance with the requirements of Hazardous Materials Programs for:** ▪ **Hazardous Waste Generation** ▪ **Hazardous Materials Release Response and Inventory** ▪ **California Accidental Release (CalARP)** ▪ **Aboveground Storage Tank** ▪ **Uniform Fire Code Article 80 Section 103(b) & (c) 1991** ▪ **Underground Storage Tank** **www.cchealth.org/groups/hazmat/**	❑ **See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ J. **Vehicle and Equipment Cleaning**	❑ **Show on drawings as appropriate:** **(1) Commercial/industrial facilities having vehicle/equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses.** **(2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use).** **(3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer.** **(4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.**	❑ **If a car wash area is not provided, describe any measures taken to discourage on-site car washing and explain how these will be enforced.**	**Describe operational measures to implement the following (if applicable):** ❑ **Washwater from vehicle and equipment washing operations shall not be discharged to the storm drain system.** Refer to "Outdoor Cleaning Activities and Professional Mobile Service Providers" for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/ ❑ **Car dealerships and similar may rinse cars with water only.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ K. **Vehicle/Equipment Repair and Maintenance**	❑ **Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater.** ❑ **Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas.** ❑ **Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.**	❑ **State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area.** ❑ **State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.** ❑ **State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.**	**In the Stormwater Control Plan, note that all of the following restrictions apply to use the site:** ❑ **No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinsewater from parts cleaning into storm drains.** ❑ **No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately.** ❑ **No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.** Refer to "Automotive Maintenance & Car Care Best Management Practices for Auto Body Shops, Auto Repair Shops, Car Dealerships, Gas Stations and Fleet Service Operations". Brochure can be found at http://rcflood.org/stormwater/ Refer to Outdoor Cleaning Activities and Professional Mobile Service Providers for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ L. **Fuel Dispensing Areas**	❑ **Fueling areas[6] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable.** ❑ **Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area.**		❑ **The property owner shall dry sweep the fueling area routinely.** ❑ **See the Fact Sheet SD-30 , "Fueling Areas" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

[6] **The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
❑ M. **Loading Docks**	❑ **Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas shall be drained to the sanitary sewer, or diverted and collected for ultimate discharge to the sanitary sewer.** ❑ **Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation.** ❑ **Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer.**		❑ **Move loaded and unloaded items indoors as soon as possible.** ❑ **See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on WQMP Drawings	3 Permanent Controls—List in WQMP Table and Narrative	4 Operational BMPs—Include in WQMP Table and Narrative
☒ N. **Fire Sprinkler Test Water**		☒ **Provide a means to drain fire sprinkler test water to the sanitary sewer.**	☒ **See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com**
O. **Miscellaneous Drain or Wash Water or Other Sources** ☐ **Boiler drain lines** ☐ **Condensate drain lines** ☒ **Rooftop equipment** ☐ **Drainage sumps** ☒ **Roofing, gutters, and trim.** ☐ **Other sources**		☐ **Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system.** ☐ **Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.** ☐ **Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment.** ☐ **Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water.** ☒ **Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.** **Include controls for other sources as specified by local reviewer.**	

STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE

HYDROLOGY AND HYDRAULIC ANALYSIS REPORT

980 W. 7th Street Development

City of San Jacinto, Riverside County, California

Prepared for: Generation Healthcare

Prepared by: Jared T. Brown, P.E. | Guide Engineering

6011 Rose Ct., Granite Bay, CA 95746

Original Date: March 2026 | Revised: August 31, 2026

1. Introduction and Project Description

This report presents the hydrologic and hydraulic analysis for the proposed development at 980 W. 7th Street in San Jacinto, Riverside County, California. The analysis evaluates pre-development (undeveloped site) and post-development conditions for the 10-year and 100-year storm events in accordance with the Riverside County Flood Control and Water Conservation District (RCFC&WCD) Hydrology Manual (2018) and Hydraulic Design Manual (March 2024).

The project involves redevelopment of approximately 18.7 acres, including existing buildings and additions, with new impervious surfaces, grading, and stormwater conveyance improvements. On-site drainage is collected by catch basins CB#1 through CB#7 and an upstream INLET, then conveyed in the Main Street storm sewer to the existing outfall (OUTFALL). The revised post-development model routes the 24-inch mainline as Link-15 (INLET to CB#4), Link-16 (CB#4 to CB#6), Link-17 (CB#6 to MH#3), and Link-09 (MH#3 to OUTFALL).

Post-development peak flow at the downstream outfall remains comparable to pre-development in the 10-year event and is reduced in the 100-year event. Hydraulic grade line (HGL) remains below all manhole and inlet rims in both revised post-development storms. No mainline surcharge is reported.

2. Regulatory and Design Standards

Hydrology. SCS TR-55 methods in Autodesk Storm and Sanitary Analysis are used for watersheds well under the District 300–500 acre threshold. Pre- and post-development peaks are compared at the common downstream outfall to confirm no adverse increase in runoff.

Hydraulics. The storm sewer is sized for the 10-year event and checked for the 100-year event. HGL must remain below rim elevations. Minimum pipe velocity of approximately 3 ft/s is the self-cleaning target; maximum velocities are limited to prevent erosion. Freeboard and no-rise criteria apply to adjacent properties.

Design storms. SCS Type II 24-hour distribution with rainfall depths of 1.80 inches (10-year) and 3.00 inches (100-year), Riverside County (Desert Center) gage as modeled. Routing method is hydrodynamic with overflow ponding enabled and a 30-second routing time step.

3. Pre-Development (Undeveloped Site) Conditions

The site consists of largely pervious and open areas with scattered existing buildings. Watersheds drain through junction boxes and open channels into the Main Street storm sewer and discharge at Out-01. Total tributary area is approximately 18.73 acres. Pre-development calculations are unchanged and are included as Exhibit E.

Pre-development peak flows at Out-01:

- 10-year storm: **4.77 cfs** (max velocity 2.23 ft/s; max depth 1.28 ft)
- 100-year storm: **7.67 cfs** (max velocity 2.44 ft/s; max depth 2.00 ft)

HGL remains below all rims with adequate freeboard. Pipes flow partially full with no surcharge. Pre-development frontage profiles are Exhibit C.

4. Post-Development (Developed Site) Conditions —

The revised Developed site.SPF model includes eight subbasins totaling 18.72 acres (SHED-A 0.81 ac, SHED-C 0.41 ac, SHED-E 0.19 ac, SHED-F 0.15 ac, SHED-G 0.96 ac, SHED-H 0.80 ac, SUB-D 0.40 ac, and UPSHED 15.00 ac). Curve numbers are 94 to 98 on developed commercial cover and 80 on UPSHED and SHED-H.

Site runoff is intercepted by sag inlets (CB#1–CB#7 and INLET) and conveyed in 12-inch laterals to the 24-inch Main Street mainline. The mainline alignment used in the revised model is:

- Link-15: INLET → CB#4 162 ft, 24-inch, slope 0.10%
- Link-16: CB#4 → CB#6 141 ft, 24-inch, slope 0.10%
- Link-17: CB#6 → MH#3 177 ft, 24-inch, slope 0.08%
- Link-09: MH#3 → OUTFALL 97 ft, 24-inch, slope 0.15%

Post-development peak flows at OUTFALL (revised):

- 10-year storm: **5.42 cfs** (max velocity 2.54 ft/s; max depth 1.26 ft; max HGL 23.94 ft)
- 100-year storm: **6.83 cfs** (max velocity 2.66 ft/s; max depth 1.49 ft; max HGL 24.17 ft)

10-year profile. HGL is below every rim. Maximum HGL values along the mainline are INLET 24.34 ft (rim 25.50), CB#4 24.35 ft (rim 25.32), CB#6 24.28 ft (rim 25.27), MH#3 24.19 ft (rim 25.35), and OUTFALL 23.94 ft. Freeboard at MH#3 is 1.16 ft. Peak inflow at MH#3 is 5.53 cfs. All 24-inch mainline pipes flow partly full (peak depth 1.11 to 1.28 ft in a 2.00-ft pipe). No surcharge is reported.

100-year profile. HGL remains below every rim. Maximum HGL values are INLET 24.99 ft (rim 25.50), CB#4 24.80 ft, CB#6 24.56 ft, MH#3 24.43 ft (0.92 ft freeboard), and OUTFALL 24.17 ft. Peak inflow at MH#3 is 6.92 cfs. Mainline peak depths are 1.49 to 1.66 ft. No mainline surcharge is reported. Link-09 peak flow is 6.83 cfs versus a design capacity of 7.71 cfs (Q/Qfull = 0.89).

The prior model version reported an isolated 10-year HGL spike at MH#2. That node is not on the revised mainline profile. The current 24-inch alignment (Link-15 / 16 / 17 / 09) produces a monotonically decreasing HGL from INLET to OUTFALL, with the 100-year HGL higher than the 10-year HGL at every station, as expected.

5. Comparison of Pre- versus Post-Development Flows

Storm Event	Pre-Development Outfall (cfs)	Post-Development Outfall (cfs)	Change (cfs)	Impact Assessment
10-Year	4.77	5.42	+0.65	Small increase; HGL below rims; mainline within capacity
100-Year	7.67	6.83	–0.84	Decrease; no surcharge; beneficial downstream

The 10-year increase of 0.65 cfs is small relative to the 24-inch mainline capacity (7.71 cfs on Link-09). The 100-year peak decreases 0.84 cfs because developed on-site routing and the upgraded pipe network move site flow to the outfall

more efficiently and do not increase the coincident peak from the 15-acre UPSHED.

6. Hydraulic Capacity and Compliance

Node	Rim (ft)	10-Yr Max HGL (ft)	10-Yr Freeboard (ft)	100-Yr Max HGL (ft)	100-Yr Freeboard (ft)
INLET	25.50	24.34	1.16	24.99	0.51
CB#4	25.32	24.35	0.97	24.80	0.52
CB#6	25.27	24.28	0.99	24.56	0.71
MH#3	25.35	24.19	1.16	24.43	0.92
OUTFALL	—	23.94	—	24.17	—

Link	From → To	Dia. (in)	10-Yr Q (cfs)	100-Yr Q (cfs)	Capacity (cfs)	100-Yr Q/Qfull
Link-15	INLET → CB#4	24	1.94	5.93	5.55	1.07
Link-16	CB#4 → CB#6	24	2.42	6.09	5.95	1.02
Link-17	CB#6 → MH#3	24	3.49	5.99	6.42	0.93
Link-09	MH#3 → OUTFALL	24	5.42	6.83	7.71	0.89

Link-15 and Link-16 show 100-year peak flow slightly above the tabulated full-flow capacity (Q/Qfull 1.07 and 1.02). Depth remains below the 24-inch soffit on the profile (max depth 1.66 ft and 1.59 ft), and HGL stays below the rims, so the pipes are flowing full or nearly full under a mild pressure grade that does not surcharge structures. Link-09, the outfall reach, remains at Q/Qfull = 0.89.

Inlets are modeled as FHWA HEC-22 generic sag inlets. Reported peak inlet flows range from 0.34 to 2.19 cfs (10-year) and 0.57 to 5.70 cfs (100-year). No hazardous street ponding is indicated in the SSA results.

7. Conclusion and Recommendations

The post-development SSA model for 980 W. 7th Street complies with RCFC&WCD 10-year capacity and 100-year no-rise / no-adverse-impact intent. Outfall peak flow increases 0.65 cfs in the 10-year storm and decreases 0.84 cfs in the 100-year storm. HGL is below all rims in both events. The previous localized 10-year surcharge at MH#2 does not appear in the current mainline geometry.

No detention basin is required based on the outfall comparison. Easements and maintenance access should be provided along the Main Street storm sewer per District standards. This revised report, the current SSA output, and the updated profile plots are submitted for review.

Subbasin Hydrology

Subbasin : SHED-A

Input Data

Area (ac) 15.00
Weighted Curve Number 80.00
Rain Gage ID 10YEAR

Composite Curve Number

Soil/Surface Description	Area (acres)	Soil Group	Curve Number
> 75% grass cover, Good	15.00	D	80.00
Composite Area & Weighted CN	15.00		80.00

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Subbasin Hydrology

Subbasin : SHED-A

Input Data

Area (ac) 15.00
Weighted Curve Number 80.00
Rain Gage ID 100YEAR

Composite Curve Number

Soil/Surface Description	Area (acres)	Soil Group	Curve Number
> 75% grass cover, Good	15.00	D	80.00
Composite Area & Weighted CN	15.00		80.00

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Sheet Flow Computations	Subarea A	Subarea B	Subarea C

Subbasin Hydrology

Subbasin : SHED-A

Input Data

Area (ac) 0.81
Weighted Curve Number 94.00
Rain Gage ID 10-YEAR

Composite Curve Number

Soil/Surface Description	Area (acres)	Soil Group	Curve Number
Urban commercial, 85% imp	0.81	C	94.00
Composite Area & Weighted CN	0.81		94.00

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

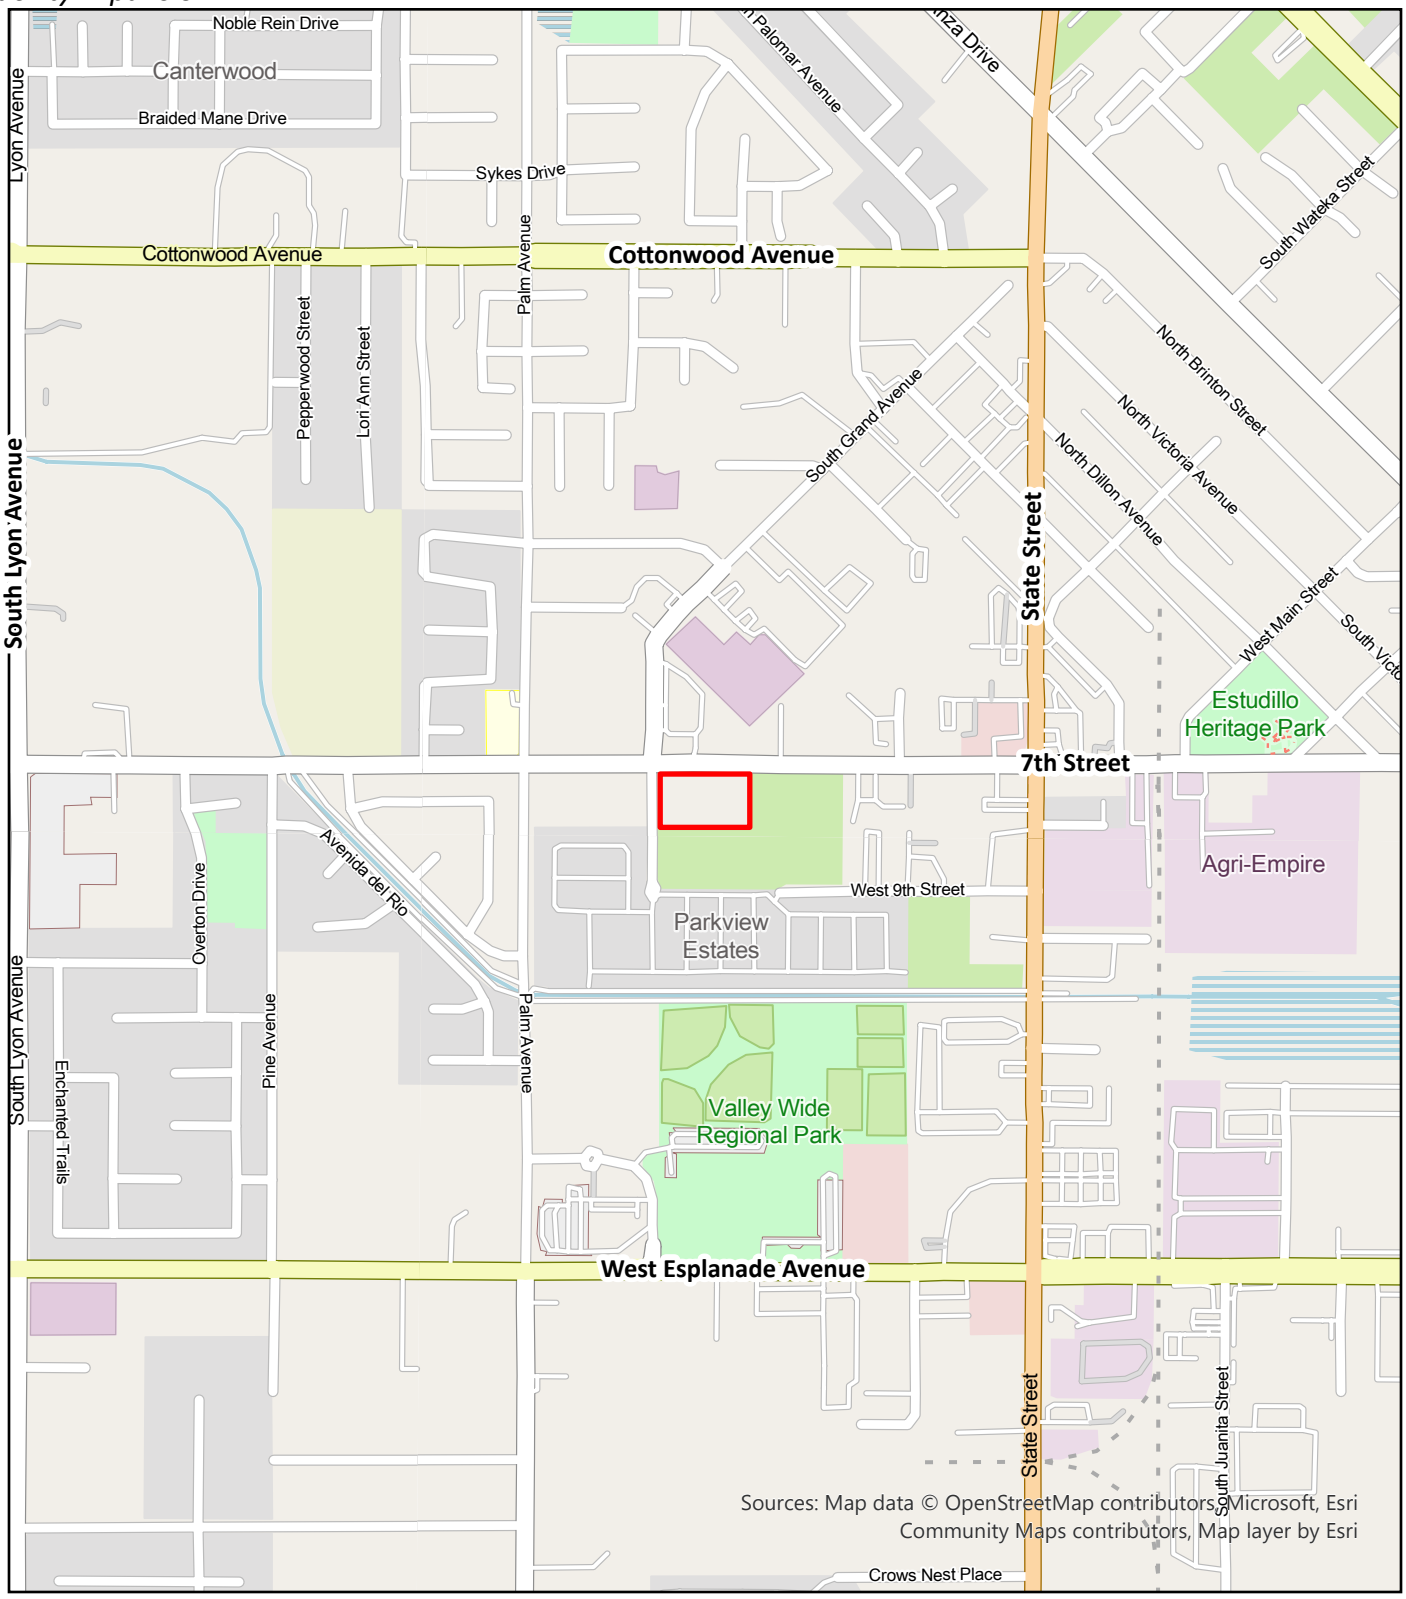
1 INTRODUCTION

This Noise and Vibration Impact Analysis evaluates the potential noise impacts of the proposed Bradley Gardens Skilled Nursing Facility Expansion Project ("Project" or "proposed Project"). The Project is located within the City of San Jacinto within Riverside County.

1.1 Project Description

The Project site is located at 980 West 7th Street, at the southeast corner of the intersection of West 7th Street and South Grand Avenue. Regional access to the Project site is provided by State Route (SR) 79 and SR 74. Local access to the site is provided by West 7th Street and South Grand Avenue. The Project site consists of one parcel encompassing approximately 2.98 acres. The site is identified as Assessor's Parcel Number (APN) 435-330-003. The Project site is developed and currently operates as the Bradley Gardens facility, which offers a variety of psychiatric-focused care to patients with varying health needs. The Project site and the surrounding area are shown in Figure 1-1, *Local Vicinity*.

The Project proposes the expansion of the existing Bradley Gardens Nursing Facility on the 2.98-acre site. The Project includes demolition of the existing 1,074-square-foot (SF) maintenance and storage building for the construction of an 18,000 SF building in addition to the existing 44-bed, 12,132 SF Skilled Nursing Facility (SNF) building that would provide 43 additional SNF and Short-term Psychiatric (STP) beds, resulting in a total capacity of 87 beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building into a 16-bed Psychiatric Health Facility (PHF). Refer to Figure 1-2, *Conceptual Site Map*, for the details. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, and pavement of parking areas and driveways. The proposed Project would also include a 236-horsepower diesel emergency generator in order to provide backup power for the expanded facility.



The Project site has an existing General Plan land use designation of Industrial (I) and is zoned as Industrial Light (IL). Refer to Table 1-1, *Land Use and Zoning Designations of Project Site and Surrounding Area*, for a description of the land use and zoning designations of the Project site and surrounding area.

Table 1-1: Land Use and Zoning Designations of Project Site and Surrounding Area

Direction	General Plan Land Use	Zoning
Proposed Project Site	Industrial (I)	Industrial Light (IL)
North	Industrial (I)	Industrial Light (IL)
East	Industrial (I)	Industrial Light (IL)
South	Industrial (I)	Industrial Light (IL)
West	Industrial (I)	Industrial Light (IL)

1.2 Purpose of the Report

To support the California Environmental Quality Act (CEQA) document for the proposed Project, this report evaluates potential noise-related impacts to surrounding land uses as a result of implementation of the Project. This report begins with an overview of the study area, the Project site, and the key components of the proposed development. It then provides a foundational explanation of noise and vibration concepts to help frame the analysis.

To ensure consistency with local requirements, this report outlines relevant noise guidelines and regulatory standards that apply to the Project. It also describes the existing noise environment in and around the Project site to establish a baseline for comparison. From there, the analysis addresses potential short-term noise and vibration impacts that could occur during construction activities. Finally, the report examines long-term operational impacts once the Project is built and active.

1.3 Summary of Findings

The conclusions of this analysis are shown in Table 1-2, *Summary of Findings*. The Project would not result in significant impacts related to noise and vibration.

Table 1-2: Summary of Findings

Topics	Significance Findings	Mitigation Measures Proposed
Construction Noise	Less than significant	NA
Operation Noise	Less than significant	NA
Construction Vibration	Less than significant	NA
Operation Vibration	Less than significant	NA
Airport Noise	Less than significant	NA

Notes: NA = not applicable

2 NOISE SCALES AND DEFINITIONS

Sound is energy transferred through air that our ears detect as small changes in air pressures. Noise is defined as any sound that is unwanted or excessive. Noise is considered undesirable when it disrupts everyday activities, poses a risk of physical harm, or negatively impacts health. Its effects on people can include irritation, difficulty communicating, sleep disruption, and in severe cases, hearing loss. These impacts can stem from either the pitch or the loudness of the sound. Pitch refers to the frequency of a sound wave, how many vibrations occur per second, which determines whether a sound is high or low in tone. Humans generally perceive higher-pitched sounds as louder. Loudness, on the other hand, relates to the intensity or amplitude of the sound.

Typically, noise is measured or predicted by a sound pressure level, reported in decibels (dB). The dB is a logarithmic unit used to represent the ratio between a measured sound pressure level and a standard reference level. A sound level of 0 dB corresponds to the quietest sound that a healthy, unimpaired human ear can hear. The human ear does not hear all frequencies equally. To better approximate the sensitivity of human hearing, the A-weighted decibel scale (dBA) has been developed. On this scale, the human range of hearing extends from approximately 3 dBA to approximately 140 dBA. Figure 2-1, *Common Noise Levels*, shows typical sound levels and human response for everyday sounds and noises.

Sound and vibration are intimately related. Sound is produced by the vibration of sound pressure waves in the air. Vibrating surfaces and structures can radiate sound, so measures taken to reduce vibration will often lead to a reduction in noise level.

2.1 Terminology

Sound: Sound is a vibratory disturbance produced by a vibrating object that travels through a medium, such as air, in the form of pressure waves. It can be detected by a receiver, such as the human ear or a microphone.

Noise: Sound that is loud, unpleasant, unexpected, or otherwise undesirable.

Ambient noise: The combined noise from all nearby and distant sources present in a specific environment.

Decibel (dB): Unit used to measure the intensity of a sound.

A-weighted decibel (dBA): Unit of sound pressure level in decibels on the “A-weighted” scale.

Sound exposure level (SEL): Represents all the acoustic energy (sound pressure) of an individual noise event as if that event had occurred within a one-second time period.

Equivalent sound level (L_{eq}): L_{eq} is the equivalent steady-state level which within a stated period of time contains the same acoustic energy as the time-varying sound level during the same time period.

Maximum sound level (L_{max}): The highest values measured by the sound meter over a given time period.

Figure 2-1: Noise Measurement Locations

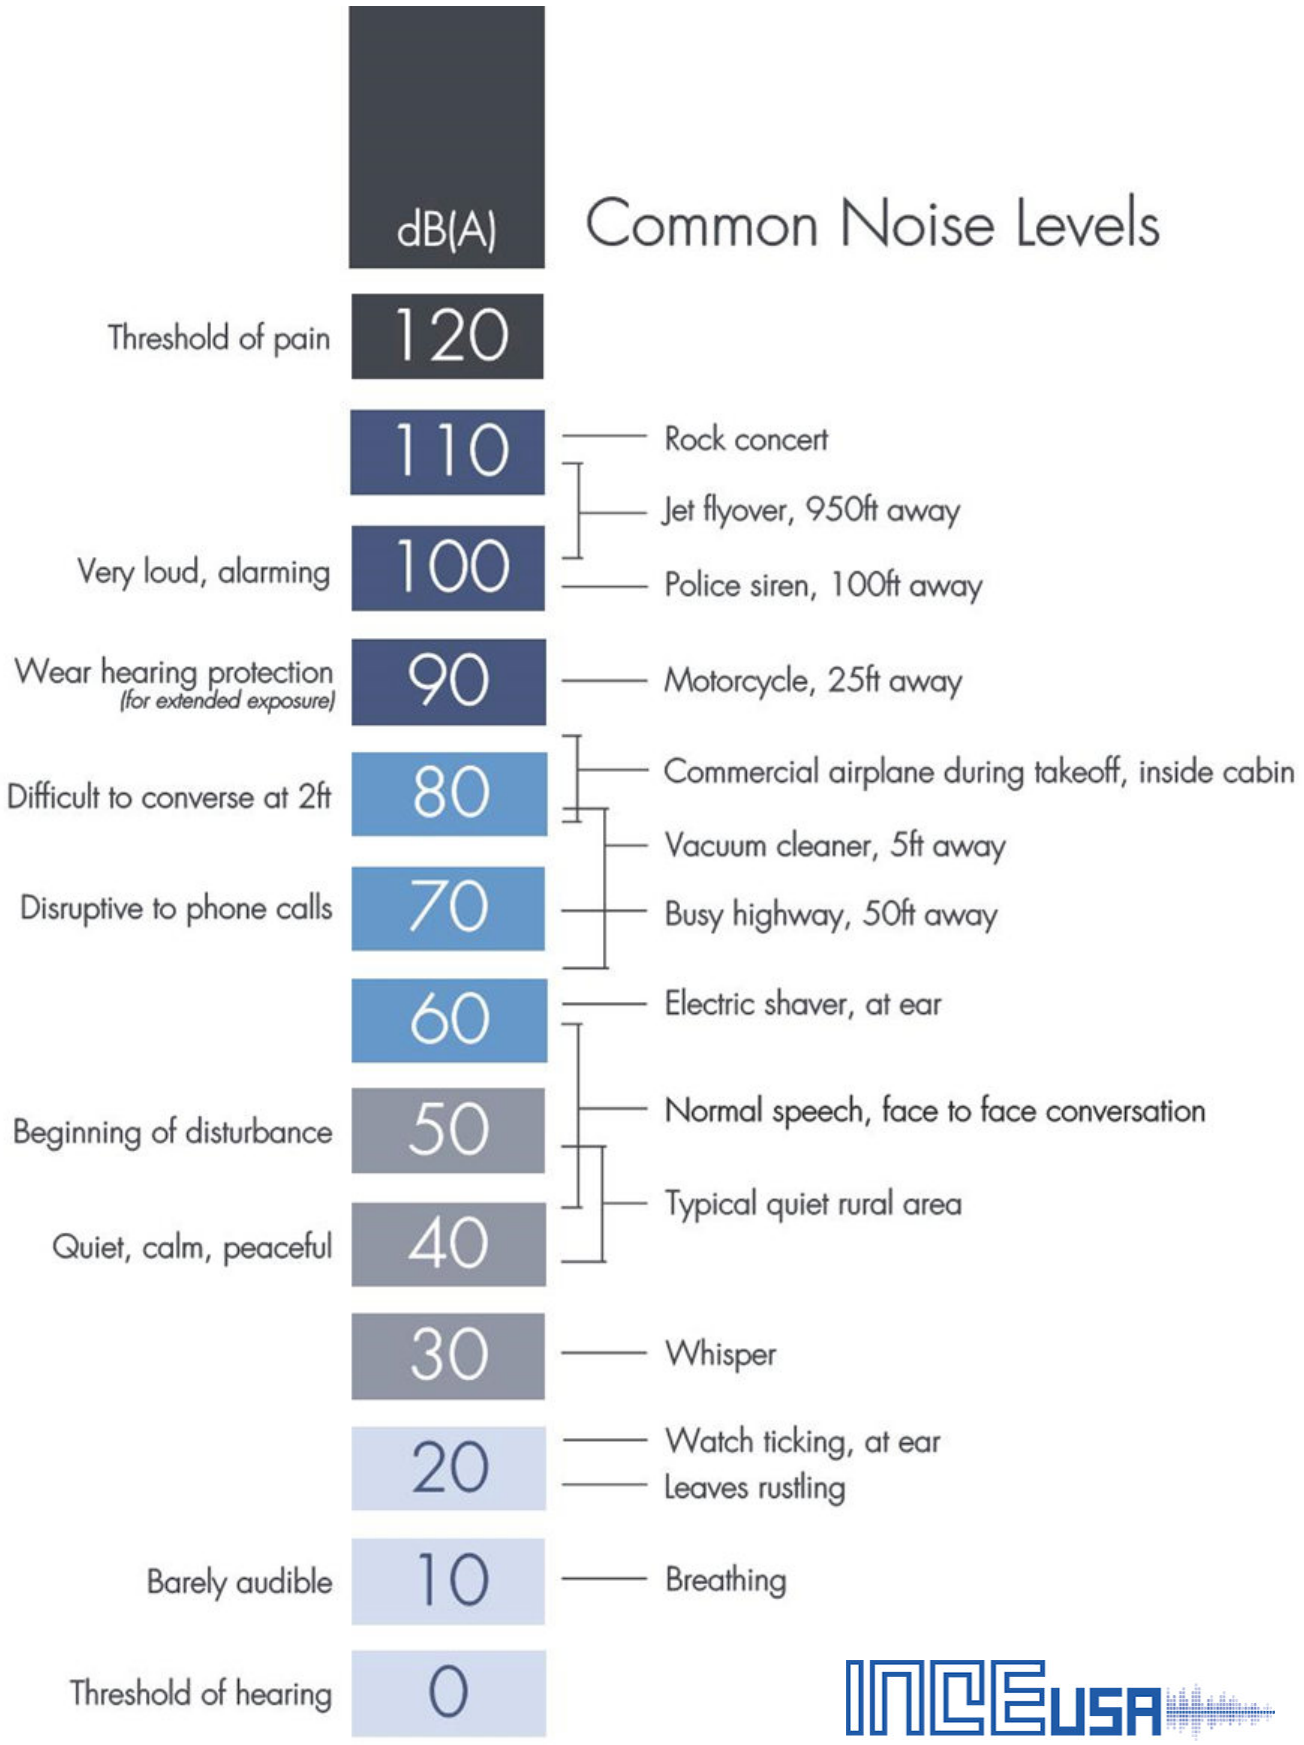

Figure 2-1: Common Noise Levels

Minimum sound level (L_{min}): The lowest values measured by the sound meter over a given time period.

Day-night average sound level (L_{dn}): A noise metric used to reflect a person's cumulative exposure to sound over a 24-hour period, expressed as the noise level for the average day of the year on the basis of annual operation.

Community noise equivalent level (CNEL): CNEL represents a composite 24-hour noise level. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time-of-day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are to account for the noise-sensitive time periods during the evening and night hours when quiet is most desirable and sound appears louder. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure.

Root mean square (RMS): RMS is the average vibration amplitude. The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body (FTA, 2018).

Peak Particle Velocity (PPV): PPV is the maximum instantaneous peak of the vibration signal (FTA, 2018). The PPV is most frequently used to describe vibration impacts on buildings.

Vibration Decibel (VdB): VdB is a unit used to measure ground motion caused by vibrations, specifically particle velocity in inches per second.

2.2 Sound Propagation

Sound propagates uniformly outward in a spherical pattern. Sound can propagate through air, water, and solids. During propagation, waves can be reflected, refracted, or attenuated by the medium. The reduction of sound (acoustic) waves is known as attenuation. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance in air from a point source. Sound attenuation can occur in numerous ways, including:

- Dissipating through the air when absorbed by another medium.
- Reflected against a barrier.
- Via interference from ambient noise.

2.3 Stationary Noise

A stationary noise source refers to any fixed-location activity or equipment that generates noise. Examples include engines, machinery, energy generation systems, and other powered equipment, as well as activities such as loading and unloading and parking lot activity. Although noise from motor vehicles on public roads is generally exempt from local regulation, these vehicles are considered stationary noise

sources when used on private property, such as at construction sites, truck terminals, or warehouse facilities.

The impact of stationary noise depends on several factors, including the type and operation of the equipment, the distance and path between the noise source and the receiver, and environmental conditions such as weather. Regulation of stationary noise can occur at the point of manufacture (for example, limits on engine noise), through restrictions on hours of operation, location of installation, or by requiring noise mitigation features such as barriers, structures, or other project features.

Construction activities are a frequent and often temporary source of stationary noise. Although construction-related noise is typically higher than existing background levels, it is limited to the duration of the work. Construction occurs in phases, each involving different equipment and operations, resulting in varied noise levels and characteristics throughout the project. Despite differences in equipment type and size, the primary sources and patterns of noise during construction are consistent enough to categorize noise levels by construction phase.

2.4 Mobile Noise

Traffic noise levels are primarily influenced by three factors: the volume of traffic, the speed of vehicles, and the proportion of trucks within the traffic flow. In general, traffic noise becomes louder with increased vehicle volume, higher speeds, and a greater number of heavy trucks. Vehicle noise comes from a combination of sources, including the engine, exhaust system, and tires.

Because noise levels are measured on a logarithmic scale, doubling the volume of traffic (while speed and truck percentage remain the same) results in an increase of about 3 dBA. According to the Federal Highway Administration (FHWA), a change of 3 dBA is considered "barely perceptible" and a change of 5 dBA is considered readily perceptible. A 10 dBA increase is typically required to produce a doubling in perceived loudness. The mix of vehicles also affects noise levels; as the number of heavy trucks rises and makes up a larger share of the traffic, nearby noise levels increase (FTA, 2018).

2.5 Noise From Multiple Sources

Because sound pressure levels in decibels are measured on a logarithmic scale, they cannot be added or subtracted using standard arithmetic. Instead, these levels are combined using energy-based summation. This means that adding a new noise source with the same sound level as an existing one does not result in a doubling of the overall noise level.

When two noise sources differ by 10 dBA or more, the louder source determines the overall level, and the combined noise level will be equal to that louder source. If the difference is between 0 and 1 dBA, the resulting level will be 3 dBA higher than the louder source or both sources if they are equal. A difference of 2 to 3 dBA results in a combined level 2 dBA above the louder source. When the difference is between 4 and 10 dBA, the resulting level will be 1 dBA higher than the louder source (FTA, 2018).

2.6 Vibration

The FTA *Transit Noise and Vibration Impact Assessment Manual* describes that vibration is the periodic oscillation of a medium or object. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Unlike airborne noise, ground-borne vibration is generally not perceptible outdoors and is primarily an indoor annoyance. Vibration effects should therefore be evaluated at the structure, considering building characteristics. Light structures such as wood-framed homes are more susceptible to vibration than heavy buildings with deep or spread foundations. In general, heavier buildings respond less to ground vibration due to soil-structure coupling.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts on buildings. The root mean square (RMS) vibration is the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Also, vibration decibel notation (VdB) is another vibration notation used by the FTA to describe vibration levels, provide a background of common vibration levels, and set vibration limits. Typical sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, heavy trucks and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. For construction-related activities, PPV-based threshold, such as those established by California Department of Transportation (Caltrans), are generally more appropriate for evaluating potential impacts on both structures and human receptors.

3 REGULATORY SETTING

3.1 Federal

Federal Transit Administration Noise and Vibration Guidance

The noise and vibration assessment in this report is based on criteria from the FTA's 2018 *Transit Noise and Vibration Impact Assessment Manual* (FTA Manual) for a detailed construction noise assessment. Table 3-1, *Construction Noise Thresholds*, lists the FTA's recommended noise thresholds for a detailed construction noise assessment based on adjacent land uses.

Table 3-1: Construction Noise Thresholds

Land Use	$L_{eq.equip(8hr)}$, dBA	
	Day	Night
Residential	80	70
Commercial	85	85
Industrial	90	90

Source: Federal Transit Administration. (2018). *Federal Transit Administration Transit Noise and Vibration Guidance.*

Construction activity can result in varying degrees of ground vibration, depending on the equipment and method employed. Operation of the construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings founded on the soil near the construction site respond to these vibrations with varying results, ranging from no perceptible effects at the lowest levels, low rumbling sounds and perceptible vibration at moderate levels, and slight damage at the highest levels. While ground vibrations from construction activities do not often reach levels that can damage structures, fragile buildings must receive special consideration.

Federal Interagency Committee on Noise

The Federal Interagency Committee on Noise made the following recommendations when reviewing noise levels for land use planning. If screening analysis shows that noise sensitive areas will be at or above 65 dB and will have an increase of 1.5 dB L_{dn} or more, further analysis should be conducted of noise-sensitive areas between 60-65 dB L_{dn} having an increase of 3 dB L_{dn} or more due to the proposed project noise exposure. If the 65 dB L_{dn} screening test calls for further analysis between 60-65 dB L_{dn}, agency mitigation options may include noise sensitive areas between 60-65 dB L_{dn} that are projected to have an increase of 3 dB or more as a result of the proposed project noise exposure. When the ambient noise level is less than 60 dB L_{dn}, a margin of safety of 5 dB is applied to the identified outdoor level to account for other adverse effects on activity interference and annoyance as well as for the most sensitive fraction of the population.

3.2 State

Noise Element Requirements

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a Noise Element within the General Plan. The Element must identify and evaluate noise problems within the community, focusing on noise sources such as transportation, industrial plants, and airports, and presenting noise contours using CNEL or Ldn.

The Governor's Office of Land Use and Climate Innovation (previously known as the Governor's Office of Planning and Research) Noise Element Guidelines include recommended exterior and interior noise level standards for local jurisdictions to identify and prevent creation of incompatible land uses due to noise. The Noise Element Guidelines contain a land use compatibility table that describes the compatibility of various land uses with a range of environmental noise levels in terms of community noise equivalent level (CNEL). A noise environment of 50 CNEL to 60 CNEL is considered to be "normally acceptable" for residential uses.

Title 24 – California Building Standards Code

The California Building Code (CBC) (California Code of Regulations Title 24, Part 2) contains general building design and construction requirements relating to fire and life safety, structural safety, and access compliance. Section 1206.4, *Allowable Interior Noise Levels*, of the CBC requires that interior noise levels attributable to exterior sources shall not exceed 45 dB in any habitable room.

California Department of Transportation

Caltrans published updates to the *Traffic Noise Analysis Protocol* and *Transportation and Construction Vibration Guidance Manual* in April 2020. It contains the recommended thresholds to evaluate vibration impacts during construction. The construction vibration criteria include consideration of building conditions, as shown in Table 3-2, *Construction Vibration Damage Thresholds*.

Table 3-2: Construction Vibration Damage Thresholds

Structure and Condition	Maximum PPV, inches/second	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial structures	2.0	0.5

PPV=peak particle velocity
Notes: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

3.3 Local

City of San Jacinto General Healthy Community Element

The City of San Jacinto General Plan (Envision San Jacinto 2040) is a policy document adopted by the City Council to guide long-term growth and development within the City. The General Plan includes goals and policies used by the City to evaluate land use and development decisions. Noise policies are contained in the Public Safety Element and provide guidance for managing noise exposure and land use compatibility throughout the City. The following policies are applicable to the proposed Project.

Goal PS-6: A comfortable community environmental that is free from excessive noise pollution.

Policies

PS-6.1 Noise Exposure. Consider the noise compatibility of existing and future development when making land use planning decisions.

PS-6.2 Noise Mitigation. Require new development to mitigate excessive noise to the standards indicated in Tables PS-1 [included below as Table 3-3], PS-2 [included below as Table 3-4], PS-3 [included below as Table 3-5], and PS-4 to the extent feasible through best practices, including building location and orientation, building design features, placement of noise-generating equipment away from sensitive receptors, shielding of noise-generating equipment, placement of noise-tolerant features between noise sources and sensitive receptors, and use of noise-minimizing materials.

Table 3-3: Land Use Compatibility for Community Noise Exposure

Land Use Categories	Community Noise Equivalent Level (CNEL)			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential	<60	55-70	70-75	75-80
Hospitals, Nursing Homes, Assisted Living	A	C	C	C
Hotel, Motel, Mixed Use	A	A	B	B
Churches	A	A	A	A
Schools, Libraries, Museums	A	A	A	B
Sports Arenas, Outdoor Spectator Sports	B	B	C	C
Playgrounds, Neighborhood Parks	A	A	A	A
Golf Courses, Riding Stables, Water Recreation, Cemeteries	A	A	A	A
Office Buildings, Businesses	A	A	B	C
Industrial, Manufacturing, Utilities, Agriculture	A	A	A	B

Zone A (Normally Acceptable): Specified Land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
Zone B (Conditionally Acceptable): New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
Zone C (Normally Unacceptable): New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
Zone D (Clearly Unacceptable): New construction or development should generally not be undertaken.
Source: City of San Jacinto, (2024), General Plan Chapter Five: Public Safety | Envision San Jacinto.

Table 3-4: Maximum Allowable Noise Exposure From Mobile Noise Sources

Land Use Categories	Community Noise Equivalent Level (CNEL) Energy Average CNEL[1]	
	Interior	Exterior
Residential – single-family, multi-family, duplex, and mobile home	65 dB(A)	45 dB(A)
Residential – transient lodging, hotels, motels, nursing homes, hospitals, assisted care facilities	65 dB(A)	45 dB(A)
Private offices, churches, libraries, theaters, concert halls, meeting halls, schools	65 dB(A)	45 dB(A)
General commercial, office, retail, reception, restaurant	65 dB(A)	45 dB(A)
Light industrial[2]	--	--
Parks and playgrounds[3]	65 dB(A)	50 dB(A)
Golf courses, outdoor spectator sports	70 dB(A)	--

Notes:
1. In Community Noise Equivalent Level (CNEL)
2. Noise standards do not apply to Light Industrial areas.
3. Outdoor environment limited to playground areas, picnic areas, and other areas of frequent human use.

Table 3-5: Allowable Exterior/Interior Noise Level Due to Stationary Noise Source

Land Use Categories	Allowed Equivalent Noise Level, dBA L_{eq}^2 (Exterior)		Allowed Equivalent Noise Level, dBA L_{eq}^2 (Interior)	
	7:00 a.m. to 10:00 p.m.	10:00 p.m. to 7:00 a.m.	7:00 a.m. to 10:00 p.m.	10:00 p.m. to 7:00 a.m.
All single-family residential properties	65	45	45	40
All multifamily residential properties and mobile home parks	65	50	45	40
All commercial property	65	60	45	40
The residential portion of mixed-use properties	70	70	45	40
All manufacturing or industrial properties and all other uses	70	70	-	-

Notes:

1. If the ambient noise level exceeds the resulting standard, the ambient noise level shall be the standard.
2. Measurements for compliance are made on the affected property pursuant to Municipal Code Section 8.40.160.
3. It is unlawful for any person at any location within the incorporated area of the city to create noise, or to allow the creation of any noise on property owned, leased, occupied, or otherwise controlled by such person, which noise causes the noise level, when measured at any location on any other property, to exceed either of the following:
   a. The noise standard for the applicable zone for any fifteen (15) minute period;
   b. A maximum instantaneous (single instance) noise level equal to the value of the noise standard plus twenty (20) dBA for any period time (measured using A-weighted slow response).
4. In the event the ambient noise level exceeds the noise standard, the maximum allowable noise level under such category shall be increased to reflect the maximum ambient noise level.
5. The residential portion of mixed-use properties standard shall apply to that portion of the residential property falling within one hundred (100) feet of a commercial property or use if the noise originates from that commercial property or use.
6. If the measurement location on a boundary between two different types of land uses, the lower noise level standard applicable to types of land uses shall apply.

PS-6.3 Acoustical Studies. Require acoustical studies for new discretionary developments and transportation improvements that have the potential to affect existing noise-sensitive uses such as schools, hospitals, libraries, care facilities, and residential areas, and for projects that would introduce new noise-sensitive uses into an area where existing noise levels may exceed the thresholds identified in this element. For projects that are required to prepare an acoustical study, the following mobile and stationary noise source criteria shall be used to determine the significance of those impacts.

Mobile Noise Sources:

a. Where existing traffic noise levels are within or below the "normally acceptable" noise criteria at the affected land use (see Table PS-1), a readily perceptible 5 dBA CNEL or greater increase in roadway noise will be considered significant;
b. Where existing traffic noise levels falls within the "conditionally acceptable" noise criteria at the sensitive land use, a +3 dBA CNEL or greater increase in roadway noise levels will be considered significant; and
c. Where existing traffic noise levels exceed the "conditionally acceptable" noise criteria at the sensitive land use, a +1.5 dBA CNEL or greater increase in roadway noise levels will be considered significant.

PS-6.5 Vehicular Traffic. Monitor and enforce existing speed limits and motor vehicle codes requiring adequate mufflers on all types of vehicles traveling through the city.

PS-6.6 Commercial Noise. Require the use of noise attenuation measures, including screening and buffering techniques, for all new commercial development expected to produce excessive noise; in existing cases where the City's noise standards are exceeded, work with Code Enforcement to require compliance.

PS-6.7 Construction Noise. Require construction activities to reduce noise impacts on adjacent uses to the criteria identified in Tables PS-3, or, if the criteria cannot be met, to the maximum extent feasible, complying with Chapter 8.40 of the San Jacinto Municipal Code (Noise Control) and use best practices. Construction activities outside of the permitted construction hours identified in the San Jacinto Municipal Code may be approved on a case-by-case basis by the Community Development Director.

Actions

PS-6a Review Chapter 8.40 of the San Jacinto Municipal Code and update as necessary to ensure that the noise standards are consistent with this General Plan, including Tables 3-3, 3-4, PS 3-5, and PS 3-6 and to require new residential, mixed-use with a residential component, and other noise-sensitive development to be designed to minimize noise exposure to noise sensitive uses through incorporation of site planning and architectural techniques.

PS-6e Require all construction activity to comply with the limits (maximum noise levels, hours and days of allowed activity) established in the City noise regulations (Title 24 California Code of Regulations, Noise Ordinance) in order to reduce impacts associated with temporary construction noise to the extent feasible. Trucks associated with construction activities shall follow the designated truck routes described in the Mobility Element.

PS-6i During subsequent updates to Section 8.40 of the Muni Code, review and update Section 8.40.090, Construction Activity Noise Regulations, as needed in order to allow provisions for emergency repairs, exceptional circumstances, and reasonable Sunday construction and maintenance activities, while continuing to achieve the objectives of providing a nuisance-free noise environment.

City of San Jacinto Municipal Code

The City of San Jacinto regulates noise through Title 8 of the Municipal Code (Health and Safety), specifically Chapter 8.40, *Noise Control*.

Section 8.40.030, *Land Use Compatibility Standard.* This section includes the same land use compatibility standards that are listed in Table PS-1 of the General Plan, which is included as Table 3-3 of this report. The standards listed in Table 3-3, *Land Use Compatibility for Community Noise Exposure*, shall apply to all development and infrastructure projects.

Section 8.040.040, *Mobile noise source standards*. This section includes the same maximum allowable noise exposure from mobile sources that are listed in Table PS-2 of the General Plan, which is included as Table 3-4 of this report. The noise standards listed in Table 3-4, *Maximum Allowable Noise Exposure from Mobile Noise Sources*, shall apply to all development and infrastructure projects, unless otherwise specifically indicated.

Section 8.040, *Stationary noise source standards, exterior and exterior*. This section lists the allowable exterior/interior noise levels that are listed in Table PS-3 of the General Plan, which is included as Table 3-5, *Allowable Exterior/Interior Noise Level Due to Stationary Noise Source*, of this report.

Section 8.40.090, *Construction activity noise regulations.*

A. The erection (including excavation), demolition, alteration or repair of any building shall occur between the hours of seven a.m. and seven p.m. on weekdays and Saturdays, and between nine a.m. and six p.m. on Sundays and holidays, except when such work complies with the terms of a temporary use permit which may be issued by the community development director or his or her designee, upon a showing of sufficient need due to hot or inclement weather, or the use of an unusually long process material, or other circumstances of unusual and compelling nature.
B. No landowner, construction company owner, contractor, subcontractor or employer shall permit or allow any person or persons working under their direction and control to operate any tool, equipment or machine in violation of the provisions of this section.

C. Exceptions.

1. The provisions of this section shall not apply to emergency construction work performed by a private party when authorized by the city manager or his or her designee;
2. The maintenance, repair or improvement of any public work or facility by public employees, by any person or persons acting pursuant to a public works contract, or by any person or persons performing such work or pursuant to the direction of, or on behalf of, any public agency; provided, however, this exception shall not apply to the city of San Jacinto, or its employees, contractors or agents, unless:
    a. The city manager or a department head determines that the maintenance, repair or improvement is immediately necessary to maintain public services; or
    b. The maintenance, repair or improvement is of a nature that cannot feasibly be conducted during normal business hours; or
    c. The city council has approved project specifications, contract provisions, or an environmental document that specifically authorizes construction during hours of the day that would otherwise be prohibited pursuant to this section;
3. Any construction that complies with the noise limits specified in Section 8.40.050.

4 EXISTING CONDITIONS

4.1 Existing Noise Levels

To assess existing ambient noise levels in the Project area, EPD conducted short-term noise measurements on April 8, 2026, at three locations in the vicinity of the proposed Project. These measurement locations are shown in Figure 4-1, *Noise Measurement Locations*, and are representative of typical noise exposure levels experienced at the nearest sensitive receptors. Each measurement consisted of a 15-minute recording taken between 12:00 p.m. and 1:30 p.m. These short-term L_{eq} measurements are considered indicative of general noise conditions throughout the day.

The measurements were conducted during "off-peak" traffic hours (9:00 a.m. to 3:00 p.m.) to establish a more conservative baseline. During traditional peak hours, traffic congestion often results in lower vehicle and heavy truck volumes. In contrast, free-flowing traffic conditions immediately before or after peak periods can produce higher noise levels. The recorded noise levels at the measurement sites and at the nearest sensitive receptors are summarized in Table 4-1, *Ambient Noise Measurements*.

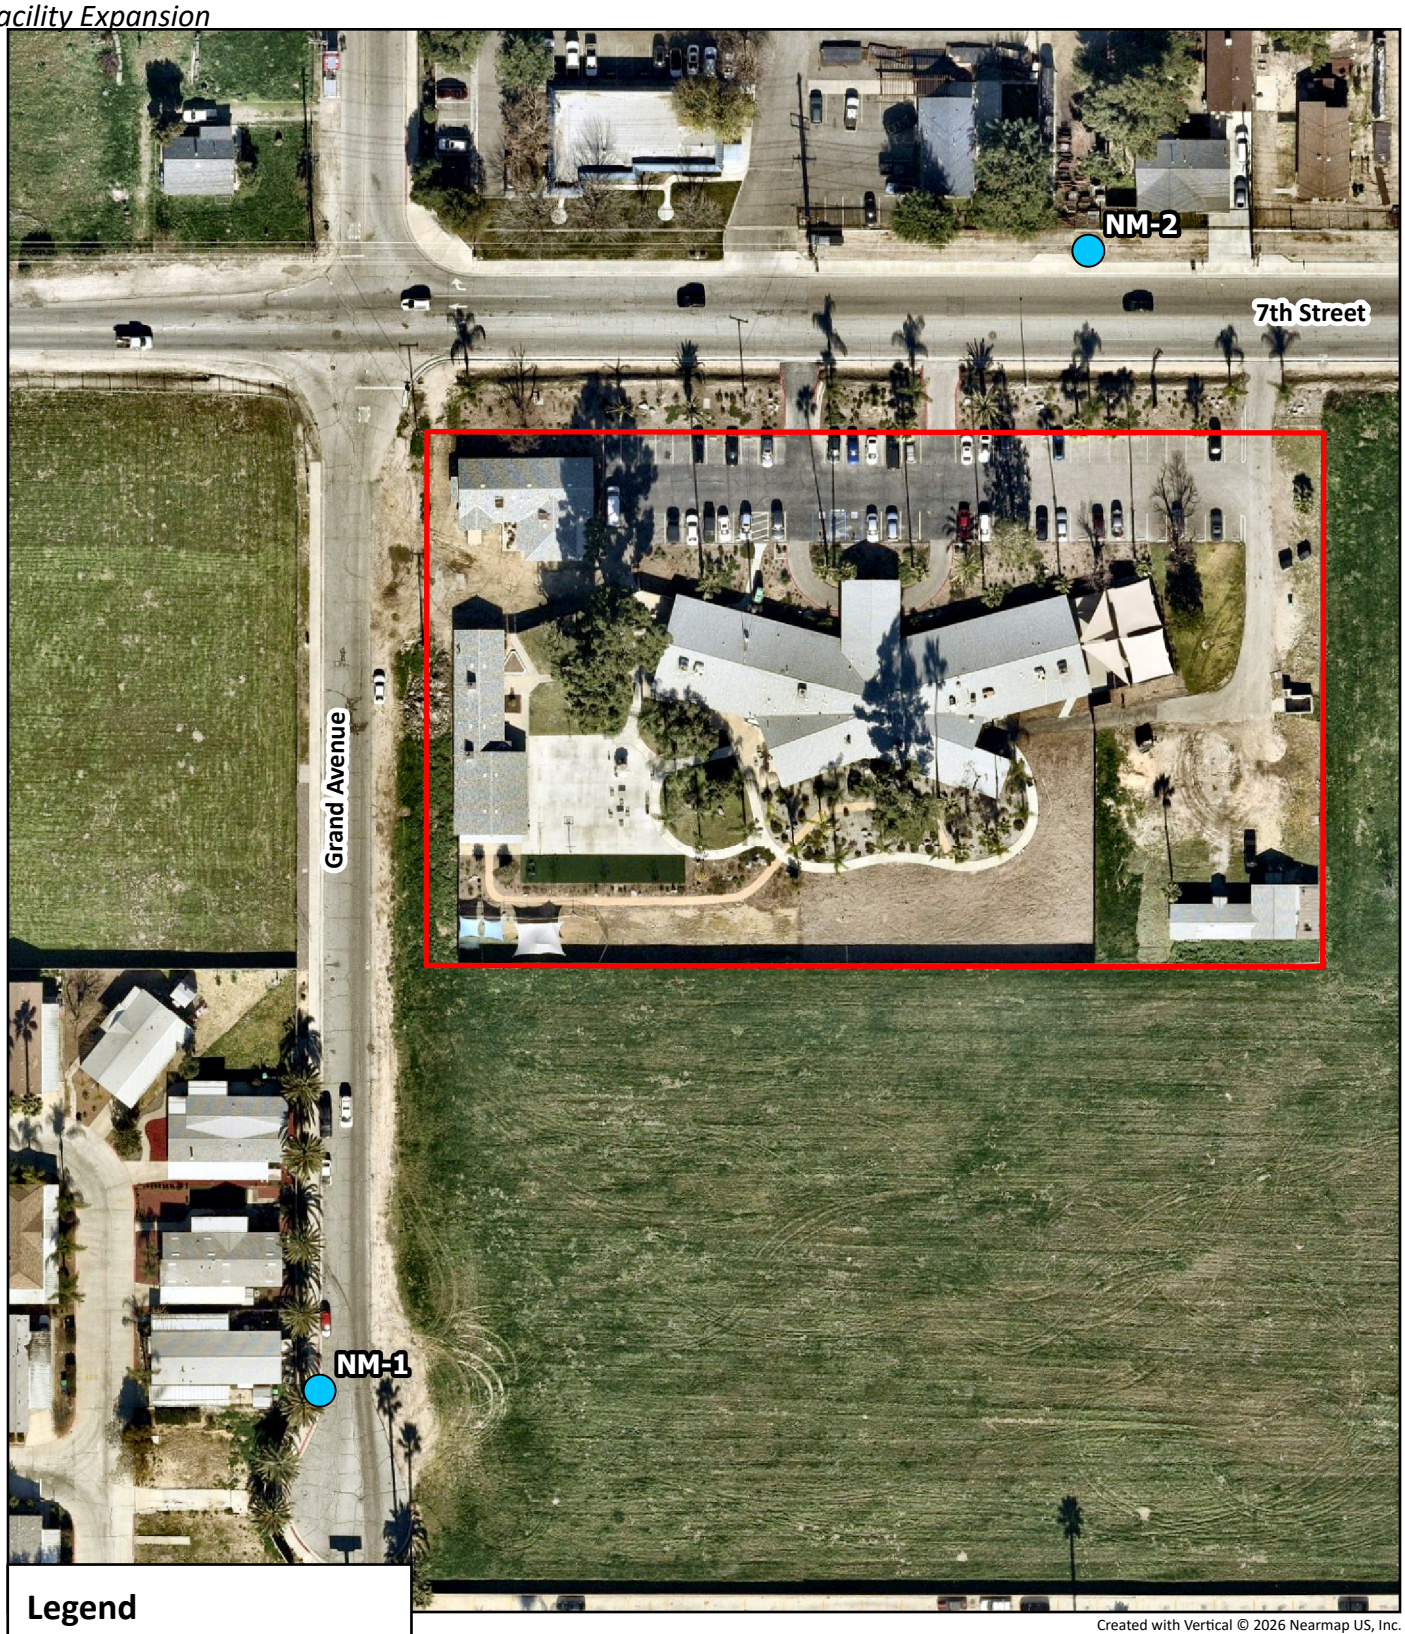

Table 4-1: Ambient Noise Measurements

Location	Description	L_{eq} (dBA)	L_{max} (dBA)	L_{min} (dBA)
NM-1	South of 943 West 7th St, San Jacinto, CA 92582	69.8	86.8	45.7
NM-2	Along South Grand Avenue, east of 913 South Grand Avenue, San Jacinto, CA 92582	58.3	79.2	37.8

Notes: dBA=A-weighted decibels; L_{eq}=Equivalent Sound Level; L_{min}=Minimum Sound Level; L_{max}=Maximum Sound Level
Source: Refer to Appendix A, *Noise Measurement Data*.

The background ambient noise levels in the Project area are dominated by transportation-related noise associated with West 7th Street. The meteorological conditions during the measurement of ambient noise levels included clear conditions and warm temperatures with light windspeeds (4 miles per hour). Noise monitoring equipment used for the ambient noise survey consisted of a PCE-430, which is a Class 1 sound level meter with a half-inch measurement microphone. The monitoring equipment complies with applicable requirements of the American National Standards Institute (ANSI) for sound level meters. The results of the field measurements are included in Appendix A.

Figure 4-1: Noise Measurement Locations

4.2 Sensitive Receptors

Noise-sensitive receptors are locations or individuals that may be adversely affected by elevated noise levels due to their nature, function, or occupancy. Land uses considered sensitive by the State of California includes schools, playgrounds, athletic facilities, hospitals, rest homes, rehabilitation centers, long-term care and mental care facilities. Generally, a sensitive receptor is identified as a location where human populations (especially children, senior citizens, and sick people) are present.

The sensitive receptors closest to the Project site boundary are the property lines of the single-family residences approximately 80 feet north of the Project site across W. 7th Street and 90 feet west of the Project site across S. Grand Avenue. Due to the setback to the property line, the nearest structure with sensitive receptors is the single-family residence located 90 feet north of the Project site. Other noise sensitive land uses near the Project site are located at greater distances than those listed above and would experience lower noise levels than those detailed in this report due to the additional attenuation from distance and the shielding of intervening structures.

4.3 Aircraft Noise

Aircraft-related noise levels are primarily associated with aircraft engine noise made during takeoff, landing, or idling on the tarmac. The nearest airport is the Hemet Ryan Airport, which is located 3.9 miles southeast of the Project site.

4.4 Stationary Sources

Land uses in the Project area are industrial and residential. The primary sources of stationary noise in the Project vicinity are urban-related activities (e.g., mechanical equipment, and parking areas). The noise associated with residential may represent a single-event noise occurrence, short-term noise, or long-term/continuous noise. However, industrial noise is generally continuous, sustained, and higher in intensity, often persisting for long durations and sometimes operating around the clock.

4.5 Existing Traffic Noise

Traffic conditions in the Project vicinity are characterized by steady vehicular flow along primary arterials, with periodic congestion occurring during morning and evening peak hours. Roadway segments adjacent to the study area experience moderate to high traffic volumes, including a mix of passenger vehicles and commercial trucks in and out from the nearby existing residential and industrial land uses along W. 7th Street. Intersections within the vicinity operate with intermittent delays, particularly during peak commuting periods. Overall, traffic activity reflects typical urban conditions and serves as a primary contributor to the existing ambient noise environment.

5 THRESHOLDS OF SIGNIFICANCE

5.1 CEQA Thresholds

Appendix G, *Environmental Checklist Form*, of the CEQA Guidelines contains the following significance criteria. A project could have potential significant impacts regarding noise and vibration if it were to:

- Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of the other agencies;
- Generate excessive ground vibration or ground borne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within 2 miles of a public or public use airport, expose people residing or working in the project area to excessive noise levels.

Based on these standards/criteria, the effects of the Project have been categorized as having "no impact," a "less-than-significant impact," or a "potentially significant impact." Mitigation measures are recommended for potentially significant impacts. If a potentially significant impact cannot be reduced to a less-than-significant level through the application of existing regulations and mitigation, it is categorized as a significant and unavoidable impact.

5.2 Methodology

Construction Noise

Since the City's Municipal Code does not establish quantified thresholds for increases in noise or vibration, this analysis applies the thresholds from the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual. Construction noise levels were estimated using typical equipment noise levels published by the FTA and the Federal Highway Administration (FHWA), in conjunction with the FHWA's Roadway Construction Noise Model (RCNM), which incorporates a national database of reference noise levels for construction equipment.

The equipment list used in this analysis was developed based on project land use and location using the California Emissions Estimator Model (CalEEMod). Because the specific equipment to be used on-site is not yet confirmed, and because equipment would move throughout the site rather than remain stationary for extended periods, this evaluation considers the combined noise levels of the two loudest equipment operating simultaneously during each construction phase using the Computer Aided Noise Abatement (CadnaA) program. CadnaA can analyze multiple types of noise sources using the spatially accurate project site plan and OpenStreetMap data in its calculations to predict outdoor noise levels. Using the ISO 9613-2 protocol, CadnaA calculates the distance from each noise source to the noise receptor locations and

applies ground absorption, distance attenuation, and barrier/building attenuation inputs to provide a summary of the noise level at each receptor, as well as the partial noise level contributions from each source.

Construction noise is expressed in terms of A-weighted equivalent sound levels (dBA L_{eq}). The FTA manual identifies a daytime noise threshold of 80 dBA L_{eq} for residential land uses, which is considered conservative. Accordingly, this analysis uses the 80 dBA L_{eq} threshold to evaluate potential construction noise impacts. It is important to note that the 80 dBA construction threshold applies to the time-averaged L_{eq}, not the momentary L_{max} value.

Operational Noise

Operational noise would include noise from off-site mobile sources and on-site noise sources such as heating, ventilation, air conditioning (HVAC) units, parking lot activities, and on-site vehicles including automobiles, garbage, and delivery trucks traveling on internal roads. Operational noise sources were compared to the exterior thresholds set in the City of San Jacinto Municipal Code to evaluate the significance of impact. The operational noise on-site is analyzed using the CadnaA program.

Consistent with the ISO 9613-2 protocol, the CadnaA noise prediction model relies on reference sound power levels (PWL) to describe individual noise sources. While sound pressure levels (SPL) quantify in decibels the intensity of a given sound at a reference distance, SPLs vary with distance from the source and are influenced by intervening obstacles and barriers, air absorption, wind, and other factors. In contrast, sound power represents the total acoustic energy emitted by a source and is an absolute value that is not affected by the surrounding environment.

The operational noise level calculations presented in this study account for distance attenuation due to geometric spreading, which occurs when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. A default ground attenuation factor of 0.5 was used in the analysis to represent mixed ground conditions, reflecting a combination of hard and soft surfaces. This approach provides a reasonable approximation for environments where both surface types are present and aligns with typical real-world conditions.

The FHWA Highway Traffic Prediction Model (FHWA-RD-77-108) was used to evaluate traffic-related noise conditions along local roadway segments in the Project vicinity. Since the ambient noise level ranges from 58.3 to 69.8 dBA (see Table 4-1, *Ambient Noise Measurements*), the mobile noise increase due to implementation of the Project was compared to the lowest threshold of 1.5 dBA to evaluate the significance.

Emergency Generator

The proposed Project would have one 236 horsepower (hp) emergency generator on-site. Emergency generators operate only during power outages or other emergencies, which are infrequent and temporary events, and are not a routine operational noise source. Periodic maintenance and testing would be brief, infrequent, limited to daytime hours, and restricted in annual duration by air district requirements, so it

would not substantially affect ambient noise levels or contribute to the Project's long-term noise level. Therefore, further analysis regarding the emergency generator is not warranted.

Construction and Operation Vibration

Vibration levels were calculated based on the structure damage assessment method provided in the Caltrans' *Transportation and Construction Vibration Guidance Manual*. As the nearest sensitive receptor structures are residential uses, the construction damage threshold of 0.3 inches per second is applied.

Distance to the Surrounding Sensitive Receptors

As discussed above, there are sensitive receptors located in the Project vicinity. The nearest sensitive receptors are the residences located to the north of the Project site. Other noise sensitive land uses near the Project site are located at greater distances than those listed above and would experience lower noise levels than those detailed in this report due to the additional attenuation from distance and the shielding of intervening structures. The construction vibration impacts are evaluated from the construction activities to the nearest residential structures. Please refer to Table 5-1, *Distances Used for Construction Noise Analysis*, for details of distances.

Table 5-1: Distances Used for Construction Noise Analysis

Sensitive Receptor	Distance Between Project Boundary to Surrounding Land Uses (feet)	Distance from Construction Activities to the Nearest Structure (feet)
Residential to the North	80	90
Residential to the West	90	100

Airport Noise

The distance between the Project site and the nearest airport was evaluated to determine whether the Project is located within an airport land use plan area or within the vicinity of a public or private airstrip. Aircraft flyovers may occasionally be audible at the project site due to air traffic in the surrounding area. The nearest airport is the Hemet Ryan Airport, which is located 3.9 miles southeast of the Project site. The Project is not located within the Airport Influence Area of Hemet Ryan Airport (County of Riverside, 2023). Therefore, further analysis is not warranted.

5.3 Significance Criteria

The following significance criteria are based on the analysis identified within Appendix G of the CEQA Guidelines. The City's General Plan guidelines and Municipal Code regulations identify noise compatibility and establish noise standards that are implemented as thresholds. However, the existing City regulations do not identify thresholds that are considered substantial or vibration criteria during construction. Thus,

information gathered from the FTA Manual, and Caltrans *Transportation and Construction Vibration Manual* were utilized to evaluate construction thresholds, and vibration thresholds, respectively.

Construction

The threshold of 80 dBA L_{eq} set in the FTA's *Transit Noise and Vibration Impact Assessment Manual* was used to evaluate noise impacts.

Vibration

Vibration-generating activities were evaluated using the Caltrans *Transportation and Construction Vibrational Manual* vibration damage thresholds to assess potential construction-related impacts at nearby buildings. The threshold for older residential structures was used, which is 0.3 PPV (in/sec), as listed previously in Table 3-2, *Construction Vibration Damage Thresholds*.

Summary

Table 5-2, *Significance Criteria Summary*, provides a summary of thresholds established by the City of San Jacinto and used in this report.

Table 5-2: Significance Criteria Summary

Analysis	Conditions	Significant Criteria	
		Daytime	Nighttime
Operational Mobile Noise[1]	If ambient is within or below the "normally acceptable" noise criteria at the affected land use	≥ 5 dBA CNEL Project Increase	
	If ambient is within or below the "conditionally acceptable" noise criteria at the affected land use	≥ 3 dBA CNEL Project Increase	
	If ambient exceeds the "conditionally acceptable" noise criteria at the affected land use	≥ 1.5 dBA CNEL Project Increase	
Operational Stationary Source[1,2]	Exterior Noise Level Standards	65 dBA	45 dBA
Construction	The erection (including excavation), demolition, alteration or repair of any building shall occur between the hours of seven a.m. and seven p.m. on weekdays and Saturdays, and between nine a.m. and six p.m. on Sundays and holidays, except when such work complies with the terms of a temporary use permit which may be issued by the community development director or his or her designee, upon a showing of sufficient need due to hot or inclement weather, or the use of an unusually long process material, or other circumstances of unusual and compelling nature.[4]		
	Noise Level at Residential Property[5]	80 dBA	Not Allowed
	Construction Off-site Traffic Noise	3.0 dBA	
	Vibration Damage Criteria[6]	0.3 PPV (inches/second)

6 PROJECT IMPACTS

6.1 Construction Noise

On-Site Construction Noise

Construction is accomplished in different phases with a specific equipment mix, depending on the work to be performed during that phase. As a result of the different equipment mix for each phase, each phase has its own noise characteristics; some phases have higher continuous noise levels, while others have higher impact noise levels. The Project construction activities are expected to occur in the following phases:

1. Demolition
2. Site preparation;
3. Grading;
4. Building construction;
5. Paving; and
6. Architectural coating.

Construction activities frequently shift from one location to another. For example, during site preparation and grading, noise-generating activities may concentrate in an area for a short period to remove existing structures, while the majority of the grading involves the equipment moving back and forth in a predictable pattern throughout the site. The building construction and foundation work generally concentrates near the building location, while paving involves a pattern of movement throughout the site over a short term. Therefore, the FTA recommends that construction activities are best evaluated as multiple moving point sources because equipment changes position in terms of its distance and direction relative to the receivers (FTA, 2018). Due to the size and location of the expansion, only the sound power level from the two loudest equipment operating concurrently on-site was used. The noise levels of the potential construction equipment are listed in Table 6-1, *Construction Equipment Noise Levels*.

Table 6-1: Construction Equipment Noise Levels

Activity	Equipment[1]	Quantities[1]	Maximum Noise Level @ 50 Feet[2,3]	Two Loudest Noise Levels @ 50 Feet[2,3]	Sound Power Level at Source
			dBA L_{max}	dBA L_{eq}	dB (PWL)
Demolition	Concrete/Industrial Saws	1	**89.6**	84.5	**114.7**
	Rubber Tired Dozers	1	81.7		
	Tractors/Loaders/Backhoes	1	**84.0**		
Site Preparation	Graders	1	**85.0**	82.7	112.8
	Rubber Tired Dozers	1	**84.0**		
	Crawler Tractors	1	81.7		
Grading	Graders	1	**85.0**	82.7	112.8
	Rubber Tired Dozers	1	**84.0**		
	Crawler Tractors	1	81.7		
Paving	Pavers	1	77.2	84.5	**114.7**
	Roller	1	80.0		
	Cement and Mortar Mixer	1	80.0		
	Tractors/Loaders/Backhoes	1	**84.0**		
	Paving Equipment	1	**89.5**		
Building Construction	Cranes	1	**80.6**	80.7	110.9
	Forklift	1	74.7		
	Generator Sets	1	72.8		
	Tractors/Loaders/Backhoes	1	**84.0**		
	Welders	3	74.0		
Architectural Coating	Air Compressors	1	77.7	77.7	107.8

Notes: **bold** = Selected equipment with the two highest noise levels. PWL=Sound Power Level.
Sources:

1. The equipment list at each construction phase is based on the California Emissions Estimator Model and questionnaire filled by the applicant.
2. Federal Highway Administration. (2006). *Construction Noise Handbook*.
3. The noise levels are based on Table 9.1 of the Construction Noise Handbook. If the exact equipment listed is not available, a default noise level of 85 dBA, representative of typical construction equipment, is used. Specifically, the Forklift is modeled using this default value. Additionally, for the category of Tractors/Loaders/Backhoes, the noise level of a Tractor (84 dBA) is used, as it represents the loudest among the three.

The nearest off-site noise sensitive receptors are the single-family residences located 80 feet to the north and 90 feet to the west of the Project site. The nearest on-site noise sensitive receptors are the employees and patients from the existing uses on-site. Project construction would be allowed only between the hours of 7:00 a.m. and 7:00 p.m. on weekdays and Saturdays, and between 9:00 a.m. and 6:00 p.m. on Sundays and holidays, in compliance with the City's Municipal Code. Further, the noise levels of construction equipment are listed in Table 6-1, *Construction Equipment Noise Levels*, above. As discussed above, as a conservative analysis, this analysis assumes the two loudest equipment are operating on-site concurrently. As shown in Table 6-1, the estimated temporary noise levels from the loudest Project construction activities, paving, at the nearest sensitive receptors would be 71.9 dBA on-site and 62.8 dBA off-site, which would not exceed the FTA threshold of 80 dBA L_{eq} for residential properties, refer to Appendix B, *Noise Modeling Details.* As such, impacts from Project construction noise would be less than significant.

Construction Noise from Off-Site Traffic

Project construction would result in additional traffic on adjacent roadways over the period that construction occurs. According to the California Emissions Estimator Model (CalEEMod), which is used to predict the number of construction-related automotive trips, the maximum number of Project construction trips traveling to and from the Project site during a single construction phase is estimated to be 8 worker trips and 25 hauling trips per day. Using a reference from the State of Illinois Department of Transportation, noise generated by one truck at 55 miles per hour generates a noise level equivalent to approximately 28 automobiles (State of Illinois, 2015). Therefore, during the demolition phase, the Project is expected to result in the equivalent of approximately 708 automobile trips (8 + [25 x 28] =708). According to the *Caltrans Traffic Noise Analysis Protocol*, a doubling of traffic on a roadway results in an increase of 3 dB (Caltrans, 2020a). A 3 dBA change is considered a just perceptible difference. The Project site would be accessible via West 7th Street during construction. There are 8,686 daily vehicle trips on West 7th Street (Streetlight Data, 2026). Therefore, the Project's construction trips (708 trips) would not result in a doubling of traffic on the transportation network; thus, noise from the addition of construction trips would not be perceptible. Additionally, construction is temporary, and construction trips would cease upon completion of the Project. As such, impacts related to off-site construction noise would be less than significant.

6.2 Operational Noise

Long-term operational noise would be generated from the day-to-day operational activities including:

- Off-site mobile sources: automobiles traveling to and from the Project site.
- On-site noise sources:
    - Stationary sources including HVAC units and parking activities.
    - Mobile sources including passenger vehicles, daily delivery trucks, and weekly garbage trucks moving on-site.

Off-Site Mobile Noise

Roadway segment noise levels for the "Existing" and "Existing with Project" scenarios were compared to evaluate Project-related operational noise impacts. According to the *Bradley Gardens Vehicle Miles Traveled Screening Analysis* (VMT Analysis) prepared for the Project, the Project would generate an estimated 181 net new daily trips (EPD Solutions, Inc., 2026). The existing daily trips along West 7th Street is 8,686. According to the *Caltrans Traffic Noise Analysis Protocol*, a doubling of traffic on a roadway results in an increase of 3 dB (Caltrans, 2020a). A 3 dBA change is considered a just perceptible difference. However, as a conservative analysis, this report uses the 1.5 dBA threshold to evaluate the operational off-site traffic noise. The increase due to the Project would be 0.09 dBA based on the following formula:

$$Change\ in\ Noise = 10 * Log\ (\frac{Volumn_{Existing+project}}{Volumn_{Existing}})$$

Therefore, the traffic noise increase from implementation of the proposed Project would be less than significant.

On-Site Noise

Heating, Ventilation, and Air Conditioning

The Project proposes construction of a new building and renovation of an existing building. Typically, mechanical equipment such as heating, ventilation, and air conditioning (HVAC) units would be located on the rooftop of the structure. It is assumed that one ton of HVAC capacity is required for every 300 to 500 SF. Based on this assumption, and as a conservative analysis, the renovated building would require one 8-ton HVAC unit, while the new building would require seven 8-ton HVAC units. For this analysis, it is assumed that the new structures would utilize a commonly available HVAC unit with standard sound performance (or similar), such as an 8.5-ton commercial packaged air conditioner manufactured by Daikin (Klondike AC & Heating, 2026). According to the manufacturer's specifications, this unit generates a sound pressure level of 82.65 dBA at the source. As a conservative assumption, all HVAC units were modeled as operating continuously (24 hours per day) at a steady-state sound pressure level of 82.7 dBA. In addition, no noise attenuation from walls or other on-site structures was assumed, further ensuring a conservative analysis.

Based on modeling results from CadnaA (refer to Attachment B, *Noise Modeling Data*), the noise generated from HVAC units would be 40.7 dBA and 36.1 dBA during the daytime and nighttime at the nearest sensitive receptors to the north and west, respectively, which would not exceed the City's exterior thresholds of 65 dBA for daytime and 45 dBA for nighttime.

On-Site Mobile Noise

There are two components of on-site mobile noise: vehicles traveling on internal roads, including regular automobile vehicles, occasional delivery trucks, and weekly garbage trucks, and parking activities. As a

conservative analysis, it was assumed there would be 10 auto vehicle trips per hour during the day on-site, which is the highest peak hour trips based on the VMT Analysis prepared for the Project (EPD Solutions, Inc., 2026). It was assumed that one percent of the vehicles on-site every hour would be attributed to truck activities to account for occasional delivery trucks and weekly garbage trucks. During the night, the traffic volume would decrease to 50 percent and there would be no heavy trucks. Based on the *Noise Navigator Sound Level Database with Over 1700 Measurement Values*, light traffic generates 50.8 dBA at 50 feet, which is within the normally acceptable noise range for single-family community noise standards (Berger, E. H. et al, 2015). As such, traffic associated within the proposed Project would not be of sufficient volume to exceed community noise standards, which are based on a time-averaged scale such as the CNEL scale.

Project Operational Noise Increase in Ambient Noise

To evaluate potential operational noise impacts, Project-generated noise levels from stationary sources and on-site vehicle activities were combined with existing ambient noise measurements to determine any incremental increase above baseline conditions. The difference between the combined noise levels and ambient conditions represents the Project's contribution to overall noise. Based on modeling results prepared using CadnaA (see Appendix B, *Noise Modeling Data*), predicted noise levels would reach 53.8 dBA at the residences to the north, and 41.4 dBA at the residences to the east. Existing ambient noise levels in the Project vicinity range from 58.3 to 69.8 dBA L_{eq}, as shown in Table 4-1. As demonstrated in Table 6-2, *Project Operational Noise Levels*, the increase over ambient would be less than the incremental thresholds based on the ambient noise level measured. Therefore, operational noise associated with the proposed Project would not substantially elevate ambient noise levels beyond established thresholds, and impacts would be considered less than significant.

Table 6-2: Project Operational Noise Levels

Land Use	Project Noise Level (dBA)[1]	Ambient Noise Level (dBA)[2]	Cumulative Noise Level (dBA)[3]	Increase over Ambient(dBA)[4]	Incremental increase (dBA)[5]	Exceed Threshold?
Residential to the North	53.8	69.8	69.9	0.1	1.5	No
Residential to the East	41.4	58.3	58.4	0.1	3.0	No

1. Refer to Appendix B, Noise *Modeling Data*, for outputs.
2. Ambient Noise Level is based on the noise measurement in Table 4-1. The ambient noise for the residential to the north was based on data collected at NM-1, and for the residential to east was based on NM-2.
3. Calculation is based on Logarithmic Addition of Sound Level, $SPL_{total}=10*Log(10^{SP1/10}+10^{SPL2/10})$.
4. Difference between Cumulative Noise Level and Ambient Noise Level.
5. Thresholds are based on the noise measurement in Table 4-1.

6.3 Vibration

Construction Vibration

Construction activities can generate varying levels of ground vibration depending on the equipment used and the methods employed. These vibrations propagate through the ground and decrease in intensity with distance. Table 6-3, *Construction Equipment Vibration Levels*, presents typical vibration levels associated with various types of construction equipment.

Table 6-3: Construction Equipment Vibration Levels

Equipment	Reference Vibration Level at 25 feet (PPV [inches/second])[1]	Vibration Level at 80 feet (PPV [inches/second])[1]	Vibration Level at 90 feet (PPV [inches/second])[1]
Loaded Trucks	0.076	0.013	0.011
Small Bulldozer	0.003	0.001	<0.001

Source:
1. FTA. (2018). *Transit Noise and Vibration Impact Assessment Manual*.
2. $PPV_{equip} = PPV_{ref} \times \left(\frac{25}{D}\right)^{1.5}$, D=distance between the equipment to the sensitive receptors.

Based on the equipment list in Table 6-1, *Construction Equipment Noise Levels*, the Project construction would use vibration-heavy equipment on-site including small rubber-tired dozers and loaded trucks. The Project would not use any equipment over 80,000 pounds or heavy-vibration equipment. The nearest off-site residential structure is located as close as 80 feet from the construction activities. At this distance, Project construction would generate a vibration level of 0.013 from a loaded truck, which would be the most vibrating piece of equipment used. As shown in Table 6-3, *Construction Equipment Vibration Levels*, the vibration level at the nearest off-site residential structure would range from 0.013 to less than 0.001 PPV (inches per second), which would not exceed the threshold of 0.3 inches per second established by Caltrans. As such, vibration impacts during construction would be less than significant.

As an extension project, the Project would also construct a new building attached to the existing building. The small bulldozer should be located more than one foot from the existing building and loaded trucks should be located more than 10 feet from the existing building to avoid vibration impacts to the existing structures. Table 6-4, *Buffer Distance for Potential Construction Equipment*, contains the recommended buffer distance to make sure that the vibration level at the existing structures from construction equipment will not exceed the established building damage criteria.

Table 6-4: Buffer Distance for Potential Construction Equipment

Equipment	Reference Vibration Level at 25 Feet (PPV [inches/second])[1]	Buffer Distance for 0.3 PPV [inches/second][2]
Loaded Trucks	0.076	10
Small Bulldozer	0.003	1

Source:

3. FTA. (2018). *Transit Noise and Vibration Impact Assessment Manual*.
4. $PPV_{equip} = PPV_{ref} \times \left(\frac{25}{D}\right)^{1.5}$, D=distance between the equipment to the sensitive receptors.

Operational Vibration

The Project proposes an extension of existing medical facilities by renovating an existing building and constructing a new building, which would not involve railroads or substantial heavy truck operations that are typically associated with significant operational vibration. Operation of the Project would include passenger vehicles for commuting and garbage trucks for solid waste disposal, which would not be frequent daily activities. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement conditions. Daily garbage trucks and occasional delivery trucks on-site would be travelling at very low speeds, so it is expected that vibration from these trucks at nearby sensitive receptors would not be noticeable. It is important these trucks already exist on-site. Therefore, operational vibration impacts from the proposed project would be less than significant.

7 CONCLUSION

During construction, the Project would be required to comply with the rules and regulations set forth in the City's Noise Element and Municipal Code. Construction noise from the Project would not exceed the 80 dBA threshold. In addition, construction vibration would not exceed the threshold of 0.3 inches per second. As such, the Project would not result in a significant impact related to noise and vibration from construction.

Noise modeling shows that HVAC units and on-site mobile sources would generate about 40.7 dBA during the day and 36.1 dBA at night at nearby sensitive receptors, which are below the City's thresholds. When combined with existing ambient noise, total levels would remain within typical background ranges, adding only minimal increases. Overall, the Project's operational noise would not significantly impact surrounding areas and is considered less than significant. Finally, the healthcare facility would only involve passenger vehicles, and occasional delivery and garbage trucks on-site, which would not cause significant vibration to the on-site or nearby structures. As an institutional-expansion project, the Project operation would be expected to generate pure-tone or impulsive noise. As such, the Project would not result in a significant impact related to noise and vibration from operation.

Additionally, the nearest airport is the Hemet Ryan Airport, which is located 3.9 miles southeast of the Project site, and the Project is not located within the Airport Influence Area of the Hemet Ryan Airport. Thus, impacts related to aircraft noise would be less than significant.

Overall, impacts related to noise and vibration from the proposed Project would be less than significant.

To:	City of San Jacinto
From:	Jordan Mower, Alex Garber; EPD Solutions, Inc.
Date:	June 24, 2026
Site:	980 West 7th Street, San Jacinto, CA
Subject:	Vehicle Miles Traveled (VMT) Screening Analysis Bradley Gardens – EPD Project No. 26-017

This technical memorandum evaluates the proposed Project located at 980 West 7th Street in the City of San Jacinto. The purpose of this analysis is to determine whether a vehicle miles traveled (VMT) analysis would be required for the Project. This memo evaluates the Project using the City of San Jacinto's *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (June 2020).

Project Description

The Project site is within the southwestern portion of the City of San Jacinto in Riverside County, California. The Project site is located at 980 West (W.) 7th Street, at the southeast corner of the intersection of W. 7th Street and South (S.) Grand Avenue. Regional access to the Project site is provided by State Route (SR) 79 and SR 74. Local access to the site is provided by W. 7th Street and S. Grand Avenue. The Project site consists of one parcel encompassing approximately 2.98 acres. The site is identified as Assessor's Parcel Number (APN) 435-330-003. The Project site is developed and currently operates as the Bradley Gardens facility, which offers a variety of psychiatric-focused care to patients with varying health needs, including supervised Psychiatric Health Facility (PHF) care beds, Skilled Nursing Facility (SNF) and Short-Term Psychiatric (STP) care beds, and rehabilitation and therapy programs.

The Project proposes the expansion of the existing Bradley Gardens Nursing Facility on the 2.98-acre site. The Project includes demolition of the existing 1,074-square-foot (SF) maintenance and storage building for the construction of a 18,000 SF building addition to the existing 44-bed SNF building that would provide 43 additional SNF and STP beds, resulting in a total capacity of 87 beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building into a 16-bed PHF. The proposed Project would result in a floor area ratio (FAR) of 0.27. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, and pavement of parking areas and driveways. With the completion of the proposed Project, there would be a total of 103 beds (SNF, STP, and PHF beds) on the Project site. The Project site has an existing General Plan land use designation of Industrial (I) and is zoned as Industrial Light (IL).

The proposed Project site plan is shown in Figure 1. It should be noted that the Project site plan shows 17,372 SF for the 43-bed addition; this analysis utilized 18,000 SF for the 43-bed addition, presenting a conservative analysis.

Project Trip Generation

A trip generation analysis was prepared to determine the estimated change in site trip generation that would result from the proposed Project. The analysis used trip rates from the Institute of Transportation

Engineers (ITE) *Trip Generation Manual, 12th Edition*. The proposed Project was analyzed using ITE Land Use Code 620 – Nursing Home. As shown in Table 1, the existing 44- bed skilled nursing facility generates 135 daily trips, with 6 trips occurring during the AM peak hour and 10 trips occurring in the PM peak hour. The proposed Project's total trip generation with 103 total beds would be 315 daily trips, with 14 trips occurring during the AM peak hour and 23 trips occurring during the PM peak hour. The proposed Project would therefore generate 180 net daily trips, 8 net AM peak hour trips, and 13 net PM peak hour trips.

Figure 1: Proposed Project Site Plan

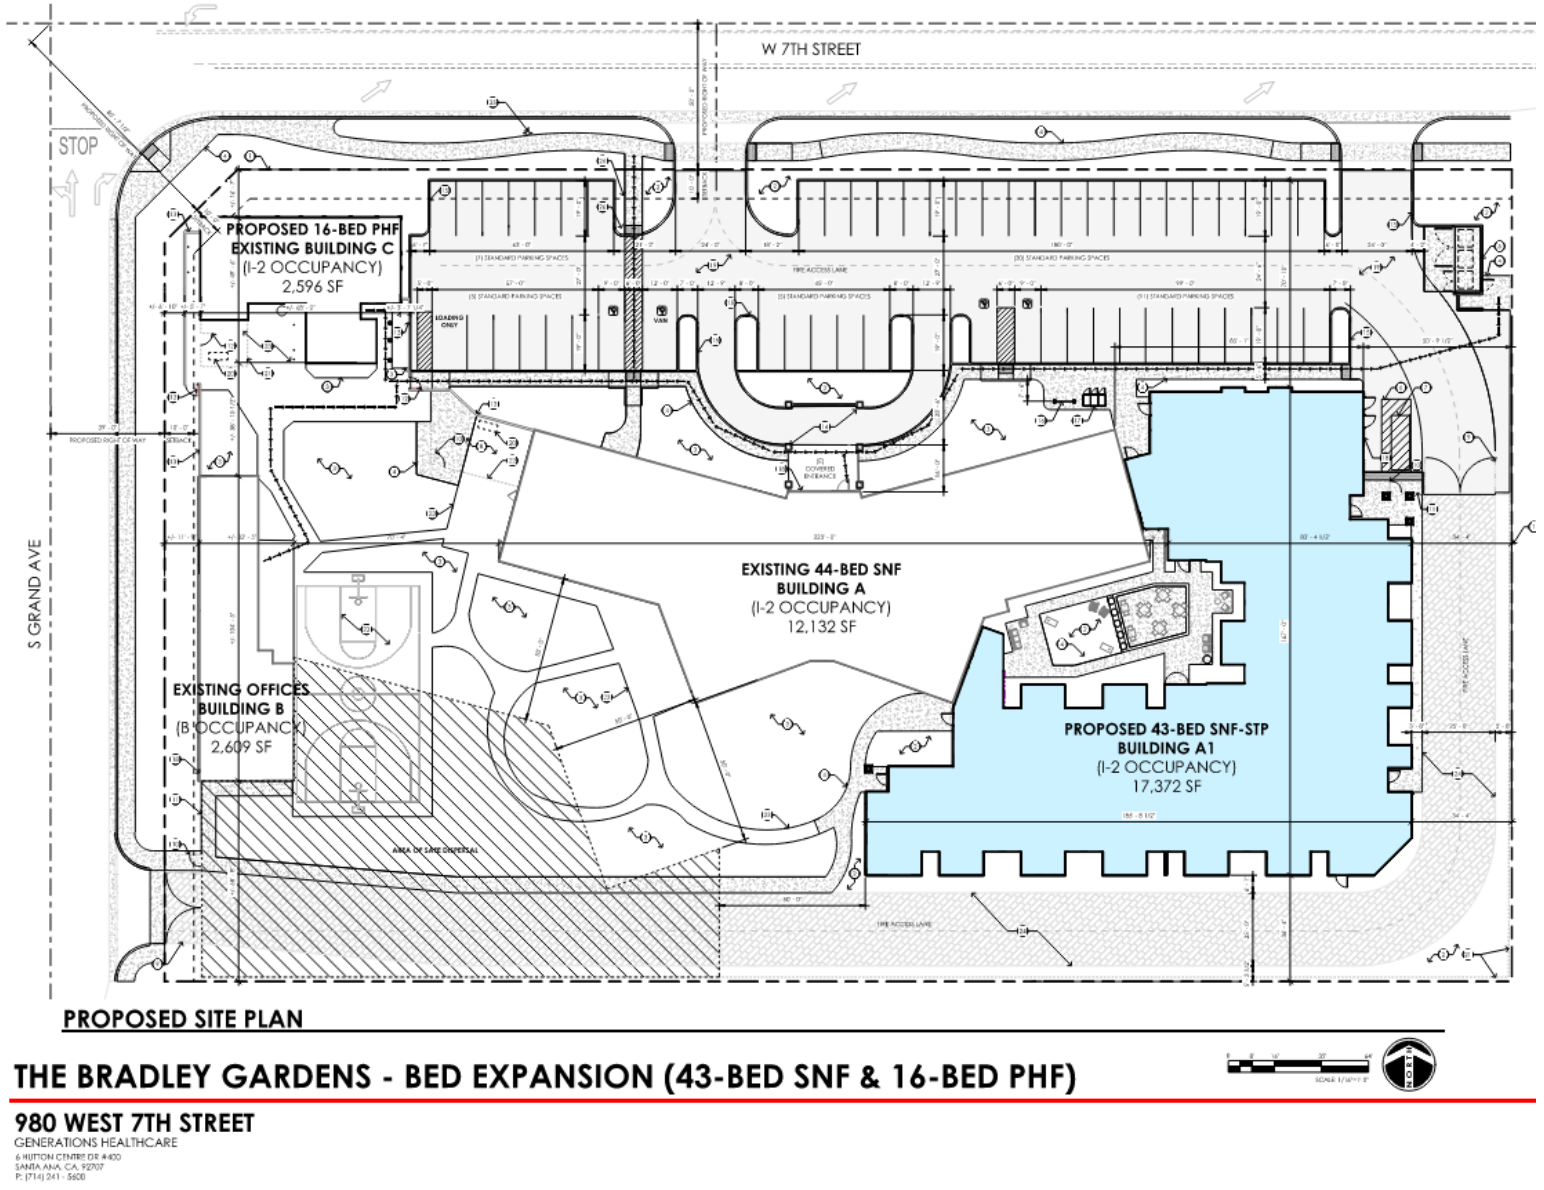

Table 1: Project Trip Generation

				AM Peak Hour			PM Peak Hour		
Land Use		**Units**	**Daily**	**In**	**Out**	**Total**	**In**	**Out**	**Total**
Trip Rates									
620 Nursing Home[1]		Beds	3.06	0.1	0.04	0.14	0.07	0.15	0.22
Existing Trip Generation									
Nursing Home[1]	44	Beds	135	4	2	6	3	7	10
Proposed Project Total Trip Generation

[1]Institute of Transportation Engineers, Trip Generation Manual, 12th Edition, 2025. Land Use Code 620 - Nursing Home (Average Rate)

Vehicle Miles Traveled (VMT) Background

Senate Bill (SB) 743 was signed by Governor Brown in 2013 and required the Governor's Office of Planning and Research (OPR; now the Governor's Office of Land Use and Climate Innovation) to amend the California Environmental Quality Act (CEQA) Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts, aiming to promote the reduction of greenhouse gas (GHG) emissions, the development of multimodal transportation networks, and a diversity of land uses. In response, Section 15064.3, *Determining the Significance of Transportation Impacts*, was added to the CEQA Guidelines, which states that VMT is the most appropriate measure of transportation impacts and shall apply statewide beginning on July 1, 2020.

City of San Jacinto VMT Screening

The City of San Jacinto's *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* provides the following three screening criteria for which projects can be presumed to have a less-than-significant impact related to VMT.

Transit Priority Area (TPA) Screening: Projects located within a TPA[1] may be presumed to have a less-than-significant impact absent substantial evidence to the contrary. This presumption may NOT be appropriate if the project:

- Has a floor area ratio (FAR) of less than 0.75;
- Includes 5 percent or more parking for use by residents, customers, or employees of the project than required by the City;
- Is inconsistent with the applicable Sustainable Communities Strategy; or
- Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

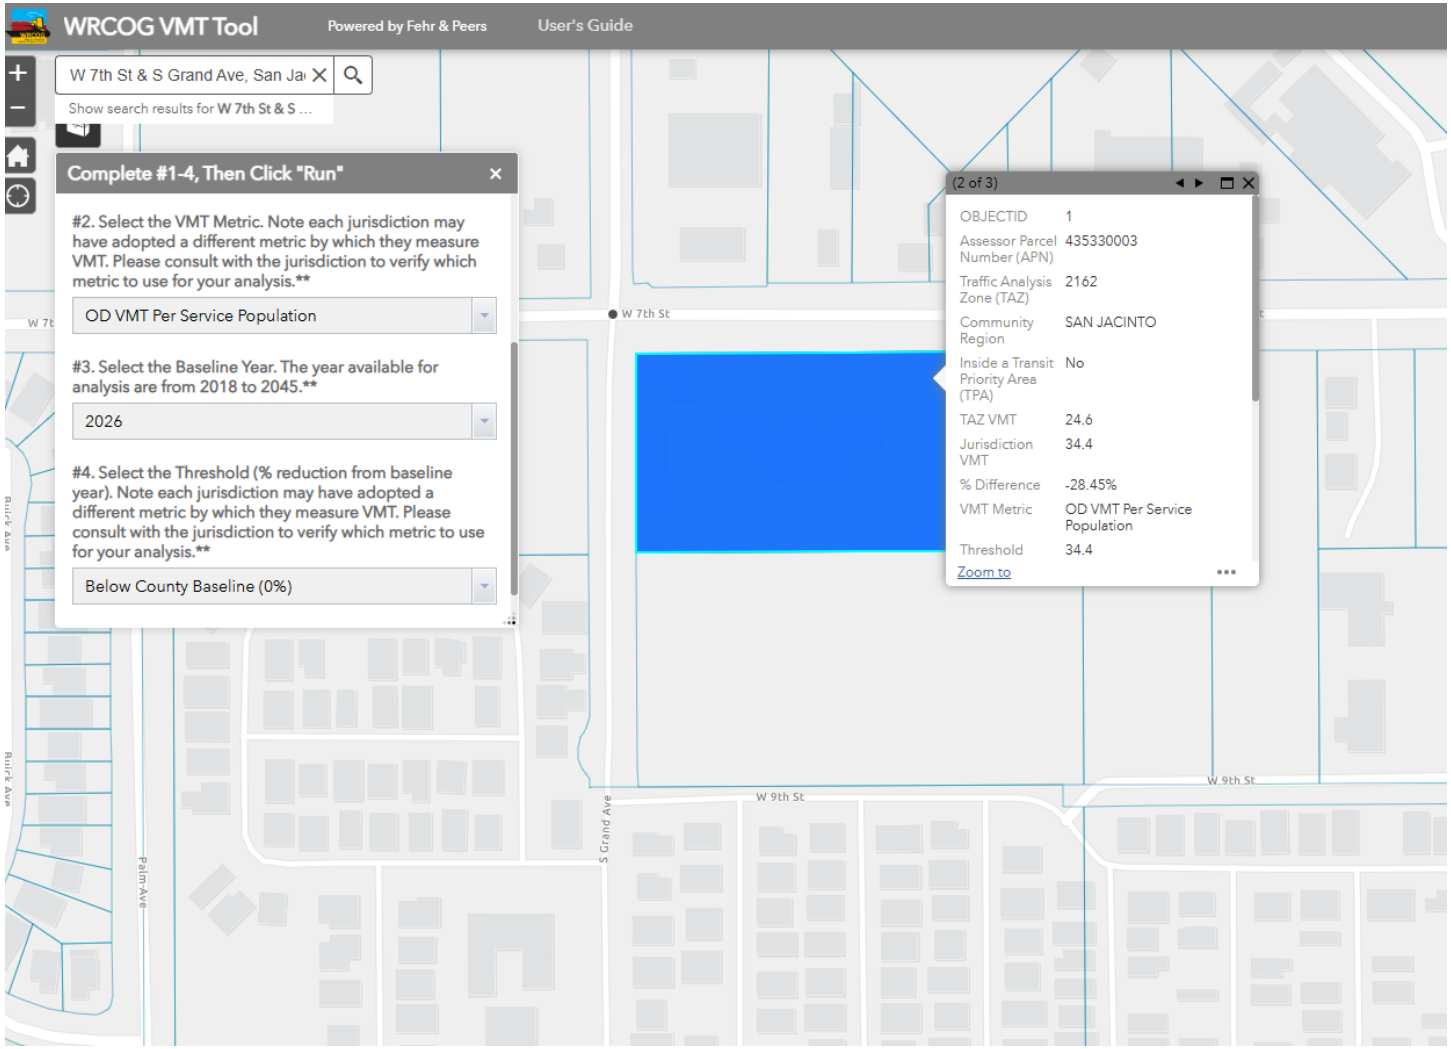
Low VMT Area Screening: The City's guidelines include a screening threshold for projects located in a low-VMT generating area, which is defined as traffic analysis zones (TAZs) with a total daily VMT/SP that is less than the baseline level for the Western Riverside Council of Governments (WRCOG) subregion. For projects that are inconsistent with the land use assumptions coded into the projects' TAZ, this screening criteria would not be appropriate, and the project would not satisfy the requirements of this screening criteria.

Project Type Screening: Local serving retail projects less than 150,000 square feet may be presumed to have a less-than-significant impact absent substantial evidence to the contrary. Local serving retail generally improves the convenience of shopping close to home and has the effect of reducing vehicle travel.

[1] A Transit Priority Area (TPA) is defined as a half-mile radius around an existing major transit stop or an existing stop along a high-quality transit corridor per the definitions below.
Pub. Resources Code, § 21064.3 - 'Major transit stop' means a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 20 minutes or less during the morning and afternoon peak commute periods.
Pub. Resources Code, § 21155 - For purposes of this section, a 'high-quality transit corridor' means a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

In addition to local serving retail, the following uses can also be presumed to have a less-than-significant impact absent substantial evidence to the contrary as their uses are local serving in nature:

- Projects located in a Transit Priority Areas (TPA)
- Projects located in a low-VMT generating area
- Local-serving K-12 schools
- Local parks
- Day care centers
- Local-serving gas stations
- Local-serving banks
- Local-serving hotels (e.g. non-destination hotels)
- Student housing projects
- Local serving community colleges that are consistent with the assumptions noted in the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)
- Projects generating less than 500 daily vehicle trips. This generally corresponds to the following "typical" development potentials:
    - 53 single family housing units
    - 68 multi-family, condominiums, or townhouse housing units
    - 150,000 square feet of local serving commercial
    - 100,000 square feet of office
    - 100,000 square feet of light industrial
    - 300,000 square feet of warehousing
    - 300,000 square feet of high cube transload and short-term storage warehouse



The applicability of each criterion to the Project is discussed below.

Screening Criterion 1 - Transit Priority Area (TPA) Screening: Per the City's VMT screening criteria, projects located within an existing TPA may be presumed to result in a less-than-significant VMT impact. As shown in Figure 2, *WRCOG VMT Tool Screening Results,* based on the WRCOG VMT Tool, the proposed Project is not located within an existing TPA. Therefore, the Project does not satisfy Screening Criterion 1.

Screening Criterion 2 – Low VMT Area Screening: Per the City's VMT screening criteria, projects that are consistent with the existing land use and are located within a low VMT area may be presumed to have a less-than-significant impact on VMT. The Project's proposed land use is not consistent with the General Plan; therefore, Screening Criterion 2 – Low VMT Area Screening is not applicable to the Project.

Screening Criterion 3 – Project Type Screening: According to the City's Guidelines, local serving projects and land uses may be presumed to have a less-than-significant VMT impact. Additionally, projects that are expected to generate 500 or fewer daily vehicle trips are presumed to have a less-than-significant VMT impact. The Project does not propose any local serving land uses. However, as shown in Table 1, the proposed Project is expected to generate 315 total daily vehicle trips, which is fewer than the 500 daily vehicle trip threshold provided in the City's Guidelines. Therefore, the Project satisfies Screening Criterion 3.

Figure 2: WRCOG VMT Tool Screening Results

Summary

The proposed Project satisfies Screening Criterion 3 (Project Type Screening) as the Project is expected to generate fewer than the 500 daily vehicle trip threshold provided in the City's Guidelines. Therefore, the Project is presumed to have a less-than-significant VMT impact, and no further analysis is required.

1. INTRODUCTION

1.1. PURPOSE OF THE INITIAL STUDY

This Initial Study has been prepared in accordance with the following:

- California Environmental Quality Act (CEQA) of 1970 (Public Resources Code Sections 21000 et seq.); and
- Guidelines for Implementation of the California Environmental Quality Act (State CEQA Guidelines) (California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000 et seq.) as amended and approved on December 28, 2018.

Pursuant to CEQA, this Initial Study has been prepared to analyze the potential for significant impacts on the environment resulting from implementation of the proposed Project, described in greater detail in Section 3.0, *Project Description*. As required by State CEQA Guidelines Section 15063, this Initial Study is a preliminary analysis prepared by the Lead Agency, the City of San Jacinto, to determine if a Mitigated Negative Declaration or an Environmental Impact Report is required to evaluate the potential environmental impacts associated with the Project.

This Initial Study informs the City of San Jacinto decision-makers, affected agencies, and the public of potentially significant environmental impacts associated with the implementation of the Project. A "significant effect" or "significant impact" on the environment means *"a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project"* (State CEQA Guidelines Section 15382).

Given the Project's broad scope and level of detail, combined with previous analyses and current information about the site and environs, the City's intent is to adhere to the following CEQA principles:

- Provide meaningful early evaluation of site planning constraints, service and infrastructure requirements, and other local and regional environmental considerations. (Public Resources Code Section 21003.1)
- Encourage the applicant to incorporate environmental considerations into project conceptualization, design, and planning at the earliest feasible time. (State CEQA Guidelines Section 15004[b][3])
- Specify mitigation measures for reasonably foreseeable significant environmental effects and commit the City and applicant to future measures containing performance standards to ensure their adequacy when detailed development plans and applications are submitted. (State CEQA Guidelines Section 15126.4)

1.2. DOCUMENT ORGANIZATION

This Initial Study includes the following sections:

Section 1. Introduction

Provides information about CEQA and its requirements for environmental review and explains that an Initial Study was prepared to evaluate the proposed Project's potential impact to the physical environment, and to determine if an Environmental Impact Report (EIR) is required.

Section 2. Environmental Setting

Provides information about the proposed Project's location.

Section 3. Project Description

Includes a description of the proposed Project's physical features and characteristics.

Section 4. Environmental Checklist

Includes the summarized results for the Environmental Checklist from Appendix G of the State CEQA Guidelines and evaluates the proposed Project's potential to result in significant adverse effects to the physical environment. Identifies if an EIR is required, and if one is, what environmental topics need to be analyzed in the EIR.

Section 5. Environmental Analysis

Includes the information and data that was analyzed leading to the results of the Environmental Checklist.

2. ENVIRONMENTAL SETTING

2.1. PROJECT LOCATION

The Project site is within the southwestern portion of the City of San Jacinto in Riverside County, California. The Project site is located at 980 West (W.) 7th Street, at the southeast corner of the intersection of W. 7th Street and South (S.) Grand Avenue. Regional access to the Project site is provided by State Route (SR) 79 and SR 74. Local access to the site is provided by W. 7th Street and S. Grand Avenue. The Project site and surrounding area are shown on Figure 2-1, *Regional Location*, and Figure 2-2, *Local Vicinity*.

2.2. EXISTING PROJECT SITE

The Project site consists of one parcel encompassing approximately 2.98 acres. The site is identified as Assessor's Parcel Number (APN) 435-330-003. The Project site is developed and currently operates as the Bradley Gardens facility, which offers a variety of psychiatric-focused care to patients with varying health needs, including supervised Psychiatric Health Facility (PHF) care beds, Skilled Nursing Facility (SNF) and Short-Term Psychiatric (STP) care beds, and rehabilitation and therapy programs. The Bradley Gardens facility currently operates 24 hours a day, seven days a week. The Project site is currently comprised of four buildings totaling 18,411 square feet (SF). The existing buildings consist of a one-story 44-bed SNF building totaling 12,132 SF, a one-story vacant office building totaling 2,596 SF, a one-story administrative office building totaling 2,609 SF, and a one-story maintenance and storage building totaling 1,074 SF. In addition to the existing structures, the Project site is also improved with asphalt-paved parking areas, an outdoor courtyard, walkways, associated landscaping, and perimeter fencing.

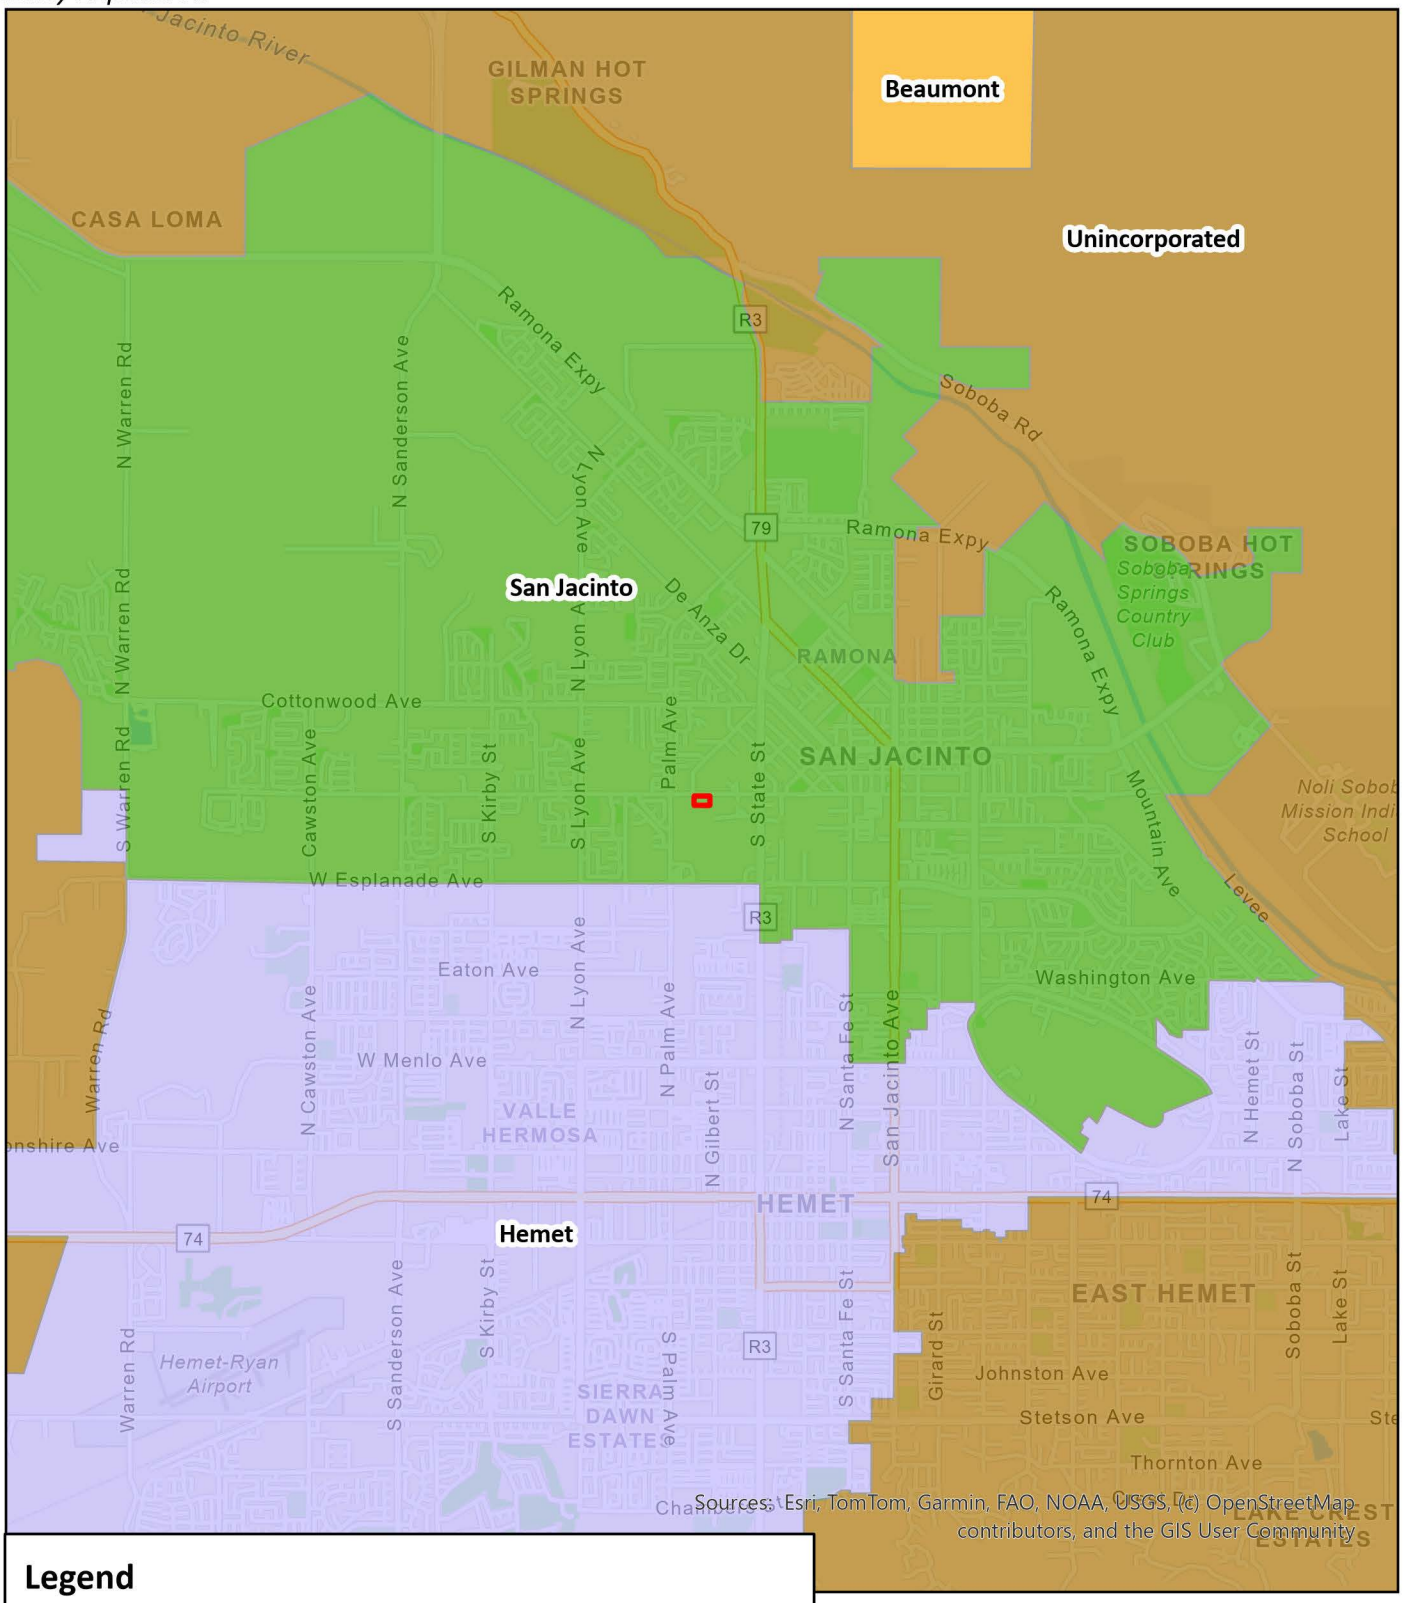
The Project site is relatively flat with a gentle slope towards the southeast. The site is sparsely vegetated and has shrubs and trees surrounding the existing SNF building. Existing access to the site is provided via three driveways located on W. 7th Street. The Project site's existing conditions are shown on Figure 2-3, *Aerial View*, and Figure 2-4, *Existing Site Photos*.

2.3. EXISTING LAND USE AND ZONING DESIGNATION OF THE PROJECT SITE

The Project site has a City of San Jacinto General Plan land use designation of Industrial (I). The Industrial (I) land use designation allows for a variety of industrial and manufacturing activities that do not generate significant amounts of pollution, including limited regional and sub-regional commercial activities that are non- or low-polluting and which can co-exist compatibly with surrounding land uses. Other uses that are determined to be compatible with primary uses may also be allowed. The maximum intensity of development under this land use designation is a floor area ratio (FAR) of 0.50.

The Project site has a zoning designation of Industrial Light (IL). The IL zoning designation allows for general manufacturing uses, auto repair services, pest control services, pool maintenance services, and woodworking shops. This zone allows a maximum FAR of 0.50.

The Project site's existing land use designation is shown on Figure 2-5, *Existing General Plan Designation*, and the existing zoning designation is shown on Figure 2-6, *Existing Zoning Designation*.



2.4. SURROUNDING LAND USES

The existing land use, General Plan designation, and zoning designation for surrounding parcels are described in Table 2-1.

Table 2-1: Surrounding Existing Land Use, General Plan Designations, and Zoning Designation

	Existing Land Use	General Plan Designation	Zoning Designation
North	W. 7th Street followed by a metal fabrication plant	Industrial (I)	Industrial Light (IL)
South	Vacant land	Industrial (I)	Industrial Light (IL)
East	Vacant land	Industrial (I)	Industrial Light (IL)
West	S. Grand Avenue followed by Vacant land	Industrial (I)	Industrial Light (IL)
Southwest	S. Grand Avenue followed by residences	High Density Residential (HDR)	Residential, High Density (RH)

3. PROJECT DESCRIPTION

3.1. PROJECT OVERVIEW

The Project proposes the expansion of the existing 44-bed Bradley Gardens facility to a total of 103 beds. The Project includes demolition of the existing 1,074 SF maintenance and storage building located in the southeastern corner of the site for construction of an expansion to the existing 44-bed SNF building. The proposed building addition would total approximately 17,372 SF and would provide 43 additional SNF and STP beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building located in the northwestern corner of the site into a 16-bed PHF. The Project would not modify the existing 2,609 SF administrative office building along the western boundary of the site. The proposed Project would result in an FAR of 0.27. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, parking lot, and driveways. Figure 3-1, *Conceptual Site Plan*, illustrates the proposed site plan.

For purposes of this MND, the proposed addition to the SNF building is conservatively analyzed as an 18,000 SF building.

3.2. PROJECT FEATURES

Building Summary and Architecture

The Project includes expansion of the existing Bradley Gardens facility, including an addition to the existing SNF building and conversion of the existing vacant office building into a PHF. Each Project component is discussed below.

Skilled Nursing Facility Expansion

The proposed SNF-STP building expansion would be single story and approximately 22 feet in height. The proposed SNF-STP building would be setback approximately 34.3 feet from the eastern boundary of the site, approximately 36.3 feet from the southern boundary of the site, and approximately 71.75 feet from the site's northern boundary. The new 18,000 SF building addition would accommodate 43 additional SNF and STP beds, resulting in a total SNF building size of 30,132 SF. The proposed building would also include a kitchen area, dining/recreation rooms, patient rooms, offices, a nurse station, a rehabilitation room, storage rooms, showers, and restrooms. Additionally, an internal corridor is featured as part of the facility's layout. As shown in Figure 3-2, *Skilled Nursing Facility Elevations*, the proposed SNF building would establish an architectural presence through emphasis on building finish materials and consistent material usage and color scheme. The proposed SNF building would have a color scheme of brown, beige, and grey with various building finish materials, including stucco, stone veneer, asphalt shingle roof, and aluminum windows.

Psychiatric Health Facility

The converted PHF building would be single-story and approximately 14 feet in height. The proposed PHF building would be setback approximately 10 feet from the western boundary of the site and approximately 10 feet from the site's northern boundary. The 16-bed PHF would total approximately

2,596 SF and would include patient rooms, nurse station, office, dining room, rehabilitation/activity room, showers, and storage rooms. Additionally, an internal corridor is featured as part of the facility's layout. As shown in Figure 3-3, *Psychiatric Health Facility Elevations*, the proposed PHF building would establish an architectural presence through emphasis on building finish materials and consistent material usage and color scheme. The proposed PHF building would be beige and grey with various building finish materials, including stucco, stone veneer, asphalt shingle roof, and aluminum windows.

Parking

Upon implementation of the proposed Project, the expanded Bradley Gardens facility would include a total of 52 passenger vehicle parking spaces, including 4 accessible spaces. The proposed parking spaces would be provided in a surface lot along the northern boundary of the Project site for employees, patients, and visitors. A portion of the parking area would be surfaced with pervious concrete to provide stormwater infiltration, as described under Drainage Improvements below. In addition, up to 3 short-term bicycle parking spaces and 3 long-term bicycle parking spaces would be provided near the entrance to the existing SNF-STP building for a total of 6 bicycle parking spaces.

Landscaping and Fencing

Currently, the Project site includes approximately 36,347 SF of landscaping, which covers approximately 28 percent of the site. The Project proposes an additional 4,015 SF of ornamental landscaping for a total of 40,362 SF of landscaping. With the proposed Project, landscaping would cover approximately 31 percent of the site, as shown in Figures 3-4, *Conceptual Landscape Plan*. Proposed landscaping would include 24-inch box trees, 1-gallon and 5-gallon trees, various shrubs, and succulents in the southeastern corner of the site near the proposed SNF-STP addition. Landscaped areas adjacent to the building would receive rood runoff from disconnected downspouts, as described under Drainage Improvements below.

A 7-foot-tall block wall is proposed along the western boundary of the site, extending from the south of the proposed PHF building to the southern boundary of the site. A 7-foot-tall gate is proposed in the southwestern corner of the Project site to access the fire lane from S. Grand Avenue. The Project would not modify the existing 7-foot-tall chain link fence along the perimeter of the site. Knox padlocks would be provided for all gates.

Recreation and Open Space

Currently, the Project site includes recreation/open space in the form of an outdoor courtyard that is located southwest of the existing SNF building. The Project would feature a common open space between the existing SNF building and the proposed SNF-STP building addition. Recreational amenities would include a concrete walkway, seating areas with chairs and tables, artificial turf, and decorative plants, as shown in Figure 3-4. With the implementation of the proposed Project, recreation/open space would cover approximately 15 percent of the site.

Access and Circulation

Access to the proposed Project would be provided via three driveways. The Project would consolidate the two existing driveways on W. 7th Street that are located along the center of the site’s northern boundary into one 24-foot-wide driveway. The existing driveway on W. 7th Street in the northeastern corner of the

site would be widened to a width of 24 feet. Both these driveways would provide unrestricted ingress and egress for automobiles. In addition, a gated 25-foot-wide driveway is proposed from S. Grand Avenue in the southwest corner of the site to provide emergency vehicle access to the site. A 27.3-foot-wide drive aisle would be constructed in the surface parking lot. A fire access lane would be provided along the southern and eastern sides of the proposed SNF-STP building addition.

Infrastructure Improvements

Water and Sewer Improvements

The Project would install new on-site connections to the existing 12-inch diameter water line in W. 7th Street. The Project would also install new on-site connections to the existing 8-inch diameter sewer line in W. 7th Street.

Drainage Improvements

Stormwater would be collected via a new series of catch basins, inlets, and storm drain lines. The Project site would be divided into two drainage management areas: DMA-1, encompassing the northern parking area and a portion of the building, and DMA-2, encompassing the southern building expansion, fire access lane, and associated landscaping (Appendix H). The Project includes a parking lot with pervious concrete and a fire access lane surfaced with approximately 3,000 square feet of pervious concrete, which would allow for stormwater infiltration. The pervious concrete within the fire access lane would be designed to support an 80,000-pound fire apparatus load. The Project would also incorporate disconnected roof downspouts that would discharge roof runoff to adjacent landscaped areas for infiltration. Site-specific infiltration testing establishes a design infiltration rate of 1.97 inches per hour, inclusive of a factor of safety of 3.0 (Appendix H). Stormwater would be ultimately conveyed to the existing 24-inch storm drain line in W. 7th Street, on the northern boundary of the Project site.

Roadway Improvements

The proposed Project would dedicate 3 feet along the W. 7th Street frontage to widen the right-of-way (ROW) from 50 feet to 53 feet. The Project would also dedicate 6 feet along the S. Grand Avenue frontage to widen the ROW from 33 feet to 39 feet. Additionally, the proposed Project would install 5-foot-wide sidewalks along the Project's frontage on W. 7th Street and S. Grand Avenue.

3.3. CONSTRUCTION

Construction activities would occur over one phase and include demolition, site preparation, grading, building construction, paving, and architectural coatings. Demolition activities are expected to generate approximately five tons of debris. The Project is expected to result in the export of approximately 1,000 cubic yards of soil during the grading phase. No soil import is anticipated to occur during construction. Construction is expected to occur over 12 months, as shown in Table 3-1. Construction would occur within the hours allowed by the City of San Jacinto Municipal Code (SJMC) Section 8.40, which states that construction shall occur only between the hours of 7:00 a.m. and 7:00 p.m. on weekdays and Saturdays, and between the hours of 9:00 a.m. and 6:00 p.m. on Sundays and holidays.

Table 3-1: Construction Schedule

Activity	Start Date	End Date	Total Working Days
Demolition	12/1/2026	12/9/2026	7
Site Preparation	12/10/2026	12/16/2026	5
Grading	12/17/2026	12/23/2026	5
Building Construction	12/24/2026	12/8/2027	250
Paving	12/24/2026	12/30/2026	5
Architectural Coating	11/24/2027	11/30/2027	5

Source: Appendix A

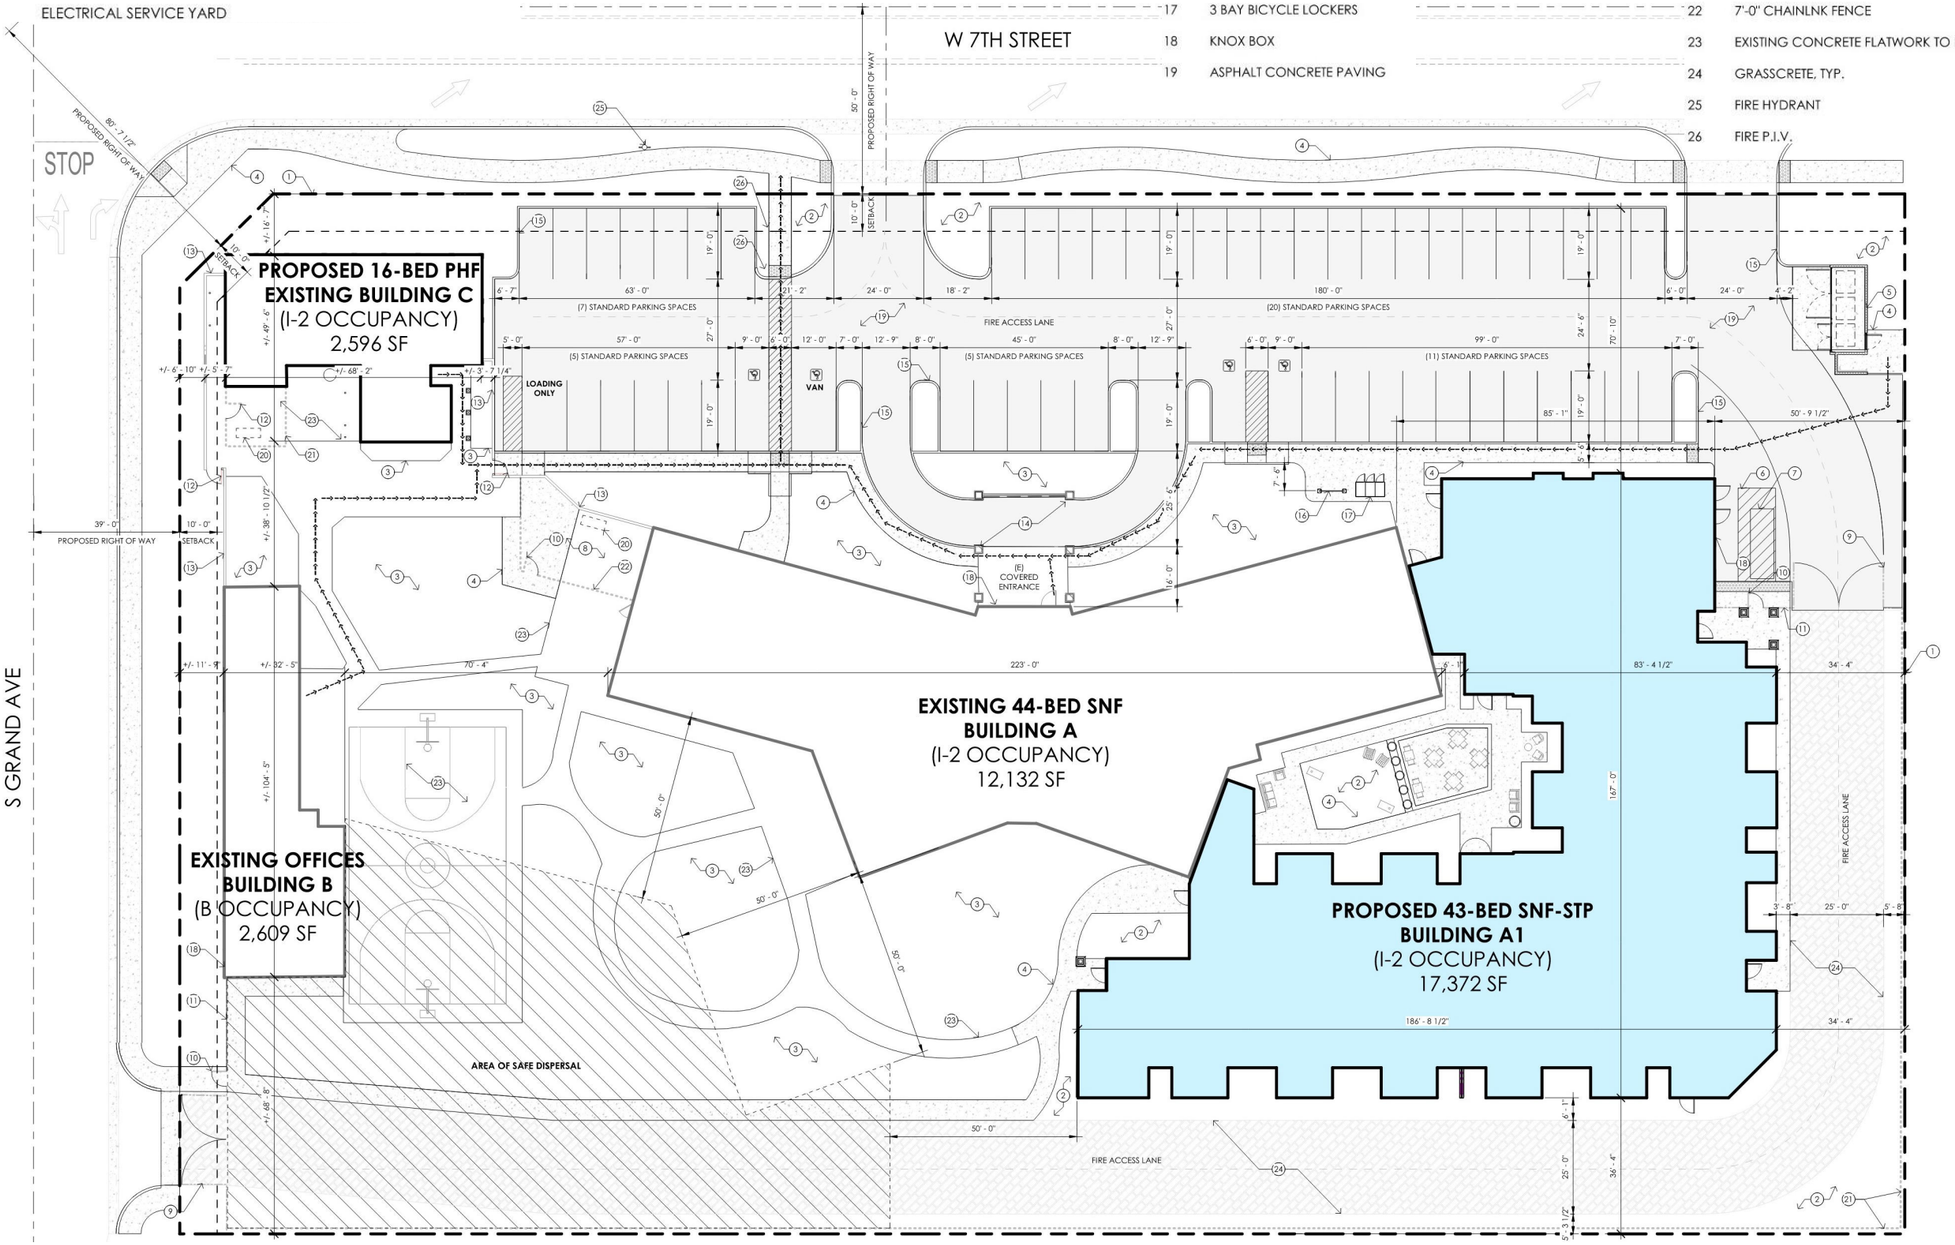
3.4. OPERATIONAL CHARACTERISTICS

The Project is analyzed as a healthcare facility. Typical operational characteristics include employees, patients, and visitors traveling to and from the site. The proposed Project would not change the existing operations of the Bradley Gardens facility, which operates 24 hours a day, seven days a week. The proposed Project would add 100 new employees across all shifts to the existing facility, which currently includes 150 employees, resulting in a total employee count of 250. The existing facility currently has the capacity to serve 44 beds/patients. Implementation of the proposed Project would increase capacity by 59 beds/patients, resulting in a total capacity of 103 beds/patients at the facility.

3.5. DISCRETIONARY APPROVALS AND PERMITS

The City is processing the proposed Project under the legal nonconforming provisions of SJMC Section 17.705.120 (Nonconforming Adjustment). Implementation of the proposed Project would require the following discretionary approvals and permits from the City of San Jacinto and other applicable agencies.

City of San Jacinto (Lead Agency):



- Conditional Use Permit
- Site Plan and Design Review
- Ministerial approvals and permits necessary to implement the proposed Project, including but not limited to, grading permit, building permit, etc.

Responsible Agency:

- State Department of Health Care Access and Information (HCAI): Review and issuance of building permits for the expansion of the SNF.

Figure 3-4: Conceptual Landscape Plan

LANDSCAPE CONCEPT NOTE:

THIS LANDSCAPE WILL CONSIST OF CALIFORNIA-FRIENDLY, LOW AND MEDIUM WATER USE PLANT MATERIAL. ALL PLANTS HAVE BEEN CHOSEN FROM THE LOW OR MEDIUM WATER USE CATEGORY ACCORDING TO WUCOLS. PLANTS HAVE BEEN CHOSEN TO CREATE A UNIFORM THEME ACROSS THE SITE CONSISTING OF MEDITERRANEAN AND CALIFORNIA FRIENDLY PLANT MATERIAL. MAINTENANCE AND LONGEVITY OF PLANT MATERIAL HAS BEEN TAKEN INTO CONSIDERATION. ROOT PANELS AND BARRIERS WILL BE UTILIZED ON ALL TREES NECESSARY, CONSISTENT WITH ALL STANDARDS AND SPECIFICATIONS. A 3" LAYER OF BARK MULCH WILL BE USED IN ALL LANDSCAPE AREAS. ALL LANDSCAPE AREAS WILL CONFORM TO ALL CURRENT LANDSCAPE GUIDELINES.

IRRIGATION CONCEPT NOTE:

THE IRRIGATION DESIGN WILL INCORPORATE THE LATEST IN SMART IRRIGATION TECHNOLOGIES. ALL NEW LANDSCAPE AREAS WILL INCLUDE HIGH EFFICIENCY, LOW WATER USE IRRIGATION EQUIPMENT AND METHODS. A SMART IRRIGATION CONTROLLER WITH A RAIN SHUT OFF DEVICE WILL ALSO BE INCORPORATED. BARK MULCH WILL BE USED TO RETAIN MOISTURE AND REDUCE EVAPORATION AND AN IRRIGATION SCHEDULE WILL BE PROVIDED TO PROGRAM THE CONTROLLER. TWO IRRIGATION SCHEDULES SHALL BE PREPARED, ONE FOR PLANT ESTABLISHMENT AND ONE FOR MAINTENANCE. ALL NEW IRRIGATION SYSTEMS WILL COMPLY WITH ALL CURRENT LANDSCAPE GUIDELINES.

ALL STREET LANDSCAPE WITHIN THE CITY OF SAN JACINTO RIGHT-OF-WAY, LMD/CFD, PARKS, OPEN SPACE AREAS, AND ALL OTHER PUBLIC LANDSCAPE IRRIGATION SYSTEMS SHALL BE INSTALLED WITH CAL-SENSE CONTROLLERS. THE CAL-SENSE CONTROLLER INSTALLATION SHALL INCLUDE THE CONTROLLER ASSEMBLY, FLOW SENSOR, ET GAUGE, AND TIPPING RAIN-BUCKET. CONTROLLER INSTALLATIONS SHALL BE CERTIFIED BY CAL-SENSE.

4. ENVIRONMENTAL CHECKLIST

4.1. BACKGROUND

Project Title: Bradley Gardens Skilled Nursing Facility Expansion Project
Lead Agency: San Jacinto
Lead Agency Contact: Frank Chen, Associate Planner fchen@sanjacintoca.gov (951) 487-7330
Responsible Agency: State Department of Health Care Access and Information (HCAI)
Project Location: The Project site is located at 980 W. 7th Street in the City of San Jacinto, at the southeast corner of the intersection of W. 7th Street and S. Grand Avenue.
Project Sponsor's Name and Address: Corcoran Construction 25690 Madison Avenue Murrieta, California 92562
General Plan and Zoning Designation: The Project site has a General Plan land use designation of Industrial (I) and a zoning designation of light Industrial (IL).
Project Description: The Project is proposing a CUP the expansion of the existing 44-bed Bradley Gardens facility to a total of 103 beds. The Project includes demolition of the existing 1,074 SF maintenance and storage building located in the southeastern corner of the site for construction of an expansion to the existing 44-bed SNF building. The proposed building addition would total approximately 17,372 SF and would provide 43 additional SNF and STP beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building located in the northwestern corner of the site into a 16-bed PHF. The Project would not modify the existing 2,609 SF administrative office building along the western boundary of the site. The proposed Project would result in an FAR of 0.27. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, parking lot, and driveways.
Surrounding Land Uses and Setting: North: W. 7th Street followed by a metal fabrication plant West: S. Grand Avenue followed by Vacant land South: Vacant land East: Vacant land

Southwest: S. Grand Avenue followed by residences
Other Public Agencies Whose Approval is Required: None

4.2. ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The subject areas checked below were determined to be new significant environmental effects or to be previously identified effects that have a substantial increase in severity either due to a change in project, change in circumstances or new information of substantial importance, as indicated by the checklist and discussion on the following pages.

☐	Aesthetics	☐	Agriculture/Forestry Resources	☐	Air Quality
☒	Biological Resources	☒	Cultural Resources	☐	Energy
☒	Geology/Soils	☐	Greenhouse Gas Emissions	☐	Hazards/Hazardous Materials
☐	Hydrology/Water Quality	☐	Land Use/Planning	☐	Mineral Resources
☐	Noise	☐	Population/Housing	☐	Public Services
☐	Recreation	☐	Transportation	☐	Tribal Cultural Resources
☐	Utilities and Service Systems	☐	Wildfire	☒	Mandatory Findings of Significances

4.3. DETERMINATION

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARACTION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a “potentially significant” or “potentially significant unless mitigated” impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier analysis pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature	9/14/2026 Date
Frank Chen Associate planner Name and Title	City of San Jacinto Lead Agency

4.4. EVALUATION OF ENVIRONMENTAL IMPACTS

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
2. All answers must take account of the whole action involved, including offsite as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.
4. "Negative Declaration: Potentially Significant Unless Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analysis," as described in (5) below, may be cross-referenced).
5. Earlier analysis may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Guidelines Section 15063 (c)(3)(d). In this case, a brief discussion should identify the following:

Earlier Analysis Used. Identify and state where they are available for review.

Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
7. Supporting Information Sources: A source list should be attached, and other sources used, or individuals contacted should be cited in the discussion.
8. This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.

9. The analysis of each issue should identify: (a) the significance criteria or threshold used to evaluate each question; and (b) the mitigation measure identified, if any, to reduce the impact to less than significance.

5. ENVIRONMENTAL ANALYSIS

This section provides evidence to substantiate the conclusions in the environmental checklist.

5.1. AESTHETICS

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☐	☒
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☒

a) Have a substantial adverse effect on a scenic vista?

Less Than Significant Impact.

Scenic vistas consist of expansive, panoramic views of important, unique, or highly valued visual features that are seen from public viewing areas. This definition combines visual quality with information about view exposure to describe the level of interest or concern that viewers may have for the quality of a particular view or visual setting. The City of San Jacinto General Plan Update Environmental Impact Report (GPU EIR) identifies that scenic resources in the City of San Jacinto include the Lakeview Mountains to the west, the San Jacinto Mountain foothills to the northeast, and the San Timoteo badlands to the northwest (City of San Jacinto, 2022b).

The Project site is developed and currently operates as the Bradley Gardens facility. Distant views of the Lakeview Mountains and San Jacinto Mountains are available from public vantage points on W 7th Street and S Grand Avenue. The proposed Project includes demolition of the existing 1,074 SF maintenance and storage building located in the southeastern corner of the site for constructing an expansion to the existing 44-bed SNF building. The proposed building addition would total approximately 18,000 SF and would provide 43 additional SNF and STP beds, resulting in a total capacity of 87 beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building located in the northwestern corner of the site into a 16-bed PHF. The proposed SNF-STP building would be single-story and have a maximum

height of 22 feet, measured from finish grade to top of highest roof ridges. The converted PHF building would be single-story and approximately 14 feet in height.

While development of the proposed Project would alter existing foreground views of the developed Project site, the Project would remain within an existing healthcare campus and would not encroach into or obstruct existing long-distance public views available from surrounding roadways. The proposed SNF-STP building would be setback approximately 34.3 feet from the eastern boundary of the site, approximately 36.3 feet from the southern boundary of the site, and approximately 71.75 feet from the site's northern boundary. The proposed PHF building would be setback approximately 10 feet from the western boundary of the site and approximately 10 feet from the site's northern boundary.

Although the Project would increase building massing and site coverage, the new one-story structures would be consistent with the existing low-rise institutional development pattern on-site. Thus, the Project would not encroach upon public views of the mountains of pedestrians and motorists along these roadways. The proposed Project is consistent with the City's development standards for the existing land use and zoning designation of the Project site, and therefore, the Project would result in less than significant impacts on scenic vistas (distant mountain views).

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact.

The proposed Project would not damage any scenic resources or historic buildings within a state scenic highway. The Project site is currently developed and surrounded by vacant land, industrial development, and residential development. The GPU EIR details that there are no officially designated State Scenic Highways in the City of San Jacinto (City of San Jacinto, 2022b). The nearest officially designated State Scenic Highway is SR 243, located approximately 8.12 miles southeast of the Project site (Caltrans, 2018). The nearest Eligible State Route Scenic Highway is SR 74, located approximately 2.21 miles south of the Project site (Caltrans, 2018).

The Project site is not visible from either SR 243 or SR 74; therefore, the Project would not substantially damage scenic resources, including trees, rock outcroppings, and historic buildings within a State Scenic Highway. Therefore, no impacts to scenic resources within a state scenic highway would occur.

c) In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Less Than Significant Impact.

The Project is located in an urbanized area within the City of San Jacinto. As described previously in Section 2, *Environmental Setting*, the Project site has an existing land use designation of Industrial (I) and a zoning designation of IL. Table AES-1 below compares the Project's consistency with San Jacinto Development Code (SJDC) standards for industrial development within the IL zone.

Table AES-1: Consistency with San Jacinto Development Code Standards

Development Features	Development Standard for IL	Proposed Project
Maximum FAR	0.50	0.27
Maximum Building Height	45 feet	Less than 30 feet
Minimum Front Setback Adjacent to Residential	50 feet	68 feet
Minimum Interior Side Setback Abutting Non-residential	10 feet	10 feet
Minimum Side Street Setback Abutting nonresidential	10 feet	10 feet*
Minimum Rear Setback Abutting nonresidential	none	36 feet
Minimum Parking Spaces Congregate Care Facility (15 or more): 1 space for each on duty employee and 1 space for each 10 beds	52	52
Maximum Impervious Surface Coverage	80%	76%

* There are no abutting residential, however side setback is a minimum of 10 feet along the west property line and 34 feet along the east property line

As shown in Table AES-1, the Project would be consistent with the SJDC development standards for the IL zone and would not conflict with an applicable zoning regulation related to scenic quality. In addition, the Project would install an additional 4,015 SF of ornamental landscaping including 24-inch box trees, 1-gallon and 5-gallon trees, various shrubs, and succulents in the southeastern corner of the site near the proposed SNF-STP addition. Therefore, impacts related to conflict with applicable zoning and other regulations governing scenic quality would be less than significant.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less Than Significant Impact.

Spill light occurs when lighting fixtures such as streetlights, parking lot lighting, exterior building lighting, and landscape lighting are not properly aimed or shielded to direct light to the desired location and light escapes and partially illuminates a surrounding location. Sensitive uses (e.g., residential uses) surrounding the Project site to the southwest could be impacted by the light from development within the boundaries of the Project site if light spill occurs.

Glare is the result of improperly aimed or blocked lighting sources that are visible against a dark background such as the night sky. Glare may also refer to the sensation experienced looking into an excessively bright light source that causes a reduction in the ability to see or causes discomfort. Glare generally does not result in illumination of off-site locations but results in a visible source of light viewable from a distance. Glare could also occur from building materials of the new structures, including glass and other reflective materials.

As described above, the Project site is currently developed and is surrounded by existing sources of nighttime lighting including illumination from vehicle headlights along W. 7th Street and S. Grand Avenue, security lighting from adjacent uses, and from interior illumination from nearby residential homes passing through windows. Sensitive receptors relative to lighting and glare include residents, motorists, and pedestrians.

The Project would introduce new sources of light from new building lighting, exterior lighting, interior lights shining through building windows, and headlights from nighttime vehicular trips generated from the Project. However, consistent with SJDC Section 17.300.080, *Outdoor Light and Glare*, all Project lighting would be directed downward and shielded so as not to spill over onto neighboring properties. Compliance with the SJDC would be implemented through the construction permitting and plan check process. Therefore, with compliance with the SJDC lighting provisions, impacts related to increased sources of light would be less than significant.

Glare in the Project vicinity is generated by building and vehicle windows reflecting light. However, there are no substantial buildings or structures near the Project site that presently generate substantial glare since most of the buildings are one or two-story structures that are constructed of non-reflective materials and are not surfaced with a substantial number of windows adjacent to one another that would create a large reflective area.

The proposed building materials do not consist of highly reflective materials. Additionally, lights installed at the site would be shielded consistent with SJDC requirements. The proposed Project would create limited new sources of light or glare from security and site lighting but would not adversely affect day or nighttime views in the area given the similarity of the existing lighting in the surrounding urbanized environment. With implementation of the regulatory requirements per SJDC Section 17.300.080, included as PPP AES-1, impacts related to light and glare would be less than significant.

Existing Plans, Programs, or Policies

PPP AES-1: Glare and Outdoor Lighting Standards. The Project is required to comply with San Jacinto Development Code Section 17.300.080 which requires all exterior lighting to be shielded or modified and located so as to eliminate spillover illumination or glare beyond the property line or upward into the sky.

Mitigation Measures

None.

5.2. AGRICULTURE AND FORESTRY RESOURCES

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and the forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact.

The State of California Department of Conservation's Farmland Mapping and Monitoring Program is charged with producing maps for analyzing impacts on the state's agricultural resources. California's agricultural lands are rated based on soil quality and irrigation status. For CEQA purposes, the following categories qualify as "agricultural land": Prime Farmland, Farmland of Statewide Importance, Unique

Farmland, Farmland of Local Importance, and Grazing Land. Per Section 21060.1 of the State CEQA Guidelines, Farmland of Local Importance and Grazing Land are not considered Farmland.

The State of California Farmland Mapping and Monitoring Program and Figure 5.2-1, *Important Farmlands Map*, of the GPU EIR indicate that there is no Prime Farmland, Unique Farmland or Farmland of Statewide Importance on the Project site (California Department of Conservation, 2022; City of San Jacinto, 2022b). The Project site is designated as "Urban and Built-Up Land" (California Department of Conservation, 2022). Additionally, the Project site is already developed and is not currently used for agricultural purposes. The site is designated for industrial development under the General Plan and is surrounded by existing roadways, vacant land, industrial development, and residential development. Given that the Project site is not being used for agricultural use, and that no Prime Farmland, Unique Farmland or Farmland of Statewide Importance has been identified within the Project site, implementation of the proposed Project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use. Therefore, the Project would result in no impacts on conversion of important farmland to non-agricultural use.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact.

As identified previously, the Project site has an existing General Plan land use designation of Industrial (I) and a zoning designation of Industrial Light (IL). Additionally, as shown in Figure 5.2-2, *Agriculture Preserve Lands,* of the GPU EIR, the Project site is not agriculturally preserved or subject to a Williamson Act contract (City of San Jacinto, 2022b). Therefore, the Project would not result in a conflict with existing zoning for agricultural use or a Williamson Act contract. Thus, the proposed Project would not result in impacts related to conflict with an existing agricultural zoning or Williamson Act contract, and impacts would not occur.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact.

"Forest land" is defined as "land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits." "Timberland" is defined as "land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products, including Christmas trees." "Timberland Production Zone" (TPZ) is defined as "an area which has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, as defined in subdivision (h)."

The Project site consists of developed land occupied by the existing Bradley Gardens facility. No forest land exists on or adjacent to the Project site. The Project site has an existing zoning designation of IL; as such, it is not zoned for forest land or timberland uses. Therefore, the Project would result in no impacts related to conflicts with existing forest land or timberland zoning.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

No Impact.

The Project site consists of developed land occupied by the existing Bradley Gardens facility. No forest land exists on or adjacent to the Project site. Therefore, the proposed Project would result in no new impacts related to the conversion of forest land to non-forest use.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

No Impact.

As identified above, the Projects site is not classified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance by the California Department of Conservation's California Important Farmland Finder Map. The Project site is developed and not currently used for agricultural purposes, is not adjacent to agricultural uses, and is designated Industrial under the City's General Plan with an IL zoning designation. The site, and the surrounding area, do not contain forest lands and are not currently designated or zoned for forest land. The Project site and the surrounding vacant lands are designated for urban and industrial uses. Additionally, the proposed Project would not convert farmland to a nonagricultural use or convert forest land to a non-forest use. Therefore, no impacts would occur, and the Project would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland to non-agricultural use or conversion of forest land to non-forest use.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.3. AIR QUALITY

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
f) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
g) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non- attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
h) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
i) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

a) Conflict with or obstruct implementation of the applicable air quality plan?

Less than Significant Impact.

The Project site is located in the South Coast Air Basin (SCAB) and is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The SCAQMD and the Southern California Association of Governments (SCAG) are responsible for preparing the Air Quality Management Plan (AQMP), which addresses federal and state Clean Air Act (CAA) requirements. The AQMP details goals, policies, and programs for improving air quality in the SCAB. In preparation of the AQMP, SCAQMD and SCAG uses regional growth projections to forecast, inventory, and allocate regional emissions from land use and development-related sources. For purposes of analyzing consistency with the AQMP, if a proposed Project would result in growth that is substantially greater than what was anticipated, then the proposed Project would conflict with the AQMP. On the other hand, if a project's density is within the anticipated growth of a jurisdiction, its emissions would be consistent with the assumptions in the AQMP, and the Project would not conflict with SCAQMD's attainment plans (Consistency Criterion 1). In addition, the SCAQMD considers a project consistent with the AQMP if the project would not result in an increase in the frequency or severity of existing air quality violations or cause a new violation (Consistency Criterion 2).

Furthermore, the SCAB is in a non-attainment status for federal ozone standards, and state and federal particulate matter standards. The SCAB has a maintenance status for federal PM_{10} standards. Any development in the SCAB, including the proposed Project, could cumulatively contribute to these pollutant violations. Should construction or operation of the proposed Project exceed these thresholds, a significant impact could occur; however, if estimated emissions are less than the thresholds, impacts would be considered less than significant.

The Project site has a General Plan Land Use designation of Industrial (I) and a zoning designation of Industrial Light (IL). The proposed Project includes demolition of the existing 1,074 SF maintenance and storage building for construction of a new 18,000 SF building addition to the existing SNF. In addition, the

Project proposes the conversion of the existing 2,596 SF vacant office building into a 16-bed PHF. The proposed Project represents the expansion of an existing health care facility. Given that it does not propose the development of housing, the Project would not directly generate a permanent residential population. The existing Bradley Gardens facility has a total of 150 employees, and the proposed Project would add 100 new employees, resulting in a total of 250 employees. The employees that would fill these roles are anticipated to come from within the City or the region.

Further, the proposed Project would result in a FAR of 0.27, which is within the maximum allowable FAR of 0.50 in the IL zone. Thus, the proposed Project would not induce population growth or growth in the area. Thus, implementation of the Project would not exceed the growth assumptions for the Project site. As a result, the proposed Project would be consistent with Consistency Criterion No. 1.

As discussed below, the emissions generated by the construction and operation of the proposed Project would not exceed applicable SCAQMD regional thresholds, and the Project would not result in an increase in the frequency or severity of existing air quality violations or cause a new violation. As such, the proposed Project would be consistent with Consistency Criterion No. 2. Therefore, impacts related to conflict with the AQMP from the proposed Project would be less than significant.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Less than Significant Impact.

The SCAB is in non-attainment status for federal ozone standards, and state and federal particulate matter standards. The SCAB is designated as a maintenance area for federal PM_{10} standards. Any development in the SCAB, including the proposed Project, could cumulatively contribute to these pollutant violations. Evaluation of the cumulative air quality impacts of the proposed Project has been completed pursuant to SCAQMD's cumulative air quality impact methodology. SCAQMD states that if an individual project results in air emissions of criteria pollutants (ROG, CO, NOx, SOx, PM_{10}, and $PM_{2.5}$) that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then it would also result in a cumulatively considerable net increase of the criteria pollutant(s) for which the Project region is in non-attainment under an applicable federal or state ambient air quality standard. SCAQMD has established daily mass thresholds for regional pollutant emissions, which are shown in Table AQ-1.

Table AQ-1: SCAQMD Regional Daily Emissions Thresholds

Air Pollutant	Maximum Daily Emissions (pounds/day)	
	Construction	Operation
ROGs	75	55
NOx	100	55
CO	550	550
SO_2	150	150
PM_{10}	150	150
$PM_{2.5}$	55	55

ROG = reactive organic gases; NOx = nitrogen oxides; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter, 10 microns in diameter; $PM_{2.5}$ = particulate matter, 2.5 microns in diameter
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Construction

Construction activities associated with the proposed Project are expected to take place over 12 months and would generate pollutant emissions from the following: (1) demolition, (2) site preparation, (3) grading, (4) building construction, (5) paving, and (6) architectural coating. The amount of emissions generated on a daily basis would vary, depending on the intensity and types of construction activities occurring.

It is mandatory for all construction projects to comply with several SCAQMD Rules, including Rule 403 for controlling fugitive dust, PM_{10}, and $PM_{2.5}$ emissions from construction activities. Rule 403 requirements include, but are not limited to, applying water in sufficient quantities to prevent the generation of visible dust plumes, applying soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the Project site, covering all trucks hauling soil with a fabric cover and maintaining a freeboard height of 12 inches, and maintaining effective cover over exposed areas.

Compliance with SCAQMD Rule 403, included as PPP AQ-1, was accounted for in the construction emissions modeling. In addition, implementation of SCAQMD Rule 1113, included as PPP AQ-2, which governs the VOC content in architectural coating, paint, thinners, and solvents was accounted for in construction emissions modeling. As shown in Table AQ-2, the California Emissions Estimator Model (CalEEMod) Version 2022.1 results indicate that construction emissions generated by the proposed Project would not exceed SCAQMD regional thresholds. Therefore, construction activities would result in a less than significant impact.

Table AQ-2: Regional Construction Emission Estimates

Emissions	Maximum Daily Regional Emissions (pounds/day)					
	ROG	**NOx**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
Maximum Daily Emissions (2026)	2.3	15.6	23.5	<0.01	3.2	1.7
Maximum Daily Emissions (2027)	52.7	11.3	17.5	<0.01	1.6	0.6
Maximum Daily Emission (2026-2027)	**52.7**	**15.6**	**23.5**	**<0.01**	**3.2**	**1.7**
SCAQMD Significance Thresholds	75	100	550	150	150	55
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: ROG = reactive organic gases; NOx = nitrogen oxides; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter, 10 microns in diameter; $PM_{2.5}$ = particulate matter, 2.5 microns in diameter
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Operation

Implementation of the proposed Project would result in long-term regional emissions of criteria air pollutants and ozone precursors associated with area sources, such as natural gas consumption, landscaping, applications of architectural coatings, and consumer products. Operation of the proposed Project would include emissions from vehicles traveling to the Project site and from vehicles in the parking lots and loading areas. The proposed Project would generate an additional 181 daily trips including 8 trips during the AM peak hour and 13 trips during the PM peak hour according to the Vehicle Miles Traveled (VMT) Screening Analysis (Appendix K). Area source emissions would occur from operation of the expanded SNF.

Operational emissions associated with the existing facility and proposed Project were modeled using CalEEMod Version 2022.1 land use emission model. Operational emissions for the existing facility, the proposed Project, and the resulting net Project emissions are presented in Table AQ-3, *Regional Operational Emission Estimates*. Net Project emissions represent the increase in emissions attributable to the proposed Project and were calculated by subtracting the existing operational operations from the proposed Project operational emissions. The net project emissions were compared to the SCAQMD regional operational significance thresholds to evaluate project impacts. As shown, the net Project emissions would result in long-term regional emissions below the SCAQMD's applicable thresholds. Therefore, operation of the proposed Project would not exceed the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS), would not result in a cumulatively considerable net increase of any criteria pollutant, and impacts would be less than significant.

Table AQ-3: Regional Operational Emission Estimates

Operational Activity	Maximum Daily Regional Emissions (pounds/day)					
	ROG	**NOx**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
Mobile	1.2	1.3	12.3	<0.01	3.1	0.8
Area	1.4	0.1	6.0	<0.01	<0.01	<0.01
Energy	<0.01	0.4	0.2	<0.01	<0.01	<0.01
Total Proposed Project Operational Emissions	**2.6**	**1.8**	**18.5**	**<0.01**	**3.1**	**0.8**
Existing Operational Emissions	1.1	0.8	7.9	<0.01	1.3	0.4
Net Project Operational Emissions	**1.5**	**1.0**	**10.6**	**<0.01**	**1.8**	**0.4**
SCAQMD Significance Thresholds	55	55	550	150	150	55
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: ROG = reactive organic gases; NOx = nitrogen oxides; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter, 10 microns in diameter; $PM_{2.5}$ = particulate matter, 2.5 microns in diameter
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

c) Expose sensitive receptors to substantial pollutant concentrations?

Less than Significant Impact.

The SCAQMD's *Final Localized Significance Threshold Methodology* (SCAQMD, 2008) recommends the evaluation of localized NOx, CO, PM_{10}, and $PM_{2.5}$ construction-related impacts to sensitive receptors in

the immediate vicinity of the Project site. Such an evaluation is referred to as a localized significance threshold (LST) analysis. According to the SCAQMD's *Final Localized Significance Threshold Methodology*, "off-site mobile emissions from the Project should not be included in the emissions compared to the LSTs" (SCAQMD, 2008). The SCAQMD has developed LSTs that represent the maximum emissions from a Project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards, and thus would not cause or contribute to localized air quality impacts. LSTs are developed based on the ambient concentrations of NOx, CO, PM_{10}, and $PM_{2.5}$ pollutants for each of the 38 source receptor areas (SRAs) in the Basin. The Project site is located within SRA 28 (Hemet/ San Jacinto Valley).

Sensitive receptors can include residences, schools, playgrounds, childcare centers, athletic facilities. The nearest sensitive receptor is a single-family residence located approximately 90 feet (27 meters) north of the Project site across W. 7th Street. As the nearest sensitive receptor is located approximately 27 meters (90 feet) from the Project site, the minimum (most stringent) 25-meter receptor distance is used for evaluation of localized impacts to provide a conservative analysis.

Construction

Construction of the proposed Project may expose nearby sensitive receptors to airborne particulates as well as a small quantity of construction equipment pollutants (i.e., usually diesel-fueled vehicles and equipment). However, construction contractors would be required to implement measures to reduce or eliminate emissions by following SCAQMD's standard construction practices. SCAQMD Rule 402 (included as PPP AQ-3) requires implementation of dust suppression techniques to prevent fugitive dust from creating a nuisance off site. SCQMD Rule 403 (PPP AQ-1) requires that fugitive dust be controlled with best available control measures so that the presence of such dust does not remain visible in the atmosphere beyond the property line of the emission source. As shown in Table AQ-4, *Localized Construction Emission Estimates*, Project construction-source emissions would not exceed SCAQMD LSTs and impacts would be less than significant.

Table AQ-4: Localized Construction Emission Estimates

Construction Activity	Maximum Daily Localized Emissions (pounds/day)			
	NOx	CO	PM_{10}	$PM_{2.5}$
2026				
Demolition	10.9	10.8	0.4	0.4
Site Preparation	13.4	13.2	2.7	1.5
Grading	13.4	13.2	2.7	1.5
Building Construction	9.9	11.5	0.3	0.3
Building Construction and Paving	14.9	18.7	0.6	0.5
Maximum On-site Emission (2026)	***14.9***	***18.7***	***2.7***	***1.5***
2027				
Building Construction	9.5	11.4	0.3	0.3
Paving	10.6	12.9	0.3	0.3
Architectural Coating	1.1	1.5	<0.01	<0.01

Construction Activity	Maximum Daily Localized Emissions (pounds/day)			
	NOx	CO	PM_{10}	$PM_{2.5}$
Maximum On-site Emission (2027)	***10.6***	***12.9***	***0.3***	***0.3***
Maximum On-site Emissions (2026-2027)	**14.9**	**18.7**	**2.7**	**1.5**
SCAQMD Screening Thresholds	198.0	925.0	5.5	3.5
Threshold Exceeded?	**No**	**No**	**No**	**No**

Notes: NOx = nitrogen oxides; CO = carbon monoxide; PM_{10} = particulate matter, 10 microns in diameter; $PM_{2.5}$ = particulate matter, 2.5 microns in diameter
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Operation

According to the SCAQMD LST methodology, LSTs apply to Project on-site emissions of stationary and on-site mobile sources. Projects that involve mobile sources that spend extended periods queuing and idling at a site, such as transfer facilities or warehousing and distribution buildings, have the potential to exceed the operational LSTs. The proposed Project would not involve vehicles idling or queueing for extended periods. Therefore, due to the lack of significant stationary source emissions or idling diesel-powered vehicles, impacts related to operational LSTs are presumed to be less than significant.

Construction Health Risk Assessment

In addition to criteria pollutant emissions, construction of the proposed Project would generate diesel particulate matter (DPM) emissions from the exhaust of off-road, heavy-duty diesel construction equipment used during demolition, site preparation, grading, building construction, paving, and architectural coating activities, as well as from on-road haul, vendor, and worker vehicles traveling to and from the Project site. DPM has been identified as a toxic air contaminant (TAC) by the California Air Resources Board (CARB). Because sensitive receptors are located in proximity to the Project site, a Construction Health Risk Assessment was prepared for the proposed Project (included as Appendix B) to evaluate the potential carcinogenic and non-carcinogenic health risks to nearby receptors resulting from exposure to Project construction-source DPM emissions.

The City of San Jacinto has not adopted a numerical significance threshold for cancer risk or non-cancer chronic health risk impacts; therefore, the SCAQMD's significance thresholds were used.

The SCAQMD recommends using a risk level of 10 in one million as the cancer risk threshold. A risk level of 10 in one million implies a likelihood that up to 10 people, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. Non-cancer health risks are conveyed in terms of the Hazard Index (HI). A ratio of the predicted concentration of the facility's reported TAC emissions to a concentration is considered acceptable to public health professionals. A significant risk is defined as an HI of 1 or greater.

The SCAQMD defines a sensitive receptor as any residence, including private homes, condominiums, apartments, and living quarters, schools, preschools, daycare centers, and health facilities such as hospitals or retirement and nursing homes. For purposes of this HRA, sensitive receptors were placed within the air dispersion model at the locations of the closest existing residences and other establishments or residences nearest to the Project site that qualify as sensitive receptors. In addition, a uniform grid

network of receptors was placed over the Project vicinity to complete the receptor network. The nearest off-site sensitive receptor is a single-family residential structure located approximately 90 feet (27 meters) north of the Project site, across W. 7th Street, which was identified as the most impacted sensitive receptor during the construction of the Project. The nearest off-site worker receptor is Talley Metal Fabrication, located at 989 W 7th St, San Jacinto, CA, approximately 107 feet (33 meters) north of the Project site.

As shown in Table AQ-5, *Construction Health Risk Results*, the estimated maximum cancer risk attributable to construction of the proposed Project would be 4.88 in one million at the maximally impacted sensitive/residential receptor and 0.13 in one million at the maximally impacted worker receptor, both of which are below the SCAQMD significance threshold of 10 in one million. The maximum chronic non-cancer HI during construction would be 0.01 for both the maximally impacted sensitive receptor and the maximally impacted worker receptor, which is below the SCAQMD significance threshold of 1.0. Thus, the construction of the Project would have a less-than-significant impact for both cancer risk and chronic non-cancer impacts.

Table AQ-5: Construction Health Risk Results

Receptor	Cancer Risk (per million)		Threshold Exceeded?
	Maximum Lifetime Project Risk	SCAQMD Significance Threshold	
Maximum Impacted Sensitive Receptor - Cancer Risk (Prebirth to 1.02 Years)	4.88 in one million	10 in one million	**No**
Maximum Impacted Sensitive Receptor - Cancer Risk (Adult, 1.02 Years)	0.18 in one million	10 in one million	**No**
Maximum Impacted Worker Receptor - Cancer Risk (1.02 Years)	0.13 in one million	10 in one million	**No**
Receptor	**Chronic Non-Cancer Hazard Index**		**Threshold Exceeded?**
	Maximum Lifetime Project Risk	**SCAQMD Significance Threshold**	
Maximum Impacted Sensitive Receptor	0.01	1.0	**No**
Maximum Impacted Worker Receptor	0.01	1.0	**No**

Source: Construction Health Risk Assessment (Appendix B)

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Less than Significant Impact.

The proposed Project would not generate any other emissions that were not described previously. The Project site does not contain land uses typically associated with emitting objectionable odors. According to the SCAQMD CEQA Air Quality Handbook, land uses associated with odor issues include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting activities,

refineries, landfills, dairies, and fiberglass molding operations. The proposed Project would expand an existing SNF, which would not involve the types of uses that lead to odors.

Potential odor sources associated with the proposed Project may result from construction equipment exhaust and the application of asphalt and architectural coatings during construction activities and the temporary storage of typical solid waste (refuse) associated with the proposed Project's operational uses. The proposed Project would also be required to comply with SCAQMD Rule 402 (included as PPP AQ-3) to prevent occurrences of public nuisance odors. Standard construction requirements would minimize odor impacts from construction. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of construction; thus, impacts would be less than significant.

Existing Plans, Programs, or Policies

PPP AQ-1: SCAQMD Rule 403. The Project is required to comply with the provisions of South Coast Air Quality Management District (SCAQMD) Rule 403, which includes the following:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Project are watered, with complete coverage of disturbed areas, at least 3 times daily during dry weather; preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and Project site areas are reduced to 15 miles per hour or less.

PPP AQ-2: SCAQMD Rule 1113. The Project is required to comply with the provisions of South Coast Air Quality Management District Rule (SCAQMD) Rule 1113. Only "Low-Volatile Organic Compounds" paints (no more than 50 gram/liter of VOC) and/or High Pressure Low Volume (HPLV) applications shall be used.

PPP AQ-3: SCAQMD Rule 402. The Project is required to comply with the provisions of South Coast Air Quality Management District (SCAQMD) Rule 402. The Project shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Mitigation Measures

None.

5.4. BIOLOGICAL RESOURCES

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☒	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☒	☐

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Wildlife or U.S. Fish and Wildlife Service?

Less Than Significant Impact with Mitigation. The Biological Resources Assessment prepared for the Project, included as Appendix C, determined that the Project site is fully developed and does not support native habitat. According to a review of the California Natural Diversity Database (CNDDB) and the California Native Plant Society (CNPS), 12 special-status plant species, 69 special-status wildlife species, and four special-status plant communities with potential to occur within the San Jacinto quadrangle.

However, a field survey conducted on February 6, 2026, did not identify any special-status plant species, wildlife species, or sensitive plant communities onsite.

Special-status species were evaluated based on habitat requirements, known distributions, and the availability of suitable habitat on-site. The Biological Resources Assessment determined that the Project site has moderate potential to support Cooper's Hawk (*Astur cooperii*) (Appendix C). The Project site was determined to have no potential to support any of the other special-status wildfire species.

No species with potential to occur on-site are listed as threatened or endangered under the federal or State Endangered Species Acts. However, nesting birds are protected under the federal Migratory Bird Treaty Act (MBTA) and Sections 3503, 3503.5, 3511, and 3513 of the California Fish and Game Code. Given the potential for special-status avian species to occur on-site, MM BIO-1: Pre-construction Nesting Bird

Survey is included to avoid impacts to nesting birds during construction activities.

Under MM BIO-1, prior to issuance of a grading permit or any ground disturbance permit, the applicant shall submit to, and receive approval from, the City: (1) evidence that a qualified biologist has been retained with a scope of work covering the survey and monitoring requirements of this measure, and (2) the biologist's written confirmation that the protocol below will be implemented. No such permit shall be issued for work occurring between February 1 and August 31 until both items are approved.

A qualified biologist shall conduct a preconstruction nesting bird clearance survey within three days prior to any ground-disturbing or vegetation removal activities occurring between February 1 and August 31. If no active nests are found, the biologist shall prepare a brief letter report documenting the negative findings. If active nests are present, a no-disturbance buffer shall be established, with the distance determined by the biologist based on site-specific conditions including noise levels, visibility, and species sensitivity. Construction activities shall be restricted within the buffer zone until the young have fledged and the nest is no longer active. Buffers shall be clearly marked in the field, and construction personnel will be instructed to avoid those areas. A biological monitor shall oversee compliance with the buffer and monitor nesting behavior to ensure construction activities do not result in adverse impacts. With implementation of this measure, impacts to special-status avian species would be less than significant.

The Project site is located within the San Jacinto Valley Area Plan of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) but is not located within a Criteria Cell, designated conservation area, or MSHCP designated survey areas (Appendix C). Thus, implementation of the Project would not result in a substantial adverse effect on any candidate, sensitive, or special-status species.

Therefore, with implementation of MM BIO-1, impacts would be less than significant.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

No Impact.

The Biological Resources Assessment describes that the Project site does not contain any drainage, riparian, or riverine features (Appendix C). There are no California Department of Fish and Wildlife (CDFW), United States Army Corps of Engineers (USACE), or Regional Water Quality Control Board (RWQCB) jurisdictional waters within the Project site boundaries. The Project area does not contain any

wetlands or vernal pools. As previously described, the Project site is fully developed and disturbed. The Project site is not located with federally designated Critical Habitat. The nearest designated Critical Habitat to the site is located approximately 2.5 miles to the east for San Bernardino Merriam's kangaroo rat (*Dipodomys merriami parvus*) and is separated from the Project site by existing development. Therefore, the Project would not result in impacts related to riparian habitat or other sensitive natural community.

c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact.

No jurisdictional drainage and/or wetland features were observed on the Project site during the field investigation (Appendix C). During field investigation, a roadside ditch was observed along the northern boundary of the site, on the southern shoulder of W. 7th Street. The Biological Assessment found that the roadside ditch was constructed to convey some flows off the road, does not qualify as jurisdictional, and does not fall under the regulatory authority of the CDFW, United States Army Corps of Engineers, or the RWQCB (Appendix C). Therefore, the proposed Project would not affect State or federally protected wetlands. No impact would occur.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less Than Significant Impact with Mitigation.

Wildlife corridors are linear features that connect areas of open space and provide avenues for the migration of animals and access to additional areas of foraging. The Project site has not been identified as supporting a wildlife migratory corridor or linkage. The nearest Western Riverside County Regional Conservation Authority (RCA)-conserved lands are located approximately 2.5 miles east of the Project site, within the San Jacinto River Soboba area, which provides opportunities for wildlife movement through the region (Appendix C). However, the Project site is separated from the RCA conserved lands by existing development and high traffic roadways. Additionally, areas within the RCA conserved lands are covered under the MSHCP plans for conservation. Further, the Project site contains developed land. Therefore, implementation of the proposed Project would result in no impacts related to wildlife movement corridors or linkages.

However, the Project site contains existing ornamental trees that could be used for nesting by common bird species that are protected by the federal MBTA and the California Fish and Game Code Sections 3503.5, 3511, and 3515 during the avian nesting and breeding season that occurs between February 1 and August 31. The provisions of the MBTA prohibit disturbing or destroying active nests. Therefore, if vegetation is required to be removed during the nesting bird season, MM BIO-1 has been included to require a nesting bird survey within three days prior to any ground-disturbing or vegetation removal activities occurring. With implementation of Mitigation Measure BIO-1, potential impacts to nesting birds would be less than significant.

e) Conflict with any local policies or ordinances protecting biological resources?

No Impact.

The City does not have a tree preservation ordinance; however, SJMC Chapter 12.20 governs tree planting and removal associated with public parks, public grounds, public streets, and public rights-of-way. The Project site contains ornamental trees located on private property, as identified in the Biological Resources Assessment (Appendix C). Because the Project does not involve trees within public rights-of-way or other City-controlled areas regulated by SJMC Chapter 12.20, implementation of the proposed Project would not conflict with applicable local policies or ordinances protecting trees. Therefore, no impact would occur.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Less Than Significant.

The Project site is located within the Western Riverside County MSHCP within the San Jacinto Valley Area Plan. The Project site is not located within any Criteria Cells or designated conservation areas. Additionally, the Project site is not located within any MSHCP designated survey areas (Appendix C).

Regarding MSHCP Section 6.1.2, the Project site does not contain any jurisdictional drainages, riparian/riverine and/or wetland features. Development of the proposed Project will not result in impacts to riparian/riverine habitats. None of the conditions associated with vernal pools (i.e., depressions, ponded water, hydric soils, etc.) were observed on- site. No features are present that would support fairy shrimp. No standing water or other sign of areas that pond water (e.g., mud cracks, tire ruts, drainages) were recorded. Therefore, the Project is consistent with Section 6.1.2 of the MSHCP.

Regarding MSCHP Section 6.1.3, the Project site supports existing development and heavily disturbed land that does not provide suitable habitat for Narrow Endemic Plant Species. As such, the Project is consistent with the requirements outlined in Section 6.1.3 of the MSHCP.

In regards to Section 6.3.2 of the MSHCP, Additional Survey Needs and Procedures, the Project site is not located within any designated species survey area. The Project site supports existing development and heavily disturbed land that does not provide suitable habitat for MSHCP listed species. As such, the Project is consistent with the requirements outlined in Section 6.3.2 of the MSHCP.

Regarding MSHCP Section 6.1.4, *Guidelines Pertaining to the Urban/Wildlands Interface*, the Project site is not located within or adjacent to any Criteria Cells, corridors, or linkages. As a result, the Project is consistent with Section 6.1.4 of the MSHCP.

Additionally, the proposed Project would be required to pay applicable MSHCP fees pursuant to SJMC Chapter 15.50 prior to grading permit approval, included as PPP BIO-1. With the payment of fees pursuant to PPP BIO-1, the Project would not result in any conflicts with the MSHCP, and impacts would be less than significant.

Existing Plans, Programs, or Policies

PPP BIO-1: MSHCP Fees. Prior to issuance of a grading or building permit, the Project Applicant shall pay fees required pursuant to the Western Riverside County Multiple Species Habitat Conservation Plan

(MSHCP) implemented under San Jacinto Municipal Code Chapter 15.50. Western Riverside County MSHCP requires a per-acre local development impact and mitigation fee payment prior to the issuance of a grading or building permit.

Mitigation Measures

MM BIO-1: Pre-Construction Nesting Bird Survey. Vegetation within and surrounding the Project site has the potential to provide refuge cover from predators, perching sites and favorable conditions for avian nesting that could be impacted by construction activities associated with the Project. Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests or eggs). In order to protect migratory bird species, a nesting bird clearance survey should be conducted prior to any ground disturbance or vegetation removal activities that may disrupt the birds during the nesting season.

To avoid such impacts, a preconstruction nesting bird clearance survey shall be conducted by a qualified biologist within three (3) days prior to the commencement of any vegetation removal or ground-disturbing activities occurring during the nesting season (February 1 through August 31). If no active nests are observed, the biologist shall document the negative findings in a brief letter report and submit it to the Lead Agency.

If an active nest is identified, a no-disturbance buffer shall be established around the nest. The buffer distance shall be determined by the biologist based on species-specific sensitivity, the type and duration of construction activity, ambient noise and human activity levels, line-of-sight between the nest and construction areas, and the presence of topographic or vegetative screening. Buffers shall be established depending on these site-specific factors, and shall remain in place until the biologist determines that the nest is no longer active and the young have successfully fledged.

The limits of the exclusion zone shall be clearly marked in the field with flagging, fencing, or other appropriate barriers, and construction personnel shall be briefed on the location and sensitivity of protected nesting areas. A biological monitor shall oversee the implementation of exclusion zones and monitor nesting behavior to ensure compliance.

Construction activities may resume within the previously established buffer area only after the qualified biologist confirms that the young have successfully fledged and the nest is no longer active.

5.5. CULTURAL RESOURCES

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☐	☐	☒	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☐	☐	☒

a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

Less Than Significant Impact.

State CEQA Guidelines Section 15064.5 defines historic resources as resources listed or determined to be eligible for listing by the State Historical Resources Commission, a local register of historical resources, or the lead agency. Generally, a resource is considered "historically significant" if it meets one of the following criteria:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values;
- Has yielded, or may be likely to yield, information important in prehistory or history.

As described previously, the Project site consists of developed land occupied by the existing Bradley Gardens care facility, a surface parking lot, and landscaping. A cultural records search and review of historical photos conducted as part of the cultural assessment performed for the Project (Appendix D) indicated that the Project site was used for agricultural purposes as early as 1953. In 1964, a main care center building and a storage building were constructed as part of the Colonial Nursing Home, and in 1971, two medical office buildings were constructed. Various improvements were made to the property from the mid-1960s to 2026, including building expansions, the construction and infilling of a pool, landscaping, and paved parking. As such, the four existing buildings on-site are over 50 years old and therefore meet the minimum age threshold to require an assessment of potential eligibility to the California Register of Historical Resources (CRHR). As such, an evaluation of the on-site buildings for historical significance was prepared. Results of the evaluation determined that none of the buildings associated with the site are eligible for listing on the National Register of Historic Places (NRHP) or the CRHR. Thus, the on-site buildings are not of historical significance, and the removal of the buildings would not result in an adverse change in the significance of a historical resource pursuant to §15064.5 (Appendix D). Therefore, the Project would result in a less than significant impact on historical resources.

b) **Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?**

Less Than Significant With Mitigation.

The Cultural Resources Study (Appendix D) prepared for the Project included an archeological investigation at the South Central Coastal Information Center (SCCIC), located at California State University, Fullerton. The search identified any previously recorded cultural resources and prior cultural resources investigations within a 1-mile radius of the Project site.

The records search identified 59 previously recorded cultural resources within the 1-mile radius and none within the Project site. The records search results also indicate that 40 cultural resource studies have been conducted within a one-mile radius of the Project, none of which include any portion of the Project boundaries.

An archaeologist conducted the cultural resources survey of the Project area on February 6, 2026. The survey identified four existing buildings and a parking lot associated with the Bradley Gardens care facility (a large main care center building, one storage building in the southeast corner, and two medical office buildings in the northwest and southwest corners) that were constructed between 1964 and 1971 The existing buildings are over 50 years old, and therefore, are considered of historic age. No prehistoric resources were identified within the Project site.

The Cultural Resources Study determined that there is a potential for previously unknown archaeological resources to be located within the Project site. Thus, Mitigation Measure CUL-1 has been included to require that in the event that potential archaeological resources are discovered during excavation, grading, or construction activities, work shall cease within 50 feet of the find until a qualified archaeologist from the City or County List of Qualified Archaeologists has evaluated the find to determine whether the find constitutes a "unique archaeological resource," as defined in Section 21083.2(g) of the California Public Resources Code. If determined to be a unique archaeological resource, the resource would then be treated in accordance with Section 21083.2(b). With implementation of Mitigation Measure CUL-1, impacts to archaeological resources would be less than significant.

c) Disturb any human remains, including those interred outside of formal cemeteries?

No Impact.

The Project site has been previously disturbed, as described above, and has not been previously used as a cemetery. Thus, human remains are not anticipated to be uncovered during project construction. In addition, California Health and Safety Code Section 7050.5, CEQA Section 15064.5, and Public Resources Code Section 5097.98 (included as PPP CUL-1) mandate the process to be followed in the event of an accidental discovery of any human remains. Specifically, California Health and Safety Code Section 7050.5 requires that if human remains are discovered, disturbance of the site shall remain halted until the coroner has conducted an investigation into the circumstances, manner, and cause of death, and made recommendations concerning the treatment and disposition of the human remains to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code. If the coroner determines that the remains are not subject to his or her authority and if the coroner has reason to believe the human remains to be those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage

Commission. Compliance with existing law would ensure that significant impacts to human remains would not occur.

Existing Plans, Programs, or Policies

PPP CUL-1: Human Remains. In the event that human remains are encountered on the Project site, work within 50 feet of the discovery shall cease and the County Coroner shall be notified immediately consistent with the requirements of California Code of Regulations (CCR) Section 15064.5(e). State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code (PRC) Section 5097.98. Prior to the issuance of grading permits, the City Community and Planning, Building, and Code Enforcement Department Director, or designee, shall verify that all grading plans specify the requirements of CCR Section 15064.5(e), State Health and Safety Code Section 7050.5, and PRC Section 5097.98, as stated above.

Mitigation Measures

MM CUL-1: Inadvertent Discovery. In the event that potential archaeological resources are discovered during excavation, grading, or construction activities, work shall cease within 50 feet of the find until a qualified archaeologist from the City or County List of Qualified Archaeologists has evaluated the find to determine whether the find constitutes a "unique archaeological resource," as defined in Section 21083.2(g) of the California Public Resources Code. Any resources identified shall be treated in accordance with California Public Resources Code Section 21083.2(g). If the discovered resource(s) appears Native American in origin, a Native American Monitor shall be contacted to evaluate any potential tribal cultural resource(s) and shall have the opportunity to consult on appropriate treatment and curation of these resources. The discovery would also be reported to the City and the South Central Coastal Information Center (SCCIC).

Prior to the issuance of any permits for ground-disturbing activities that include the excavation of soils (including as grading, excavation, and trenching), the City of San Jacinto shall ensure that all Project grading and construction plans and specifications include requirement to halt construction activity and contact an archaeologist as specified above.

5.6. ENERGY

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Less Than Significant Impact.

Construction

During construction of the proposed Project would consume energy in three general forms:

1. Petroleum-based fuels used to power off-road construction vehicles and equipment on the Project site, construction worker travel to and from the Project site, as well as delivery truck trips; and
2. Electricity associated with providing temporary power for lighting and electric equipment.
3. Natural gas is not anticipated to be needed for construction activities. Any consumption of natural gas would be minor and negligible.

Electricity Usage

Due to the Project size and the fact that construction is temporary, the electricity used during construction of the proposed Project would be substantially less than that required for Project operation and would have a negligible contribution to the Project's overall energy consumption. The electric power used would be for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers.

Petroleum Fuel Usage

Construction activities related to the SNF expansion and the associated infrastructure are not expected to result in demand for fuel greater on a per-development basis than other development projects in Southern California. Table E-1, *Total Construction Fuel Usage*, details the construction fuel usage over the Project's construction period from both construction equipment and construction workers traveling to and from the site, as shown in Table E-1 below. As shown in Table E-1, *Total Construction Fuel Usage*, construction of the proposed Project would require a total of 33,050 gallons of diesel fuel (25,320 gallons of diesel fuel from off-road construction equipment and 7,730 gallons of diesel fuel from construction vehicles) and 25,025 gallons of gasoline fuel from construction vehicles. As shown in Table E-1, this would

result in a 0.07 percent increase over countywide diesel fuel consumption and a <0.01 percent increase over countywide gasoline consumptions. Thus, increased energy consumption from the construction of the proposed Project would be nominal.

Table E-1: Total Construction Fuel Usage

Construction Source	Gallons of Diesel Fuel	Gallons of Gasoline Fuel
Construction Vehicles	7,730	25,025
Off-Road Construction Equipment	25,320	-
Total	**33,050**	**25,025**
Riverside Countywide Consumptions	50,504,775	430,881,899
Percentage Increase (%)	**0.07**	**<0.01**

Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Construction of the Project would result in fuel consumption from the use of construction tools and equipment, vendor and haul truck trips, and vehicle trips generated from construction workers traveling to and from the site. There are no unusual Project characteristics that would cause the use of construction equipment that would be less energy efficient compared with other similar construction sites in other parts of the state. Construction contractors are required to demonstrate compliance with applicable California Air Resources Board (CARB) regulations governing the accelerated retrofitting, repowering, or replacement of heavy-duty diesel on- and off-road equipment. In addition, compliance with existing CARB idling restrictions and the use of newer engines and equipment would reduce fuel combustion and energy consumption. Overall, construction activities would require limited energy consumption, as construction of the Project would only last 12 months, and would comply with all existing regulations, and would therefore not be expected to use large amounts of energy or fuel in a wasteful manner. Thus, impacts related to construction energy usage would be less than significant.

Operation

Once operational, the Project would generate demand for electricity, natural gas, and gasoline. No diesel vehicles were assumed for operations. Operational use of energy includes the heating, cooling, and lighting of the buildings, water heating, operation of electrical systems and plug-in appliances, parking lot and outdoor lighting, and the transport of electricity, and natural gas. This use of energy is typical for urban development, and no operational activities or land uses would occur that would result in extraordinary energy consumption.

The State of California provides a minimum standard for building design and construction standards through Title 24 of the California Code of Regulations (CCR). Compliance with Title 24 is mandatory at the time new building permits are issued by local governments. The County's administration of the Title 24 requirements includes review of design components and energy conservation measures that occurs during the permitting process, which ensures that all requirements are met. Typical Title 24 measures include insulation; use of energy-efficient heating, ventilation, and air conditioning equipment (HVAC); energy-efficient indoor and outdoor lighting systems; reclamation of heat rejection from refrigeration equipment to generate hot water; and incorporation of skylights, etc. Also, as Title 24 has become more progressive in realizing energy reductions and increasing efficiency, it now has requirements for solar installation for non-residential projects. With the new updates. Title 24 now mandates incorporation of

solar photovoltaic systems and battery storage in many non-residential projects, or for non-qualifying projects installation of solar-ready roofs and systems. These requirements serve to offset electricity demand and the Project will be required to adhere to applicable Title 24 requirements. The Project's compliance with Title 24 will be confirmed prior to issuance of building permits. In complying with the Title 24 standards, impacts to peak energy usage periods would be minimized, and impacts on statewide and regional energy needs would be reduced.

As detailed in Table E-2, *Project Net Annual Operational Energy Consumption*, operation of the proposed Project is estimated to result in an annual use of approximately 52,117 gallons of gasoline fuel, approximately 1,399,933 British thermal units (BTU) of natural gas, and approximately 646,337 kilowatt-hours (kWh) of electricity. As shown in Table E-2, compared to the existing facility on-site, the proposed Project would result in a net annual increase of 29,853 gallons of gasoline fuel, 760,676 BTU of natural gas, and 332,746 kWh of electricity. These increases represent less than 0.01 percent of Riverside Countywide electricity, natural gas, and gasoline consumption, respectively. Thus, operation of the Project would not use large amounts of energy or fuel in a wasteful manner, and operational energy impacts would be less than significant.

Table E-2: Project Net Annual Operational Energy Consumption

Operational Source	Energy Usage	Countywide Energy Consumption	Percentage Increase in Countywide Consumption from Project
Electricity (Kilowatt-Hour)			
Proposed Project	646,337	NA	
Existing Conditions	313,592		
Net Electricity Consumption from Project	**332,746**	**16,286,000,000**	**<0.01%**
Natural Gas (Thousands British Thermal Units)			
Proposed Project	1,399,933	NA	
Existing Conditions	639,257		
Net Natural Gas Consumption From Project	**760,676**	**42,670,000,000**	**<0.01%**
Petroleum (Gasoline Fuel) Consumption (Gallons)			
Proposed Project	52,117	NA	
Existing Conditions	22,263		
Net Petroleum (Gasoline) Consumption from Project	**29,853**	**430,881,899**	**<0.01%**

Notes: NA = Not Applicable, as this analysis compares the net increase of the Project with countywide consumption.
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Overall, construction and operations-related fuel consumption by the Project would not result in inefficient, wasteful, or unnecessary energy use compared with other similar uses in the region, and impacts would be less than significant.

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Less Than Significant Impact.

The California Title 24 Building Energy Efficiency Standards are designed to ensure new and existing buildings achieve energy efficiency and preserve outdoor and indoor environmental quality. These measures (Title 24, Part 6) are listed in the CCR. The California Energy Commission is responsible for adopting, implementing and updating building energy efficiency. Local city and county enforcement agencies have the authority to verify compliance with applicable building codes, including energy efficiency. The proposed Project would be required to comply with all applicable State and local regulations related to renewable energy and energy efficiency, including the 2025 California Building Energy Efficiency Standards (Title 24) and the California Green Building Standards Code (CALGreen). As required by SJMC Chapter 15.04, *Construction Codes*, prior to issuance of a building permit, the Project Applicant would be required to submit plans showing that the Project would be in compliance with 2025 Title 24 requirements.

In addition, construction equipment and heavy-duty trucks associated with Project construction would be required to comply with applicable California Air Resources Board (CARB) regulations, including idling restrictions and off-road diesel engine standards, which promote fuel efficiency and reduce unnecessary energy consumption during construction activities. Because the proposed SNF facility expansion would comply with applicable energy efficiency regulations and would not conflict with or obstruct any State or local plan for renewable energy or energy efficiency, impacts would be less than significant.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.7. GEOLOGY AND SOILS

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42)	☐	☐	☐	☒
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

No Impact.

The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate the hazard of surface faulting to structures for human occupancy. The Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The Act requires the State Geologist to establish regulatory zones, known as "Alquist-Priolo Earthquake Fault Zones," around the surface traces of active faults and to issue appropriate maps. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be set back from the fault (typically 50 feet).

According to the Geotechnical Investigation, the Project site is not within a state-designated Alquist-Priolo Earthquake Fault Zone. There are no known active faults that cross the site. The closest fault zone is the San Jacinto Fault, located approximately 2 miles northeast of the site (Appendix E). Thus, impacts related to a known earthquake fault would not occur.

ii. Strong seismic ground shaking?

Less than Significant Impact

The Project site is located in a seismically active region, as is all southern California, and could be subject to seismically related strong ground shaking. Ground shaking is a major cause of structural damage from earthquakes. The amount of motion expected at a building site can vary from none to forceful depending upon the distance to the fault, the magnitude of the earthquake, and the local geology. Greater movement can be expected at sites located closer to an earthquake epicenter, that consist of poorly consolidated material such as alluvium located near the source, and in response to an earthquake of great magnitude.

As described above, the Project site is not located within an active fault zone; however, the San Jacinto Fault lies approximately 2 miles northeast of the Project site (Appendix E). Due to the site's close proximity to this fault, the Project site is expected to be subject to strong seismic ground shaking during the life of the Project. The proposed Project would be designed in accordance with the provisions of the California Building Code (CBC) (California Code of Regulations, Title 24, Part 2), included in the SJMC as Section 15.04.020 (PPP GEO-1). Compliance with the CBC would ensure earthquake safety based on factors including occupancy type, the types of soils on-site, and the probable strength of the ground motion. Mandatory compliance with the CBC would include the incorporation of (1) seismic safety features to minimize the potential for significant effects as a result of earthquakes; (2) proper building footings and foundations; and (3) construction of the building structures so that it would withstand the effects of strong ground shaking. Implementation of CBC requirements would be verified by the City as part of the plan check and development review process. Additionally, the City has adopted an Earthquake Hazard Reduction Code under Chapter 15.24 of the SJMC, which includes standards for structural seismic resistance established primarily to reduce the risk of life loss or injury. Compliance with the SJMC as well

as with the requirements of the CBC would reduce hazards from strong seismic ground shaking to a less than significant level.

iii. Seismic-related ground failure, including liquefaction?

Less than Significant Impact.

Liquefaction occurs when vibrations or water pressure causes soil particles to lose their friction properties. As a result, soil behaves like a liquid, has an inability to support weight, and can flow down very gentle slopes. This condition is usually temporary and is most often caused by an earthquake vibrating water-saturated fill or unconsolidated soil. However, effects of liquefaction can include sand boils, settlement, and structural foundation failures. Soils that are most susceptible to liquefaction are clean, loose, saturated, and uniformly graded fine-grained sands in areas where the groundwater table is within approximately 50 feet below ground surface (bgs).

According to a review of the Riverside County Information Technology's Map My County website, the Project site is identified as having moderate liquefaction susceptibility (Appendix E). The Project site contains topsoil and disturbed fill, which generally consists of brown, moist, loose to medium dense silty sands. There is a potential that sandy layers below the groundwater table could be liquefiable. However, groundwater was not encountered in the geotechnical borings conducted on the Project site which reached a maximum depth of 60 bgs (Appendix E). As discussed in the Geotechnical Investigation, removal of undocumented fill during construction is anticipated to reach approximately 5 to 7 feet below existing grade across majority of the site (Appendix E). Thus, groundwater is not anticipated to be reached during grading.

Further, the Project would be designed to meet CBC requirements (adopted in SJMC Chapter 15.04; PPP GEO-1), which include standards for seismic safety, excavation, foundations, retaining walls, and demolition. The CBC would require project-specific geotechnical recommendations to be incorporated into grading plans and building design as a condition of permit approval, helping ensure the structures can withstand seismic ground movement, including liquefaction. Compliance with the CBC and the SJMC would ensure that hazards from seismic-related ground failure, including liquefaction, would be less than significant.

iv. Landslides?

No Impact.

Landslides are downhill movement of masses of earth and rock and are often associated with earthquakes; but other factors, such as the slope, moisture content of soil, composition of the subsurface geology, heavy rains, and improper grading can influence the occurrence of landslides. The Project site is relatively flat and is not located near substantial slopes or hillsides. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. According to the GPU EIR Figure 5.7-5, *Landslide Susceptibility*, the Project site is not within an area mapped for high susceptibility to landslides (City of San Jacinto, 2022b). Therefore, the proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. No impacts related to landslides would occur with implementation of the proposed Project.

b) Result in soil erosion or the loss of topsoil?

Less Than Significant Impact.

Construction of the Project has the potential to contribute to soil erosion and the loss of topsoil. Grading and excavation activities that would be required for the Project would expose and loosen topsoil, which could be eroded by wind or water. However, SJMC Chapter 13.44, *Storm Water Management*, implements the requirements of the Santa Ana Regional Water Quality Control Board (RWQCB) National Pollutant Discharge Elimination System (NPDES) Storm Water Permit Order No. R8-2010-0033 (MS4 Permit) and establishes minimum stormwater management requirements and controls that are required to be implemented for the Project.

To reduce the potential for soil erosion and the loss of topsoil, the preparation of a Stormwater Pollution Prevention Plan (SWPPP) is required by the City and RWQCB regulations. The SWPPP is required to address site-specific conditions related to specific grading and construction activities that could cause erosion and the loss of topsoil and provide erosion control best management practices (BMPs) to reduce or eliminate the erosion and loss of topsoil. Erosion control BMPs include use of silt fencing, fiber rolls, or gravel bags, stabilized construction entrance/exit, hydroseeding, etc. Based on compliance with SJMC Chapter 13.44 stormwater management requirements, RWQCB SWPPP requirements, and installation of BMPs, which would be ensured by the City's project review by the Engineering Division, construction impacts related to erosion and loss of topsoil would be less than significant.

The Project site includes existing landscaping, and the proposed Project includes installation of additional landscaping in the southeastern corner of the site near the proposed SNF building addition. With this landscaping, areas of loose topsoil that could be eroded by wind or water would not exist upon operation of the proposed Project. In addition, as described in Section 5.10, *Hydrology and Water Quality*, the proposed Project has been designed to slow, filter, and retain stormwater within the pervious areas and the proposed landscaping, which would also reduce the potential for stormwater to erode topsoil. Furthermore, implementation of the Project requires City approval of a Water Quality Management Plan (WQMP), which would ensure that RWQCB requirements and appropriate operational BMPs would be implemented to minimize or eliminate the potential for soil erosion or loss of topsoil to occur. As a result, with implementation of existing requirements, impacts related to substantial soil erosion or loss of topsoil would be less than significant.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or offsite landslide, lateral spreading, subsidence, liquefaction or collapse?

Less Than Significant Impact

Landslides and other forms of mass wasting, including mud flows, debris flows, and soil slips, occur as soil moves downslope under the influence of gravity. Landslides are frequently triggered by intense rainfall or seismic shaking. The Project site is relatively flat and is not located adjacent to any substantial slopes or hillside areas. As described previously, the Project site is not within an area mapped for high susceptibility to landslides (City of San Jacinto, 2022b). Therefore, impacts related to landslides would not occur from implementation of the Project.

Lateral spreading is a type of liquefaction-induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move downslope towards a free face (such as a river channel or an embankment). Lateral spreading may cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures. As described above in response iii, groundwater is estimated to be approximately 60 feet bgs, which is not conducive to effects related to liquefaction and lateral spreading, which require groundwater or liquefied soils to exist within 50 feet bgs. According to the Geotechnical Investigation, the potential for lateral spreading at the Project site is considered low (Appendix E). Therefore, impacts related to liquefaction and lateral spreading would not occur and impacts would be less than significant.

Subsidence is a general lowering of the ground surface over a large area that is generally attributed to lowering of the ground water levels within a groundwater basin. According to the Geotechnical Investigation (Appendix E), there is historical evidence that subsidence of 0.26 feet has occurred within the San Jacinto basin and the Project site area during the period of 1964 to 1973. However, subsidence has eased appreciably, as a result of the groundwater basin being adjudicated. According to the Geotechnical Investigation, the potential for subsidence due to groundwater withdrawal at the Project site is considered low (Appendix E). Therefore, impacts related to subsidence would be less than significant.

Overall, compliance with the requirements of the CBC (PPP GEO-1), as ensured by the City through the permitting process, would ensure potential adverse effects related to lateral spreading, subsidence, liquefaction, or collapse from implementation of the proposed Project would be less than significant.

d) Be located on expansive soil, as defined in in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less Than Significant Impact.

Expansive soils contain clay particles that swell when wet and shrink when dry. Foundations constructed on expansive soils are subjected to forces caused by the swelling and shrinkage of the soils and could result in heaving and cracking of buildings and foundations.

The Geotechnical Investigation Report (included as Appendix E) performed expansion index testing on near-surface bulk soil samples to evaluate the potential for expansive soils at the site. The results of the testing indicated that near surface soils have a “very low” potential for expansion. Compliance with the CBC (included as PPP GEO-1) would require design level geotechnical specifications as a condition of construction permit approval that would be reviewed and approved by the City. Therefore, impacts related to expansive soils would be less than significant.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater*?*

No Impact.

There are no septic tanks or alternative wastewater disposal systems currently on the Project site. The Project would install on-site sewer lines that would connect to the existing wastewater infrastructure that

is adjacent to the site and would not require the use of septic tanks or alternative methods of wastewater disposal. Therefore, no impacts related to the use of such facilities would occur from implementation of the Project.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less than Significant with Mitigation Incorporated.

According to the Paleontological Assessment prepared for the proposed Project (Appendix F), the Project site is underlain by Holocene and late Pleistocene-aged young alluvial valley deposits. Holocene alluvial deposits at the Project site have a low potential to yield significant paleontological resources. The underlying Pleistocene young alluvial deposits are considered to have a high potential to yield significant paleontological resources (Appendix F).

A paleontological literature review and collections and locality records was completed as part of the Paleontological Assessment using data from the Division of Geological Sciences at the San Bernardino County Museum and the Los Angeles County Museum of Natural History, the San Diego Society of Natural History, and the Western Science Center and data from published and unpublished paleontological literature. The resulting locality records search did not identify any previously recorded fossil localities within the boundaries of the Project site. The closest known fossil localities were found at the Monte Vista Middle School, located approximately 1 mile northeast of the Project site, and consisted of the shells of freshwater snails and the bones of frogs, snakes, lizards, and mammals, as well as the dental remains of rodents, including those of pocket gophers. Additional fossil localities were discovered 3 miles west of the Project site in association with construction of the Eastside Pipeline and 4 miles south of the Project site near the Hemet-Ryan Airport. A field survey of the Project site was conducted in February 2026 that identified no paleontological resources, or evidence indicating the presence of paleontological resources (Appendix F).

The proposed Project consists of demolition activities for construction of a SNF building, conversion of an existing building into a PHF, and associated improvements. As discussed in the Geotechnical Investigation Report, removal of undocumented fill during construction is anticipated to reach up 5 to 7 feet below existing grade across majority of the site (Appendix E). Earthmoving activities, including grading and excavation activities, have the potential to disturb previously unknown paleontological resources if earthmoving activities occur at substantial, undisturbed depths. Therefore, impacts related to paleontological resources during Project construction are potentially significant. As a result, MM GEO-1 has been proposed, which requires the preparation of a Paleontological Resources Impact Mitigation Program (PRIMP) and that ground disturbing activities, beginning at a depth of 3 feet, be monitored to identify and recover any significant fossil remains. With the implementation of MM GEO-1 into the Project, potential impacts to paleontological resources would be less than significant.

Existing Plans, Programs, or Policies

PPP GEO-1: **CBC Compliance**. The Project is required to comply with the California Building Standards Code as included in Section 15.04.020 of the San Jacinto Municipal Code to preclude significant adverse effects associated with seismic and soils hazards. CBC related and geologist and/or civil engineer specifications for the proposed Project are required to be incorporated into grading plans and building specifications as a condition of construction permit approval.

Mitigation Measures

MM GEO-1: Paleontological Monitoring. Prior to the issuance of grading permits, the Project Applicant shall provide a letter to the City, or City designee, from a professional paleontologist, stating that a qualified paleontologist has been retained to provide services for the proposed Project. The paleontologist shall develop a Paleontological Resources Impact Mitigation Plan (PRIMP) to mitigate the potential impacts to unknown buried paleontological resources that may exist onsite. The PRIMP shall be provided to the City for review and approval. The PRIMP shall require that the paleontologist be present at the pre-grading conference to establish procedures for paleontological resource surveillance. Prior to commencement of grading activities, the City of San Jacinto Planning Division, or designee, shall verify that all Project grading and construction plans specify the requirements herein related to the PRIMP and the unanticipated discovery of paleontological resources. Full-time monitoring will be required starting at 3 feet deep below the current surface. In the event paleontological resources are encountered, ground disturbing activity within 50 feet of the area shall cease. The paleontologist shall examine the materials encountered, assess the nature and extent of the find, and recommend a course of action to further investigate and protect or recover and salvage those resources that have been encountered pursuant to the guidelines of the Society of Vertebrate Paleontology.

Criteria for discarding specific fossil specimens shall be made explicit in the PRIMP. If the qualified paleontologist determines that impacts to a sample containing significant paleontological resources cannot be avoided by Project construction, then recovery techniques shall be applied. Actions include recovering a sample of the fossiliferous material prior to construction, monitoring construction activities and halting construction if an important fossil needs to be recovered, and/or cleaning, identifying, and cataloging specimens for curation and research purposes. Recovery, salvage, and treatment shall be done at the Project Applicant's expense. All recovered and salvaged resources shall be prepared to the point of identification and permanent preservation by the paleontologist. Resources shall be identified and curated into an established accredited professional repository. The paleontologist shall have a repository agreement in hand prior to initiating recovery of the resource. A report documenting the results of the monitoring, including any salvage activities and the significance of any fossils, shall be prepared and submitted to the City, or City designee. The report and inventory, when submitted to the City of San Jacinto Planning Division, shall signify completion of the program to mitigate impacts to paleontological resources.

5.8. GREENHOUSE GAS EMISSIONS

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

GHG Thresholds

The analysis methodology from SCAQMD is used in the evaluation of potential impacts related to greenhouse gas (GHG) from implementation of the proposed Project.

SCAQMD: SCAQMD does not have approved thresholds; however, SCAQMD does have draft thresholds that provide a tiered approach to evaluate GHG impacts. The current interim SCAQMD threshold consists of the following:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.
- Tier 2 consists of determining whether the project is consistent with a GHG reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project is less than significant:
    - Option 1: All land use types: 3,000 $MTCO_{2e}$ per year
    - Option 2: Based on land use type: residential: 3,500 $MTCO_{2e}$ per year; commercial: 1,400 $MTCO_{2e}$ per year; or mixed use: 3,000 $MTCO_{2e}$ per year
- Tier 4 has the following options:
    - Option 1: Reduce business as usual emissions by a certain percentage; this percentage is currently undefined.
    - Option 2: Early implementation of applicable AB 32 Scoping Plan measures
    - Option 3, 2020 target for service populations (SP), which includes residents and employee: 4.8 $MTCO_2e$/SP/year for projects and 6.6 $MTCO_2e$/SP/year for plans;
    - Option 3, 2035 target: 3.0 $MTCO_2e$/SP/year for projects and 4.1 $MTCO_2e$/SP/year
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The assessment of the proposed Project applies the Tier 3: Numerical Screening Thresholds approach. In addition, SCAQMD methodology for project construction emissions is to average them over 30 years and then add them to the project's operational emissions to determine if the project would exceed the screening values listed above (Appendix A).

The City of San Jacinto has utilized Option 1 for other projects within the city, thus, Option 1 was utilized for this analysis and the GHG threshold used is 3,000 $MTCO_2e$ per year.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less Than Significant Impact

Global climate change is not confined to a particular project area. A typical project does not generate enough GHG emissions on its own to influence global climate change significantly; hence, the issue of global climate change is, by definition, a cumulative environmental impact. GHGs are produced by both direct and indirect emissions sources. Direct emissions include consumption of natural gas, heating and cooling of buildings, landscaping activities and other equipment used directly by land uses. Indirect emissions include the consumption of fossil fuels for vehicle trips, electricity generation, water usage, and solid waste disposal.

Construction activities produce combustion emissions from various sources, such as site excavation, grading, utility engines, heavy-duty construction vehicles on-site, equipment hauling materials to and from the site, asphalt paving, and motor vehicles transporting the construction crew. Exhaust emissions from on-site construction activities would vary daily as construction activity levels change.

In addition, operation of the proposed Project would result in area and indirect sources of operational GHG emissions that would primarily result from vehicle trips, electricity and natural gas consumption, water transport (the energy used to pump water), and solid waste generation. GHG emissions from electricity consumed by the building would be generated off-site by fuel combustion at the electricity provider. GHG emissions from water transport are also indirect emissions resulting from the energy required to transport water from its source.

GHG emissions during Project construction and operations were estimated using CalEEMod version 2022.1. In accordance with SCAQMD recommendations, the Project's amortized construction GHG emissions (as shown in Table GHG-1) are added to the operational emissions in order to determine the Project's total annual estimated GHG emissions. The estimated operational GHG emissions that would be generated from implementation of the proposed Project, combined with the construction emissions, are shown in Table GHG-2. As shown in Table GHG-2, net Project GHG emissions would be less than the SCAQMD's Tier 3 threshold of 3,000 $MTCO_2e$. Therefore, based upon SCAQMD's screening threshold, impacts related to GHG emissions would be less than significant.

Table GHG-1: Project Construction GHG Emissions

Construction Year	Annual GHG Emissions ($MTCO_2e$)
2026	33
2027	386
Total Emissions	**419**
Total Emissions Amortized Over 30 Years	14

Notes: Numbers have been rounded. $MTCO_2e$ = metric tons of carbon dioxide equivalent.
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Table GHG-2: Total Project GHG Emissions

Activity	Annual GHG Emissions ($MTCO_2e$)
Mobile	509
Area	2
Energy	177
Water	12
Waste	96
Refrigeration	0.1
Total Project Operation Emissions	**796**
Amortized Project Construction Emissions	14
Total Project Emissions	**810**
Existing Emissions	349
Net Project Emissions	**460**
SCAQMD Tier III Significance Threshold	3,000
Threshold Exceeded?	**No**

Notes: Numbers have been rounded. $MTCO_2e$ = metric tons of carbon dioxide equivalent.
Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Less Than Significant Impact.

he Project proposes the expansion of the existing 44-bed Bradley Gardens facility to a total of 103 beds. The Project includes demolition of the existing 1,074 SF maintenance and storage building located in the southeastern corner of the site for construction of an expansion to the existing 44-bed SNF building. The proposed building addition would total approximately 18,000 SF and would provide 43 additional SNF and STP beds. The Project also proposes the conversion of the existing 2,596 SF vacant office building located in the northwestern corner of the site into a 16-bed PHF. The design of the proposed building would comply with State and federal programs that are designed to ensure energy efficiency and reduce GHG emissions.

On December 15, 2022, CARB adopted the 2022 Scoping Plan. The 2022 Scoping Plan set the State's GHG emissions reduction target for 2045 at 85 percent below 1990 levels, which was codified by Senate Bill 32. Table GHG-3 shows the Project's consistency with the 2022 Scoping Plan. As shown in Table GHG-3, 2022 *Scoping Plan Consistency*, the Project is consistent with the 2022 Scoping Plan.

Table GHG-3: 2022 Scoping Plan Consistency Summary

Action	Consistency
GHG Emissions Reductions Relative to the SB 32 Target	
40 percent Below 1990 levels by 2030.	**Consistent.** The proposed Project would comply with applicable Title 24, Part 6 building energy efficiency standards and other State and local requirements supporting statewide greenhouse gas reduction targets consistent with SB 32.
Smart Growth/Vehicle Miles Traveled VMT	
VMT per capita reduced 25 percent below 2019 levels by 2030, and 30 percent below 2019 levels by 2045.	**Consistent.** The Project site has an existing General Plan land use designation of Industrial (I) and is zoned Industrial Light (IL). The Industrial (I) designation supports industrial and employment-generating uses, including light industrial, manufacturing, warehouse, service commercial, and related support uses. The IL zoning district allows for general manufacturing and light industrial activities, including auto repair services, pest control services, pool maintenance services, and woodworking shops, as well as other compatible uses. The proposed Project includes demolition of an existing 1,074-square-foot storage building and construction of a new 18,000-square-foot building addition to the existing skilled nursing facility (SNF), resulting in a total of 87 SNF beds. The Project also includes conversion of an existing 2,596-square-foot administrative office building into a 16-bed Psychiatric Health Facility (PHF), resulting in a total campus capacity of 103 beds. The Project would have a floor area ratio (FAR) of approximately 0.27, which is consistent with the development intensity permitted by the General Plan land use designation. The Project represents the expansion of an existing institutional healthcare facility and does not introduce residential uses. It would not generate substantial population or employment growth beyond that anticipated under the General Plan or regional growth forecasts. As previously evaluated in the air quality analysis, the Project is consistent with the Southern California Association of Governments (SCAG) 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and would not conflict with regional VMT

Action	Consistency
	reduction strategies or statewide greenhouse gas reduction targets.
Light-Duty Vehicle (LDV) Zero-Emission Vehicles (ZEVs)	
100 percent of LDV sales are ZEV by 2035.	**Consistent.** The proposed Project would be designed and constructed in accordance with Title 24, Parts 6 and 11 requirements applicable to healthcare facilities, including provisions for electrical infrastructure to support future electric vehicle charging where required by code.
New Residential and Commercial Buildings	
All electric appliances beginning 2026 (residential) and 2029 (commercial), contributing to 6 million heat pumps installed statewide by 2030.	**Consistent.** The proposed Project would comply with Title 24, Part 6 energy efficiency requirements, including the installation of electrical wiring for built-in appliances. Although the Project would include natural gas use on-site, the Project would incorporate energy-efficient building design features and would not result in inefficient energy consumption.
Construction Equipment	
25 percent of energy demand electrified by 2030 and 75 percent electrified by 2045.	**Consistent.** The proposed Project would be required to use construction equipment that is registered by CARB and meet CARB's standards. CARB sets its standards to be in line to reduce energy demand by 25 percent in 2030 and 75 percent in 2045.
Transportation Electrification	
Create a jurisdiction-specific ZEV ecosystem to support deployment of ZEVs statewide (such as permit streamlining, infrastructure siting, consumer education, or preferential parking policies).	**Consistent.** The proposed Project would be designed and constructed in accordance with the Title 24 Part 6 and Part 11 requirements, which include constructing homes to allow for electric vehicle charging. Therefore, the proposed Project would not interfere with the implementation of a ZEV ecosystem within the City.
VMT Reduction	
Adopt and implement Complete Streets policies and investments, consistent with general plan circulation element requirements.	**Consistent.** The Project includes redevelopment of an existing skilled nursing facility campus and consists of building expansion, conversion of an existing office building, and associated site improvements, including drive aisles, driveways, landscaping, and pedestrian pathways. The Project would provide internal pedestrian circulation improvements through on-site pathways connecting building areas and access points. These improvements are limited to the Project site and do not include modifications to the surrounding public roadway network. The Project would not conflict with the implementation of Complete Streets policies or planned circulation improvements.

Action	Consistency
Increase public access to shared clean mobility options (such as planning for and investing in electric shuttles, bike share, car share, transit).	**Consistent.** The Project includes redevelopment of an existing skilled nursing facility campus and consists of building expansion, conversion of an existing office building, and associated site improvements, including drive aisles, driveways, landscaping, and pedestrian pathways. The Project would not include shared mobility services such as shuttle programs, bike share, or car share systems. However, it would maintain internal pedestrian circulation through on-site pathways connecting building areas and access points. The nearest public transit access is the State and Seventh bus stop (Stop ID: 3214), located approximately 0.28 miles (approximately 1,500 feet) from the Project site. This stop provides access to regional bus transit services. Given the Project's infill location within an existing developed area, it would not conflict with implementation of transit services or regional shared mobility programs and would remain accessible to existing multimodal transportation options in the vicinity.
Amend zoning or development codes to enable mixed-use, walkable, and compact infill development (such as increasing allowable density of the neighborhood).	**Consistent.** The General Plan includes policies that encourage amendments to zoning and development codes to support mixed-use, walkable, and compact infill development. While the Project does not propose zoning amendments or mixed-use development, it represents infill redevelopment of an existing developed healthcare campus through the expansion of a skilled nursing facility and conversion of an existing office building to a psychiatric health facility. The Project site has a zoning designation of Industrial Light (IL). The IL zoning designation allows for general manufacturing uses, auto repair services, pest control services, pool maintenance services, and woodworking shops. The Project does not include a change in land use designation or zoning. The proposed redevelopment would occur within an existing developed urbanized site and reflects efficient use of previously developed land consistent with infill development objectives and compact growth patterns. Therefore, the Project is consistent with the intent of this policy and does not conflict with the General Plan's objectives for compact and efficient land use patterns
Building Decarbonization	
Adopt all-electric new construction reach codes.	**Consistent.** The proposed Project would comply with Title 24 Parts 6 and 11, which include electric heat

Action	Consistency
	pumps installed during construction and electric hookups for all appliances.
Adopt policies and incentive programs to reduce electrical loads from equipment plugged into outlets (such as purchasing Energy Star equipment for municipal buildings, occupancy sensors, smart power strips, equipment controllers, etc.).	**Consistent.** The proposed Project would be constructed in accordance with Title 24 CALGreen requirements, which include the installation of Energy Star equipment and appliances in new buildings.
Facilitate deployment of renewable energy production and distribution and energy storage.	**Consistent.** The proposed Project would be constructed in accordance with the CALGreen Building Energy Efficiency Standards (Title 24 Part 6) and meet all other requirements related to energy efficiency standards.

Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

In addition to the CARB 2022 Scoping Plan, the City of San Jacinto is one of 12 Western Riverside Council of Governments (WRCOG) jurisdictions that participated in preparing the 2021 Subregional Climate Action Plan (WRCOG Subregional CAP). The WRCOG Subregional CAP establishes a community-wide emissions reduction target of 15 percent below 2010 levels by 2020, and 49 percent below 2010 levels by 2035, consistent with guidance from CARB and the Governor's Office of Planning and Research. CARB and the California Attorney General have determined that this approach is consistent with the statewide AB 32 goal of reducing emissions to 1990 levels. As shown in Table GHG-4, *WRCOG Subregional CAP Consistency Summary*, the Project is consistent with the WRCOG Subregional CAP.

Table GHG-4: WRCOG Subregional CAP Consistency Summary

Measure	Consistency
Energy	
LE-1: Expand Local Renewable Energy Production. Increase solar PV installations on new and existing buildings.	**Consistent.** The Project would comply with Title 24 Part 6 building energy requirements and applicable California Energy Code provisions for healthcare facilities.
LE-4: Building & Appliance Electrification. Transition energy use away from fossil natural gas to clean electricity and renewable natural gas.	**Consistent.** The Project would comply with Title 24 Part 6 energy efficiency and electrification requirements for nonresidential healthcare facilities, including building systems and equipment electrification to the extent required by code.
LE-6: Shade Trees. Strategically plant trees to reduce the urban heat island effect.	**Consistent.** The Project would provide private open space for each proposed residence, as well as common open space and landscaped areas totaling approximately 4,015 square feet. These landscaped areas would allow for the incorporation of shade trees and vegetation throughout the Project site, including within open space areas and along pedestrian circulation routes, which supports reduction of localized heat island effects consistent with the intent of this policy.
LT-2: Pedestrian Infrastructure Improvements. Expand and improve pedestrian infrastructure, including sidewalks, crosswalks, and pedestrian signals.	**Consistent.** The Project includes internal site improvements consisting of pedestrian pathways, drive aisles, and driveways that provide circulation within the existing campus and connect building areas and site access points. These on-site pedestrian improvements would enhance internal pedestrian connectivity and access to existing public sidewalks in the surrounding area.

	The Project would not modify the public roadway network but would support improved pedestrian access consistent with LT-2.
LT-7: Increase Housing Density. Increase the density of planned housing units within the city.	**Consistent.** The Project does not propose residential development or any increase in housing density. It involves the expansion of an existing healthcare facility on a site designated Industrial (I) and zoned Industrial Light (IL). The Project does not affect housing capacity assumptions under the General Plan or regional growth forecasts.
LT-8: Increase Land Use Diversity. Provide for a variety of development types and uses.	**Consistent.** The Project site is designated Industrial (I) and zoned Industrial Light (IL), which allows for a range of industrial, service commercial, and compatible uses. The Project involves the expansion of an existing skilled nursing facility and conversion of an office building to a psychiatric health facility within an existing developed campus. The Project does not introduce new land use categories or require a change in land use designation or zoning. It represents continued use and expansion of institutional healthcare services within an existing developed industrial setting.
LT-9: Transit-Oriented Development. Place new developments in close proximity to transit services.	**Consistent.** The Project is located approximately 0.28 miles (approximately 1,500 feet) from the nearest transit stop (State Street and Seventh Street, Stop ID: 3214), providing access to regional transit services. The Project supports transit accessibility by locating redevelopment within an existing developed area near transit service.
LT-10: Local ZEV Programs. Provide charging stations and other support for zero emission vehicles (ZEVs).	**Consistent.** The proposed Project would be designed and constructed in accordance with the Title 24 Part 6 and Part 11 requirements, which include EV-ready charging infrastructure to allow for electric vehicle charging in the garages.
Solid Waste	
LS-1: Zero Waste Initiatives. Support the State's mandates and strive for zero waste.	**Consistent.** The proposed Project would be required to comply with applicable City of San Jacinto solid waste and recycling requirements implemented in accordance with statewide regulations, including AB 341 and SB 1383. These regulations require recycling of commercial solid waste and diversion of organic waste from landfills through recycling and organics collection programs, supporting statewide waste reduction and landfill methane reduction goals.

Source: Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

In addition to the CARB 2022 Scoping Plan and the WRCOG Subregional CAP, the Project would comply with all applicable State and local regulatory requirements in effect at the time of construction and operation, including the California Building Standards Code (Title 24), which incorporates the California Energy Code and CALGreen requirements. The Project is also consistent with Connect SoCal 2024 (2024–2050 Regional Transportation Plan/Sustainable Communities Strategy), which establishes long-range regional transportation, land use, and emissions reduction strategies for the SCAG region, including transportation investments, programming, and regional growth considerations. These policies are implemented at the regional and local level through agency coordination and planning processes. The

Project would not conflict with Connect SoCal 2024 and would remain consistent with regional growth assumptions, as it involves the expansion and conversion of an existing institutional healthcare facility, does not include residential development, and would not alter regional population or housing growth patterns.

Overall, the Project would not conflict with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emissions and impacts would be less than significant.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.9. HAZARDS AND HAZARDOUS MATERIALS

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☐	☒
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☐	☒

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact.

A hazardous material is defined as any material that, due to its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous wastes, and any material that a business or the local implementing agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

Construction

The proposed construction activities could involve the transport, use, and disposal of hazardous materials such as paints, solvents, oils, grease, and caulking. In addition, hazardous materials could be needed for fueling and servicing construction equipment on the site. These types of materials routinely used during construction are not acutely hazardous, and all storage, handling, use, and disposal of these materials are regulated by existing federal and State requirements that the project is required to strictly adhere to.

The Project involves demolition of an existing building. As part of Project construction, the potentially asbestos-containing materials (ACM) and lead based paint (LBP) materials from building demolition would need to be disposed. Construction contractors would be required to comply with federal, State, and local laws and regulations regarding the transport, use, and storage of hazardous materials. Applicable laws and regulations include CCR, Title 8 Section 1529 (pertaining to ACM) and Section 1532.1 (pertaining to LBP); CFR, Title 40, Part 61, Subpart M (pertaining to ACM); CFR, Title 29, Hazardous Waste Control Act; CFR, Title 49, Chapter I; and Hazardous Materials Transportation Act requirements as imposed by the U.S. Department of Transportation (USDOT), California Division of Occupational Safety and Health (CalOSHA), California Environmental Protection Agency (CalEPA) and California Department of Toxic Substances Control (DTSC). Additionally, construction activities would require a SWPPP, which is mandated by the NPDES General Construction Permit (included as PPP HYD-1 herein) and enforced by the Santa Ana RWQCB. The SWPPP will include strict on-site handling rules and BMPs to minimize potential adverse effects to workers, the public, and the environment during construction.

Mandatory compliance with applicable laws and regulations related to the routine transport, use, and disposal of hazardous materials during construction activities at the Project site would limit potentially significant hazards to construction workers, the public, and the environment. Impacts would be less than significant.

Operation

The proposed Project involves the operation of the proposed 103-bed Bradley Gardens SNF, which would routinely use household hazardous materials including cleaning agents, disinfectants, paints, pesticides, batteries, fertilizers, aerosol cans, and limited medical-related supplies. These hazardous materials are also currently used by the existing SNF uses on the Project site. These types of materials are not acutely hazardous and would continue to be used and stored in limited quantities onsite. The normal routine use of these products pursuant to existing regulations would not result in a significant hazard to people or the environment in the vicinity of the Project. Therefore, operation of the Project would not result in a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials or waste, and impacts would be less than significant.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less Than Significant Impact.

In February 2026, Partner Engineering and Science, Inc completed a Phase I Environmental Assessment (Phase I ESA) of the Project site (Appendix G). The 2026 Phase I ESA did not identify any Recognized Environmental Conditions (RECs) related to the Project site. The Phase I ESA did identify one Business

Environmental Risk (BER), which is a risk that can have a material environmental impact on the business associated with the current or planned use of commercial real estate.

Construction

Accidental Releases. While the routine use, storage, transport, and disposal of hazardous materials in accordance with applicable regulations during construction activities would not pose health risks or result in significant impacts; improper use, storage, transportation and disposal of hazardous materials and wastes could result in accidental spills or releases, posing health risks to workers, the public, and the environment. The Project site does not have any RECs and was previously used for vacant land, for agricultural uses, and is currently developed with a SNF.

To avoid an impact related to an accidental release, the use of BMPs during construction are implemented as part of a SWPPP as required by the NPDES General Construction Permit (PPP HYD-1). Implementation of an SWPPP would minimize potential adverse effects to workers, the public, and the environment. Construction contract specifications would include strict on-site handling rules and BMPs that include, but are not limited to:

- Establishing a dedicated area for fuel storage and refueling and construction dewatering activities that includes secondary containment protection measures and spill control supplies;
- Following manufacturers' recommendations on the use, storage, and disposal of chemical products used in construction;
- Avoiding overtopping construction equipment fuel tanks;
- Properly containing and removing grease and oils during routine maintenance of equipment; and
- Properly disposing of discarded containers of fuels and other chemicals.

Therefore, Project construction would result in less than significant impacts related to hazards to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Asbestos Containing Materials. The buildings on the Project site were constructed in 1964 and 1971 when many structures were constructed with what are now recognized as hazardous building materials, such as lead and asbestos. Demolition of the existing structure could result in the release of hazardous materials. However, asbestos abatement contractors must follow State regulations contained in California Code of Regulations Sections 1529, and 341.6 through 341.14 as implemented by SCAQMD Rule 1403 to ensure that asbestos removed during demolition or redevelopment of the existing buildings is transported and disposed of at an appropriate facility. The contractor and hauler of the material are required to file a Hazardous Waste Manifest which details the hauling of the material from the site and the disposal of it. Section 19827.5 of the California Health and Safety Code requires that local agencies not issue demolition permits until an applicant has demonstrated compliance with notification requirements under applicable federal regulations regarding hazardous air pollutants, including asbestos. These requirements are included as PPP HAZ-1 to ensure that the Project applicant submits verification to the City that the appropriate activities related to asbestos have occurred, which would reduce the potential of impacts related to asbestos to a less than significant level.

Lead Based Materials. Lead-based materials may also be located within existing structures on the Project site. The lead exposure guidelines provided by the United States Department of Housing and Urban

Development provide regulations related to the handling and disposal of lead-based products. Federal regulations to manage and control exposure to lead-based paint are described in Code of Federal Regulations Title 29, Section 1926.62, and State regulations related to lead are provided in the California Code of Regulations Title 8 Section 1532.1, as implemented by CalOSHA. These regulations cover the demolition, removal, cleanup, transportation, storage and disposal of lead-containing material. The regulations outline the permissible exposure limit, protective measures, monitoring, and compliance to ensure the safety of construction workers exposed to lead-based materials. CalOSHA's Lead in Construction Standard requires project applicants to develop and implement a lead compliance plan when lead-based paint would be disturbed during construction or demolition activities. The plan must describe activities that could emit lead, methods for complying with the standard, safe work practices, and a plan to protect workers from exposure to lead during construction activities. In addition, CalOSHA requires 24-hour notification if more than 100 SF of lead-based paint would be disturbed. These requirements are included as PPP HAZ-2 to ensure that the Project applicant submits verification to the City that the appropriate activities related to lead have occurred, which would reduce the potential of impacts related to lead-based materials to a less than significant level.

Operation

As described previously, the proposed Project involves operation of the proposed 103-bed Bradley Gardens SNF, which would routinely use household hazardous materials including cleaning agents, disinfectants, paints, pesticides, batteries, fertilizers, aerosol cans, and limited medical-related supplies. These hazardous materials are also currently used by the existing SNF uses on the Project site. These types of materials are not acutely hazardous and would continue to be used and stored in limited quantities onsite. The normal routine use of these products pursuant to existing regulations would not result in a significant hazard to people or the environment in the vicinity of the Project. As a result, operation of the proposed Project would not create a reasonably foreseeable upset and accident condition involving the release of hazardous materials into the environment, and impacts would be less than significant.

c) Emit hazardous emissions or handle hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No Impact.

The closest school to the Project site is San Jacinto Elementary School, which is about 0.95 miles northeast of the Project site. Thus, the proposed Project would not be within one-quarter mile of an existing school. As described previously, construction and operation of the Project would involve the use, storage, and disposal of small amounts of hazardous materials on the Project site. These hazardous materials would be limited and used and disposed of in compliance with federal, State, and local regulations, which would reduce the potential for accidental release into the environment near a school. In addition, emissions that would be generated from construction and operation of the proposed Project were evaluated in the air quality analysis in Section 5.3, *Air Quality*, which determined that emissions generated from the proposed Project would not result in impacts to sensitive receptors, including schools. Thus, the proposed Project would not emit hazardous or handle acutely hazardous materials, substances, or waste within 0.25 mile of school and there would be no impact.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

No Impact.

Government Code Section 65962.5 specifies lists of the following types of hazardous materials sites: hazardous waste facilities; hazardous waste discharges for which the State Water Quality Control Board has issued certain types of orders; public drinking water wells containing detectable levels of organic contaminants; underground storage tanks with reported unauthorized releases; and solid waste disposal facilities from which hazardous waste has migrated. As described in the Phase I ESA (Appendix G), the proposed Project site is not included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and therefore there would be no impact.

e) For a project within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

No Impact.

The closest airport to the Project site is Hemet-Ryan Airport, which is located approximately 3.9 miles to the southwest of the Project site (Appendix J). The Project site is not within the Airport Land Use Compatibility Plan for the Hemet-Ryan Airport, as demonstrated in GPU EIR Figure 5.9-1, *Airport Land Use Compatibility Zones* (City of San Jacinto, 2022b). Therefore, the proposed Project would not result in an airport-related safety hazard for people residing or working in the Project area. The Project would have no impact on safety hazards related to airports.

f) Impair implementation of an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact.

Construction

The proposed construction activities, including equipment and supply staging and storage, would occur within the Project site and would not restrict access of emergency vehicles to the Project site or adjacent areas. The installation of driveways and connections to existing infrastructure systems that would be implemented during construction of the proposed Project could require the temporary closure of one side or portions of W. 7th Street and S. Grand Avenue (i.e., hours or a few days). However, the construction activities would be required to ensure emergency access in accordance with Section 503 of the California Fire Code (Title 24, California Code of Regulations, Part 9), which would be ensured through the City's permitting process. Thus, implementation of the Project through the City's permitting process would ensure existing regulations are adhered to and would reduce potential construction related emergency access impacts to a less than significant level. Thus, impacts related to inadequate emergency access during construction activities would not occur.

Operation

Operation of the proposed Project would not result in a physical interference with an emergency response evacuation. Access to the proposed Project would be provided via three driveways. The Project would

consolidate the two existing driveways on W. 7th Street that are located along the center of the site's northern boundary into one 24-foot-wide driveway. The existing driveway on W. 7th Street in the northeastern corner of the site would be widened to a width of 24 feet. In addition, a gated 25-foot-wide driveway is proposed from S. Grand Avenue in the southwest corner of the site to provide emergency vehicle access to the site.

The Project is also required to design and construct internal access and provide fire suppression facilities (e.g., hydrants and sprinklers) in conformance with the SJMC Code and the Riverside County Fire Department (RCFD) prior to approval to ensure adequate emergency access pursuant to the requirements in Section 503 of the California Fire Code (Title 24, California Code of Regulations, Part 9) and the Fire Code included per SJMC Chapter 8.16. As a result, the proposed Project, including the driveway improvements, would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, and impacts would be less than significant.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

No Impact.

According to the California Department of Forestry and Fire Protection (CAL FIRE) Hazard Severity Zone map and GPU EIR Figure 5.20-1, *Fire Hazard Severity Zones,* the Project site not located within a Very High Fire Hazard Severity Zone (VHFHSZ) (CAL FIRE, 2025; City of San Jacinto, 2022b). Additionally, the Project site is located in an urban area and is not adjacent to wildlands. Implementation of the proposed Project would be required to adhere to the California Fire Code and would be reviewed by the City's Building and Safety Division during the permitting process to ensure that the Project plans meet the general applicable adopted fire protection requirements. The proposed Project would result in no impact to the exposer of people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

Existing Plans, Programs, or Policies

PPP HAZ-1: SCAQMD Rule 1403. Prior to issuance of demolition permits, the Project Applicant shall submit verification to the City Building and Safety Division that an asbestos survey has been conducted at all existing buildings located on the Project site. If asbestos or asbestos containing material is found, the Project Applicant shall follow all procedural requirements and regulations of the South Coast Air Quality Management District (SCAQMD) Rule 1403. Rule 1403 regulations require that the following actions be taken: notification of SCAQMD prior to construction activity, asbestos removal in accordance with prescribed procedures, placement of collected asbestos in leak-tight containers or wrapping, and proper disposal.

PPP HAZ-2: Lead. Prior to issuance of demolition permits, the Project Applicant shall submit verification to the City Building and Safety Division that a lead-based paint survey has been conducted at all existing buildings located on the Project site. If lead-based paint is found, the Project Applicant shall follow all procedural requirements and regulations for proper removal and disposal of the lead-based paint. CalOSHA has established limits of exposure to lead contained in dusts and fumes. Specifically, CCR Title 8, Section 1532.1 provides for exposure limits, exposure monitoring, and respiratory protection, and mandates good working practices by workers exposed to lead.

PPP HYD-1: SWPPP. As discussed below in Section 5.10, *Hydrology and Water Quality*.

Mitigation Measures

None.

5.10. HYDROLOGY AND WATER QUALITY

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in a substantial erosion or siltation on- or off-site?	☐	☐	☒	☐
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?	☐	☐	☒	☐
e) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☐	☐	☒	☐
f) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?	☐	☐	☒	☐
g) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
h) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Less than Significant Impact.

Construction

Construction of the Project would require demolition of an existing building and grading and excavation of soils, which would loosen sediment, and then have the potential to mix with surface water runoff and degrade water quality. Additionally, construction would require the use of heavy equipment and construction-related chemicals, such as concrete, cement, asphalt, fuels, oils, antifreeze, transmission fluid, grease, solvents, and paints. These potentially harmful materials could be accidentally spilled or improperly disposed of during construction and, if mixed with surface water runoff could wash into and pollute waters.

These types of water quality impacts during construction of the Project would be prevented through implementation of a grading and erosion control plan that is required by the Construction Activities General Permit (State Water Resources Board Order No. 2022-0057-DW, NPDES No. CAS000002), which requires preparation of a SWPPP by a Qualified SWPPP Developer (included as PPP HYD-1). The SWPPP is required for plan check and approval by the City's Building and Safety Division, prior to provision of permits for the Project, and would include construction BMPs such as:

- Silt fencing, fiber rolls, or gravel bags;
- Street sweeping and vacuuming;
- Storm drain inlet protection;
- Stabilized construction entrance/exit;
- Vehicle and equipment maintenance, cleaning, and fueling;
- Hydroseeding;
- Material delivery and storage;
- Stockpile management;
- Spill prevention and control;
- Solid waste management; and/or
- Concrete waste management.

Adherence to the existing requirements and implementation of the appropriate BMPs as ensured through the City's construction permitting process, which would ensure that the Project would not violate any water quality standards or waste discharge requirements, potential water quality degradation associated with construction activities would be minimized, and impacts would be less than significant.

Operation

The proposed Project would operate as a 103-bed SNF, which would introduce potential for pollutants such as chemicals from cleaners, pesticides and sediment from landscaping, trash and debris, and oil and grease from vehicles. These pollutants could potentially discharge into surface waters and result in degradation of water quality. However, the proposed Project would be required to incorporate a WQMP which would incorporate source control and treatment control Best Management Practices (BMPs) to prevent pollutants from entering the storm drain system (PPP HYD-2). The Low Impact Development (LID)

site design would minimize impervious surfaces and provide infiltration of runoff into landscaped/pervious pavement areas.

Operation of the proposed facility would generate typical urban runoff from rooftop surfaces, landscaped areas, drive aisles, and pedestrian walkways. Stormwater would be collected through an on-site catch basin system and conveyed to two LID infiltration BMPs: approximately 1,093 square feet of pervious concrete along the north side of the parking lot (DMA 1) and approximately 3,000 square feet of pervious concrete within the fire access road along the south and east sides of the Project (DMA 2). The proposed Project would also incorporate disconnected roof downspouts that would discharge roof runoff to adjacent landscaped areas for infiltration. These BMPs are designed to satisfy the applicable LID Design Capture Volume (DCV) requirements and to treat runoff through infiltration prior to discharge. The site soils consist of Grangeville sandy loam and Grangeville fine sandy loam with in-situ saturated hydraulic conductivity (Ksat) rates of 1.98 to 5.95 inches per hour (Hydrologic Soil Groups A/B) Site-specific infiltration testing completed for the proposed Project establishes a design infiltration rate of 1.97 inches per hour, inclusive of a factor of safety of 3.0, which confirms that infiltration rates are sufficient to support infiltration-based BMPs (Appendix H).

The Project would implement source control BMPs to minimize the introduction of pollutants that could result in water quality impacts, as well as treatment control BMPs to treat stormwater runoff. Source control measures applicable to the proposed Project are identified in the Pollutant Sources/ Source Control Checklist included in the WQMP and include covered trash and refuse enclosures, storm drain inlet stenciling, and landscape and pest management controls (Appendix H). A series of on-site storm drain facilities incorporating LID features and peak storm flow elements are proposed. Runoff from the proposed building addition and parking areas would be collected through a catch basin system routed to pervious concrete infiltration areas on the Project site. The storm drain system and associated inlets would be sized to accommodate both water quality treatment flow rates and larger storm events. In addition, The proposed Project would introduce approximately 4,093 SF of new pervious pavement to the Project site (Appendix H).

With implementation of the operational source and treatment control BMPs that are outlined in the preliminary WQMP (Appendix H) that would be reviewed and approved by the City during the permitting and approval process, potential pollutants would be reduced to the maximum extent feasible, and implementation of the proposed Project would not substantially degrade water quality. Therefore, impacts would be less than significant.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Less than Significant Impact.

As discussed above and within Appendix H, development of the proposed Project would retain and infiltrate stormwater runoff on-site rather directing it off-site, thereby maintaining the site's existing contribution to groundwater recharge.. In addition, the proposed Project would install an on-site storm drain system that would convey runoff to pervious concrete infiltration systems and would discharge roof runoff to adjacent landscaped areas through disconnected downspouts that would capture, filter, and infiltrate runoff on-site. The on-site infiltration BMPs provide a combined capacity of approximately 5,376 cubic feet, exceeding the combined Design Capture Volume (DCV) of approximately 2,150 cubic feet

(Appendix H). Site-specific testing established a design infiltration rate of 1.97 inches per hour, inclusive of a factor of safety of 3.0, confirming that the proposed BMPs would drain within the required drawdown period (Appendix H). As a result, the proposed Project would not decrease groundwater supplies or interfere substantially with groundwater recharge; and the Project would not impede sustainable groundwater management of the basin. Thus, the proposed Project would have a less than significant impact.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in a substantial erosion or siltation on- or off-site?

Less than Significant Impact.

Construction

Construction and demolition activities associated with the Project would expose soil and loosen sediment, which could result in erosion or siltation. However, the Project site does not include any slopes, which reduces the construction erosion potential. As described previously, construction of the proposed Project requires City approval of a SWPPP prepared by a Qualified SWPPP Developer, as included in PPPHYD-1. The SWPPP is required during the City's plan check and permitting process and would include construction BMPs to reduce erosion or siltation. Typical BMPs for erosion or siltation include use of silt fencing, fiber rolls, gravel bags, stabilized construction driveway, and stockpile management (as described in the previous response above). Adherence to the existing requirements and implementation of the required BMPs per the plan check and permitting process would ensure that erosion and siltation associated with construction activities would be minimized, and impacts would be less than significant.

Operation

The Project site consists of an existing skilled nursing facility, associated surface parking, and landscaped areas. Existing site improvements include several single-story buildings, an asphaltic concrete parking lot, drive aisles, sidewalks, and a basketball court, with the remainder of the site consisting of landscaped areas, an exercise yard, and earthen or gravel-covered areas (Appendix H). Development of the proposed Project would result in a total of approximately 91,824 SF of impervious surfaces within the Project limits, or approximately 71 percent of the 2.96-acre site (Appendix H). Of this total, approximately 52,326 SF represents newly developed surface area (Appendix H). The Project would minimize impervious surfaces through the introduction of pervious concrete pavement and disconnected roof downspouts that discharge to landscaped areas, which would allow for infiltration. The Project site does not contain any drainage, riparian, or riverine features. The pervious surfaces on the site would be improved with infiltration pavement and landscaping, and there would be no substantial areas of bare or disturbed soil on-site subject to erosion. In addition, the Project is required to implement LID BMPs, as included in PPP HYD-2, which would provide operational BMPs to ensure that operation of the proposed Project would not result in erosion or siltation. With implementation of these regulations, impacts related to erosion or siltation on-site or off-site would be less than significant.

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which

would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?

Less than Significant Impact.

As discussed previously, during construction, a SWPPP would be implemented to control drainage and maintain drainage patterns across the proposed Project. As discussed in the Hydrology Report (Appendix I), under existing conditions, stormwater surface flows drain northward and eastward through the Project frontage toward the Main Street Storm Sewer system. Under the proposed Project, flows would be directed toward catch basins and routed through an upgraded on-site storm drain system discharging to the Main Street Storm Sewer. Pre-development peak flows at the downstream outfall were 4.77 cubic feet per second (cfs) for the 10-year storm and 7.67 cfs for the 100-year storm. Post-development flows are 5.42 cfs for the 10-year storm (an increase of 0.65 cfs, within modeling tolerance) and 6.83 cfs for the 100-year storm (a decrease of 0.84 cfs). The proposed condition would result in a small increase in runoff rate for the 10-year storm event and a decrease in the 100-year storm event (Appendix I). Therefore, the Project would not result in a substantial increase in the amount of surface runoff, and impacts would be less than significant.

e) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Less than Significant Impact.

As described in the previous responses, the proposed Project would be required to implement a SWPPP (PPP HYD-1) during construction that would implement BMPs, such as the use of silt fencing, fiber rolls, and gravel bags, that would ensure that runoff would not substantially increase during construction, and that pollutants would not discharge from the Project site, which would reduce potential impacts to drainage systems and water quality to a less than significant level.

The proposed Project would introduce approximately 4,093 SF of new pervious pavement to the Project site (Appendix H). Pre-development peak flows at the downstream outfall were 4.77 cubic feet per second (cfs) for the 10-year storm and 7.67 cfs for the 100-year storm. Post-development flows are 5.42 cfs for the 10-year storm (an increase of 0.65 cfs, within modeling tolerance) and 6.83 cfs for the 100-year storm (a decrease of 0.84 cfs). The proposed condition would result in a small increase in runoff rate for the 10-year storm event and a decrease in the 100-year storm event (Appendix I). The proposed stormwater system would remove coarse sediment, trash, and pollutants (i.e., sediments, nutrients, heavy metals, oxygen demanding substances, oil and grease, bacteria, and pesticides) through infiltration via on-site pervious concrete BMPs and disconnected roof downspouts, which would provide sufficient Design Capture Volume (DCV). Development of the proposed Project would not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems and impacts would be less than significant.

f) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?

Less than Significant Impact.

According to the Federal Emergency Management Agency (FEMA) Map No. 06065C1490H, the Project site is classified as Flood Zone X, outside the 0.2 percent annual chance floodplain (FEMA, 2024). Additionally, a SWPPP and WQMP would be prepared and implemented as part of the Project to ensure pollutants are contained and would not be released from the Project site during construction and operation. Pre-development peak flows at the downstream outfall were 4.77 cubic feet per second (cfs) for the 10-year storm and 7.67 cfs for the 100-year storm. Post-development flows are 5.42 cfs for the 10-year storm (an increase of 0.65 cfs, within modeling tolerance) and 6.83 cfs for the 100-year storm (a decrease of 0.84 cfs). The proposed condition would result in a small increase in runoff rate for the 10-year storm event and a decrease in the 100-year storm event (Appendix I). Post-construction stormwater infrastructure would ensure capture and treatment of storm flows exceeding the DCV based on the water quality design storm. Therefore, implementation of the Project would not impede or redirect flood flows.

g) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

No Impact.

According to FEMA Map No. 06065C1490H the Project site is classified as Flood Zone X, outside the 0.2 percent annual chance floodplain (FEMA, 2024). The site is not within a special flood hazard area.

Tsunamis are ocean wave trains generally caused by tectonic displacement of the sea floor associated with shallow earthquakes, sea floor landslides, rock falls, and exploding volcanic islands. The Project site is located approximately 47 miles east of the Pacific Ocean; consequently, there is no potential for the Project site to be inundated by a tsunami that could release pollutants. In addition, the Project site is flat and not located near any steep hillsides; therefore, there is no potential for the site to be adversely affected by mudflow.

Similarly, a seiche is the sloshing of a closed body of water from earthquake shaking. Seiches are of concern relative to water storage facilities because inundation from a seiche can occur if the wave overflows a containment wall, such as the wall of a reservoir, water storage tank, dam, or other artificial body of water. The Project site is not within the vicinity of any impounded bodies of water; therefore, the Project is not at risk of a seiche.

Thus, implementation of the proposed Project would not expose people or structures to a significant risk of loss, injury, or death involving inundation by seiche, tsunami, or mudflow that could release pollutants due to inundation of the Project site. No impact would occur.

h) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Less than Significant Impact.

As described previously, the Project would be required to have an approved SWPPP (PPP HYD-1), which would include construction BMPs to minimize the potential for construction related sources of pollution.

For operations, the proposed Project would be required to implement source control BMPs to minimize the introduction of pollutants; and treatment control BMPs to treat runoff. Applicable source control measures are documented in the Pollutant Sources/ Source Control Checklist included in the WQMP (Appendix H). With implementation of the operational source and treatment control BMPs that would be required by the City during the permitting and approval process, potential pollutants would be reduced to the maximum extent feasible, and implementation of the proposed Project would not obstruct implementation of a water quality control plan.

As described previously, the Project would be required to implement a WQMP (PPP HYD-2), which would be verified as part of the City's permitting process. The proposed Project would introduce approximately 4,093 SF of new pervious pavement to the Project site through the installation of pervious concrete infiltration BMPs, and would discharge roof runoff to landscaped areas through disconnected downspouts (Appendix H). These BMPs would capture, filter, and infiltrate runoff on-site. As a result, the proposed Project would not decrease groundwater supplies or interfere substantially with groundwater recharge; and the Project would not impede implementation of a sustainable groundwater management plan or water quality control plan. Thus, the proposed Project would have a less than significant impact.

Existing Plans, Programs, or Policies

PPP HYD-1: SWPPP. Prior to grading permit issuance, the Project developer shall have a SWPPP prepared by a Qualified SWPPP Developer (QSD) pursuant to the San Jacinto Municipal Code Chapter 17.600. The SWPPP shall incorporate all necessary BMPs and other City requirements to comply with the NPDES requirements to limit the potential of polluted runoff during construction activities. Project contractors shall be required to ensure compliance with the SWPPP and permit periodic inspection of the construction site by San Jacinto City staff or its designee to confirm compliance.

PPP HYD-2: WQMP. Prior to grading permit issuance, the Project developer shall have a WQMP approved by the City for implementation. The project shall comply with the San Jacinto Municipal Code Chapter 19.600 and the Municipal Separate Storm Sewer System (MS4) permit requirements in effect for the Regional Water Quality Control Board (RWQCB) at the time of grading permit to control discharges of sediments and other pollutants during operations of the Project.

Mitigation Measures

None.

5.11. LAND USE AND PLANNING

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

a) Physically divide an established community?

No Impact.

The physical division of an established community could occur if a major road (expressway or freeway, for example) were built through an existing community or neighborhood, or if a major development was built which was inconsistent with the land uses in the community such that it divided the community. The environmental effects caused by such a facility or land use could include lack of, or disruption of, access to services, schools, or shopping areas. It might also include the creation of blighted buildings or areas due to the division of the community.

The proposed Project site is surrounded by industrial uses, residential uses, parcels of undeveloped land, and existing roadways. The proposed Project would expand the existing use on the Project site; as such, the proposed Project would connect to and integrate with the existing neighborhood and would not change roadways or install any infrastructure that would result in a physical barrier. Therefore, implementation of the proposed Project would not physically divide an established community, and impacts would not occur.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant Impact.

The Project site has a General Plan land use designation of Industrial (I) and a zoning designation of Industrial Light (IL). The proposed Project would expand the existing Bradley Gardens facility, which currently operates as a legal nonconforming use on the Project site. The City is processing the proposed Project under the legal nonconforming provisions of SJMC Section 17.705.120 (Nonconforming Adjustment), and the following discretionary approvals are required: a Conditional Use Permit, , and Site Plan and Design Review.

The proposed Project has been evaluated for consistency with all applicable plans, policies, and regulations adopted for the purpose of avoiding or mitigating environmental effects, including the City of San Jacinto General Plan and SJDC development standards. As demonstrated in Table LU-1 below, the

proposed Project is consistent with all applicable City of San Jacinto General Plan policies. The proposed Project would be developed in conformance with the SJDC development standards for the IL zone, including applicable standards for setbacks, building height, floor area ratio, landscaping, and parking, as confirmed in Table AES-1 of this IS/MND.

The proposed Project would not conflict with the City's adopted MSHCP requirements, as the Project site is not located within a Criteria Cell or designated conservation area and MSHCP development impact fees would be paid prior to permit issuance (PPP BIO-1). The proposed Project would comply with all applicable stormwater management requirements under SJMC Chapter 13.44 and the Santa Ana RWQCB NPDES permit, and would implement a SWPPP (PPP HYD-1) and WQMP (PPP HYD-2). The proposed Project would also be designed in conformance with CBC seismic safety requirements (PPP GEO-1) and all applicable California Fire Code and building code standards.

Therefore, the proposed Project would not conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, and impacts would be less than significant.

Table LU-1: City of San Jacinto General Plan Consistency Analysis

General Plan Goal	Consistency Analysis
Policy LU 2.1: Plan for New Development. Ensure that new development corresponds to the provision of infrastructure, public services and community facilities, and that new development funds and constructs its fair share of improvement in accordance with City requirements.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would install new on-site connections to the existing 12-inch diameter water line and the existing 8-inch diameter sewer line in W. 7th Street. Stormwater infrastructure, including a new series of catch basins and storm drain lines, would be constructed to manage runoff from the expanded facility. The proposed Project would be subject to applicable development impact fees for fire services and other public infrastructure, ensuring that the Project funds its fair share of service improvements in accordance with City requirements.
Policy LU 2.2: Infill Development. Encourage new development to occur in infill locations in a balanced and efficient pattern that reduces sprawl, preserves open space, and creates convenient connections to other land uses and activity centers.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project represents infill development that makes productive use of existing developed land and infrastructure, and would not contribute to urban sprawl or the conversion of undeveloped land. The proposed Project would also construct new sidewalks along W. 7th Street and S. Grand Avenue to improve pedestrian connections to the surrounding area.
Policy LU 3.1: Surrounding Uses. Consider as part of the development review process the compatibility of new development with surrounding uses and the ability of new development to enhance the character of the surrounding area.	**Consistent.** As described in Section 3, *Project Descriptio*n, the proposed Project would expand the existing Bradley Gardens facility, which has operated as a SNF on the Project site for decades. The proposed Project would not change the existing use on the site. The surrounding area is characterized by industrial, residential, and vacant land uses, and the proposed one-story building addition at a maximum height of 22

	feet would remain consistent with the existing low-rise development pattern. The proposed Project would also add landscaping, updated architectural finishes, new sidewalks, and improved site access, enhancing the character of the immediate vicinity.
Policy LU 3.4: Environmental Compatibility. Limit development in areas subject to severe natural hazards, such as landslides, ground subsidence, liquefaction, and flooding.	**Consistent.** As described in Section 5.7, *Geology and Soils*, the Project site is relatively flat, is not located within an Alquist-Priolo Earthquake Fault Zone, and is not in the path of any known or potential landslides. While the site has moderate liquefaction susceptibility, groundwater was not encountered in geotechnical borings to 60 feet below ground surface, and the Project would be designed to meet CBC requirements (PPP GEO-1), including project-specific geotechnical recommendations incorporated at permit approval. As described in Section 5.10, *Hydrology and Water Quality*, the Project site is located in FEMA Flood Zone X, outside the 0.2 percent annual chance floodplain. The proposed Project would therefore not place development in an area subject to severe natural hazards.
Policy LU 3.8: Public Utilities. Ensure land uses and development are compatible with existing and proposed utility facilities including the San Jacinto Wastewater Treatment Facility.	**Consistent.** As described in Section 5.19, *Utilities and Service Systems,* the proposed Project would install new on-site connections to the existing 12-inch diameter water line and 8-inch diameter sewer line in W. 7th Street. These on-site connections would not require expansion of off-site utility infrastructure. The existing utility systems have the capacity to accommodate the proposed expansion, and the Project would remain compatible with the existing utility facilities.
Policy LU 5.2: Standards and Guidelines. Develop and enforce development standards and objective design guidelines that provide clear direction for achieving quality community design in new development and redevelopment projects.	**Consistent.** As described in Section 5.1, *Aesthetics*, the proposed Project has been evaluated for consistency with the San Jacinto Development Code (SJDC) development standards applicable to the Industrial Light (IL) zoning designation. The proposed Project's setbacks, height, floor area ratio of 0.27, landscaping coverage, and parking meet applicable SJDC standards, as confirmed in Table AES-1 of the IS/MND. The proposed Project would therefore be developed in conformance with the City's objective design guidelines.
Policy LU 5.4: Gathering Places. Encourage the provision of both formal and informal public gathering spaces through pedestrian-oriented street design; sidewalk furniture and pedestrian-oriented development; well-designed, multi-use public spaces of	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would construct new 5-foot sidewalks along the W. 7th Street and S. Grand Avenue frontages, improving pedestrian connectivity along the site perimeter. On-site, the proposed Project would create a new common open space area for

different sizes including pocket parks, plazas, monuments, and community events.	facility residents between the existing SNF building and the proposed SNF-STP addition, featuring a concrete walkway, seating areas with chairs and tables, artificial turf, and decorative plants. Recreation and open space would cover approximately 15 percent of the site upon Project completion.
Policy LU 5.5: Landscaping. Use landscaping for screening, solar control, parking lot shade, and other beautification purposes throughout the City.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would add 4,015 SF of ornamental landscaping, increasing total on-site landscaping from approximately 36,347 SF to 40,362 SF, covering approximately 31 percent of the site. Proposed landscaping includes 24-inch box trees, 1-gallon and 5-gallon trees, various shrubs, and succulents near the proposed SNF addition. The landscaping would provide screening, shade, and beautification consistent with this policy.
Policy LU 5.6: Streetscapes. Promote drought tolerant landscaping, tree planting, and tree preservation along City streets as a means of improving aesthetics, making neighborhoods more pedestrian friendly, and providing environmental and economic benefits.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project includes ornamental landscaping with succulents, which are drought-tolerant species, along the southeastern corner of the site near the proposed SNF addition. Existing landscaped areas along the W. 7th Street and S. Grand Avenue frontages would be retained. The proposed Project would also dedicate right-of-way along both street frontages and install new 5-foot sidewalks, enhancing the pedestrian environment along adjacent streets.
Policy LU-5.9: Public and Private Investment. Invest public and private resources in the maintenance and rehabilitation of existing housing to prevent or reverse neighborhood deterioration.	**Consistent.** As described in Section 3, *Project Description*, he proposed Project would revitalize an existing developed site through the demolition of a deteriorated 1,074 SF maintenance and storage building and the construction of a modern 18,000 SF SNF-STP addition. The existing vacant office building would be converted into an active 16-bed PHF, eliminating a dormant structure on the site. New landscaping, updated architectural finishes, improved parking, and new site infrastructure would upgrade the appearance and function of the facility, reversing potential neighborhood deterioration.
Policy ED-2.3: Medical Facilities. Continue to promote the establishment of local and regional serving medical facilities in San Jacinto to diversify economic activity and better serve the healthcare needs of San Jacinto Valley residents and businesses.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would expand the existing Bradley Gardens facility from a 44-bed SNF to a 103-bed facility that includes SNF, Short-Term Psychiatric (STP), and Psychiatric Health Facility (PHF) beds. The expansion would increase the facility's capacity to serve community members with specialized psychiatric and rehabilitative healthcare needs, add 100 new employees, and strengthen the City's medical

	services base, directly supporting the City's goal of diversifying economic activity through local healthcare investment.
Policy M-1.1: Balanced Circulation System. Provide for a balanced circulation system that promotes the safe and efficient movement of people and goods throughout the City.	**Consistent.** As described in Section 3, *Project Description,* the proposed Project would consolidate two existing driveways on W. 7th Street into one 24-foot-wide driveway and widen the northeastern driveway to 24 feet, improving site access and reducing conflict points. A gated 25-foot-wide emergency access driveway is proposed on S. Grand Avenue. Internal circulation would be served by a 27.3-foot-wide drive aisle within the surface parking lot. The Project would also construct new 5-foot sidewalks along site frontages and provide 6 bicycle parking spaces, supporting multiple modes of travel.
Policy M-1.2: Access and Mobility. Strive to maintain sufficient access and mobility for all modes of travel and users of the roadway network.	**Consistent.** As described in Section 5.17, *Transportation*, the proposed Project would generate a net increase of 181 daily vehicle trips, which is below the 500 daily trip threshold under the City's VMT Guidelines. The Project would not result in any significant impact to the existing roadway network. Site access would be maintained via two unrestricted driveways on W. 7th Street and an emergency access driveway on S. Grand Avenue. New sidewalks, ROW dedications, and bicycle parking would improve multi-modal access to and from the site.
Policy M-1.5: Transportation Improvements for All Users. Encourage roadway, sidewalk, and median improvements that enhance the visual character of the roadway system and promote pedestrian and bicycle safety.	**Consistent.** As described in Section 3, *Project Description,* the proposed Project would install new 5-foot sidewalks along the W. 7th Street and S. Grand Avenue frontages of the Project site. The Project and would dedicate 3 feet along W. 7th Street to widen the ROW from 50 to 53 feet and 6 feet along S. Grand Avenue to widen the ROW from 33 to 39 feet. These improvements would enhance pedestrian safety, improve the visual character of adjacent streetscapes, and support the City's goals for multi-modal transportation.
Policy M-4.5: Support Facilities. Encourage new developments to provide bicycle parking, lockers, and other support facilities for bicyclists.	**Consistent.** As shown in Section 3, *Project Description*, the proposed Project would provide 3 short-term and 3 long-term bicycle parking spaces near the entrance to the existing SNF building, for a total of 6 bicycle parking spaces. The combination of short-term and long-term bicycle parking supports both visiting cyclists and employees who commute by bicycle.
Policy M-5.1: Appropriate Parking Supply. Use the development review process to plan for new	**Consistent.** As shown in Section 3, *Project Description*, the proposed Project would provide a total of 52 passenger vehicle parking spaces, including 4 ADA-

developments to provide appropriate vehicle parking supply to meet demand.	accessible spaces, in a surface lot along the northern boundary of the site. Parking would serve employees, patients, and visitors. The proposed parking supply has been reviewed as part of the City's development review process and is consistent with applicable SJDC development standards.
Policy M-6.1: Vehicle Miles Traveled. Maintain vehicle miles traveled (VMT) thresholds and Transportation Demand Management (TDM) mitigation requirements for the purpose of environmental review under the California Environmental Quality Act (CEQA).	**Consistent.** As shown in Section 5.17, *Transportation*, a VMT Screening Analysis was prepared for the proposed Project. The Project would generate a net increase of 181 daily trips, with a total of 315 daily vehicle trips, which is below the City's 500 daily trip screening threshold. Therefore, the Project qualifies for VMT screening and is presumed to have a less than significant VMT impact, consistent with the City's adopted VMT thresholds under CEQA.
Policy M-6.4: New Development. Work with developers to reduce greenhouse gas emissions and minimize congestion related to new development through improvements to the circulation system and on-site improvements that encourage non-vehicular modes of travel.	**Consistent.** As described in Section 3, *Project Description,* and Section 5.8, *Greenhouse Gas Emissions*, the proposed Project would not result in a significant increase in GHG emissions, with net new operational emissions well below the SCAQMD Tier 3 screening threshold of 3,000 $MTCO_2e$ per year. The proposed Project would construct new sidewalks along both street frontages, provide 6 bicycle parking spaces, and dedicate ROW to support future roadway improvements, all of which encourage non-vehicular modes of travel and reduce vehicle-related emissions.
Policy PS-1.2 Earthquake Protection. Enforce State seismic design guidelines and all relevant building codes to reduce the risk of damage associated with seismic activity.	**Consistent.** As described in Section 5.7, *Geology and Soils,* the Project site is not within an Alquist-Priolo Earthquake Fault Zone; however, the San Jacinto Fault is located approximately 2 miles northeast of the site. The proposed Project would be designed in accordance with the CBC (adopted in SJMC Section 15.04.020; PPP GEO-1), including mandatory seismic safety features, proper building footings and foundations, and structural design to withstand strong ground shaking. Project-specific geotechnical recommendations from the Geotechnical Investigation would be incorporated into grading plans and building design as a condition of permit approval. The City would verify CBC compliance during plan check and development review.
Policy PS-1.5 Development. Require assessment and mitigation of hazards related to liquefaction, landslides, and flooding for new development projects or City improvement projects that are identified by the City as susceptible to these hazards.	**Consistent.** As described in Section 5.7, *Geology and Soils*, the Project site is identified as having moderate liquefaction susceptibility. While the site is classified as having moderate liquefaction susceptibility, groundwater was not encountered in borings to 60 feet below ground surface, and the Project would comply with CBC requirements (PPP GEO-1) incorporating project-specific geotechnical recommendations. The

	site is relatively flat with no known landslide susceptibility per GPU EIR Figure 5.7-5. As described in Section 5.10, *Hydrology and Water Quality*, the site is located in FEMA Flood Zone X, outside the 0.2 percent annual chance floodplain. Therefore, hazards related to liquefaction, landslides, and flooding have been assessed and addressed through applicable regulatory compliance.
Policy PS-1.6 Impact Reduction. Reduce the risk of impacts from geologic and seismic hazards by applying proper and up to date land use planning, development engineering, building construction, and retrofitting requirements.	**Consistent.** As described in Section 5.7, *Geology and Soils*, the proposed Project would be designed and constructed in compliance with the CBC, as adopted in SJMC Section 15.04.020 (PPP GEO-1), which incorporates current standards for seismic safety, structural design, foundations, and retaining walls. The City has also adopted an Earthquake Hazard Reduction Code under SJMC Chapter 15.24 to reduce risk of life loss from seismic events. Project-specific geotechnical recommendations would be incorporated into grading plans and building design as a condition of permit approval, and compliance would be verified by the City during plan check. Collectively, these requirements reduce geologic and seismic hazard risks to a less than significant level.
Policy PS-2.1: Building Fire Codes. Require that all buildings and facilities within San Jacinto comply with local, state, and federal regulatory standards such as the California Building and Fire Codes as well as other applicable fire safety standards.	**Consistent.** As described in Section 5.15, *Public Services*, the proposed Project would be required to comply with the California Fire Code (Title 24, California Code of Regulations, Part 9) and the Fire Code as adopted in SJMC Chapter 8.16. The Project would be designed and constructed to provide fire suppression facilities, including hydrants and sprinklers, in conformance with SJMC standards and Riverside County Fire Department (RCFD) requirements. The City's Building and Safety Division would review Project plans during the permitting process to ensure compliance with all applicable building and fire code requirements prior to construction approval.
Policy PS-2.2: Fire Protection Services. Reduce the risk of fire to the community by coordinating emergency preparedness with the Riverside County Fire Department (RCFD).	**Consistent.** As described in Section 5.15, *Public Services*, fire protection services for the Project site are provided by the RCFD. The nearest station, Riverside County Fire Station 25 (132 S San Jacinto Ave), is approximately 1.4 miles northeast of the Project site. The proposed Project would be required to comply with GPU Action RM-6f, contribute development impact fees to offset fire protection needs, and provide adequate emergency ingress and egress per City standards. The proposed Project's modest scale increase would not substantially increase service

	demands, and the two existing stations would continue to maintain current service levels.
Policy PS-3.1: Regulatory Compliance. Coordinate with local, state, and federal agencies to ensure that the City's regulations related to flood control are in compliance with federal, state, and local standards.	**Consistent.** As described in Section 5.10, *Hydrology and Water Quality*, the proposed Project would implement stormwater Best Management Practices (BMPs) consistent with the Santa Ana Regional Water Quality Control Board NPDES permit requirements. The Project site is classified as Flood Zone X, outside the 0.2 percent annual chance floodplain. The proposed Project would comply with all applicable local, state, and federal flood control standards.
Policy PS-3.5: Municipal Code. Implement the standards and requirements defined in the Municipal Code to reduce flood hazards and address flood-prone areas within San Jacinto.	**Consistent**. As described in Section 5.10, *Hydrology and Water Quality*, the proposed Project would comply with SJMC Chapter 13.44, Storm Water Management, which implements NPDES requirements. A Stormwater Pollution Prevention Plan (SWPPP) (PPP HYD-1) and Water Quality Management Plan (WQMP) (PPP HYD-2) would be prepared and implemented to ensure compliance with applicable stormwater management standards.
Policy PS-3.7: Stormwater Runoff. Encourage new developments that add impervious surfaces to integrate low impact development best management practices to reduce stormwater runoff.	**Consistent.** As described in Section 5.10, *Hydrology and Water Quality*, the proposed Project includes Low Impact Development (LID) features, including 1,093 square feet of pervious concrete in the parking lot and approximately 3,000 square feet of pervious concrete in the fire access lane to allow for stormwater infiltration. The Project is required to implement a WQMP (PPP HYD-2). A WQMP would incorporate source control and treatment control BMPs to prevent pollutants from entering the storm drain system, and the pervious concrete infiltration areas would capture and treat the Design Capture Volume prior to infiltration.
Policy PS-4.6: Proposed Facilities. Require appropriate environmental analysis to be conducted for any proposed hazardous waste materials treatment or transfer, in accordance with environmental review requirement.	**Consistent.** As described in Section 5.9, *Hazards and Hazardous Materials*, the proposed Project would not result in the introduction of new hazardous materials into the environment beyond those typically associated with a healthcare facility. The proposed IS/MND constitutes the required environmental analysis for the proposed Project. Prior to demolition, the Project applicant would be required to conduct asbestos and lead-based paint surveys of existing buildings (PPP HAZ-1 and PPP HAZ-2) and comply with all applicable hazardous materials regulations.

Policy PS-5.10: Crime Prevention Through Environmental Design. Ensure projects include design features that promote public safety and reduce criminal activity.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would incorporate site design features that promote public safety, including perimeter fencing, controlled access points, exterior lighting, and landscaping improvements. The facility operates with 24-hour supervised staff and controlled visitor access, which further promotes on-site safety and reduces potential criminal activity.
Policy PS-6.1: Noise Exposure. Consider the noise compatibility of existing and future development when making land use planning decisions. Require development and infrastructure projects to be consistent with the land use compatibility standards contained in Tables PS-1, PS-2, PS-3 and PS-4 to ensure acceptable noise exposure levels for existing and future development.	**Consistent.** As described in Section 5.13, *Noise*, the proposed Project would not result in a substantial increase in ambient noise levels beyond those established in the City's General Plan noise standards. The Project site's use as a SNF is consistent with the applicable noise compatibility standards.
Policy PS-6.2: Noise Mitigation. Require new development to mitigate excessive noise to the standards indicated in Tables PS-1, PS-2, PS-3 and PS-4 to the extent feasible through best practices, including building location and orientation, building design features, placement of noise generating equipment away from sensitive receptors, shielding of noise-generating equipment, placement of noise- tolerant features between noise sources and sensitive receptors, and use of noise-minimizing materials.	**Consistent.** As described in Section 5.13, *Noise*, construction noise would be limited to permitted hours under SJMC Section 8.40.090. Operational noise associated with the proposed Project would be consistent with the existing SNF use and would not result in a substantial increase in ambient noise levels. The proposed Project would comply with the City's applicable noise standards.
Policy PS-6.6: Commercial Noise. Require the use of noise attenuation measures, including screening and buffering techniques, for all new commercial development expected to produce excessive noise; in existing cases where the City's noise standards are exceeded, work with Code Enforcement to require compliance.	**Consistent.** As described in Section 5.13, *Noise*, the proposed Project would not produce excessive noise beyond levels associated with the existing SNF. The proposed Project would comply with applicable noise standards and would not require additional noise attenuation measures beyond those already in place.
Policy PS-6.7: Construction Noise. Require construction activities to reduce noise impacts on adjacent uses to the criteria identified in Tables PS-3 and PS-4, or, if the criteria cannot be met, to the maximum extent feasible complying with Chapter 8.40 of the San Jacinto Municipal Code (Noise Control) and use best practices. Construction activities outside of the permitted construction hours identified in the San Jacinto Municipal Code may be approved on a case-by-case basis by the Community Development Director.	**Consistent.** As described in Section 5.13, *Noise*, construction activities for the proposed Project would be limited to the hours of 7:00 a.m. to 7:00 p.m. on weekdays and Saturdays, and 9:00 a.m. to 6:00 p.m. on Sundays and holidays, as required by SJMC Section 8.40.090. Construction activities would comply with Chapter 8.40 of the SJMC and applicable noise standards.
Policy PS-7.12: Extreme Heat Vulnerabilities. Require that new developments, major remodels, and redevelopments address urban heat island issues and reduce urban heat island effects for the proposed project site and adjacent properties.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project includes the addition of 4,015 SF of ornamental landscaping for a total of 40,362 SF of landscaping, covering approximately 31 percent of the site. Landscaping and the use of

	succulents would help reduce the urban heat island effect on and adjacent to the Project site.
Policy RM-1.1: Balanced Open Space System. Support a balanced and integrated open space system that reflects a variety of considerations, including resource conservation, recreation, aesthetics, and community identity.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would maintain recreation/open space at approximately 15 percent of the site, including a new common outdoor open space area with a concrete walkway, seating areas, artificial turf, and decorative plants for use by facility residents.
Policy RM-1.2: Scenic Resources. Encourage the preservation of San Jacinto's scenic resources, including mature trees, rock outcroppings, hillsides, ridgelines, and other prominent natural landforms, to the extent practical.	**Consistent.** As described in Section 5.1, *Aesthetics*, the proposed Project would not obstruct existing long-distance public views of the Lakeview Mountains and San Jacinto Mountains available from surrounding roadways. The one-story proposed building addition is consistent with the existing low-rise institutional development pattern on-site.
Policy RM-2.4: Natural Conditions. Encourage development that avoids impacts to watershed areas, wetlands, natural drainage channels, riparian areas, and creeks, retaining these resources in their natural condition if feasible	**Consistent.** As described in Section 5.10, *Hydrology and Water Quality*, the Project site is a developed urban site that does not contain drainage, riparian, or riverine features. The proposed Project would not impact watershed areas, wetlands, natural drainage channels, or riparian areas.
Policy RM 3.1: Preservation. Protect areas containing significant historic, archaeological, and paleontological resources, as defined by the California Public Resources Code.	**Consistent.** As described in Section 5.7, *Geology and Soils*, the Project has potential to disturb previously unknown paleontological resources. With the implementation of, MM GEO-1, which requires paleontological monitoring, impacts to paleontological resources would be less than significant. Additionally, as described in Section 5.5, *Cultural Resources*, none of the existing buildings on the Project site were determined to be of historical significance. With the implementation of MM CUL-1, which requires archaeological evaluation in the event a resource is inadvertently discovered, impacts to archaeological resources would be less than significant.
Policy RM-3.4: Tribal Consultation. Consult with Native American tribes whose tribal cultural resources may be impacted by proposed development, as necessary, and in accordance with state, local, and tribal intergovernmental consultation requirements, in an effort to mitigate or avoid significant effects to resource(s).	**Consistent.** Prior to issuance of a grading permit, the Project developer shall enter into a Treatment and Disposition Agreement (TDA) with the Soboba Band of Luiseño Indians, included as PPP TCR-1, consistent with SJDC §17.300.055. Evidence of the executed TDA shall be submitted to the City Planning Division prior to permit issuance.
Policy RM-3.6: Historic Preservation. Identify, designate, and protect buildings, districts, eligible	**Consistent.** As described in Section 5.5, *Cultural Resources*, the existing structures on the Project site are not identified as historically significant resources.

properties and sites of historic importance within San Jacinto.	The proposed Project would not demolish or alter any historic structures and would not adversely affect any buildings, districts, or sites of historic importance.
Policy RM-4.5 Walkability. Encourage pedestrian-scale development and pedestrian-friendly design features to reduce vehicle emissions. (See Mobility Element).	**Consistent.** As described in Section 3, *Project Description*, the proposed Project includes the construction of new 5-foot sidewalks along the Project site frontages on W. 7th Street and S. Grand Avenue, improving pedestrian connectivity to and from the site. The Project also provides short-term and long-term bicycle parking facilities.
Policy RM 4.8: Mitigation. Require the implementation of relevant mitigation measures for all future development upon identification of potential air quality impacts.	**Consistent.** As described in Section 5.3, *Air Quality*, the proposed Project's construction and operational emissions would not exceed SCAQMD regional or localized significance thresholds, resulting in a less than significant impact. No mitigation measures related to air quality are required. Additionally, The proposed Project would comply with all applicable SCAQMD rules, including Rule 403 (PPP AQ-1),Rule 1113 (PPP AQ-2), and Rule 402 (PPP AQ-3).
Policy RM 4.9: Local Reduction Targets. The City of San Jacinto establishes the following per capita GHG reduction targets, in order to meet the requirements established by the state under AB 32 and SB 32, consistent with the CARB's 2017 Scoping Plan: 1.83 MTCO2e per service population (SP) by 2030; and 0.62 MTCO2e per service population (SP) by 2050	**Consistent.** As described in Section 5.8, *Greenhouse Gas Emissions*, the proposed Project's greenhouse gas emissions would not exceed the applicable SCAQMD thresholds. Additionally, as demonstrated under Tables GHG-3 and GHG-4, the Project would be consistent with the CARB 2022 Scoping Plan, WRCOG Subregional CAP, and would be consistent with the City's adopted GHG reduction targets and the State's climate goals under AB 32 and SB 32.
Policy RM-6.3: Site Design. Recognize the role of design features in new development to reduce potential for crime and implement best practices into existing plans and new development strategies.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project incorporates site design features to promote safety, including perimeter fencing, controlled access points, site lighting, and landscaping that supports visibility and deters criminal activity consistent with Crime Prevention Through Environmental Design (CPTED) principles.
Policy RM-7.4: Parkland Dedication. Require future private development to incorporate parkland, open space, or green space to expand recreational opportunities in the community in accordance with standards set by the San Jacinto Municipal Code.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would include a new common outdoor open space area covering approximately 15 percent of the site.
Policy RM-8.2: School Facilities. Work with developers and the school district to ensure the payment of fees, construction, and expansion of school facilities to address expected increases in school-age population.	**Consistent.** As described in Section 5.15, *Public Services*, the proposed Project is an expansion of an existing SNF that would not generate new residential uses or school-aged children. The proposed Project would not require the construction or expansion of

	school facilities and would have no impact on school enrollment.
Policy RM 9.3: Fair Share. Ensure that all new development provides for and funds its fair share of the costs for the expansion of public infrastructure and services, recreational amenities, and facilities.	**Consistent.** As described in Section 5.15, *Public Services*, the proposed Project would be responsible for the payment of applicable development impact fees, including fees for fire services, police services, parks and other services, which would offset future public infrastructure and service needs associated with the proposed expansion.
Policy RM-10.2: Solid Waste Collection. Provide adequate waste disposal, recycling, and refuse services for present and future residents and businesses, including programs that improve public access to solid waste collection and recycling facilities.	**Consistent.** As described in Section 5.19, *Utilities and Service Systems*, the proposed Project would comply with all applicable solid waste disposal and recycling requirements. The expansion of the facility would generate additional solid waste consistent with a SNF use, which would be accommodated by existing waste disposal services.
Policy RM-10.3: Hazardous Waste. Promote the proper disposal of hazardous waste, including paint, tires, medications, medical sharps, infectious waste, asbestos waste, construction waste, and electronic waste, through education, monitoring, and enforcement of proper use, storage, handling, and disposal.	**Consistent.** As described in Section 5.9, *Hazards and Hazardous Materials*, the proposed Project would comply with all applicable regulations governing the handling, storage, and disposal of hazardous waste associated with SNF operations. Compliance with PPP HAZ-1 and PPP HAZ-2 would ensure proper handling of any hazardous materials encountered during demolition.
Policy EJ-1.1: Emission Sources. Encourage existing sources of emissions to use feasible measures to minimize air quality impacts in Environmental Justice Communities and avoid new sources of significant emissions in these communities as feasible.	**Consistent.** As described in Section 5.3, *Air Quality*, the proposed Project's construction and operational emissions would not exceed SCAQMD regional or localized significance thresholds, resulting in a less than significant impact. Additionally, the proposed Project would comply with applicable SCAQMD rules (PPP AQ-1 through PPP AQ-3).
Policy EJ-4.3: Indoor Air Quality. Encourage measures to reduce indoor air quality impacts (e.g., air filtration systems, kitchen range hood exhaust fans, low-VOC paint and carpet) for new developments.	**Consistent.** As described in Section 5.3, *Air Quality*, the proposed Project would comply with SCAQMD Rule 1113 governing VOC content in architectural coatings, paints, and solvents (PPP AQ-2). As a SNF, the Bradley Gardens facility would be required to maintain indoor air quality standards consistent with applicable State health facility regulations.
Policy EJ-5.2: Accessibility. Endeavour to provide parks that are easily accessible to the surrounding neighborhood and beyond, and are as barrier-free as possible, particularly for those with limited mobility.	**Consistent.** As described in Section 3, *Project Description*, the proposed Project would provide on-site open space and recreational amenities accessible to facility residents, including a concrete walkway, seating areas, and artificial turf. The proposed Project would also include 4 ADA-accessible parking spaces, and the new 5-foot sidewalks along site frontages

	would improve accessibility for pedestrians with limited mobility.

Existing Plans, Programs, or Policies

PPP AQ-1: SCAQMD Rule 403. As listed in Section 5.3, *Air Quality.*

PPP AQ-2: SCAQMD Rule 1113. As listed in Section 5.3, *Air Quality.*

PPP AQ-3: SCAQMD Rule 402. As listed in Section 5.3, *Air Quality.*

PPP BIO-1: MSHCP Fees. As listed in Section 5.4, *Biological Resources.*

PPP GEO-1: CBC Compliance. As listed in Section 5.7, *Geology and Soils.*

PPP HAZ-1: SCAQMD Rule 1403. As listed in Section 5.9, *Hazards and Hazardous Materials***.**

PPP HAZ-2: Lead. As listed in Section 5.9, *Hazards and Hazardous Materials***.**

PPP HYD-1: SWPPP. As listed in Section 5.10, *Hydrology and Water Quality.*

PPP HYD-2: WQMP. As listed in Section 5.10, *Hydrology and Water Quality*.

Mitigation Measures

None.

5.12. MINERAL RESOURCES

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact.

The City of San Jacinto GPU Draft EIR Figure 5.12-1 *Mineral Resource Zones* designates the Project site as being located in MRZ-3, which is an area containing mineral deposits, the significance of which cannot be evaluated (City of San Jacinto, 2022b). The Project site was previously used for agricultural uses and is currently developed with a SNF; the Project site was never used for mineral extraction. Additionally, the site is designated Industrial (I) by the City's General Plan and is zoned Industrial Light (IL). Extraction of mineral resources is not permitted under the Project site's land use or zoning designation. As such, the proposed Project would not result in the loss of availability of a known mineral resource and there would be no impact.

b) Result in the loss of availability of a locally important mineral resource recovery site delineated on the general plan, specific plan. or other land use plan?

No Impact.

As discussed previously, the Project site is within an MRZ zone-3. However, no mineral extraction activities occur on the Project site currently, or historically. Additionally, no mineral extraction is planned as part of the Project or permitted under the site's land use and zoning designations. As such, the proposed Project would not result in the loss of availability of a locally-important mineral resource recovery site delineated on the general plan, specific plan or other land use plan. Therefore, there would be no impact to the loss of available, locally important, mineral resource recovery sites.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.13. NOISE

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☒	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐

c) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less Than Significant Impact.

Construction

Noise generated by construction equipment would include a combination of trucks, power tools, concrete mixers, and portable generators that when combined can reach high levels. Construction is expected to occur in the following stages: demolition, site preparation, grading, building construction, architectural coating, and paving. The Project would not include pile driving, which typically results in the highest construction noise volumes.

Construction noise would be temporary in nature and would be limited to permitted hours under the SJMC Section 8.40.090, which allows construction activity between the hours of 7:00 a.m. and 7:00 p.m. on weekdays and Saturdays, and between 9:00 a.m. and 6:00 p.m. on Sundays and holidays.

A Noise and Vibration Impact Analysis prepared for the Project and is included as Appendix J. Table N-1 lists typical construction equipment noise levels by phase. As shown, construction noise levels for the loudest equipment range from approximately 72.8 to 89.6 dBA Lmax at 50 feet.

Table N-1: Typical Construction Equipment Noise Levels

Activity	Equipment[1]	Quantities[1]	Maximum Noise Level @ 50 Feet[2,3]	Two Loudest Noise Levels @ 50 Feet[2,3]	Sound Power Level at Source
			dBA L_{max}	dBA L_{eq}	dB (PWL)
Demolition	Concrete/Industrial Saws	1	**89.6**	84.5	**114.7**
	Rubber Tired Dozers	1	81.7		
	Tractors/Loaders/Backhoes	1	**84.0**		
Site Preparation	Graders	1	**85.0**	82.7	112.8
	Rubber Tired Dozers	1	**84.0**		
	Crawler Tractors	1	81.7		
Grading	Graders	1	**85.0**	82.7	112.8
	Rubber Tired Dozers	1	**84.0**		
	Crawler Tractors	1	81.7		
Paving	Pavers	1	77.2	84.5	**114.7**
	Roller	1	80.0		
	Cement and Mortar Mixer	1	80.0		
	Tractors/Loaders/Backhoes	1	**84.0**		
	Paving Equipment	1	**89.5**		
Building Construction	Cranes	1	**80.6**	80.7	110.9
	Forklift	1	74.7		
	Generator Sets	1	72.8		
	Tractors/Loaders/Backhoes	1	**84.0**		
	Welders	3	74.0		
Architectural Coating	Air Compressors	1	77.7	77.7	107.8

Notes: **bold** = Selected equipment with the two highest noise levels. PWL = Sound Power Level.
Footnotes:
1. The equipment list at each construction phase is based on the California Emissions Estimator Model and questionnaire filled by the applicant.
2. Federal Highway Administration. (2006). *Construction Noise Handbook*.
3. The noise levels are based on Table 9.1 of the Construction Noise Handbook. If the exact equipment listed is not available, a default noise level of 85 dBA, representative of typical construction equipment, is used. Specifically, the Forklift is modeled using this default value. Additionally, for the category of Tractors/Loaders/Backhoes, the noise level of a Tractor (84 dBA) is used, as it represents the loudest among the three.
Source: Noise and Vibration Impact Analysis (Appendix J)

The nearest off-site noise-sensitive receptors are single-family residences located approximately 70 feet to the north and 90 feet to the west of the Project site boundary. As a conservative analysis, the Noise and Vibration Impact Analysis assumed the two loudest pieces of equipment operating simultaneously during each construction phase. As documented in the Noise and Vibration Impact Analysis (Appendix J), the estimated temporary noise levels from Project construction activities at the nearest sensitive receptors would be 71.9 dBA on-site and 62.8 dBA off-site, which would not exceed the Federal Transit Administration (FTA) daytime threshold of 80 dBA Leq for residential land uses. Project construction would

therefore result in a less-than-significant impact with respect to temporary increases in ambient noise levels.

Regarding off-site construction traffic, the Project would generate a maximum of approximately 8 worker trips and 25 hauling trips per day during the most intensive construction phase. The Project site is accessible via W. 7th Street, which carries approximately 8,686 existing daily vehicle trips. The Project's construction trips would not result in a doubling of traffic volumes on W. 7th Street, and therefore, construction-related traffic noise would not increase by a perceptible 3 dBA (Appendix J). Construction is temporary and trips would cease upon Project completion. As such, impacts related to off-site construction noise would be less than significant.

Operation

Stationary Noise Impacts. Long-term operational noise would be generated from on-site stationary sources including heating, ventilation, and air conditioning (HVAC) equipment, and from on-site mobile sources including passenger vehicles, delivery trucks, and garbage trucks. Table N-2, *Operational Noise Level Increase of the Nearest Receptor*, summarizes the Project's operational noise levels and the resulting increase over existing ambient conditions at the nearest sensitive receptors.

Table N-2: Project Operational Noise Levels

Land Use	Project Noise Level (dBA)	Ambient Noise Level (dBA)	Cumulative Noise Level (dBA)	Increase over Ambient (dBA)[1]	Incremental Increase Threshold (dBA)	Exceed Threshold?
Residential to the North	53.8	69.8	69.9	0.1	1.5	**No**
Residential to the East	41.4	58.3	58.4	0.1	3.0	**No**

Notes:
1. Difference between Cumulative Noise Level and Ambient Noise Level.
Source: Noise and Vibration Impact Analysis (Appendix J)

As documented in the Noise and Vibration Impact Analysis (Appendix J), HVAC units and on-site mobile sources would generate approximately 40.7 dBA during the daytime and 36.1 dBA during the nighttime at the nearest sensitive receptors to the north and west, respectively. These levels do not exceed the City of San Jacinto's exterior thresholds of 65 dBA (daytime) and 45 dBA (nighttime) for single-family residential properties. As shown in Table N-2, *Project Operational Noise Levels*, when combined with existing ambient noise levels (ranging from 58.3 to 69.8 dBA Leq), the Project would result in an overall noise increase of only 0.1 dBA over ambient levels, which would not exceed the applicable incremental thresholds. Therefore, operational stationary noise impacts would be less than significant.

Off-Site Traffic Noise. The Project would generate an estimated 181 net new daily trips. The existing daily trip volume on West 7th Street is approximately 8,686 trips. Based on the Caltrans Traffic Noise Analysis Protocol, the Project-related traffic increase would result in a noise level increase of approximately 0.09 dBA CNEL on W. 7th Street. Because existing ambient noise levels in the Project vicinity exceed 65 dBA CNEL, the applicable significance threshold for off-site traffic noise is 1.5 dBA CNEL. The 0.09 dBA increase

is well below this threshold (Appendix J). Therefore, off-site operational traffic noise impacts would be less than significant.

d) Generation of excessive groundborne vibration or groundborne noise levels?

Less than Significant Impact.

Construction

Construction activities can generate varying degrees of ground vibration depending on the equipment used, the distance to receptors, and soil conditions. Vibration impacts were evaluated using the structure damage assessment methodology in the Caltrans Transportation and Construction Vibration Guidance Manual. The applicable damage threshold for older residential structures is 0.3 in/sec PPV.

Based on the anticipated equipment mix, Project construction would utilize small rubber-tired dozers and loaded trucks. The Project would not use any equipment over 80,000 pounds or heavy-vibration equipment. Table N-3, *Construction Equipment Vibration Levels*, presents the vibration levels for construction equipment at the nearest sensitive receptor distances.

Table N-3: Construction Equipment Vibration Levels

Equipment	Reference Vibration Level at 25 feet (PPV [inches/second])	Vibration Level at 80 feet (PPV [inches/second])	Vibration Level at 90 feet (PPV [inches/second])
Loaded Trucks	0.076	0.013	0.011
Small Bulldozer	0.003	0.001	<0.001

Source: Noise and Vibration Impact Analysis (Appendix J)

As shown in Table N-3, *Vibration Source Amplitudes for Construction Equipment*, the vibration level at the nearest off-site residential structure (located 80 feet from construction activities) from loaded trucks — the most vibration-intensive equipment anticipated — would be 0.013 PPV (in/sec), which would not exceed the 0.3 in/sec PPV threshold established by Caltrans for older residential structures. Therefore, construction vibration impacts at off-site sensitive receptors would be less than significant.

As an expansion project, construction activities would occur in proximity to the existing on-site buildings. Table N-4, *Buffer Distance for Potential Construction Equipment*, identifies recommended buffer distances for construction equipment operating near existing structures.

Table N-4: Buffer Distance for Potential Construction Equipment

Equipment	Reference Vibration Level at 25 Feet (PPV [inches/second])	Buffer Distance for 0.3 PPV [inches/second]
Loaded Trucks	0.076	10
Small Bulldozer	0.003	1

Source: Noise and Vibration Impact Analysis (Appendix J)

To minimize building damage criteria at the existing structures due to vibration from construction equipment, loaded trucks would be required to maintain a minimum buffer distance of 10 feet from the existing building and small bulldozers would be required to maintain a minimum buffer distance of 1 foot

from the existing building (included as PPP N-1). Compliance with these buffer distances during construction would ensure vibration levels at the existing on-site structures remain below the applicable damage threshold. Vibration impacts during construction would be less than significant.

Operation

The Project proposes an expansion of an existing SNF. P Operation of the Project would include passenger vehicles for commuting and garbage trucks for solid waste disposal, which would not be frequent daily activities. Truck vibration levels are dependent on vehicle characteristics, load, speed, and pavement conditions. Daily garbage trucks and occasional delivery trucks, which already exist on-site, would be travelling at very low speeds, so it is expected that vibration from these trucks at nearby sensitive receptors would not be noticeable (Appendix J). Therefore, operational vibration impacts from the proposed project would be less than significant.

e) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less than Significant Impact. The nearest airport to the Project site is the Hemet Ryan Airport, located approximately 3.9 miles southeast of the Project site. The Project is not located within the Airport Influence Area of the Hemet Ryan Airport (Appendix J). The Project site is located well outside of the 65 dBA CNEL noise contours associated with the Hemet Ryan Airport. Therefore, the proposed Project would not expose people residing or working in the Project area to excessive noise levels from aircraft operations. Impacts would be less than significant.

Existing Plans, Programs, or Policies

PPP N-1: Construction Equipment Buffer Distance. To minimize the effects of vibration from construction equipment on existing structures, loaded trucks would be required to maintain a minimum buffer distance of 10 feet from the existing building and small bulldozers would be required to maintain a minimum buffer distance of 1 foot from the existing building.

Mitigation Measures

None.

5.14. POPULATION AND HOUSING

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

a) Induce substantial unplanned population growth in an area, either directly or indirectly?

Less Than Significant Impact.

The proposed Project includes demolition of an existing 1,074 SF maintenance and storage building for development of a 18,000 SF addition to an existing SNF building, resulting in an expanded facility totaling 33,917 SF. Given that the proposed Project does not propose the development of any housing, the Project is not expected to directly generate permanent residential population. The Project also does not propose any infrastructure improvements or extensions that would directly induce population growth.

Based on a FAR of 0.5, the 2.98-acre Project site can accommodate industrial development of up to 64,904 SF. According to the City of San Jacinto Development Code, the employment generation factor for industrial/manufacturing uses is 500 SF per employee (City of San Jacinto, 2024). Thus, the existing General Plan designation would allow up to 130 employees for the Project site. . While the proposed Projects total of 250 employees would exceed this planning-level estimate, employment generation factors are forecasting tools and do not constitute a cap on site employment. Moreover, the exceedance would not result in substantial unplanned population growth. The approximately 100 new positions would consist of nursing, caregiving, and facility supporting staff, which are occupations readily available within the existing local and regional labor force. According to the SCAG Connect SoCal 2024 Demographics and Growth Forecast Technical Report (SCAG, 2024), Riverside County had a resident labor force of approximately 1,135,000 workers in 2019 compared to only 847,000 jobs, or approximately 1.34 resident workers per job. Within the City of San Jacinto, SCAG estimated approximately 9,700 jobs and 14,900 households in 2019, or roughly 0.65 jobs per household, indicating a substantial surplus of resident workers relative to local employment opportunities. New employment opportunities generated by the Project would therefore be expected to be filled primarily by existing residents, improving the local jobs-housing balance rather than attracting new population to the area. Any incremental immigration associated with the Project would represent a nominal fraction of the population and employment growth anticipated in the City's General Plan and SCAG's regional growth forecasts. Accordingly, the proposed Project would not directly or indirectly induce substantial unplanned population growth, and impacts would be less than significant. No mitigation is required.

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact. The Project site is currently developed with a SNF that provides temporary, short-term care for patients and does not contain any housing. The Project would expand the existing SNF facility to allow for additional 44 SNF-STP beds and 16 PHF beds. No people or housing would be displaced by implementation of the proposed Project. Thus, no impact would occur to the displacement of existing people or housing, necessitating the construction of replacement housing elsewhere.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.15. PUBLIC SERVICES

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
i) Fire protection?	☐	☐	☒	☐
ii) Police protection?	☐	☐	☒	☐
iii) Schools?	☐	☐	☐	☒
iv) Parks?	☐	☐	☐	☒
v) Other public facilities?	☐	☐	☐	☒

a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for:

v. Fire Protection and Emergency Services

Less Than Significant Impact

Fire protection and emergency services in the City of San Jacinto are provided by the Riverside County Fire Department (RCFD) and would service the Project site. There are two fire stations in the City of San Jacinto. The nearest fire station is Riverside County Fire Station 25, located at 132 S San Jacinto Ave, which is 1.4 miles northeast of the Project site. Riverside County Fire Station 78, located at 2450 Cottonwood Ave, is 2.5 roadway miles northwest of the Project site.

The proposed Project would result in an increase in total patients and staff. However, the anticipated increase in patients would be limited in scale and would not substantially increase service demands. The proposed Project would be responsible for the payment of development impact fees which would offset future fire protection needs. Additionally, the proposed Project would be required to adhere to the California Fire Code. Further, the Project would comply with GPU Action RM-6f which ensures future developers will contribute funds for fire services through the adopted developer fees.

The two existing fire stations located near the Project site would be able to accommodate the Project's needs while maintaining their current service commitments. Payment of development fees would ensure that there would be adequate fire services to serve the proposed Project. Additionally, the proposed Project would be developed to the latest City standards, which would ensure adequate

ingress and egress. Therefore, with adequate service fees and circulation for emergency personnel, there would be less than significant impacts related to fire services.

vi. Police Protection

Less Than Significant Impact.

The proposed Project would expand the existing Bradley Garden SNF. The proposed expansion would allow for an additional 59 beds. Additional improvements would include landscaping, utility connections, implementation of stormwater facilities, lighting, parking lot, and driveways to accommodate the expansion.

The Riverside County Sheriff's Department (RCSD) would provide police protection services for the Project site. The San Jacinto Station is located at 160 W. 6th Street, which is approximately 1.08 roadway miles northeast of the Project site.

SNFs typically generate limited police service demand because operations are supervised by trained staff on a 24-hour basis and visitor access is controlled and monitored. The proposed Project would introduce approximately 59 new patients and 100 additional staff, generating a corresponding increase in demand for police services. Based on the officer-to-population ratio of 1 sworn officer per 863 residents (1.16 officers per 1,000 residents) (California State Auditor, 2024), the Project would generate a service demand equivalent to approximately 0.05 additional officers (59/1,000 x 1.16 = 0.06844). This represents less than one full-time officer and is not considered a substantial increase in demand and would not require the construction or expansion of the existing policing facilities. Therefore, substantial adverse physical impacts associated with the provision of new or expanded police facilities would be less than significant.

vii. School Services

No Impact. The proposed Project consists of the expansion of an existing SNF. The Project does not include residential development and would not introduce housing that could generate school-aged children. The facility's patient population is expected to consist primarily of adults receiving short- or long-term care, and would not generate direct demand for local K–12 school enrollment.

The expansion may result in a modest increase in employment at the site; however, the associated indirect population growth is expected to be minimal and dispersed within the regional labor pool. As such, any potential increase in school enrollment associated with new employees would be negligible and would not require the construction of new or expanded school facilities.

Therefore, the Project would not result in a substantial increase in demand for school facilities, and impacts related to schools would be less than significant.

viii. Parks

No Impact. The proposed Project consists of the expansion of an existing SNF. The proposed Project does not propose any residential uses and therefore would not increase the use of existing parks and recreational facilities. The Project will have no impact on the deterioration of these facilities. The proposed development will include the existing outdoor courtyard and a new outdoor common space for use by residents of the SNF. This open space will be within the subject site, and thus will not have

environmental impacts beyond those already analyzed for the Project in this document. Given that the Project will not increase the use of parks or recreation facilities, it will not require the construction or expansion of recreational facilities. Therefore, there would be no impact to parks associated with the proposed Project.

ix. Other Public Facilities

No Impact. As discussed above, the proposed Project is an expansion of the existing SNF. The Project does not propose residential uses and thus would not directly generate growth in the permanent population. Therefore, it is not expected to impact the use or provisions of public facilities. There would be no increase in demand for existing facilities, and no resulting impacts.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.16. RECREATION

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that physical deterioration of the facility would be accelerated?

No Impact. The proposed Project consists of the expansion of an existing SNF. The proposed Project does not propose any residential uses, and therefore, would not increase the use of existing public parks and recreational facilities in the City. Residents/patients associated with the proposed Project would primarily utilize the indoor and outdoor recreational amenities provided on-site. The proposed SNF building addition and proposed PHF would include recreation/activity rooms. In addition, the proposed Project would provide outdoor recreational amenities, including a concrete walkway, seating areas with chairs and tables, artificial turf, and decorative plants, as shown in Figure 3-4. The recreational amenities will be within the Project site, and thus would not have environmental impacts beyond those already analyzed for the Project in this document. Given that the Project will not increase the use of parks or recreation facilities, it will not require the construction or expansion of recreational facilities. Therefore, there would be no impact to parks associated with the proposed Project.

b) Require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Impact. As mentioned previously, the proposed Project would include indoor and outdoor recreational amenities for use by residents/patients of the proposed Project. The potential adverse effects associated with implementation of the proposed Project have been considered throughout this analysis. Development of the onsite open space would not have any potentially significant impacts outside of those analyzed for the whole of the Project. In addition, operation of the proposed Project would only result in the demand for parks and recreational facilities as articulated in the previous response, which would not require the construction or expansion of recreational facilities. Therefore, the proposed Project would not require the construction or expansion of other recreational facilities that might have an adverse physical effect on the environment. There would be no impact related to recreation.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.17. TRANSPORTATION

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?	☐	☐	☒	☐
b) Conflict or be inconsistent with CEQA Guidelines § 15064.3, subdivision (b)?	☐	☐	☒	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities?

Less than Significant Impact.

Construction

Construction activities associated with the Project would generate vehicular trips from construction workers traveling to and from the Project site, delivery of construction supplies and import materials to, and export of debris from, the Project site. However, these construction activities would be temporary in nature and only occur during the anticipated 12-month construction period. The increase of trips during construction activities would be limited and is not anticipated to exceed the number of operational trips described below. The short-term vehicle trips from construction of the Project would generate less than significant traffic related impacts.

Operation

The Project proposes a building addition which would total approximately 18,000 SF and the conversion of the existing 2,596 SF vacant office building, associated parking, landscaping, and utility improvements to serve the site. Operation of the Project would introduce new vehicular traffic from workers and proposed operations. Vehicular traffic to and from the Project site would utilize the existing network of regional and local roadways that currently serve the Project site.

The trip generation analysis for the Project was prepared using trip rates from the Institute of Transportation Engineers (ITE) Trip Generation, 12th Edition (2025) based on the "Nursing Home" land use. As shown on Table T-1, *Project Trip Generation*, the proposed Project would result in a net increase of 181 daily trips compared to existing conditions, with a net increase of 8 AM peak hour trips and a net increase of 13 PM peak hour trips.

Table T-1: Project Trip Generation

				AM Peak Hour			PM Peak Hour		
Land Use		**Units**	**Daily**	**In**	**Out**	**Total**	**In**	**Out**	**Total**
Trip Rates									
620 Nursing Home[1]		Beds	3.06	0.10	0.04	0.14	0.07	0.15	0.22
Existing Project Trip Generation									
Nursing Home[1]	44	Beds	135	4	2	6	3	7	10
Proposed Project Trip Generation									
Nursing Home[1]	103	Beds	315	10	4	14	7	15	23
Proposed Project Total Trip Generation			315	10	4	14	7	15	23
Net Project Trip Generation			**181**	**6**	**2**	**8**	**4**	**9**	**13**

Notes:
[1] Trip rates from the Institute of Transportation Engineers, Trip Generation, 12th Edition, 2025. Land Use Code 620 – Nursing Home (average rate).
Source: VMT Screening Analysis (Appendix K)

The Project has been designed to construct on-site roadway improvements consistent with the City guidelines. As described under Table LU-2, the Project would be consistent with applicable goals and policies from the City's General Plan Mobility Element.

The Project would be located approximately 0.28 miles from bus stop located at the corner of W 7th Street and S. State Street which is served by Riverside Transit Agency (RTA) Bus Route 44. The Project would not disrupt RTA. As discussed previously, the proposed Project would install 5-foot-wide sidewalk along the Project's frontage on W. 7th Street and S. Grand Avenue. Therefore, the Project would not conflict with alternative transportation and Project impacts to transit, bicycle, and pedestrian facilities would be less than significant.

b) Conflict or be inconsistent with CEQA Guidelines § 15064.3, subdivision (b)?

Less than Significant Impact. Senate Bill (SB) 743 was signed by Governor Brown in 2013 and required the Governor's Office of Planning and Research (OPR) to amend the State CEQA Guidelines to provide an alternative to Level of Service (LOS) for evaluating transportation impacts. SB743 specified that the new criteria should promote the reduction of GHGs, the development of multimodal transportation networks and a diversity of land uses. In response, Section 15064.3 was added to the CEQA Guidelines beginning January 1, 2019. Section 15064.3(c) states that the provisions of the section shall apply statewide beginning on July 1, 2020. State CEQA Guidelines Section 15064.3, *Determining the Significance of Transportation Impacts*, states that VMT is the most appropriate measure of transportation impacts and provides lead agencies with the discretion to choose the most appropriate methodology and thresholds for evaluating VMT.

A VMT Screening Analysis (Appendix K) was prepared according to the City of San Jacinto Traffic Impact Analysis Guidelines which identifies screening thresholds to determine if projects would require a full VMT analysis. If a project meets one of the following criteria, then the VMT impact of the project is considered less-than significant and no further analysis of VMT would be required:

4. Transit Priority Area (TPA) Screening
5. Low VMT Area Screening
6. Project Type Screening

The applicability of each criterion to the proposed Project is discussed below:

Screening Criterion 1 - Transit Priority Area (TPA) Screening: Per the City's VMT screening criteria, projects located within an existing TPA may be presumed to result in a less-than-significant VMT impact. As shown in Figure 2, *WRCOG VMT Tool Screening Results,* based on the WRCOG VMT Tool, the proposed Project is not located within an existing TPA. Therefore, the Project does not satisfy Screening Criterion 1.

Screening Criterion 2 – Low VMT Area Screening: Per the City's VMT screening criteria, projects that are consistent with the existing land use and are located within a low VMT area may be presumed to have a less-than-significant impact on VMT. The Project's proposed land use is not consistent with the General Plan; therefore, Screening Criterion 2 – Low VMT Area Screening is not applicable to the Project.

Screening Criterion 3 – Project Type Screening: According to the City's Guidelines, local serving projects and land uses may be presumed to have a less-than-significant VMT impact. Additionally, projects that are expected to generate 500 or fewer daily vehicle trips are presumed to have a less-than-significant VMT impact. The Project does not propose any local serving land uses. However, as shown in Table 1, the proposed Project is expected to generate 315 total daily vehicle trips, which is fewer than the 500 daily vehicle trip threshold provided in the City's Guidelines. Therefore, the Project satisfies Screening Criterion 3.

As the proposed Project would meet Screening Criteria 3, impacts related to VMT are presumed to be less than significant.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less than Significant Impact.

Vehicular access to the Project site would be provided via two ingress and egress driveways connecting to W. 7th Street and one gated emergency access ingress and egress driveway connecting to S. Grand Avenue. Vehicular traffic to and from the Project site would utilize the existing network of regional and local roadways that currently serve the Project site. The proposed Project would not introduce any new roadways or introduce a land use that would conflict with existing urban land uses in the surrounding area. The proposed Project includes internal driveways that would provide cars access to the building and parking. Design of the proposed Project, including the internal private roadway, ingress, egress, and other streetscape changes are subject to the City's development standards. For example, the design of Project internal roadways would be reviewed to ensure fire engine accessibility and turnaround area is provided to the fire code standards. As a result, impacts related to vehicular circulation design features would be less than significant.

d) Result in inadequate emergency access?

Less than Significant Impact.

Construction

The proposed construction activities, including equipment and supply staging and storage, would occur within the Project site, and would not restrict access of emergency vehicles to the Project site or adjacent areas. The installation of driveways and connections to existing infrastructure systems that would be implemented during construction of the proposed Project could require the temporary closure of one side or portions of W. 7th Street and S. Grand Avenue for a short period of time (i.e., hours or a few days). However, the construction activities would be required to ensure emergency access in accordance with Section 503 of the California Fire Code (Title 24, California Code of Regulations, Part 9), which would be ensured through the City's permitting process. Thus, implementation of the Project through the City's permitting process would ensure existing regulations are adhered to and would reduce potential construction related emergency access impacts to a less than significant level.

Operation

As described previously, the proposed Project site would be accessed from two unrestricted ingress and egress driveways on W. 7th Street. The proposed Project would also include a gated driveway along S Grand Avenue which would provide emergency vehicle access to the site. The construction permitting process would provide adequate and safe circulation to, from, and through the Project site, and would provide routes for emergency responders to access different portions of the Project site. The Project would provide a 27.3-foot drive aisle throughout the parking area. Because the Project is required to comply with all applicable City codes, as verified by the City potential impacts related to inadequate emergency access would be less than significant.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.18. TRIBAL CULTURAL RESOURCES

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?	☐	☐	☒	☐
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☐	☐	☒	☐

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

Less Than Significant Impact.

The Project is subject to Assembly Bill (AB) 52 regarding tribal consultation. AB 52 requires that Lead Agencies evaluate a project's potential to impact tribal cultural resources. Such resources include sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are eligible for inclusion in the California Register or included in a local register of historical resources (PRC Section 21074). AB 52 also gives Lead Agencies the discretion to determine, supported by substantial evidence, whether a resource falling outside the definition stated above nonetheless qualifies as a "tribal cultural resource."

The Project site is fully developed with four buildings associated with the existing Bradley Gardens care facility, a surface parking lot, and landscaping. As described previously in Section 5.5, *Cultural Resources*, the Cultural Resources Study did not identify any previously recorded resources within the Project site (Appendix D). None of the four existing buildings associated with the site are eligible for listing on the NRHP or the CRHR (Appendix D).

Additionally, a Sacred Lands File (SLF) search was requested from the Native American Heritage Commission (NAHC) on February 3, 2026, to identify if any tribal cultural resources are potentially located

within the Project site. The NAHC responded on February 18, 2026, stating that that the SLF search yielded positive results for known tribal cultural resources or sacred lands within a 1-mile radius of the Project area. The NAHC provided the contact information for 34 Native American tribes and individuals to be contacted for further information regarding the Project area and vicinity.

AB 52 was initiated on July 9, 2026, and concluded August 10, 2026. AB 52 notices regarding this Project were emailed to all Native American tribes identified by the NAHC. Additionally, one copy was sent via mail to the Pechanga Band of Indians. One tribe responded during the AB 52 consultation period.

The Agua Caliente Band of Cahuilla Indians (Agua Caliente Band) responded by letter dated July 9, 2026, confirming the Project area lies outside the Agua Caliente Band Reservation but within the Tribe's Traditional Use Area. Agua Caliente Band noted prior surveys in the vicinity identified cultural resources, deferred further consultation to the Soboba Band of Luiseño Indians, and concluded its consultation efforts on the Project. There was no response from any other tribe on the NAHC list. The City of San Jacinto is located within the traditional territory of the Soboba Band of Luiseño Indians (City of San Jacinto, 2022b). During ground disturbing activities associated with the Project, a tribal cultural resource could be inadvertently discovered and damaged if not properly protected. Pursuant to SJDC Section 17.300.055 (included as PPP TCR-1), the proposed Project developer shall enter into Treatment and Disposition Agreement (TDA) with the Soboba Band of Luiseño Indians to address tribal cultural resources that may be uncovered during ground disturbing activities. Compliance with the SJDC would be implemented through the construction permitting and plan check process. With implementation of the regulatory requirements per SJDC Section 17.300.055, included as PPP TCR-1, impacts related to tribal cultural resources would be less than significant.

ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Less Than Significant Impact.

As discussed above, the Project would require ground disturbing activity in an area that is identified as the traditional territory of the Soboba Band of Luiseño Indians. During ground disturbing activities associated with the Project, a tribal cultural resource could be inadvertently discovered and damaged if not properly protected. Compliance with SJDC Section 17.300.055, included as PPP TCR-1, requires that the Project developer enter into a TDA with the Soboba Band of Luiseño Indians to address tribal cultural resources that may be uncovered during ground disturbing activities.

Additionally, as described previously, California Health and Safety Code, Section 7050.5, included as PPP CUL-1, requires that if human remains are discovered in the Project site, disturbance of the site shall halt and remain halted until the coroner has conducted an investigation. If the coroner determines that the remains are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission. Therefore, compliance with regulatory requirements would ensure that impacts to tribal cultural resources would be less than significant.

Existing Plans, Programs, or Policies

PPP TCR-1: Treatment and Disposition Agreement. Prior to issuance of a grading permit, the Project developer shall enter into a Treatment and Disposition Agreement (TDA) with the Soboba Band of Luiseño Indians to address treatment and disposition of archaeological, or Tribal Cultural Resources and human remains associated with the Soboba Band of Luiseño Indians that may be uncovered or otherwise discovered during ground-disturbing activities related to the project, if monitoring deemed necessary by Soboba Band of Luiseño Indians. The TDA will establish provisions for tribal monitoring and shall be submitted to the City of San Jacinto Planning Division once it has been executed

PPP CUL-1: Human Remains. Listed previously in Section 5.5, *Cultural Resources*.

Mitigation Measures

None.

5.19. UTILITIES AND SERVICE SYSTEMS

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☐	☐	☒	☐
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Less Than Significant Impact.

Water

The Project site is within an area that is currently served by the EMWD. The Project would install new onsite water lines which would connect to the existing 12-inch water line in W 7th Street. The new onsite water system would convey water supplies to the proposed Project and landscaping through plumbing/landscaping fixtures that are compliant with the CalGreen Plumbing Code for efficient use of water.

The proposed Project would continue to receive water supplies through the existing water lines located within W. 7th Street right-of-way which has the capacity to provide the increased water supplies needed to serve the proposed Project, and no expansions of the water pipelines that convey water to the Project site would be required. Installation of the new water distribution lines would only serve the proposed Project and would not provide new water supplies to any off-site areas.

The construction activities related to the onsite water infrastructure that would be needed to serve the proposed Project is included as part of the Project and would not result in any physical environmental effects beyond those identified throughout this document. For example, analysis of construction emissions from excavation and installation of the water infrastructure is included in Sections 5.3, *Air Quality* and 5.8, *Greenhouse Gas Emissions*. Therefore, the proposed Project would not result in the construction of new water facilities or expansion of existing facilities, the construction of which could cause significant environmental effects, and impacts would be less than significant.

Wastewater

The Project includes installation of onsite sewer lines that would connect to the existing 8-inch sewer line within W. 7th Street. The existing sewer lines would accommodate development of the Project site and would not require expansion to serve the proposed Project. The construction activities related to installation of the onsite sewer infrastructure that would serve the proposed Project, is included as part of the proposed Project and would not result in any physical environmental effects beyond those identified throughout this document. For example, analysis of construction emissions for excavation and installation of the sewer infrastructure is included in Section 5.3, *Air Quality* and 5.8, *Greenhouse Gas Emissions*, and noise volumes from these activities are evaluated in Section 5.13, *Noise*. As the proposed Project includes facilities to serve the proposed development, it would not result in the need for construction of other new wastewater facilities or expansions, the construction of which could cause significant environmental effects. Therefore, impacts would be less than significant.

Stormwater

Stormwater would be collected via a new series of catch basins, inlets, and storm drain lines. The Project includes a parking lot with approximately 1,093 square feet of pervious concrete and a fire access lane surfaced with approximately 3,000 square feet of pervious concrete, which would allow for stormwater infiltration. The Project would also incorporate disconnected roof downspouts that would discharge roof runoff to adjacent landscaped areas for infiltration. Stormwater would be ultimately conveyed to the existing 24-inch storm drain line in W. 7th Street. As discussed above in Section 5.10, *Hydrology and Water Quality*, due to the appropriate sizing of the onsite drainage features and infiltration BMPs, as shown in the Project's Water Quality Management Plan (Appendix H) and Hydrology Report (Appendix I), as ensured through the Project permitting process, operation of the proposed Project would not substantially increase stormwater runoff, and the Project would not require or result in the construction of new off-site storm water drainage facilities or expansion of existing off-site facilities. Thus, impacts would be less than significant.

Electric Power

The Project would continue to connect to the existing Southern California Edison electrical distribution facilities that are adjacent to the Project would not require the construction of new electrical facilities.

Natural Gas

The Project would remain connected to the existing Southern California Gas natural gas distribution facilities that are adjacent to the Project site. The Project site and would not require the construction of new natural gas facilities.

Telecommunications

The proposed Project would require a connection to telecommunication services, such as wireless internet service and phone service. This can be accomplished through connection to existing services, that already service the Project site. There are two main telecommunications providers in the area: Spectrum and Frontier, one of which would provide service to the Project.

The Project would result in no impact related to construction of new or expanded utilities that could result in significant environmental effects.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Less Than Significant Impact.

The EMWD is responsible for supplying potable water to the Project site and its region. Water supplies consist of recycled water, potable groundwater, desalinated groundwater, and imported water. EMWD provides potable water, recycled water, and wastewater services to an area of approximately 682 square miles in western Riverside County and northern San Diego County, including eleven incorporated cities and unincorporated areas of Riverside County and San Diego County (EMWD, 2026).

The 2025 EMWD Urban Water Management Plan (UWMP) details that EMWD will have sufficient supplies to meet both retail and wholesale demands from 2030 to 2050 under normal year, single dry year, and multiple dry year conditions. Furthermore, EMWD forecasts for Project water demand are based on population projections of SCAG, which rely on adopted land use designations contained within the general plans that cover the geographic area. Implementation of the proposed Project would result in 59 new patients and 100 new employees. The current EMWD's adopted indoor water use efficiency standard is 47 gallons per capita per day. Thus, 59 new patients and 100 new employees would generate an additional water demand of 7,473 gallons per day or 8.37 acre-feet per year (AFY), which is within the anticipated increased demand and supply for water. The UWMP projects the population served will increase from 641,300 in 2025 to 761,100 in 2050. The UWMP also projects that total planning water demands would increase from 147,420 AFY in 2030 to 178,920 AFY in 2050, with projected supplies of 149,600 and 186,600 acre-feet per year respectively, demonstrating a positive supply margin throughout the planning period (EMWD, 2026). Development of the Project site would also be required to be compliant with CalGreen/Title 24 requirements for low flow plumbing fixtures and irrigation, which would provide for efficient water use.

Furthermore, the UWMP states that EMWD's diverse supply portfolio is expected to allow it to maintain reliable water service through 2050 under normal and dry conditions. Therefore, EMWD has sufficient water supplies available to serve the Project site during normal, dry and multiple dry years, and impacts would be less than significant.

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Less Than Significant Impact.

Wastewater generated from the Project site would also be treated by EMWD, which conveys wastewater from the Project site to the San Jacinto Valley Regional Water Reclamation Facility (RWRF) within EMWD. The San Jacinto RWRF has capacity of 15,700 AFY, with a total volume received in 2025 of 8,799 AFY (EMWD, 2026). Therefore, there is a remaining capacity of 6,901 AFY, or approximately 6.2 million gallons per day (EMWD, 2026). This remaining capacity is adequate to serve the proposed Project, and the wastewater treatment provider has adequate capacity to accommodate the Project's projected demand in addition to its existing commitments. Thus, impacts would be less than significant.

d) Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less Than Significant Impact.

The Project site would be served by the Lamb Canyon Landfill, a Class III municipal solid waste landfill operated by Riverside County with a permitted capacity of 5,000 tons per day and a closure date of April 2032. The highest recorded daily volume was 2,820.78 tons on May 28, 2026, indicating remaining permitted capacity (Cal Recycle, 2026a). The second closest landfill is Badlands Landfill, also operated by Riverside County with a permitted capacity of 5,000 tons per day and a closure date of 2059, expected to succeed the operation of the Lamb Canyon Landfill. In the month of June, the highest recorded daily volume was 3,667.04 tons on June 2, 2026, indicating remaining permitted capacity (Cal Recycle, 2026b).

The Project would generate solid waste from 59 new patients/beds and 100 new employees, as previously described. Residential waste generation is based on 3.8 pounds per person per day from the GPU EIR (City of San Jacinto, 2022b), resulting in approximately 225 pounds per day (40.92 tons per year) for patients. Employee waste generation is based on 19.5 pounds per employee per day from the GPU EIR (City of San Jacinto, 2022b), resulting in approximately 1,905 pounds per day (356.6 tons per year) for employees. Total Project solid waste generation is approximately 2,175 pounds per day (397.5 tons per year).

The proposed Project would also be subject to the Medical Waste Management Act (Health and Safety Code Section 117600 et seq.), administered statewide by the California Department of Public Health (CDPH) and enforced locally by the Riverside County Department of Environmental Health (RCDEH) as the designated local enforcement agency. The Project operator would be required to obtain a medical waste generator permit from RCDEH and to segregate, contain, label, and store medical waste in accordance with applicable requirements. Medical waste would be collected by a registered medical waste hauler and transported to a permitted medical waste treatment facility, with treated residue subsequently disposed of at a permitted landfill. Compliance with these existing regulatory requirements would ensure that medical waste generated by the Project would not result in a significant impact related to solid waste disposal capacity or hazardous materials handling.

Pursuant to AB 341's 75 percent diversion requirement, approximately 544 pounds per day (99.4 tons per year) would be disposed of at landfill facilities. Given the relatively small incremental contribution relative

to the capacity of Lamb Canyon Landfill and other regional facilities, sufficient landfill capacity is expected to be available. Therefore, solid waste impacts would be less than significant.

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less than Significant Impact.

The proposed Project would result in a new development that would generate an increased amount of solid waste. All solid waste-generating activities within the City are subject to the requirements set forth in Section 5.408.1 of the 2025 California Green Building Standards Code that requires demolition and construction activities to recycle or reuse a minimum of 65 percent of the nonhazardous construction and demolition waste, and AB 341 that requires diversion of a minimum of 75 percent of operational solid waste.

The proposed Project would be required to comply with all federal, State, and local regulations related to solid waste. Furthermore, the proposed Project would comply with all standards related to solid waste diversion, reduction, and recycling during Project construction and operation. Therefore, the proposed Project is anticipated to result in less than significant impacts related to potential conflicts with federal, State, and local management and reduction statutes and regulations pertaining to solid waste.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.20. WILDFIRE

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact.

According to the CAL FIRE Hazard Severity Zone map, and GPU EIR Figure 5.20-1, *Fire Hazard Severity Zones,* the Project site not located within a State Responsibility Area (SRA) or a Very High Fire Hazard Severity Zone (VHFHSZ) (CAL FIRE, 2025; City of San Jacinto, 2022). The Project site does not contain any emergency facilities, nor does it serve as an emergency evacuation route. Direct access to the Project site would be provided via three driveways, two on W. 7th Street and one on S. Grand Avenue. The Project is required to design and construct internal access and provide fire suppression facilities (e.g., hydrants and sprinklers) in conformance with the SJMC, and Riverside County Fire Department would review the development plans prior to approval to ensure adequate emergency access pursuant to the requirements in Section 503 of the California Fire Code (Title 24, California Code of Regulations, Part 9, included in the SJMC (Chapter 8.16, Fire Code). As a result, the proposed Project would not impair an adopted emergency response plan or emergency evacuation plan and would not result in an impact.

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact.

As described in the previous response, the Project site is not located within a SRA or a VHFHSZ. The Project site is currently developed and relatively flat. The areas within the Project's vicinity also do not contain

hillsides or other factors that could exacerbate wildfire risks. Therefore, the Project would not result in no impacts related to exposure of people or structures to significant risk involving wildland fires.

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact.

As described in the previous responses, the Project site is not within a SRA or a VHFHSZ. The Project site is located within an urbanized area within the City of San Jacinto. The Project does not involve any new infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risks or result in other impacts to the environment. Therefore, the Project would result in no impacts.

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact.

As described in the previous responses, the Project site is not within a SRA or VHFHSZ. As discussed in Section 5.10, *Hydrology and Water Quality*, the Project would not result in changes to drainage. Also as discussed in Section 5.7, *Geology and Soils*, the Project site is relatively flat and is not susceptible to landslides. Likewise, areas adjacent to the Project site are relatively flat urban sites that do not contain hillsides or other factors that would expose people or structures to flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. The Project would not generate slopes and would connect to existing drainage facilities. Therefore, the Project would result in no impacts related to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

Existing Plans, Programs, or Policies

None.

Mitigation Measures

None.

5.21. MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☐	☒	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☐	☒	☐

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Less than Significant Impact with Mitigation Incorporated.

Based on the discussion in Section 5.4, *Biological Resources*, the Project site is fully disturbed and does not support native habitat, riparian areas, wetlands, or jurisdictional waters. The Project site does not suitable habitat for any special-status plant species, wildlife species, or sensitive plant communities (Appendix C). The Project site is located within the San Jacinto Valley Area Plan of the Western Riverside County MSHCP but is not located within a Criteria Cell, conservation areas, or designated survey areas. With the payment of MSHCP fees pursuant to PPP BIO-1, the Project would not result in any conflicts with the MSHCP. However, the existing ornamental landscaping trees on the site have the potential to provide habitat for nesting migratory birds. Therefore, MM BIO-1 has been incorporated to ensure MBTA compliance and would require a nesting bird survey to be conducted prior to the commencement of construction during nesting season, which would reduce potential impacts related to nesting avian species and native wildlife nursery sites to a less-than-significant level.

As described in Section 5.5, *Cultural Resources,* the cultural resources study and structural evaluation determined that the four on-site buildings, while over 50 years old, do not meet the criteria for listing on the California Register of Historical Resources and are not considered historically significant (Appendix D). No prehistoric resources were identified during the field survey. However, Mitigation Measure CUL-1 has been included to require archaeological evaluation in the event a resource is inadvertently discovered. Therefore, with implementation of MM CUL-1, potential impacts related to cultural resources would be reduced to a less-than-significant level.

As described in Section 5.7, *Geology and Soils*, earthmoving activities, including grading and excavation activities, have the potential to disturb previously unknown paleontological resources if earthmoving activities occur at substantial, undisturbed depths. Thus, MM GEO-1, which requires the preparation of a PRIMP and that ground disturbing activities be monitored to identify and recover any significant fossil remains, has been included. With the implementation of MM GEO-1 into the Project, potential impacts to paleontological resources would be less than significant.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Less than Significant with Mitigation Incorporated.

Cumulative impacts are defined as two or more individual effects that, when considered together, are considerable or that compound or increase other environmental impacts. The cumulative impact from several projects is the change in the environment that results from the incremental impact of the development when added to the impacts of other closely related past, present, and reasonably foreseeable or probable future developments. Cumulative impacts can result from individually minor, but collectively significant, developments taking place over a period. The CEQA Guidelines, Section 15130 (a) and (b), states:

a) Cumulative impacts shall be discussed when the project's incremental effect is cumulatively considerable.
b) The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided of the effects attributable to the project. The discussion should be guided by the standards of practicality and reasonableness.

As presented in this document, potential Project-related impacts are either no impact, less than significant or would be less than significant with mitigation incorporated. Based on the analysis contained in this document, Project-related impacts would be reduced to less than significant levels with the incorporation of mitigation measures.

The cumulative effect of the proposed Project taken into consideration with other development projects in the area would be limited, because the Project would develop the site in consistency with the General Plan land use designation, zoning designation, and City code, and would not result in substantial effects to any environmental resource topic, as described though out this document.

Given that the potential Project-related impacts would all be mitigated to a less than significant level, implementation of the proposed Project would not result in impacts that are cumulatively considerable when evaluated with the impacts of other current projects, or the effects of probable future projects. Therefore, the proposed Project's contribution to any significant cumulative impacts would be less than cumulatively considerable. As discussed in Sections 5.1 through 5.20 of this document, mitigation would be required and incorporated as necessary. Therefore, impacts would be less than significant with mitigation incorporated.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less than Significant with Mitigation Incorporated.

Based on the Project Description and the preceding responses in Sections 5.1 through 5.20 of this document, implementation of the proposed Project would not cause substantial adverse effects to human beings because all potentially significant impacts of the proposed Project would be mitigated to a less than significant level. Therefore, since all potentially significant impacts of the proposed Project are expected to be mitigated to a less than significant level, implementation of the proposed Project would not cause substantial adverse effects on human beings.

2. RESPONSE TO COMMENTS ON THE PUBLIC REVIEW MND

This chapter of the Final Initial Study/Mitigated Negative Declaration (MND) contains responses to the comments that the City of San Jacinto (Lead Agency) received on the Public Review MND (SCH No. 2026090689) (Chapter 1) for the Bradley Gardens Skilled Nursing Facility Expansion Project during the public review period, which began on September 17, 2026, and ended on October 16, 2026. This document has been prepared in accordance with the California Environmental Quality Act (CEQA) as amended (Public Resources Code Section 21000 et seq.) and the Guidelines for Implementation of the California Environmental Quality Act (State CEQA Guidelines) (Cal. Code Regs., tit. 14, § 15000 et seq.) and represents the independent judgment of the Lead Agency. This document, together with the Public Review Initial Study/MND and the Mitigation Monitoring and Reporting Program (MMRP) comprise the Final Initial Study/MND.

The following public comments were submitted to the City of San Jacinto during the public review period:

Individuals

I1. Allison Jones, Received September 18, 2026

Agencies

A1. South Coast Air Quality Management District, Received October 16, 2026

The public comments and responses to comments are included in the public record and are available to the Lead Agency decision-makers for their review and consideration prior to making their decision whether to approve the proposed Project. Pursuant to State CEQA Guidelines Section 15074(b), *Consideration and Adoption of a Negative Declaration or Mitigated Negative Declaration*, none of the comments provide substantial evidence that the Project will have significant environmental effects which would require preparation of an Environmental Impact Report. Further, none of the information in the letters or responses constitute the type of significant new information that requires recirculation of the Bradley Gardens Skilled Nursing Facility Expansion Project IS/MND for further public review under State CEQA Guidelines Section 15073.5, *Recirculation of a Negative Declaration Prior to Adoption*. None of this new material indicates that the Project will result in a significant new environmental impact not previously disclosed in the Bradley Gardens Skilled Nursing Facility Expansion Project MND. Additionally, none of this information indicates that there would be a substantial increase in the severity of a previously identified environmental impact that will not be mitigated, or that there would be any of the other circumstances requiring recirculation described in State CEQA Guidelines Section 15073.5.

Although State CEQA Guidelines Section 15088 does not require a Lead Agency to prepare written responses to comments received, the City of San Jacinto has elected to prepare the following written responses with the intent of providing a comprehensive and meaningful evaluation of the proposed Project. The number designations in the responses are correlated to the bracketed and identified portions of each comment letter.

LETTER I1: ALISON JONES, RECEIVED SEPTEMBER 18, 2026

From: Alison Jones <alison.jones.otsc@gmail.com>
Sent: Friday, September 18, 2026 11:08 AM
To: Chen, Frank <fchen@sanjacintoca.gov>
Subject: Formal Public Comment and Objection – Bradley Gardens Expansion Project PROJ25-0178

[**NOTICE:** This message originated outside of City of San Jacinto -- **DO NOT CLICK** on **links** or open **attachments** unless you are sure the content is safe.]

Dear Mr. Chen,

My name is Alison Jones, and I live at Parkview Estates, 913 South Grand Avenue, Space 71, San Jacinto, California 92582.

My home is very close to the proposed Bradley Gardens Skilled Nursing Facility Expansion Project at 980 West Seventh Street.

Please accept this email as my formal public comment and objection to the Draft Initial Study and Mitigated Negative Declaration for the Bradley Gardens Skilled Nursing Facility Expansion Project, PROJ25-0178, SCH No. 2026090689. I1.1

I also object to the approval of the Conditional Use Permit and Site Plan and Design Review in their present form.

I am requesting that the City not adopt the Mitigated Negative Declaration as currently written and not approve the project as presently proposed.

Before making any decision, the City should require additional analysis of traffic, parking, pedestrian safety, emergency access, noise, lighting, security, construction impacts, and compatibility with the nearby residential community. I1.2

If these potential impacts cannot be adequately evaluated and mitigated through the current environmental document, I request preparation of an Environmental Impact Report or revision and recirculation of the environmental study for additional public review.	I1.2 cont.
The proposed project would expand the existing facility from 44 beds to 103 beds, add psychiatric treatment capacity, construct an approximately 17,372-square-foot addition, and reportedly add approximately 100 employees. The notice estimates only 181 additional daily vehicle trips. That estimate requires closer examination considering employee shift changes, visitors, patient transportation, ambulances, deliveries, vendors, medical providers, and other service vehicles.	I1.3
Parkview Estates and the surrounding streets already experience significant parking and traffic problems. Vehicles frequently occupy the available street space, and key intersections serving our neighborhood lack adequate traffic controls. Adding this level of activity may create additional risks for residents, pedestrians, children, disabled individuals, emergency vehicles, and drivers entering or leaving the mobile home park.	I1.4
I ask the City to provide and carefully examine the following: 1. The complete traffic study and the data used to calculate the projected increase of 181 daily trips.	I1.5
2. The expected number of employees on each shift and the anticipated times of shift changes.	I1.6
3. The number of on-site parking spaces and evidence that the parking supply will accommodate employees, visitors, medical transportation, ambulances, deliveries, and vendors without causing overflow parking in the surrounding neighborhood.	I1.7
4. An evaluation of the entrances and intersections serving the project and Parkview Estates, including whether stop signs, crosswalks, improved lighting, turn controls, or other traffic-safety improvements are necessary.	I1.8
5. An emergency-access analysis addressing whether fire engines and ambulances can safely and promptly reach the facility and surrounding homes when nearby streets are congested or lined with parked vehicles.	I1.9
6. A pedestrian-safety analysis that considers nearby homes, children, disabled residents, and San Jacinto Elementary School.	I1.10
7. The anticipated frequency of ambulance arrivals, emergency calls, sirens, nighttime activity, deliveries, and patient transportation.	I1.11
8. A detailed operational and security plan describing staffing, secure entrances and exits, patient admissions and discharges, unauthorized-departure prevention, emergency incidents, and coordination with local police, fire, and emergency medical services.	I1.12
9. An evaluation of operational noise, exterior lighting, mechanical equipment, construction noise, dust, construction vehicles, and nighttime impacts on nearby residents.	I1.13
10. An assessment of whether the project's size and around-the-clock operations are	I1.14

compatible with the immediately adjacent residential community. I1.14 con

I am a disabled resident and an autistic adult. Members of my family and other residents of Parkview Estates also live with autism, disabilities, mobility limitations, and sensory sensitivities. Increased traffic, noise, emergency activity, lighting, congestion, and restricted access can affect disabled and autistic residents more seriously than the general population. Predictable and safe access to our homes is especially important for residents with mobility and sensory-related disabilities. I1.15

My concerns are not based on hostility toward individuals who need mental-health or skilled-nursing services. I support appropriate access to healthcare.

My concern is whether a development of this size and intensity can operate safely at this particular location without creating significant impacts for the surrounding residential community. I1.16

If the City considers approving the project, I request enforceable conditions requiring sufficient on-site employee and visitor parking, restrictions against neighborhood overflow parking, appropriate traffic controls, protected emergency access, controlled exterior lighting, construction-hour limitations, noise restrictions, a written security and emergency-response plan, and a designated facility contact for neighborhood complaints. I1.17

Please include this email and any attachments in the official administrative record for PROJ25-0178. Please also add me to the notification list for every Planning Commission or City Council meeting, environmental decision, revised study, staff report, project modification, and appeal associated with this project. I1.18

Please confirm in writing that this comment was received on time and made part of the official record. I also request a copy or working link to the complete Initial Study, traffic analysis, parking plan, site plan, operational statement, security plan, and all supporting technical studies.

Thank you for considering the effects this project may have on Parkview Estates and the surrounding San Jacinto community. I1.19

Sincerely,

Alison Jones
913 South Grand Avenue, Space 71
San Jacinto, California 92582

RESPONSE TO COMMENT LETTER I1: Alison Jones

Response to Comment I1.1: This comment states that the commenter resides at Parkview Estates, 913 South Grand Avenue, near the Project site, and submits a formal comment and objection to the Draft IS/MND for the Bradley Gardens Skilled Nursing Facility Expansion Project (SCH No. 2026090689). The commenter also objects to approval of the Conditional Use Permit and Site Plan and Design Review in their present form, and requests that the City not adopt the MND as currently written and not approve the Project as presently proposed.

The commenter's opposition to the Project is noted. The comment does not identify any specific deficiency in the IS/MND or provide evidence of significant environmental impacts that would rise to the level of a fair argument requiring the preparation of an EIR. The specific concerns raised by the commenter are addressed in Responses to Comments I1.2 through I1.19 below. The comment is introductory in nature and does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.2: This comment states that, before making any decision, the City should require additional analysis of traffic, parking, pedestrian safety, emergency access, noise, lighting, security, construction impacts, and compatibility with the nearby residential community. The commenter requests the preparation of an EIR, or the revision and recirculation of the IS/MND, if these potential impacts cannot be adequately evaluated and mitigated through the current environmental document.

Each of the topics identified by the commenter was evaluated in the IS/MND. Traffic, pedestrian facilities, and emergency access are addressed in Section 5.17, *Transportation*, and Section 5.9, *Hazards and Hazardous Materials*. Parking is addressed in Table AES-1 of Section 5.1, *Aesthetics*, and Table LU-1 of Section 5.11, *Land Use and Planning*. Noise and vibration are addressed in Section 5.13, *Noise*. Lighting and glare are addressed in Section 5.1, *Aesthetics*. Police and fire protection services are addressed in Section 5.15, *Public Services*. Construction-related air quality and health risk impacts are addressed in Section 5.3, *Air Quality*. Compatibility with surrounding land uses is addressed in Section 5.11, *Land Use and Planning*. As described in those sections and in Responses to Comments I1.3 through I1.17 below, impacts related to each of these topics were determined to be less than significant.

Pursuant to State CEQA Guidelines Section 15064(f)(5), argument, speculation, unsubstantiated opinion or narrative, or evidence that is clearly inaccurate or erroneous does not constitute substantial evidence. The comment does not provide any substantial evidence to support a fair argument that the Project would result in a significant environmental impact requiring preparation of an EIR. Further, none of the information in the comment letter or responses constitutes the type of significant new information that requires recirculation of the IS/MND for further public review under State CEQA Guidelines Section 15073.5, *Recirculation of a Negative Declaration Prior to Adoption*. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.3: This comment summarizes the Project description, including the expansion of the existing facility from 44 beds to 103 beds, the addition of psychiatric treatment capacity, the construction of an approximately 17,372-square-foot addition, and the addition of approximately 100 employees. The commenter states that the estimate of 181 additional daily vehicle trips requires closer

examination considering employee shift changes, visitors, patient transportation, ambulances, deliveries, vendors, medical providers, and other service vehicles.

As described in Section 3, *Project Description*, of the IS/MND, the Project would increase the capacity of the existing Bradley Gardens facility from 44 beds to 103 beds through an approximately 17,372 SF addition to the existing SNF building (conservatively analyzed as 18,000 SF) and the conversion of the existing 2,596 SF vacant office building into a 16-bed PHF. The Project would add 100 new employees across all shifts to the existing 150 employees, for a total of 250 employees. The existing facility currently operates 24 hours a day, seven days a week, and the Project would not change these existing operations.

As described in Section 5.17, *Transportation*, of the IS/MND, Project trip generation was calculated using trip rates from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 12th Edition (2025), for Land Use Code 620, Nursing Home. ITE trip rates are derived from vehicle counts taken at the driveways of existing facilities of the same land use type, and therefore account for all vehicles entering and exiting those facilities, including employee trips associated with shift changes, visitors, patient transportation, ambulances, deliveries, vendors, and other service vehicles. As shown in Table T-1, *Project Trip Generation*, of the IS/MND, the expanded 103-bed facility would generate a total of 315 daily trips, which represents a net increase of 181 daily trips compared to the existing 44-bed facility, including a net increase of 8 AM peak hour trips and 13 PM peak hour trips.

Pursuant to State CEQA Guidelines Section 15064.3, vehicle miles traveled (VMT) is the appropriate metric for evaluating transportation impacts under CEQA. As described in the VMT Screening Analysis (Appendix K of the IS/MND), projects that generate 500 or fewer daily vehicle trips are presumed to have a less than significant VMT impact as regulated by the City of San Jacinto Traffic Impact Analysis Guidelines. The Project's total of 315 daily trips is less than the 500 daily vehicle trip threshold. Therefore, the Project satisfies Screening Criterion 3, Project Type Screening, and VMT impacts would be less than significant. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.4: This comment states that Parkview Estates and the surrounding streets already experience significant parking and traffic problems, that vehicles frequently occupy the available street space, and that key intersections serving the neighborhood lack adequate traffic controls. The commenter expresses concern that the Project could create additional risks for residents, pedestrians, children, disabled individuals, emergency vehicles, and drivers entering or leaving the mobile home park.

As part of the 2019 amendments to the CEQA Guidelines, SB 743 directed that the revised CEQA Guidelines "shall promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses" (Public Resources Code Section 21099[b][1]); and that "automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment" (Public Resources Code Section 21099[b][2]). As such, pursuant to Public Resources Code Section 21099(b)(2), the IS/MND is not required to analyze impacts related to traffic congestion as it shall not be considered an impact on the environment. As shown in Table T-1, *Project Trip Generation*, in Section 5.17 of the IS/MND, the proposed Project would result in a net increase of 181 daily trips compared to existing conditions, with a net increase of 8 AM peak hour trips and a net increase of 13 PM peak hour trips.

Regarding parking, under CEQA, a project's effect on parking availability is not, in itself, a physical impact on the environment. Parking deficits are considered a social effect rather than an environmental impact (*San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656), and the State CEQA Guidelines Appendix G checklist does not include parking as a threshold of significance. Nevertheless, as shown in Table AES-1, Consistency with San Jacinto Development Code Standards, in Section 5.1 of the IS/MND, the Project would provide 52 on-site parking spaces, which meets the San Jacinto Development Code (SJDC) parking requirement for congregate care facilities of one space for each on-duty employee and one space for each 10 beds. Parking for employees, patients, and visitors would be provided on site in a surface lot along the northern boundary of the Project site.

Regarding safety, vehicular access for daily operations would be provided via two driveways on W. 7th Street. The Project would consolidate the two existing driveways along the center of the site's W. 7th Street frontage into one 24-foot-wide driveway and widen the existing driveway in the northeastern corner of the site to 24 feet. The proposed 25-foot-wide driveway on S. Grand Avenue would be gated and would provide emergency vehicle access only. The Project would also dedicate 3 feet of right-of-way along W. 7th Street and 6 feet along S. Grand Avenue and install 5-foot-wide sidewalks along both Project frontages. The Project would not introduce any new roadways or land uses that would conflict with existing uses in the surrounding area, and the design of the Project's driveways and internal circulation is subject to review for compliance with the City's development standards and California Building Code safety standards. As discussed in Section 5.17(c) of the IS/MND, impacts related to hazards due to a geometric design feature would be less than significant. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.5: This comment requests the complete traffic study and the data used to calculate the projected increase of 181 daily trips.

The VMT Screening Analysis, which was prepared in accordance with the City of San Jacinto Traffic Impact Analysis Guidelines, is included as Appendix K of the IS/MND. The trip generation data is summarized in Table T-1, *Project Trip Generation*, in Section 5.17 of the IS/MND. As shown in Table T-1, trip generation was calculated using the ITE Trip Generation Manual, 12th Edition (2025). The existing 44-bed facility generates approximately 135 daily trips, and the expanded 103-bed facility would generate approximately 315 daily trips, for a net increase of 181 daily trips, including a net increase of 8 AM peak hour trips and 13 PM peak hour trips. As described in Response to Comment I1.3, ITE trip rates reflect all vehicles accessing surveyed facilities, including employee, visitor, delivery, patient transport, and service vehicle trips.

As described in Response to Comment I1.4, automobile delay and traffic congestion are not considered significant impacts on the environment pursuant to Public Resources Code Section 21099(b)(2). Therefore, a level of service (LOS) traffic study is not required for purposes of CEQA. The IS/MND and its technical appendices, including Appendix K, are available for review at https://www.sanjacintoca.gov/city_departments/community-development/planning/c_e_q_a. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.6: This comment requests the expected number of employees on each shift and the anticipated times of shift changes.

As described in Section 3.4, *Operational Characteristics*, of the IS/MND, the existing Bradley Gardens facility operates 24 hours a day, seven days a week, and the Project would not change these existing operations. The Project would add 100 new employees across all shifts to the existing 150 employees, for a total of 250 employees.

As described in Response to Comment I1.3, the ITE trip rates used to calculate Project trip generation are based on vehicle counts at existing nursing home facilities and inherently account for employee trips associated with shift changes. Additionally, the Project's on-site parking supply was calculated based on the SJDC requirement of one parking space for each on-duty employee and one space for each 10 beds, as shown in Table AES-1 of the IS/MND. The City would review and approve the site's circulation to ensure safety features as provided in the California Building Code are implemented as part of the Project's permitting process. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.7: This comment requests the number of on-site parking spaces and evidence that the parking supply would accommodate employees, visitors, medical transportation, ambulances, deliveries, and vendors without causing overflow parking in the surrounding neighborhood.

As described in Section 3.2, Project Features, of the IS/MND, the expanded facility would include a total of 52 passenger vehicle parking spaces, including 4 accessible spaces, in a surface lot along the northern boundary of the Project site for employees, patients, and visitors. As shown in Table AES-1, *Consistency with San Jacinto Development Code Standards*, the Project's 52 parking spaces meet the SJDC minimum parking requirement for congregate care facilities with 15 or more beds of one space for each on-duty employee and one space for each 10 beds. As shown in Table LU-1 of the Draft IS/MND, the Project would also be consistent with General Plan Policy M-5.1, Appropriate Parking Supply. In addition, as shown on Figure 3-1, *Conceptual Site Plan*, the Project would retain the existing covered passenger drop-off and loading zone to accommodate patient transportation and medical transport vehicles, and would provide a 10-foot by 25-foot loading space for deliveries and vendors. The Project would also provide 6 bicycle parking spaces.

Under CEQA, a project's effect on parking availability is not, in itself, a physical impact on the environment. Parking deficits are considered a social effect rather than an environmental impact (*San Franciscans Upholding the Downtown Plan v. City and County of San Francisco* (2002) 102 Cal.App.4th 656), and the State CEQA Guidelines Appendix G checklist does not include parking as a threshold of significance. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.8: This comment requests an evaluation of the entrances and intersections serving the Project and Parkview Estates, including whether stop signs, crosswalks, improved lighting, turn controls, or other traffic-safety improvements are necessary.

As described in Section 5.17(c), *Transportation*, of the IS/MND, vehicular access to the Project site would be provided via two ingress and egress driveways on W. 7th Street and one gated emergency access driveway on S. Grand Avenue. The Project would consolidate two existing driveways on W. 7th Street into one 24-foot-wide driveway and widen the existing northeastern driveway to 24 feet, which would reduce the number of driveway conflict points along the W. 7th Street frontage. Vehicular traffic to and from the Project site would use the existing network of regional and local roadways that currently serve the site,

and the Project would not introduce any new roadways or incompatible uses. The design of the Project's driveways, internal circulation, and frontage improvements compliance with the City's development standards would be ensured by the City's development review and permitting process. The Project would also install 5-foot-wide sidewalks along its W. 7th Street and S. Grand Avenue frontages to enhance pedestrian access and safety.

As described in Section 5.17, *Transportation*, the Project would generate a net increase of 8 AM peak hour trips and 13 PM peak hour trips compared to existing conditions. Per the City's Traffic Impact Analysis Guidelines, this level of trip generation would not substantially change traffic conditions at the intersections serving the Project site or Parkview Estates. California Building Code and circulation development standards would be ensured by the City's development review and permitting process. Therefore, impacts related to hazards due to a geometric design feature were determined to be less than significant, and no off-site traffic control improvements are required to mitigate a CEQA impact. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.9: This comment requests an emergency-access analysis addressing whether fire engines and ambulances can safely and promptly reach the facility and surrounding homes when nearby streets are congested or lined with parked vehicles.

Emergency access is evaluated in Section 5.9(f), *Hazards and Hazardous Materials*, Section 5.15, *Public Services*, Section 5.17(d), *Transportation*, and Section 5.20(a), *Wildfire*, of the IS/MND. Fire protection and emergency medical services would be provided by the Riverside County Fire Department (RCFD). The nearest fire station is RCFD Fire Station 25, located approximately 1.4 miles northeast of the Project site.

During operation, the Project site would be accessed by two unrestricted driveways on W. 7th Street and a gated 25-foot-wide emergency vehicle access driveway on S. Grand Avenue, which would be equipped with Knox padlocks for fire department access. The Project would provide a 27.3-foot-wide drive aisle throughout the parking area and a fire access lane along the southern and eastern sides of the proposed SNF-STP building addition, surfaced with pervious concrete designed to support an 80,000-pound fire apparatus load. The Project is required to design and construct internal access and provide fire suppression facilities (e.g., hydrants and sprinklers) in conformance with the San Jacinto Municipal Code (SJMC), and RCFD would review the development plans prior to approval to ensure adequate emergency access pursuant to Section 503 of the California Fire Code (SJMC Chapter 8.16). As described in Response to Comment I1.7, the Project would provide its required parking on site and would not rely on on-street parking along W. 7th Street or S. Grand Avenue.

During construction, equipment and supply staging and storage would occur within the Project site. Driveway installation and utility connections could require the temporary closure of one side or portions of W. 7th Street and S. Grand Avenue for a short period of time (i.e., hours or a few days); however, construction activities would be required to maintain emergency access in accordance with Section 503 of the California Fire Code, which would be ensured through the City's permitting process. As concluded in the IS/MND, impacts related to emergency access would be less than significant. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.10: This comment requests a pedestrian-safety analysis that considers nearby homes, children, disabled residents, and San Jacinto Elementary School.

As described in Section 5.17(a), *Transportation*, of the IS/MND, the Project would install 5-foot-wide sidewalks along its W. 7th Street and S. Grand Avenue frontages and would not conflict with any program, plan, ordinance, or policy addressing pedestrian facilities. The sidewalk along the S. Grand Avenue frontage, which is currently undeveloped, would enhance pedestrian and disabled resident access to and from the nearby Parkview Estates. The Project would also provide 4 accessible parking spaces on site. As described in Section 5.9(c), *Hazards and Hazardous Materials*, of the IS/MND, the closest school to the Project site is San Jacinto Elementary School, located approximately 0.95 miles northeast of the Project site. The Project site is therefore not located within one-quarter mile of an existing school, and the Project would not be expected to substantially affect pedestrian routes to the school.

As described in Response to Comment I1.8, the Project's vehicular access for daily operations would be located on W. 7th Street, the Project would consolidate existing driveways along the W. 7th Street frontage, and the Project would generate a net increase of 181 daily trips, including 8 AM peak hour trips and 13 PM peak hour trips. Consistent with the City's Traffic Impact Analysis Guidelines, further traffic analysis is not warranted given that the Project is anticipated to generate fewer than 500 daily trips. The Project would not introduce any new roadways or geometric design features that would increase hazards to pedestrians. Therefore, potential impacts related to pedestrian facilities and safety would be less than significant. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.11: This comment requests the anticipated frequency of ambulance arrivals, emergency calls, sirens, nighttime activity, deliveries, and patient transportation.

The existing Bradley Gardens facility currently operates 24 hours a day, seven days a week, and receives patient transportation, deliveries, and service vehicles under existing conditions. As described in Section 3.4, *Operational Characteristics*, of the IS/MND, the Project would not change the existing operations of the facility. As described in Response to Comment I1.3, ambulance, patient transportation, and delivery trips are accounted for in the ITE trip rates used to calculate Project trip generation.

Regarding noise, as described in Section 5.13, *Noise*, of the IS/MND, operational noise from HVAC equipment and on-site mobile sources, including passenger vehicles, delivery trucks, and garbage trucks, would be approximately 40.7 dBA during the daytime and 36.1 dBA during the nighttime at the nearest sensitive receptors, which would not exceed the City's exterior noise standards of 65 dBA (daytime) and 45 dBA (nighttime) for residential properties. As shown in Table N-2, *Project Operational Noise Level*s, the Project would increase ambient noise levels by 0.1 dBA, which would not exceed the applicable incremental thresholds. Emergency vehicle sirens are associated with emergency response on public roadways, are intermittent, and are an existing characteristic of the facility and the surrounding roadway network. Regarding sirens, SJMC Section 8.40.070(C) exempts public safety personnel in the course of executing their official duties, including emergency personnel, from the provisions of the City's noise control chapter, including sound emanating from all equipment used by such personnel, whether stationary or mobile. Therefore, siren noise from emergency vehicles responding to the facility is exempt from the City's noise standards. Siren use would also be intermittent and is an existing characteristic of the facility and the surrounding roadway network. Regarding nighttime lighting, as described in Section 5.1, *Aesthetics*, all Project lighting would be directed downward and shielded consistent with SJDC Section

17.300.080 (PPP AES-1). The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.12: This comment requests a detailed operational and security plan describing staffing, secure entrances and exits, patient admissions and discharges, unauthorized-departure prevention, emergency incidents, and coordination with local police, fire, and emergency medical services.

CEQA requires the evaluation of a project's physical changes to the environment. An operational and security plan is not required to evaluate the Project's environmental impacts under CEQA. As described in Section 5.15, *Public Services*, of the IS/MND, police protection services would be provided by the Riverside County Sheriff's Department San Jacinto Station, located approximately 1.08 roadway miles northeast of the Project site. SNFs typically generate limited demand for police services because operations are supervised by trained staff on a 24-hour basis and visitor access is controlled and monitored. The Project would generate a service demand equivalent to less than one additional officer and would not require the construction or expansion of police facilities. Fire protection and emergency medical services are addressed in Response to Comment I1.9.

As described in Section 3.0, *Project Description*, and Table LU-1 of the IS/MND, the Project includes site design features that promote public safety, including perimeter fencing, controlled access points, exterior lighting, and landscaping improvements. The Project would retain the existing 7-foot-tall perimeter fencing, construct a new 7-foot-tall block wall along the western boundary of the site, and provide Knox padlocks at all gates. The facility operates with 24-hour supervised staff and controlled visitor access. In addition, the facility's staffing, admissions, discharges, and patient safety procedures are subject to State licensing and certification requirements. The commenter's request for an operational and security plan will be forwarded to City decisionmakers for consideration. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.13: This comment requests an evaluation of operational noise, exterior lighting, mechanical equipment, construction noise, dust, construction vehicles, and nighttime impacts on nearby residents.

Regarding construction noise, as described in Section 5.13, *Noise*, of the IS/MND and the Noise and Vibration Impact Analysis (Appendix J), construction would be limited to the hours permitted by SJMC Section 8.40.090 (7:00 a.m. to 7:00 p.m. on weekdays and Saturdays, and 9:00 a.m. to 6:00 p.m. on Sundays and holidays), and no nighttime construction is proposed. The Project would not include pile driving. Assuming the two loudest pieces of equipment operating simultaneously during each construction phase, construction noise levels at the nearest off-site sensitive receptors would be 62.8 dBA, which would not exceed the Federal Transit Administration daytime threshold of 80 dBA Leq for residential uses. Construction vibration at the nearest off-site residential structure would be 0.013 in/sec PPV, well below the 0.3 in/sec PPV threshold. The Project would generate a maximum of approximately 8 worker trips and 25 hauling trips per day during the most intensive construction phase, which would not result in a perceptible increase in traffic noise along W. 7th Street. Construction would be temporary and is expected to occur over approximately 12 months.

Regarding construction dust and emissions, the Project would be required to comply with SCAQMD Rule 403 (included in the IS/MND as PPP AQ-1), which requires that fugitive dust be controlled with best available control measures so that dust does not remain visible beyond the property line, and SCAQMD Rule 402 (included in the IS/MND as PPP AQ-3), which requires dust suppression techniques to prevent fugitive dust from creating a nuisance off site. As shown in Table AQ-4, *Localized Construction Emission Estimates*, construction emissions would not exceed the SCAQMD localized significance thresholds. As described in Section 5.3, *Air Quality*, and the Health Risk Assessment (Appendix B), the maximum cancer risk at the most impacted sensitive receptor would be 4.88 in one million and the chronic hazard index would be 0.01, which are below the SCAQMD thresholds of 10 in one million and 1.0, respectively.

Regarding operational noise and mechanical equipment, as described in Response to Comment I1.11, HVAC equipment and on-site mobile sources would generate approximately 40.7 dBA during the daytime and 36.1 dBA during the nighttime at the nearest sensitive receptors, below the City's exterior standards of 65 dBA and 45 dBA, respectively, and would increase ambient noise levels by 0.1 dBA. Off-site Project traffic would increase noise levels along W. 7th Street by approximately 0.09 dBA CNEL, well below the 1.5 dBA CNEL threshold. Regarding exterior lighting, as described in Section 5.1, *Aesthetics*, all Project lighting would be directed downward and shielded so as not to spill onto neighboring properties, consistent with SJDC Section 17.300.080 (PPP AES-1). As concluded in the IS/MND, impacts related to noise, vibration, light and glare, and construction air quality would be less than significant. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.14: This comment requests an assessment of whether the Project's size and around-the-clock operations are compatible with the immediately adjacent residential community.

As described in Section 2.2, *Existing Project Site*, and Section 3.4, *Operational Characteristics*, of the IS/MND, the Bradley Gardens facility currently operates on the Project site 24 hours a day, seven days a week, and the Project would not change the existing use or hours of operation. The proposed SNF-STP addition would be single-story with a maximum height of approximately 22 feet, and the PHF would occupy an existing single-story building approximately 14 feet in height. As shown in IS/MND Table AES-1, the Project would result in a floor area ratio (FAR) of 0.27, below the maximum FAR of 0.50. The Parkview Estates community is located southwest of the Project site, across S. Grand Avenue, and does not directly abut the site. As shown in Table AES-1 of the IS/MND, the Project would meet or exceed all applicable SJDC setback standards. The Project would provide a front setback of 68 feet, exceeding the 50-foot minimum that applies adjacent to residential uses. The Project would provide interior and side street setbacks of 10 feet, consistent with the 10-foot minimum required abutting nonresidential uses; and a rear setback of 36 feet, where no minimum setback is required. As shown in Table LU-1 of the IS/MND, the Project would be consistent with General Plan Policy LU 3.1, Surrounding Uses, because the one-story addition would remain consistent with the existing low-rise development pattern and the Project would add landscaping, updated architectural finishes, new sidewalks, and improved site access. As described in Section 5.11(a), the Project would not physically divide an established community.

The physical environmental effects of the Project on nearby residences, including noise, lighting, traffic, air quality, and emergency access, were evaluated in the IS/MND and determined to be less than significant, as described in Responses to Comments I1.3 through I1.13. Additionally, the Project is being processed under the legal nonconforming provisions of SJMC Section 17.705.120 and requires approval

of a Conditional Use Permit and Site Plan and Design Review, through which City decisionmakers will consider the Project's compatibility with surrounding uses. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.15: This comment states that the commenter is a disabled resident and an autistic adult, and that members of the commenter's family and other residents of Parkview Estates also live with autism, disabilities, mobility limitations, and sensory sensitivities. The commenter states that increased traffic, noise, emergency activity, lighting, congestion, and restricted access can affect disabled and autistic residents more seriously than the general population, and that predictable and safe access to their homes is especially important for residents with mobility and sensory-related disabilities.

The City acknowledges the commenter's concerns and the importance of predictable and safe access for residents of Parkview Estates. The noise, lighting, and air quality thresholds used in the IS/MND are designed to protect sensitive receptors, including residences. In addition, the Project would be reviewed to ensure consistency with City development standards as part of the development review and permitting process. As described in Response to Comment I1.13, the Project would increase ambient noise levels at the nearest sensitive receptors by 0.1 dBA, which would not be perceptible, and nighttime operational noise levels of 36.1 dBA would be below the City's 45 dBA nighttime standard. All Project lighting would be shielded and directed downward to prevent spillover onto neighboring properties (PPP AES-1). As described in Responses to Comments I1.3 and I1.4, the Project would generate a net increase of 13 PM peak hour trips, and daily vehicular access to the site would be provided from W. 7th Street, with the S. Grand Avenue driveway gated for emergency vehicle access only.

Regarding access, the Project would not restrict access to Parkview Estates or any surrounding residences. As described in Response to Comment I1.9, construction of driveways and utility connections could require the temporary closure of one side or portions of W. 7th Street and S. Grand Avenue for a short period of time (i.e., hours or a few days); however, access would be maintained through the City's permitting process, including emergency access in accordance with Section 503 of the California Fire Code. As concluded in the IS/MND, impacts to nearby residents would be less than significant. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.16: This comment states that the commenter's concerns are not based on hostility toward individuals who need mental-health or skilled-nursing services, and that the commenter supports appropriate access to healthcare. The commenter states that the concern is whether a development of this size and intensity can operate safely at this location without creating significant impacts for the surrounding residential community.

The physical environmental effects associated with the size and intensity of the Project are addressed in Responses to Comments I1.3 through I1.15. The comment expresses general concerns and does not contain any comments related to the IS/MND environmental analysis or information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.17: This comment requests that, if the City considers approving the Project, enforceable conditions be imposed requiring sufficient on-site employee and visitor parking, restrictions against neighborhood overflow parking, appropriate traffic controls, protected emergency access,

controlled exterior lighting, construction-hour limitations, noise restrictions, a written security and emergency-response plan, and a designated facility contact for neighborhood complaints.

Under CEQA, mitigation measures are required only to reduce significant environmental impacts. As described in Responses to Comments I1.3 through I1.15, impacts related to transportation, emergency access, noise, and lighting were determined to be less than significant. The IS/MND details existing regulations including the provision of on-site parking consistent with SJDC standards (Table AES-1), shielded exterior lighting consistent with SJDC Section 17.300.080 (PPP AES-1), limitation of construction activities to the hours permitted by SJMC Section 8.40.090, emergency access consistent with Section 503 of the California Fire Code and RCFD plan review, and construction dust control consistent with SCAQMD Rules 402 and 403 (PPP AQ-3 and PPP AQ-1). Conditions of approval are imposed at the discretion of the City through the Conditional Use Permit and Site Plan and Design Review process. The commenter's request for conditions of approval will be forwarded to City decisionmakers for consideration. The comment does not contain any comments related to the IS/MND environmental analysis or information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.18: This comment requests that the comment letter and any attachments be included in the official administrative record for PROJ25-0178. The commenter also requests to be added to the notification list for every Planning Commission or City Council meeting, environmental decision, revised study, staff report, project modification, and appeal associated with the Project.

The comment letter has been included in the administrative record for the Project and is included in this Final IS/MND. Pursuant to Public Resources Code Section 21092.2, the City will provide notice to all persons who have filed a written request for notice, and the commenter will be added to the Project notification list. The comment does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

Response to Comment I1.19: This comment requests written confirmation that the comment was received on time and made part of the official record. The commenter also requests a copy of, or working link to, the complete Initial Study, traffic analysis, parking plan, site plan, operational statement, security plan, and all supporting technical studies. The comment concludes by thanking the City for considering the effects of the Project on Parkview Estates and the surrounding San Jacinto community.

The comment letter was received on September 18, 2026, within the public review period for the IS/MND, which began on September 17th, 2026, and ended on October 16th, 2026, and has been made part of the administrative record. The IS/MND and its technical appendices, including the VMT Screening Analysis (Appendix K), are available at https://www.sanjacintoca.gov/city_departments/community-development/planning/c_e_q_a. The Project site plan and parking layout are shown on Figure 3-1, *Conceptual Site Plan*, of the Draft IS/MND. As described in Response to Comment I1.12, an operational or security plan is not required to evaluate the Project's environmental impacts under CEQA. The comment is conclusory in nature and does not contain any information requiring changes to the IS/MND. The comment will be forwarded to City decisionmakers as part of the Final IS/MND.

LETTER A1: SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT, RECEIVED OCTOBER 16, 2026

South Coast
Air Quality Management District
21865 Copley Drive, Diamond Bar, CA 91765-4178
(909) 396-2000 • www.aqmd.gov

San Jacinto, CA 92583

October 16, 2026

Draft Mitigated Negative Declaration (MND) for the Bradley Gardens Skilled Nursing Facility Expansion Project (Proposed Project) (SCH No.: 2026090689)

South Coast Air Quality Management District (South Coast AQMD) Staff appreciate the opportunity to review the above-mentioned document. The City of San Jacinto is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD Staff have provided a brief summary of the project information and prepared the following comments which are organized by topic of concern.

Summary of Proposed Project Information in the Draft MND

Based on the Draft MND, the Proposed Project consists of expanding an existing 44-bed skilled nursing facility to 103 beds through construction of a single-story addition (17,372 square feet) providing 43 additional skilled nursing and short-term psychiatric beds, conversion of an existing vacant office building (2,596 square feet) into a 16-bed psychiatric health facility, and demolition of an existing maintenance and storage building (1,074 square feet), with 52 vehicle parking spaces and 6 bicycle parking spaces. Based on a review of aerial photographs, South Coast AQMD Staff found that the nearest sensitive receptor (e.g., residential development) is located approximately 90 feet (27 meters) north of the Project site. Construction of the Proposed Project is anticipated to occur over 12 months. The Proposed Project is located at 980 West 7th Street in San Jacinto.[1] A1.1

South Coast AQMD Comments

South Coast AQMD Air Permits and Role as a Responsible Agency

If implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, etc., air permits from South Coast AQMD will be required. The Final MND should include a discussion about the potentially applicable South Coast AQMD rules that may be applicable to the Proposed Project. Those rules may include, for example, Rule 201 – Permit to Construct,[2] Rule 203 – Permit A1.2

[1] Initial study. Page 26.
[2] South Coast AQMD, Rule 201 is available at: https://www.aqmd.gov/docs/default-source/rule-book/reg-ii/rule-201.pdf

to Operate,[3] Rule 401 – Visible Emissions,[4] Rule 402 – Nuisance,[5] Rule 403 – Fugitive Dust,[6] Rule 1110.2 – Emissions from Gaseous and Liquid Fueled Engines,[7] Rule 1113 – Architectural Coatings,[8] Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil,[9] Rule 1179 – Publicly Owned Treatment Works Operations,[10] Regulation XIII – New Source Review,[11] Rule 1401 – New Source Review of Toxic Air Contaminants,[12] Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants,[13] Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines,[14] etc. It is important to note if air permits from South Coast AQMD are required, the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections 15086, the Lead Agency is required to consult with South Coast AQMD.

CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of the process for conducting a review of the Proposed Project and issuing discretionary approvals. Moreover, it is important to note that if a Responsible Agency determines that a CEQA document is not adequate to rely upon for its discretionary approvals, the Responsible Agency must take further actions listed in CEQA Guideline Section 15096(e), which could have the effect of delaying the implementation of the Proposed Project. In its role as CEQA Responsible Agency, the South Coast AQMD is obligated to ensure that the CEQA document prepared for this Proposed Project contains a sufficient project description and analysis to be relied upon in order to issue any discretionary approvals that may be needed for air permits. South Coast AQMD is concerned that the project description and analysis in its current form in the MND is inadequate to be relied upon for this purpose.

A1.2 contd.

For these reasons, the final CEQA document should be revised to include a discussion about any and all new stationary and portable equipment requiring South Coast AQMD air permits, provide the evaluation of their air quality and greenhouse gas impacts, and identify South Coast AQMD as a Responsible Agency for the Proposed Project as this information will be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting Staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at https://www.aqmd.gov/home/permits.

Conclusion

[3] South Coast AQMD, Rule 203 is available at: https://www.aqmd.gov/docs/default-source/rule-book/reg-ii/rule-203.pdf

The Lead Agency is recommended to revise the CEQA analysis to address the aforementioned comments and provide the necessary evidence to sufficiently support the conclusions reached. If the requested information and analysis are not included in the final CEQA document, either the Final MND or other type of CEQA document, the Lead Agency should provide reasons for not doing so. Pursuant to California Public Resources Code Section 21092.5(b) and CEQA Guidelines Section 15074, prior to approving the Proposed Project, the Lead Agency shall consider the MND for adoption together with any comments received during the public review process and notify each public agency when any public hearings are scheduled. Please provide South Coast AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. When responding to issues raised in the comments, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided. In addition, if the Lead Agency decides to adopt the Final MND, please provide South Coast AQMD with a notice of any scheduled public hearing(s). A1.3

South Coast AQMD staff are available to work with the Lead Agency to ensure that impacts to air quality, GHG emissions, and health risk from the Proposed Project are accurately evaluated and mitigated to the greatest extent possible. Please contact Sahar Ghadimi, Ph.D., Air Quality Specialist, at sghadimi@aqmd.gov or me at SWang1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang

Response to Comment A1.1: This comment states that the South Coast Air Quality Management District (SCAQMD) has reviewed the Draft IS/MND for the Bradley Gardens Skilled Nursing Facility Expansion Project. This comment then provides a summary of the Project information within the Draft IS/MND.

This comment is introductory in nature and does not raise a specific issue with the adequacy of the Draft IS/MND. Because the comment does not express any specific concern or question regarding the adequacy of the Draft IS/MND, no further response is warranted.

Response to Comment A1.2: The comment states that if implementation of the proposed Project would require the use of stationary and portable equipment such as emergency generator(s) and fire pump(s), permit(s) from SCAQMD will be required. The comment states that if permits are required, SCAQMD will be a Responsible Agency for the Project. The comment states that as a Responsible Agency, SCAQMD is obligated to ensure that the CEQA document prepared for the Project contains a sufficient project description and analysis. The comment states that the Final IS/MND should include a discussion about any new stationary and portable equipment requiring SCAQMD air permits, provide evaluation of their air quality and greenhouse gas impacts, and identify SCAQMD as a Responsible Agency.

The City acknowledges the comment. The Draft IS/MND did not identify an emergency generator as part of the Project. Because the Project would include a skilled nursing facility, the Project analysis within this Final IS/MND has been conservatively assumed to include one 236-horsepower diesel-powered emergency generator to provide backup power for the expanded facility. The generator is conservatively assumed to operate up to 200 hours per year, consistent with SCAQMD Rule 1470. Because installation and operation of the generator would require SCAQMD permits, SCAQMD has been identified as a Responsible Agency in Chapter 3 of this Final IS/MND.

In response to this comment, the following technical studies have been revised to address the emergency generator as included in this Final IS/MND:

- **Revised Appendix A: Air Quality, Energy, and Greenhouse Gas Assessment,** which addresses stationary source criteria pollutant regional and localized emissions, diesel fuel consumption, and GHG emissions from the emergency generator.
- **Revised Appendix B: Construction and Operational Health Risk Assessment**, which addresses diesel particulate matter (DPM) emissions from generator operation and evaluates operational cancer and chronic non-cancer health risks, as well as combined construction and operational cancer risk.
- **Revised Appendix J: Noise and Vibration Impact Analysis**, which includes a qualitative discussion of noise from the emergency generator. A quantitative analysis was not prepared because the generator would operate only during power outages or other emergencies and for brief, infrequent, daytime maintenance and testing, and it would not be a routine operational noise source.

As a result, the following changes have been made to the Draft IS/MND, as shown in Section 3.0, Errata, of this Final IS/MND:

- **Section 3.4, Operational Characteristics**: The Project Description now states that the Project would include a 236-horsepower diesel emergency generator.
- **Section 3.5, Discretionary Approvals and Permits**: SCAQMD has been added as a Responsible Agency for permits and approvals associated with stationary equipment.
- **Section 4.1, Environmental Checklist**: SCAQMD has been added as a Responsible Agency.

- **Section 5.3, Air Quality**:
    - Threshold 5.3b): Stationary source emissions are added to the operational discussion and Table AQ-3. Net emissions remain below SCAQMD regional thresholds, and impacts would remain less than significant.
    - Threshold 5.3c): A localized operational analysis is added (Table AQ-5), and emissions remain below SCAQMD LSTs; and therefore, impacts would remain less than significant.
    - Threshold 5.3c): The Health Risk Assessment has been revised to include operational DPM and new Tables AQ-7 and AQ-8. As shown in Table AQ-7, the maximum operational cancer risk is 2.21 in one million at the sensitive receptor and 0.24 in one million at the worker receptor; which is below the SCAQMD cancer risk threshold of 10 in one million. The chronic hazard index is below 1.0. As shown in Table AQ-8, the combined construction and operational cancer risk for the maximally impacted sensitive receptor is 2.37 in one million and 0.36 in one million at the maximally impacted worker receptor, both of which are below the SCAQMD threshold of 10 in one million. The construction risk results (Table AQ-6) were also updated due to an error in exposure duration; the cancer risk during construction is now estimated at approximately 4.76 in one million and remains below the threshold. Therefore, impacts related to air quality emissions would be less than significant.

- **Section 5.6, Energy**: Diesel fuel consumption is added to the text and Table E-2. Diesel fuel consumption from the proposed Project is estimated to be approximately 1,723 gallons per year, which is less than 0.01 percent of Riverside County diesel consumption, and not used in an inefficient, wasteful, or wasteful manner.
- **Section 5.8, Greenhouse Gas Emissions**: Stationary source emissions (18 $MTCO_2e$ per year) are added to Table GHG-2. Net Project emissions (478 MTCO2e per year) remain below the SCAQMD Tier 3 threshold of 3,000 $MTCO_2e$. Thus, impacts related to greenhouse gas emissions would remain less than significant.
- **Section 5.13, Noise**: The stationary noise discussion now includes a qualitative discussion of the emergency generator. As the generator would operate only during power outages or other emergencies and for brief, infrequent, daytime maintenance and testing, and it would not be a routine operational noise source, operational noise impacts would remain less than significant.

The revisions described above clarify and amplify the Project Description and the analysis in the Draft IS/MND. The revisions do not alter any impact significance conclusions. None of the information in this response, Revised Appendix A, Revised Appendix B, Revised Appendix J, or the corresponding revisions to the Draft IS/MND constitutes significant new information requiring recirculation of the Draft IS/MND for further public review under State CEQA Guidelines Section 15073.5, *Recirculation of a Negative Declaration Prior to Adoption*. None of the revised material indicates that the Project will result in a significant new environmental impact not previously disclosed in the Draft IS/MND. Additionally, none of this information indicates that there would be a substantial increase in the severity of a previously identified environmental impact that will not be mitigated, or that there would be any of the other circumstances requiring recirculation described in State CEQA Guidelines Section 15073.5.

Response to Comment A1.3: This comment recommends that the Lead Agency revise the Draft IS/MND to address the issues raised and provide sufficient supporting evidence for its conclusions or alternatively explain in the Final IS/MND why the requested information and analysis were not included. This comment

concludes the SCAQMD's discussion and summarizes the standard practice for Lead Agencies when responding to Public Agencies' comments. The comment also thanks the Lead Agency for giving the SCAQMD the opportunity to comment on the Draft IS/MND and contact information if future questions arise.

As substantiated by the responses provided above, the Draft IS/MND has been revised to adequately address the issues raised in this comment letter. Pursuant to State CEQA Guidelines Section 15074(b), *Consideration and Adoption of a Negative Declaration or Mitigated Negative Declaration*, none of the comments or additional analysis within this Final IS/MND indicate or provide a fair argument that the Project will have significant environmental effects which would require preparation of an Environmental Impact Report. Further, none of the information in the letters or responses constitute the type of significant new information that requires recirculation of the Draft IS/MND for further public review under State CEQA Guidelines Section 15073.5, R*ecirculation of a Negative Declaration Prior to Adoption*. None of the revised material indicates that the Project will result in a significant new environmental impact not previously disclosed in the Draft IS/MND. Additionally, none of this information indicates that there would be a substantial increase in the severity of a previously identified environmental impact that will not be mitigated, or that there would be any of the other circumstances requiring recirculation described in State CEQA Guidelines Section 15073.5.

3. ERRATA TO THE BRADLEY GARDENS SKILLED NURSING FACILITY EXPANSION PUBLIC REVIEW IS/MND

This section contains revisions to the Draft IS/MND based upon: (1) clarifications required to prepare a response to a specific comment; and/or (2) typographical errors. These revisions do not alter any impact significance conclusions as disclosed in the Draft IS/MND. Changes made to the IS/MND are identified here in ~~strikeout~~ text to indicate deletions and in **bold underlined** text to signify additions.

REVISIONS IN RESPONSE TO WRITTEN COMMENTS AND CITY CHANGES TO TEXT

The following text, organized by IS/MND section, has been revised in response to comments received on the IS/MND and corrections identified by the City.

Project Description

Section 3.4 on page 20 is revised as follows:

3.4. OPERATIONAL CHARACTERISTICS

The Project is analyzed as a healthcare facility. Typical operational characteristics include employees, patients, and visitors traveling to and from the site. The proposed Project would not change the existing operations of the Bradley Gardens facility, which operates 24 hours a day, seven days a week. The proposed Project would add 100 new employees across all shifts to the existing facility, which currently includes 150 employees, resulting in a total employee count of 250. The existing facility currently has the capacity to serve 44 beds/patients. Implementation of the proposed Project would increase capacity by 59 beds/patients, resulting in a total capacity of 103 beds/patients at the facility. **The proposed Project would include a 236 horsepower diesel emergency generator in order to provide backup power for the expanded facility.**

Section 3.5 on page 20 is revised as follows:

3.5. DISCRETIONARY APPROVALS AND PERMITS

The City is processing the proposed Project under the legal nonconforming provisions of SJMC Section 17.705.120 (Nonconforming Adjustment). Implementation of the proposed Project would require the following discretionary approvals and permits from the City of San Jacinto and other applicable agencies.

City of San Jacinto (Lead Agency):

- Conditional Use Permit
- Site Plan and Design Review
- Ministerial approvals and permits necessary to implement the proposed Project, including but not limited to, grading permit, building permit, etc.

Responsible Agency:

- State Department of Health Care Access and Information (HCAI): Review and issuance of building permits for the expansion of the SNF.

- **South Coast Air Quality Management District (SCAQMD): Issuance of permits and approvals associated with the operation of stationary equipment.**

Environmental Checklist

Section 4.1 on page 29 is revised as follows:

Responsible Agency:

State Department of Health Care Access and Information (HCAI) **and South Coast Air Quality Management District (SCAQMD)**

Air Quality

Threshold 5.3b) on pages 43 and 44 is revised as follows:

Operation

Implementation of the proposed Project would result in long-term regional emissions of criteria air pollutants and ozone precursors associated with area sources, such as natural gas consumption, landscaping, applications of architectural coatings, and consumer products. Operation of the proposed Project would include emissions from vehicles traveling to the Project site and from vehicles in the parking lots and loading areas. The proposed Project would generate an additional 181 daily trips including 8 trips during the AM peak hour and 13 trips during the PM peak hour according to the Vehicle Miles Traveled (VMT) Screening Analysis (Appendix K). Area source emissions would occur from operation of the expanded SNF. **Stationary source emissions would occur from the operation of an emergency generator.**

Operational emissions associated with the existing facility and proposed Project were modeled using CalEEMod Version 2022.1 land use emission model. Operational emissions for the existing facility, the proposed Project, and the resulting net Project emissions are presented in Table AQ-3, *Regional Operational Emission Estimates*. Net Project emissions represent the increase in emissions attributable to the proposed Project and were calculated by subtracting the existing operational operations from the proposed Project operational emissions. The net project emissions were compared to the SCAQMD regional operational significance thresholds to evaluate project impacts. As shown, the net Project emissions would result in long-term regional emissions below the SCAQMD's applicable thresholds. Therefore, operation of the proposed Project would not exceed the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS), would not result in a cumulatively considerable net increase of any criteria pollutant, and impacts would be less than significant.

Table AQ-3: Regional Operational Emission Estimates

Operational Activity	Maximum Daily Regional Emissions (pounds/day)					
	ROG	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Mobile	1.2	1.3	12.3	<0.01	3.1	0.8
Area	1.4	0.1	6.0	<0.01	<0.01	<0.01
Energy	<0.01	0.4	0.2	<0.01	<0.01	<0.01

Operational Activity	Maximum Daily Regional Emissions (pounds/day)					
	ROG	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Stationary	**0.4**	**1.1**	**1.0**	**<0.01**	**0.1**	**0.1**

Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: ROG = reactive organic gases; NOx = nitrogen oxides; CO = carbon monoxide; SO_2 = sulfur dioxide; PM_{10} = particulate matter, 10 microns in diameter; $PM_{2.5}$ = particulate matter, 2.5 microns in diameter
Source: **Revised** Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Threshold 5.3c) on pages 46 and 47 is revised as follows:

Operation

The localized significance thresholds for operation are determined by the size of the Project site and the distance to the nearest sensitive receptor, as well as the maximum trip length possible within the Project site. As the Project site is 2.98 acres, operational LSTs were estimated by interpolating between the 2-acre and 5-acre site thresholds to approximate values corresponding to the Project site area. Consistent with the localized construction emissions analysis, the 25-meter receptor distance category was applied.

As shown in Table AQ-5, *Localized Operational Emission Estimates*, the Project's localized operational emissions would be below the SCAQMD LSTs. Therefore, localized operational air quality impacts would be less than significant.

Table AQ-1: Localized Operational Emission Estimates

Operational Activity	Maximum Daily Localized Emissions (pounds/day)			
	NOx	CO	PM_{10}	$PM_{2.5}$
Mobile	**0.3**	**1.9**	**<0.01**	**<0.01**
Area	**0.1**	**6.0**	**<0.01**	**<0.01**

Stationary	**1.1**	**1.0**	**0.1**	**0.1**
Total Project Emissions	**1.9**	**9.1**	**0.1**	**0.1**
SCAQMD Significance Thresholds	**260.9**	**1,269.5**	**2.4**	**1.2**
Threshold Exceeded?	**No**	**No**	**No**	**No**

Notes: NOx = nitrogen oxides; CO = carbon monoxide; PM_{10} = particulate matter, 10 microns in diameter; $PM_{2.5}$ = particulate matter, 2.5 microns in diameter

Source: Revised Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Construction and Operational Health Risk Assessment

In addition to criteria pollutant emissions, construction of the proposed Project would generate diesel particulate matter (DPM) emissions from the exhaust of off-road, heavy-duty diesel construction equipment used during demolition, site preparation, grading, building construction, paving, and architectural coating activities, as well as from on-road haul, vendor, and worker vehicles traveling to and from the Project site. **The proposed Project would also generate DPM emissions during operations from the use of an emergency generator.** DPM has been identified as a toxic air contaminant (TAC) by the California Air Resources Board (CARB). Because sensitive receptors are located in proximity to the Project site, a Construction **and Operational** Health Risk Assessment was prepared for the proposed Project (included as Appendix B) to evaluate the potential carcinogenic and non-carcinogenic health risks to nearby receptors resulting from exposure to Project construction-source DPM emissions.

The City of San Jacinto has not adopted a numerical significance threshold for cancer risk or non-cancer chronic health risk impacts; therefore, the SCAQMD's significance thresholds were used.

The SCAQMD recommends using a risk level of 10 in one million as the cancer risk threshold. A risk level of 10 in one million implies a likelihood that up to 10 people, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. Non-cancer health risks are conveyed in terms of the Hazard Index (HI). A ratio of the predicted concentration of the facility's reported TAC emissions to a concentration is considered acceptable to public health professionals. A significant risk is defined as an HI of 1 or greater.

The SCAQMD defines a sensitive receptor as any residence, including private homes, condominiums, apartments, and living quarters, schools, preschools, daycare centers, and health facilities such as hospitals or retirement and nursing homes. For purposes of this HRA, sensitive receptors were placed within the air dispersion model at the locations of the closest existing residences and other establishments or residences nearest to the Project site that qualify as sensitive receptors. In addition, a uniform grid network of receptors was placed over the Project vicinity to complete the receptor network. The nearest off-site sensitive receptor is a single-family residential structure located approximately 90 feet (27 meters) north of the Project site, across W. 7th Street, which was identified as the most impacted sensitive receptor during the construction of the Project. The nearest off-site worker receptor is Talley Metal Fabrication, located at 989 W 7th St, San Jacinto, CA, approximately 107 feet (33 meters) north of the Project site.

As shown in Table ~~AQ-5~~ AQ-6, *Construction Health Risk Results*, the estimated maximum cancer risk attributable to construction of the proposed Project would be ~~4.88~~ **4.76** in one million at the maximally impacted sensitive/residential receptor and 0.13 in one million at the maximally impacted worker receptor, both of which are below the SCAQMD significance threshold of 10 in one million. The maximum chronic non-cancer HI during construction would be 0.01 for both the maximally impacted sensitive receptor and the maximally impacted worker receptor, which is below the SCAQMD significance threshold of 1.0. Thus, the construction of the Project would have a less-than-significant impact for both cancer risk and chronic non-cancer impacts.

Table ~~AQ-5~~ AQ-6: Construction Health Risk Results

Receptor	Cancer Risk (per million)		Threshold Exceeded?
	Maximum Lifetime Project Risk	SCAQMD Significance Threshold	
Maximum Impacted Sensitive Receptor - Cancer Risk (Prebirth to ~~1.02~~ **0.99** Years)	~~4.88~~ **4.76** in one million	10 in one million	**No**
Maximum Impacted Sensitive Receptor - Cancer Risk (Adult, ~~1.02~~ **0.99** Years)	0.18 in one million	10 in one million	**No**
Maximum Impacted Worker Receptor - Cancer Risk (~~1.02~~ **0.99** Years)	0.13 in one million	10 in one million	**No**
Receptor	**Chronic Non-Cancer Hazard Index**		**Threshold Exceeded?**
	Maximum Lifetime Project Risk	**SCAQMD Significance Threshold**	
Maximum Impacted Sensitive Receptor	0.01	1.0	**No**
Maximum Impacted Worker Receptor	0.01	1.0	**No**

Source: Construction **and Operational** Health Risk Assessment (**Revised** Appendix B)

Table AQ-7, *Operational Health Risk Results*, presents a summary of the cancer risks and chronic non-cancer hazards resulting from Project operations along with the SCAQMD health risk significance thresholds. As shown in Table AQ-7, the estimated maximum cancer risk during operations is 2.21 in one million for the maximally impacted sensitive/residential receptors and 0.24 in one million at the maximally impacted worker receptor, both of which are below the SCAQMD significance threshold of 10 in one million. The maximum chronic non-cancer HI during operations would be less than 0.01 for the maximally impacted sensitive receptor and 0.05 for the maximally impacted worker receptor, which is below the SCAQMD significance threshold of 1.0. Thus, operation of the Project would have a less-than-significant impact for both cancer risk and chronic non-cancer impacts.

Table AQ-7: Operational Health Risk Results

Receptor	Cancer Risk (per million)		Exceeds Significance Threshold?
	Maximum Lifetime Proposed Project Risk	Significance Threshold	
Maximum Impacted Sensitive Receptor – Infant to Adult (30 years)	**2.21**	**10**	**No**
Maximum Impacted Sensitive Receptor – Adult (30 years)	**1.44**	**10**	**No**
Maximum Impacted Worker Receptor (25 years)	**0.24**	**10**	**No**

Receptor	Chronic Non-Cancer Hazard Index		Exceeds Significance Threshold?
	Maximum Lifetime Proposed Project Risk	Significance Threshold	
Maximum Impacted Sensitive Receptor	<0.01	1.0	No
Maximum Impacted Worker Receptor	0.05	1.0	No

Source: Construction and Operational Health Risk Assessment (Revised Appendix B)

Table AQ-8, *Combined Construction and Operational Health Risk Results*, presents the combined construction and operational cancer risk for the Project. As shown in Table AQ-8, the combined construction and operational cancer risk for the maximally impacted sensitive receptor is 2.37 in one million, below the SCAQMD cancer risk threshold of 10 in one million. The cancer risk for combined construction and operation at the maximally impacted worker receptor is 0.36 in one million, which is below the significance threshold of 10 in one million. Thus, impacts related to combined construction and operation cancer risk would be less than significant.

Table AQ-8: Combined Construction and Operational Health Risk Results

Receptor	Cancer Risk (per million)		Exceeds Significance Threshold?
	Maximum Lifetime Proposed Project Risk	Significance Threshold	
Maximum Impacted Sensitive Receptor Prebirth to 30 years	2.37	10	No
Maximum Impacted Worker (25 years)	0.36	10	No

Source: Construction and Operational Health Risk Assessment (Revised Appendix B)

Energy

Threshold 5.6a) on page 59 is revised as follows:

As detailed in Table E-2, *Project Net Annual Operational Energy Consumption*, operation of the proposed Project is estimated to result in an annual use of approximately 52,117 gallons of gasoline fuel, **approximately 1,723 gallons of diesel fuel,** approximately 1,399,933 British thermal units (BTU) of natural gas, and approximately 646,337 kilowatt-hours (kWh) of electricity. As shown in Table E-2, compared to the existing facility on-site, the proposed Project would result in a net annual increase of 29,853 gallons of gasoline fuel, **1,723 gallons of diesel fuel,** 760,676 BTU of natural gas, and 332,746 kWh of electricity. These increases represent less than 0.01 percent of Riverside Countywide electricity, natural gas, and gasoline consumption, respectively**, and less than 0.01 percent of Riverside County diesel consumption**. Thus, operation of the Project would not use large amounts of energy or fuel in a wasteful manner, and operational energy impacts would be less than significant.

Table E-2: Project Net Annual Operational Energy Consumption

Operational Source	Energy Usage	Countywide Energy Consumption	Percentage Increase in Countywide Consumption from Project
Electricity (Kilowatt-Hour)			
Proposed Project	646,337	NA	
Existing Conditions	313,592		
Net Electricity Consumption from Project	**332,746**	**16,286,000,000**	**<0.01%**
Natural Gas (Thousands British Thermal Units)			
Proposed Project	1,399,933	NA	
Existing Conditions	639,257		
Net Natural Gas Consumption From Project	**760,676**	**42,670,000,000**	**<0.01%**
Petroleum (Gasoline Fuel) Consumption (Gallons)			
Proposed Project	52,117	NA	
Existing Conditions	22,263		
Net Petroleum (Gasoline) Consumption from Project	**29,853**	**430,881,899**	**<0.01%**
Petroleum (Diesel Fuel) Consumption (Gallons)			
Proposed Project	**1,723**	**NA**	
Existing Conditions	**-**		
Net Petroleum (Diesel) Consumption from Project	**1,723**	**227,147,767**	**<0.01%**

Notes: NA = Not Applicable, as this analysis compares the net increase of the Project with countywide consumption.
Source: **Revised** Air Quality, Energy, and Greenhouse Gas Assessment (Appendix A)

Greenhouse Gas Emissions

Threshold 5.8a) on pages 69 and 70 is revised as follows:

Global climate change is not confined to a particular project area. A typical project does not generate enough GHG emissions on its own to influence global climate change significantly; hence, the issue of global climate change is, by definition, a cumulative environmental impact. GHGs are produced by both direct and indirect emissions sources. Direct emissions include consumption of natural gas, heating and cooling of buildings, landscaping activities and other equipment used directly by land uses. Indirect emissions include the consumption of fossil fuels for vehicle trips, electricity generation, water usage, and solid waste disposal.

Construction activities produce combustion emissions from various sources, such as site excavation, grading, utility engines, heavy-duty construction vehicles on-site, equipment hauling materials to and from the site, asphalt paving, and motor vehicles transporting the construction crew. Exhaust emissions from on-site construction activities would vary daily as construction activity levels change.

In addition, operation of the proposed Project would result in area and indirect sources of operational GHG emissions that would primarily result from vehicle trips, electricity and natural gas consumption, water transport (the energy used to pump water), and solid waste generation. GHG emissions from electricity consumed by the building would be generated off-site by fuel combustion at the electricity provider. GHG emissions from water transport are also indirect emissions resulting from the energy required to transport water from its source.

GHG emissions during Project construction and operations were estimated using CalEEMod version 2022.1. In accordance with SCAQMD recommendations, the Project's amortized construction GHG emissions (as shown in Table GHG-1) are added to the operational emissions in order to determine the Project's total annual estimated GHG emissions. The estimated operational GHG emissions that would be generated from implementation of the proposed Project, combined with the construction emissions, are shown in Table GHG-2. As shown in Table GHG-2, net Project GHG emissions would be less than the SCAQMD's Tier 3 threshold of 3,000 $MTCO_2e$. Therefore, based upon SCAQMD's screening threshold, impacts related to GHG emissions would be less than significant.

Table GHG-1: Project Construction GHG Emissions

Construction Year	Annual GHG Emissions ($MTCO_2e$)
2026	33
2027	386
Total Emissions	**419**
Total Emissions Amortized Over 30 Years	14

Notes: Numbers have been rounded. $MTCO_2e$ = metric tons of carbon dioxide equivalent.

Noise

Threshold 5.13a) on page 107 will be revised as follows:

Operation

Stationary Noise Impacts. Long-term operational noise would be generated from on-site stationary sources including heating, ventilation, and air conditioning (HVAC) equipment, and from on-site mobile sources including passenger vehicles, delivery trucks, and garbage trucks. **The proposed Project would have one 236 horsepower (hp) emergency generator on-site. Emergency generators operate only during power outages or other emergencies, which are infrequent and temporary events, and are not a routine operational noise source. Periodic maintenance and testing would be brief, infrequent, limited to daytime hours, and restricted in annual duration by SCAQMD requirements. Accordingly, the generator would not substantially affect ambient noise levels or contribute to the Project's long-term operational noise level. Thus, impacts would be less than significant.**

This page intentionally left blank.

4. Mitigation Monitoring and Reporting Program

INTRODUCTION

The California Environmental Quality Act (CEQA) requires a lead or public agency that approves or carries out a project for which a Mitigated Negative Declaration has been certified which identifies one or more significant adverse environmental effects and where findings with respect to changes or alterations in the project have been made to adopt a "…reporting or monitoring program for the changes to the project which it has adopted or made a condition of project approval in order to mitigate or avoid significant effects on the environment" (CEQA, Public Resources Code Sections 21081, 21081.6).

A Mitigation Monitoring and Reporting Program (MMRP) is required to ensure that adopted mitigation measures are successfully implemented for the Bradley Gardens Skilled Nursing Facility Expansion Project (Project). The City of San Jacinto is the Lead Agency for the Project and is responsible for implementation of the MMRP. This report describes the MMRP for the Project and identifies the parties that will be responsible for monitoring implementation of the individual mitigation measures in the MMRP.

MITIGATION MONITORING AND REPORTING PROGRAM

The MMRP for the Project will be active through all phases of the Project, including design, construction, and operation. The table identifies the Plans, Programs, and Policies (PPPs) and mitigation measures required by the City to mitigate or avoid significant adverse impacts associated with implementation of the Project, the timing of implementation, and the responsible party or parties for monitoring compliance.

The MMRP also includes a column that will be used by the compliance monitor (individual responsible for monitoring compliance) to document when implementation of the measure is completed. As individual PPPs and mitigation measures are completed, the compliance monitor will sign and date the MMRP, indicating that the required actions have been completed.

This page intentionally left blank.

Table 4-1: Mitigation Monitoring and Reporting Program

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
AESTHETICS				
PPP AES-1: Glare and Outdoor Lighting Standards. The Project is required to comply with San Jacinto Development Code Section 17.300.080 which requires all exterior lighting to be shielded or modified and located so as to eliminate spillover illumination or glare beyond the property line or upward into the sky.	Project Applicant	Prior to issuance of building permits	City of San Jacinto Building & Safety Division	
AIR QUALITY				
PPP AQ-1: SCAQMD Rule 403. The Project is required to comply with the provisions of South Coast Air Quality Management District (SCAQMD) Rule 403, which includes the following: • All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions. • The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered, with complete coverage of disturbed areas, at least 3 times daily during dry weather; preferably in the mid-morning, afternoon, and after work is done for the day. • The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less.	Project Applicant	Prior to issuance of demolition, grading and building permits	City of San Jacinto Building & Safety Division	
PPP AQ-2: SCAQMD Rule 1113. The Project is required to comply with the provisions of South Coast Air Quality Management District Rule (SCAQMD) Rule 1113. Only "Low-Volatile Organic Compounds" paints (no more than 50 gram/liter of VOC) and/or High Pressure Low Volume (HPLV) applications shall be used.	Project Applicant	Prior to issuance of building permits	City of San Jacinto Building & Safety Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
PPP AQ-3: Rule 402. The Project is required to comply with the provisions of South Coast Air Quality Management District (SCAQMD) Rule 402. The Project shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.	Project Applicant	Prior to issuance of demolition, grading and building permits	City of San Jacinto Building & Safety Division	
BIOLOGICAL RESOURCES				
PPP BIO-1: MSHCP Fees. Prior to issuance of a grading or building permit, the Project Applicant shall pay fees required pursuant to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) implemented under San Jacinto Municipal Code Chapter 15.50. Western Riverside County MSHCP requires a per-acre local development impact and mitigation fee payment prior to the issuance of a grading or building permit.	Project Applicant	Prior to issuance of grading and building permits	City of San Jacinto Planning Division	
MM BIO-1: Pre-Construction Nesting Bird Survey. Vegetation within and surrounding the Project site has the potential to provide refuge cover from predators, perching sites and favorable conditions for avian nesting that could be impacted by construction activities associated with the Project. Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (Sections 3503, 3503.5, 3511, and 3513 prohibit the take, possession, or destruction of birds, their nests or eggs). In order to protect migratory bird species, a nesting bird clearance survey should be conducted prior to any ground disturbance or vegetation removal activities that may disrupt the birds during the nesting season. To avoid such impacts, a preconstruction nesting bird clearance survey shall be conducted by a qualified biologist within three (3) days prior to the commencement of any vegetation removal or ground-disturbing	Project Applicant, Qualified Biologist	Within 3 days prior to ground disturbing activities	City of San Jacinto Planning Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
activities occurring during the nesting season (February 1 through August 31). If no active nests are observed, the biologist shall document the negative findings in a brief letter report and submit it to the Lead Agency. If an active nest is identified, a no-disturbance buffer shall be established around the nest. The buffer distance shall be determined by the biologist based on species-specific sensitivity, the type and duration of construction activity, ambient noise and human activity levels, line-of-sight between the nest and construction areas, and the presence of topographic or vegetative screening. Buffers shall be established depending on these site-specific factors, and shall remain in place until the biologist determines that the nest is no longer active and the young have successfully fledged. The limits of the exclusion zone shall be clearly marked in the field with flagging, fencing, or other appropriate barriers, and construction personnel shall be briefed on the location and sensitivity of protected nesting areas. A biological monitor shall oversee the implementation of exclusion zones and monitor nesting behavior to ensure compliance. Construction activities may resume within the previously established buffer area only after the qualified biologist confirms that the young have successfully fledged and the nest is no longer active.				
CULTURAL RESOURCES				
PPP CUL-1: Human Remains. In the event that human remains are encountered on the Project site, work within 50 feet of the discovery shall cease and the County Coroner shall be notified immediately consistent with the requirements of California Code of Regulations (CCR) Section 15064.5(e). State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code (PRC) Section 5097.98. Prior to the issuance of grading permits, the City Community and Planning, Building, and Code Enforcement	City of San Jacinto Planning Division, Qualified Archaeologist	Prior to issuance of grading permits	City of San Jacinto Planning Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
Department Director, or designee, shall verify that all grading plans specify the requirements of CCR Section 15064.5(e), State Health and Safety Code Section 7050.5, and PRC Section 5097.98, as stated above.				
MM CUL-1: Inadvertent Discovery. In the event that potential archaeological resources are discovered during excavation, grading, or construction activities, work shall cease within 50 feet of the find until a qualified archaeologist from the City or County List of Qualified Archaeologists has evaluated the find to determine whether the find constitutes a "unique archaeological resource," as defined in Section 21083.2(g) of the California Public Resources Code. Any resources identified shall be treated in accordance with California Public Resources Code Section 21083.2(g). If the discovered resource(s) appears Native American in origin, a Native American Monitor shall be contacted to evaluate any potential tribal cultural resource(s) and shall have the opportunity to consult on appropriate treatment and curation of these resources. The discovery would also be reported to the City and the South Central Coastal Information Center (SCCIC). Prior to the issuance of any permits for ground-disturbing activities that include the excavation of soils (including as grading, excavation, and trenching), the City of San Jacinto shall ensure that all Project grading and construction plans and specifications include requirement to halt construction activity and contact an archaeologist as specified above.	City of San Jacinto Planning Division, Qualified Archaeologist	Prior to issuance of grading permits	City of San Jacinto Planning Division	
GEOLOGY AND SOILS				
PPP GEO-1: CBC Compliance. The Project is required to comply with the California Building Standards Code as included in Section 15.04.020 of the San Jacinto Municipal Code to preclude significant adverse effects associated with seismic and soils hazards. CBC related and geologist and/or civil engineer specifications for the proposed Project are required to be incorporated into grading plans and building specifications as a condition of construction permit approval.	Project Applicant	Prior to issuance of building permits	City of San Jacinto Building & Safety Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
MM GEO-1: Paleontological Monitoring. Prior to the issuance of grading permits, the Project Applicant shall provide a letter to the City, or City designee, from a professional paleontologist, stating that a qualified paleontologist has been retained to provide services for the proposed Project. The paleontologist shall develop a Paleontological Resources Impact Mitigation Plan (PRIMP) to mitigate the potential impacts to unknown buried paleontological resources that may exist onsite. The PRIMP shall be provided to the City for review and approval. The PRIMP shall require that the paleontologist be present at the pre-grading conference to establish procedures for paleontological resource surveillance. Prior to commencement of grading activities, the City of San Jacinto Planning Division, or designee, shall verify that all Project grading and construction plans specify the requirements herein related to the PRIMP and the unanticipated discovery of paleontological resources. Full-time monitoring will be required starting at 3 feet deep below the current surface. In the event paleontological resources are encountered, ground disturbing activity within 50 feet of the area shall cease. The paleontologist shall examine the materials encountered, assess the nature and extent of the find, and recommend a course of action to further investigate and protect or recover and salvage those resources that have been encountered pursuant to the guidelines of the Society of Vertebrate Paleontology. Criteria for discarding specific fossil specimens shall be made explicit in the PRIMP. If the qualified paleontologist determines that impacts to a sample containing significant paleontological resources cannot be avoided by Project construction, then recovery techniques shall be applied. Actions include recovering a sample of the fossiliferous material prior to construction, monitoring construction activities and halting construction if an important fossil needs to be recovered, and/or cleaning, identifying, and cataloging specimens for curation and research purposes. Recovery, salvage, and treatment shall be done at the Project	Project Applicant, Qualified Paleontologist	Prior to issuance of grading permits	City of San Jacinto Planning Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
Applicant's expense. All recovered and salvaged resources shall be prepared to the point of identification and permanent preservation by the paleontologist. Resources shall be identified and curated into an established accredited professional repository. The paleontologist shall have a repository agreement in hand prior to initiating recovery of the resource. A report documenting the results of the monitoring, including any salvage activities and the significance of any fossils, shall be prepared and submitted to the City, or City designee. The report and inventory, when submitted to the City of San Jacinto Planning Division, shall signify completion of the program to mitigate impacts to paleontological resources.				
HAZARDS AND HAZARDOUS MATERIALS				
PPP HAZ-1: SCAQMD Rule 1403. Prior to issuance of demolition permits, the Project Applicant shall submit verification to the City Building and Safety Division that an asbestos survey has been conducted at all existing buildings located on the Project site. If asbestos or asbestos containing material is found, the Project Applicant shall follow all procedural requirements and regulations of the South Coast Air Quality Management District (SCAQMD) Rule 1403. Rule 1403 regulations require that the following actions be taken: notification of SCAQMD prior to construction activity, asbestos removal in accordance with prescribed procedures, placement of collected asbestos in leak-tight containers or wrapping, and proper disposal.	Project Applicant	Prior to issuance of demolition permits	City of San Jacinto Building & Safety Division	
PPP HAZ-2: Lead. Prior to issuance of demolition permits, the Project Applicant shall submit verification to the City Building and Safety Division that a lead-based paint survey has been conducted at all existing buildings located on the Project site. If lead-based paint is found, the Project Applicant shall follow all procedural requirements and regulations for proper removal and disposal of the lead-based paint. CalOSHA has established limits of exposure to lead contained in dusts and fumes.	Project Applicant	Prior to issuance of demolition permits	City of San Jacinto Building & Safety Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
Specifically, CCR Title 8, Section 1532.1 provides for exposure limits, exposure monitoring, and respiratory protection, and mandates good working practices by workers exposed to lead.				
PPP HYD-1: SWPPP. Listed below in *Hydrology and Water Quality*.	Project developer	Prior to issuance of grading permit	City of San Jacinto Engineering Division	
HYDROLOGY & WATER QUALITY				
PPP HYD-1: SWPPP. Prior to grading permit issuance, the Project developer shall have a SWPPP prepared by a Qualified SWPPP Developer (QSD) pursuant to the San Jacinto Municipal Code Chapter 17.600. The SWPPP shall incorporate all necessary BMPs and other City requirements to comply with the NPDES requirements to limit the potential of polluted runoff during construction activities. Project contractors shall be required to ensure compliance with the SWPPP and permit periodic inspection of the construction site by San Jacinto City staff or its designee to confirm compliance.	Project developer	Prior to issuance of grading permit	City of San Jacinto Engineering Division	
PPP HYD-2: WQMP. Prior to grading permit issuance, the Project developer shall have a WQMP approved by the City for implementation. The project shall comply with the San Jacinto Municipal Code Chapter 19.600 and the Municipal Separate Storm Sewer System (MS4) permit requirements in effect for the Regional Water Quality Control Board (RWQCB) at the time of grading permit to control discharges of sediments and other pollutants during operations of the Project.	Project developer	Prior to issuance of grading permit	City of San Jacinto Engineering Division	
NOISE				
PPP N-1: Construction Equipment Buffer Distance. To minimize the effects of vibration from construction equipment on existing structures, loaded trucks would be required to maintain a minimum buffer distance of 10 feet from the existing building and small bulldozers would be required to maintain a minimum buffer distance of 1 foot from the existing building.	Project Applicant	During construction	City of San Jacinto Building & Safety Division	

Plan, Program, Policy (PPP) / Mitigation Measure	Responsible Party for Implementation	Timing	Responsible Party for Monitoring	Date of Completion and Initials
TRIBAL CULTURAL RESOURCES				
PPP TCR-1: Treatment and Disposition Agreement. Prior to issuance of a grading permit, the Project developer shall enter into a Treatment and Disposition Agreement (TDA) with the Soboba Band of Luiseño Indians to address treatment and disposition of archaeological, or Tribal Cultural Resources and human remains associated with the Soboba Band of Luiseño Indians that may be uncovered or otherwise discovered during ground-disturbing activities related to the project, if monitoring deemed necessary by Soboba Band of Luiseño Indians. The TDA will establish provisions for tribal monitoring and shall be submitted to the City of San Jacinto Planning Division once it has been executed.	Project developer	Prior to issuance of grading permits	City of San Jacinto Planning Division	
PPP CUL-1: Human Remains. Listed previously in *Cultural Resources*.	City of San Jacinto Planning Division, Qualified Archaeologist	Prior to issuance of grading permits	City of San Jacinto Planning Division	

Outlook

Formal Public Comment and Objection – Bradley Gardens Expansion Project PROJ25-0178

From Alison Jones <alison.jones.otsc@gmail.com>
Date Fri 9/18/2026 11:08 AM
To Chen, Frank <fchen@sanjacintoca.gov>

[**NOTICE:** This message originated outside of City of San Jacinto -- **DO NOT CLICK** on **links** or open **attachments** unless you are sure the content is safe.]

Dear Mr. Chen,

My name is Alison Jones, and I live at Parkview Estates, 913 South Grand Avenue, Space 71, San Jacinto, California 92582.

My home is very close to the proposed Bradley Gardens Skilled Nursing Facility Expansion Project at 980 West Seventh Street.

Please accept this email as my formal public comment and objection to the Draft Initial Study and Mitigated Negative Declaration for the Bradley Gardens Skilled Nursing Facility Expansion Project, PROJ25-0178, SCH No. 2026090689.

I also object to the approval of the Conditional Use Permit and Site Plan and Design Review in their present form.

I am requesting that the City not adopt the Mitigated Negative Declaration as currently written and not approve the project as presently proposed.

Before making any decision, the City should require additional analysis of traffic, parking, pedestrian safety, emergency access, noise, lighting, security, construction impacts, and compatibility with the nearby residential community.

If these potential impacts cannot be adequately evaluated and mitigated through the current environmental document, I request preparation of an Environmental Impact Report or revision and recirculation of the environmental study for additional public review.

The proposed project would expand the existing facility from 44 beds to 103 beds, add psychiatric treatment capacity, construct an approximately 17,372-square-foot addition, and reportedly add approximately 100 employees. The notice estimates only 181 additional daily vehicle trips. That estimate requires closer examination considering employee shift changes, visitors, patient transportation, ambulances, deliveries, vendors, medical providers, and other service vehicles.

Parkview Estates and the surrounding streets already experience significant parking and traffic problems. Vehicles frequently occupy the available street space, and key intersections serving our

neighborhood lack adequate traffic controls. Adding this level of activity may create additional risks for residents, pedestrians, children, disabled individuals, emergency vehicles, and drivers entering or leaving the mobile home park.

I ask the City to provide and carefully examine the following:

1. The complete traffic study and the data used to calculate the projected increase of 181 daily trips.

2. The expected number of employees on each shift and the anticipated times of shift changes.

3. The number of on-site parking spaces and evidence that the parking supply will accommodate employees, visitors, medical transportation, ambulances, deliveries, and vendors without causing overflow parking in the surrounding neighborhood.

4. An evaluation of the entrances and intersections serving the project and Parkview Estates, including whether stop signs, crosswalks, improved lighting, turn controls, or other traffic-safety improvements are necessary.

5. An emergency-access analysis addressing whether fire engines and ambulances can safely and promptly reach the facility and surrounding homes when nearby streets are congested or lined with parked vehicles.

6. A pedestrian-safety analysis that considers nearby homes, children, disabled residents, and San Jacinto Elementary School.

7. The anticipated frequency of ambulance arrivals, emergency calls, sirens, nighttime activity, deliveries, and patient transportation.

8. A detailed operational and security plan describing staffing, secure entrances and exits, patient admissions and discharges, unauthorized-departure prevention, emergency incidents, and coordination with local police, fire, and emergency medical services.

9. An evaluation of operational noise, exterior lighting, mechanical equipment, construction noise, dust, construction vehicles, and nighttime impacts on nearby residents.

10. An assessment of whether the project's size and around-the-clock operations are compatible with the immediately adjacent residential community.

I am a disabled resident and an autistic adult. Members of my family and other residents of Parkview Estates also live with autism, disabilities, mobility limitations, and sensory sensitivities. Increased traffic, noise, emergency activity, lighting, congestion, and restricted access can affect disabled and autistic residents more seriously than the general population. Predictable and safe access to our homes is especially important for residents with mobility and sensory-related disabilities.

My concerns are not based on hostility toward individuals who need mental-health or skilled-nursing services. I support appropriate access to healthcare.

My concern is whether a development of this size and intensity can operate safely at this particular location without creating significant impacts for the surrounding residential community.

If the City considers approving the project, I request enforceable conditions requiring sufficient on-site employee and visitor parking, restrictions against neighborhood overflow parking, appropriate traffic controls, protected emergency access, controlled exterior lighting, construction-hour limitations, noise restrictions, a written security and emergency-response plan, and a designated facility contact for neighborhood complaints.

Please include this email and any attachments in the official administrative record for PROJ25-0178. Please also add me to the notification list for every Planning Commission or City Council meeting, environmental decision, revised study, staff report, project modification, and appeal associated with this project.

Please confirm in writing that this comment was received on time and made part of the official record. I also request a copy or working link to the complete Initial Study, traffic analysis, parking plan, site plan, operational statement, security plan, and all supporting technical studies.

Thank you for considering the effects this project may have on Parkview Estates and the surrounding San Jacinto community.

Sincerely,

Alison Jones

Draft Mitigated Negative Declaration (MND) for the Bradley Gardens Skilled Nursing Facility Expansion Project (Proposed Project) (SCH No.: 2026090689)

South Coast Air Quality Management District (South Coast AQMD) Staff appreciate the opportunity to review the above-mentioned document. The City of San Jacinto is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD Staff have provided a brief summary of the project information and prepared the following comments which are organized by topic of concern.

Summary of Proposed Project Information in the Draft MND

Based on the Draft MND, the Proposed Project consists of expanding an existing 44-bed skilled nursing facility to 103 beds through construction of a single-story addition (17,372 square feet) providing 43 additional skilled nursing and short-term psychiatric beds, conversion of an existing vacant office building (2,596 square feet) into a 16-bed psychiatric health facility, and demolition of an existing maintenance and storage building (1,074 square feet), with 52 vehicle parking spaces and 6 bicycle parking spaces. Based on a review of aerial photographs, South Coast AQMD Staff found that the nearest sensitive receptor (e.g., residential development) is located approximately 90 feet (27 meters) north of the Project site.Construction of the Proposed Project is anticipated to occur over 12 months. The Proposed Project is located at 980 West 7th Street in San Jacinto.[1]

South Coast AQMD Comments

South Coast AQMD Air Permits and Role as a Responsible Agency

If implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, etc., air permits from South Coast AQMD will be required. The Final MND should include a discussion about the potentially applicable South Coast AQMD rules that may be applicable to the Proposed Project. Those rules may include, for example, Rule 201 – Permit to Construct,[2] Rule 203 – Permit

[1] Initial study. Page 26.
[2] South Coast AQMD, Rule 201 is available at: https://www.aqmd.gov/docs/default-source/rule-book/reg-ii/rule-201.pdf

to Operate,[3] Rule 401 – Visible Emissions,[4] Rule 402 – Nuisance,[5] Rule 403 – Fugitive Dust,[6] Rule 1110.2 – Emissions from Gaseous and Liquid Fueled Engines,[7] Rule 1113 – Architectural Coatings,[8] Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil,[9] Rule 1179 – Publicly Owned Treatment Works Operations,[10] Regulation XIII – New Source Review,[11] Rule 1401 – New Source Review of Toxic Air Contaminants,[12] Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants,[13] Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines,[14] etc. It is important to note if air permits from South Coast AQMD are required, the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections 15086, the Lead Agency is required to consult with South Coast AQMD.

CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of the process for conducting a review of the Proposed Project and issuing discretionary approvals. Moreover, it is important to note that if a Responsible Agency determines that a CEQA document is not adequate to rely upon for its discretionary approvals, the Responsible Agency must take further actions listed in CEQA Guideline Section 15096(e), which could have the effect of delaying the implementation of the Proposed Project. In its role as CEQA Responsible Agency, the South Coast AQMD is obligated to ensure that the CEQA document prepared for this Proposed Project contains a sufficient project description and analysis to be relied upon in order to issue any discretionary approvals that may be needed for air permits. South Coast AQMD is concerned that the project description and analysis in its current form in the MND is inadequate to be relied upon for this purpose.

For these reasons, the final CEQA document should be revised to include a discussion about any and all new stationary and portable equipment requiring South Coast AQMD air permits, provide the evaluation of their air quality and greenhouse gas impacts, and identify South Coast AQMD as a Responsible Agency for the Proposed Project as this information will be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD's Engineering and Permitting Staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD's webpage at https://www.aqmd.gov/home/permits.

Conclusion

[13] South Coast AQMD, Rule 1466 is available at: https://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1466.pdf
[14] South Coast AQMD, Rule 1470 is available at: https://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1470.pdf

The Lead Agency is recommended to revise the CEQA analysis to address the aforementioned comments and provide the necessary evidence to sufficiently support the conclusions reached. If the requested information and analysis are not included in the final CEQA document, either the Final MND or other type of CEQA document, the Lead Agency should provide reasons for not doing so. Pursuant to California Public Resources Code Section 21092.5(b) and CEQA Guidelines Section 15074, prior to approving the Proposed Project, the Lead Agency shall consider the MND for adoption together with any comments received during the public review process and notify each public agency when any public hearings are scheduled. Please provide South Coast AQMD with written responses to all comments contained herein prior to the adoption of the Final MND. When responding to issues raised in the comments, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided. In addition, if the Lead Agency decides to adopt the Final MND, please provide South Coast AQMD with a notice of any scheduled public hearing(s).

South Coast AQMD staff are available to work with the Lead Agency to ensure that impacts to air quality, GHG emissions, and health risk from the Proposed Project are accurately evaluated and mitigated to the greatest extent possible. Please contact Sahar Ghadimi, Ph.D., Air Quality Specialist, at sghadimi@aqmd.gov or me at SWang1@aqmd.gov should you have any questions.

Sincerely,

Sam Wang
